4. STUDY CHARACTERISTICS AND QUALITY APPRAISAL

vii. DCI

viii. Iuorno 2002

Study ID	Iuorno 2002	
Study Citation	Iuorno et al., *Endocrine Practice*, 8:417-423, 2002	
Study Country	Venezuela	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (18-40 years)	
PCOS diagnostic criteria	Defined by the presence of oligomenorrhea (≤6 menstrual periods during the previous year) and hyperandrogenism (high serum free testosterone levels or hirsutism).	
Presence of infertility	Not reported	
Presence of other condition/s	Not reported	
Medication History	*None of the women had taken any medications, including insulin-sensitizing agents or oral contraceptives, during the 2 months before the study.*	
N per group	*Allocated/randomised: 20 (10 DCI, 10 placebo)* *Analysed: 20 (10 DCI, 10 placebo)*	
Setting	Hospital de Clinicas, Caracas, Venezuela	
Intervention	*DCI 600mg daily*	
Comparison	*Placebo supplement daily*	
Co-interventions	*Women were instructed not to alter their usual eating habits, physical activity, or lifestyle during the study, and they were also advised to refrain from sexual intercourse or to use a barrier method of contraception.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*BMI, total testosterone, free testosterone, fasting glucose, fasting insulin, total cholesterol*	
Follow up Duration	*6 – 8 weeks (follow-up was conducted during the follicular phase, determined by serum progesterone level < 2.5ng/mL).*	
Summary Result/s	*DCI improved glucose tolerance, reduces circulating insulin, decreases serum androgen concentrations and ameliorates other metabolite abnormalities associated with insulin resistance in lean women with PCOS.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *"we conducted the current study to determine whether the administration of D-chiro-inositol to lean women with the polycystic ovary syndrome would decrease serum androgens or improve ovulatory frequency (or both). In a randomized, double-blind study, 20 lean women with the polycystic ovary syndrome were given either D-chiro-inositol or placebo"*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Partial –only diagnosis and use of medications*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial*
Inclusion criteria	Yes Partial No Not reported	Women with the polycystic ovary syndrome, as defined by the presence of oligomenorrhea (≤6 menstrual periods during the previous year) and hyperandrogenism (high serum free testosterone levels or hirsutism). Normal thyroid function and prolactin levels.
Exclusion criteria	Yes Partial No Not reported	*None of the women had taken any medications, including insulin-sensitizing agents or oral contraceptives, during the 2 months before the study.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Yes* *Intervention and placebo were packaged at the same time as the randomisation schedule was generated, and were labelled according to subject number.*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Yes*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*No dropouts/not reported*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes, BMI and age were quite similar.*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Possibly* *This study was supported by NIH SBIR grant R43HD35772 (Insmed Pharmaceuticals), NIH-NCRR M01 RR00065-37S1 (M.J.I.), R01HD35629 (J.E.N.), and Insmed Pharmaceuticals, Inc.* *There was no declaration of conflicts of interest or description of the role of the sponsor in the study.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*No*

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Moderate RoB due to lack of reporting of randomisation sequence generation, and possible COI*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes had moderate risk of bias due to the nature of the study design.*	

ix.Nestler 1999

Study ID	Nestler 1999	
Study Citation	Nestler JE, Jakubowicz DJ, Reamer P, Gunn RD, Allan G. Ovulatory and metabolic effects of D-chiro-inositol in the polycystic ovary syndrome. New England Journal of Medicine. 1999 Apr 29;340(17):1314-20.	
Study Country	Venezuela	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS, 18 to 40 years of age	
PCOS diagnostic criteria	NR- Presence of oligomenorrhoea and hyperandrogenism.	
Presence of infertility	Not reported	
Presence of other condition/s	No	
Medication History	*No*	
N per group	*Allocated/randomised: 44 (22 DCI, 22 placebo)* *Assessed at end of study: 44 (22 DCI, 22 placebo)*	
Setting	Hospital de Clinicas Caracas in Caracas, Venezuela.	
Intervention	Oral administration of 1200 mg of D-chiro-inositol once daily for six to eight weeks	
Comparison	Placebo once daily for six to eight weeks	
Co-interventions	*No*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Ovulation* *Androgens* *Insulin resistance* *Lipid profile* *BMI* *WHR*	
Follow up Duration	*8 weeks*	
Summary Result/s	D-Chiro-inositol increases the action of insulin in patients with the polycystic ovary syndrome, thereby improving ovulatory function and decreasing serum androgen concentrations, blood pressure, and plasma triglyceride concentrations.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* Effects of D-chiroinositol on ovulation and ovarian production of androgens in women with the polycystic ovary syndrome.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Partial*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial* Ultrasonography of the ovaries revealed polycystic ovaries in all the women, but this condition was not an inclusion criterion.
Inclusion criteria	Yes Partial No Not reported	Yes Obesity, defined as a body-mass index (the weight in kilograms divided by the square of the height in meters) of more than 28, normal results on thyroid-function tests, and normal serum prolactin concentrations. None of the women had diabetes mellitus, but 10 had impaired glucose tolerance, defined as a serum glucose concentration of at least 140 but less than 200 mg per deciliter (7.8 to 11.2 mmol per liter) two hours after the oral administration of 75 g of glucose. None had taken any medications for at least two months.
Exclusion criteria	Yes	*Not Reported*

		Partial No Not reported	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* The randomization schedule was generated in blocks of four, and the drug and placebo were packaged at the same time and labelled according to subject number.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Yes*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Yes*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*No drop outs*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*No*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any	Yes Partial	*Not Reported*

	differences between the groups?	No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

viii.MI+DCI

x.Le Donne 2019

Study ID	*Le Donne 2019*	
Study Citation	*Le Donne, M et al. "Effects of three treatment modalities (diet, myoinositol or myoinositol associated with D-chiro-inositol) on clinical and body composition outcomes in women with polycystic ovary syndrome." European review for medical and pharmacological sciences vol. 23,5 (2019): 2293-2301. doi:10.26355/eurrev_201903_17278*	
Study Country	*Italy*	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	*Women with PCOS (Rotterdam criteria), age between 16 and 45 years; BMI ≥ 25kg/m^2*	
PCOS diagnostic criteria	*Rotterdam*	
Presence of infertility	*Not reported*	
Presence of other condition/s	*Overweight and obesity (BMI ≥ 25kg/m^2)*	
Medication History	*"no hormone therapy for less than 6 months " and "with commitment not to take any throughout the 6-month duration of the study"*	
N per group	*Allocated/randomised: 43 : Diet only (n=21), Diet + MI + FA (n=10), Diet + MI + DCI + FA (n=12)* *Assessed at end of study: 43 : Diet only (n=21), Diet + MI + FA (n=10), Diet + MI + DCI + FA (n=12)*	
Setting	*Department of Human Pathology in Adulthood and Childhood "G. Barresi", University of Messina, Messina, Italy*	
Intervention	*MI + FA; Lo.Li.Pharma (Rome, Italy), each sachet contains 2000 mg MI and 200 µg folic acid, 2 sachets daily*	
Comparison	*MI + DCI + FA; Lo.Li.Pharma (Rome, Italy), each softgel capsule contains 550 mg MI, 13.8 mg DCI, and 200 µg folic acid, 2 capsules daily*	
Co-interventions	*Diet (1200 Kcal) administered to all groups* • *according to Italian guidelines, Livelli di Assunzione di Riferimento di Nutrienti (LARN)39 and consisted of 25% fats, 15-18% proteins and the remaining portion glucids; low glycemic index (IG) foods were recommended.* *There was a third arm that received only the diet intervention. Details are not reported as there is no direct comparison between inositol and this group given inositol was combined with folic acid.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Menstrual cycle, Ferriman-Gallwey score, BMI, waist circumference, hip circumference, WHR, and body composition by bioimpedentiometry - measured at baseline, 3 and 6 months.*	
Follow up Duration	*3 and 6 months*	
Summary Result/s	*MI + DCI (+ FA) in association with diet seems to accelerate the weight loss and the fat mass reduction with a slight increase of per- cent lean mass, and this treatment contributes significantly in restoring the regularity of the menstrual cycle.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *"The purpose of this study was to evaluate, in overweight/obese women with PCOS, which of three distinct treatment modalities*

			achieved the greatest clinical benefits in terms of clinical and body composition outcomes when administered for 6 months to three corresponding groups of patients."
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Partial* ● *no exclusion criteria specified*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial* ● *Inclusion criteria: yes.* ● *Exclusion criteria: not specified.*
Inclusion criteria		Yes Partial No Not reported	*Yes* *Women with PCOS (Rotterdam criteria);* *age between 16 and 45 years;* *BMI ≥ 25kg/m2;* *no hormone therapy for less than 6 months;* *no concurrent medical disease and taking no medications or over-the-counter products at baseline with commitment not to take any throughout the 6-month duration of the study.*
Exclusion criteria		Yes Partial No Not reported	*Not reported*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Partial / unclear – the authors report that participants were blinded, however it is difficult to see how this transpired given one intervention is a sachet, another is a soft gel, and another is diet alone without a placebo.*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes (all groups were on the same diet)*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*No dropouts*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported – no trial registration or protocol available*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes* *"The three groups of women did not differ significantly for any index, including the frequency of irregular cycles."*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Yes* *Rate of oligomenorrhea and indices of body composition were reported in the results.*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *"The Authors declare that they have no conflict of interests."*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS		*Randomization method and allocation concealment not clear, no report of blinding for investigators and assessors, adherence to diet (self-reported?)*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

xi.Benelli 2016

Study ID	*Benelli 2016*
Study Citation	*Benelli, Elena et al. "A Combined Therapy with Myo-Inositol and D-Chiro-Inositol Improves Endocrine Parameters and Insulin Resistance in PCOS Young Overweight Women." International journal of endocrinology vol. 2016 (2016): 3204083. doi:10.1155/2016/3204083*
Study Country	*Italy*
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS, BMI > 30*
PCOS diagnostic criteria	*Rotterdam*
Presence of infertility	*Not reported*
Presence of other condition/s	*Obesity defined as: BMI > 30*
Medication History	*Not reported*
N per group	*Allocated/randomised: 46 (MI + DCI + FA= 21; FA only= 25)* *Assessed at end of study: 46 (MI + DCI + FA= 21; FA only= 25)*
Setting	*Department of Clinical and Experimental Medicine, University of Pisa, Italy*
Intervention	*MI + DCI combined treatment at the ratio of 40:1*.....Column Break..... *in soft gel capsule containing 550 mg of MI, 13.8 mg of DCI + 200 µg of folic acid (INOFOLIC® COMBI, LO.LI.PHARMA) 2x day*
Comparison	*200 µg of folic acid (INOFOLIC® COMBI, LO.LI.PHARMA) 2x day*
Co-interventions	*NR*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Endocrine profile and insulin resistance*
Follow up Duration	*6 months*

Summary Result/s		*MI + DCI (+ FA) improved the endocrine and metabolic parameters in young women with PCOS and BMI > 30.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Partial (no comparison reported in PICO)* *The goal of this study was to investigate if the therapy combining MI and DCI in the ratio of 40 : 1 could improve the endocrine profile and the insulin resistance of obese women with a PCOS diagnosis.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Partial* *Both very vague, for example, "young women" but does not state age for inc/exc criteria*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial*
Inclusion criteria		Yes Partial No Not reported	*Yes* *Women with PCOS (Rotterdam criteria)* *Age not specified* *BMI > 30*
Exclusion criteria		Yes Partial No Not reported	*Diabetes* *Smokers* *Alcohol users*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported* *"…they were randomly assigned to two groups"*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*No dropouts*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Partial* *Note that Table 2 legend includes "P, progesterone; 17OHP, 17-OH-progesterone" but does not report those.* *Trial registration or protocol not reported.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes* *"At baseline, patients in groups A and B did not differ significantly"*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *"The authors declare that there are no competing interests regarding the publication of this paper."*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS		*Randomization and blinding not reported, Inc/Exc criteria not conclusive (age? endocrine / menstrual / fertility issues?)*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

xii.Bahadur 2021

Study ID	Bahadur 2021
Study Citation	Bahadur, A. Arora, H. Ravi, A.K. Naithani, M. Bahurupi, Y. Chaturvedi, J. Ajmani, M. Mundhra, R. (2021). Comparison of clinical, metabolic and hormonal effects of metformin versus combined therapy of metformin with myoinositol plus D-chiro-inositol in women with polycystic ovary syndrome (PCOS): A randomized controlled trial. *Cureus,* 13(6): e15510
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Newly diagnosed women with PCOS, aged 18-45
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	Not reported
Medication History	*Those taking PCOS-related medications such as OCPs were not eligible.*
N per group	*Allocated/randomised: 77 (MYI+DCI+Metformin=39, Metformin alone=38)* *Assessed at end of study: 72 (MYI+DCI+Metformin=36, Metformin alone=36)*
Setting	*Obstetrics and Gynaecology department at medical institution, India*
Intervention	*Myoinositol 550mg +D-chiro-inositol 150mg +Metformin 500mg each dose, twice daily for 6 months* *Daily dose:* *MYO 1100mg + DCI 300mg + Metformin 1000mg*
Comparison	*Metformin 500mg each dose, twice daily for 6 months*

		Daily dose: *1000mg*	
Co-interventions		*None reported*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Changes in clinical, metabolic and hormonal parameters:* *Clinical: Menstrual cyclicity, mFG score, global acne score, waist circumference, hip circumference, waist:hip ratio, BMI* *Metabolic and hormonal: lipid profile, fasting and postprandial blood sugar, fasting and postprandial insulin, LH/FSH ratio, serum testosterone, DHEAS, HOMA-IR index* *None identified as primary or secondary measures in publication but trials register specifies primary endpoint as post-prandial endogenous insulin levels.*	
Follow up Duration		*6 months*	
Summary Result/s		*Synergistic effect of metformin in combination with MYI+DCI in women with PCOS and insulin resistance in terms of improvement in cycle regularity, global acne score, LH levels, LH:FSH ratio, lipid profile including cholesterol, HDL and LDL levels and postprandial insulin.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Partial* *Does not specify primary outcome measure in publication, although trials register shows primary outcome was specified as postprandial endogenous insulin levels.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Yes* *Reproductive age 18-45 years old* *Newly diagnosed PCOS according to Rotterdam criteria* *Willing to participate in the study and follow up* *Provided written informed consent*
Exclusion criteria		Yes Partial No Not reported	*Yes* *Prescribed other PCOS-related drugs such as OCPs, deranged kidney or liver function tests, uncontrolled thyroid disorders, hyperprolactinaemia, known hypersensitivity to metformin or MYI+DCI, endocrinological disorders such as congenital adrenal hyperplasia, Cushing's syndrome or androgen-secreting tumours.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Computer-generated randomisation table*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*MYI+DCI+Metformin=3/39 = 7.7%* *Metformin alone = 2/39 = 5.1%* *MYI+DCI+Metformin = 3 lost to follow up* *Metformin alone = 2 lost to follow up* *No reasons for withdrawal in each group were reported.*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Partial* *Trials register shows primary outcome was postprandial endogenous insulin levels, which was not reported in publication.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Partial* *Outcomes not adjusted for age*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported* *The sample size is 77. Page 6/7 mentioned "The limitation of the study is that it has a small sample size." It is not clear whether this study was sufficiently powered.*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Possible reporting bias. Primary outcome measure not clearly declared in publication. 20% dropout due to SEs from metformin commonly reported and yet very low dropout rates in this study.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

xiii.Nordio 2012

Study ID	Nordio 2012
Study Citation	Nordio and Proietti., *European Review for Medical and Pharmacological Sciences* 16: 575-581, 2012
Study Country	Italy
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants		*Women with PCOS (BMI > 27 kg/m2, mean age 28 years old, range 18-41)*	
PCOS diagnostic criteria		*Rotterdam*	
Presence of infertility		*Not reported*	
Presence of other condition/s		*No diabetes*	
Medication History		*Not reported*	
N per group		*Allocated/randomised: 50 (24 MI group, 26 MI+DCI group)* *Assessed at end of study: 36 (24 MI group, 12 MI+DCI group)*	
Setting		*Italy* *No information about outpatient or inpatient.*	
Intervention		*2 g of myo-inositol in powder (Inofolic® Lolipharma, Rome, Italy) twice a day for 6 months*	
Comparison		*550 mg of myo-inositol plus 13.8 mg of D-chiro-inositol in soft gel capsule (Inofolic® Combi, Lolipharma patent) twice a day for 6 months*	
Co-interventions		*The patients were asked not to change usual habits both for food, sport and lifestyle.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*At pre-treatment blood pressure, weight and height were measured and waist to hip ratio (WHR) and BMI were calculated through standard equation. In the morning, sex hormone binding globulin, serum steroids and lipid profile levels were measured. All the patients underwent an oral glucose tolerance test (OGTT) and plasma glucose and insulin were measured after 20, 30, 60, 120 minutes.*	
Follow up Duration		*6 months*	
Summary Result/s		*At the end of the treatment, both MI and MI+DCI groups showed an improvement of the metabolic parameters and no significant differences were found. As expected, the combined supplementation with MI and DCI resulted to be more effective, compared to the MI group, after three months of treatment.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		*Yes* *Partial* *No* *Not reported*	*Yes* *In this study we compared the effects of MI supplementation alone versus a combined MI and DCI therapy in reducing the metabolic syndrome risk as well as the improvement of the clinical features in PCOS overweight women.*
Does the study have specified inclusion/exclusion criteria?		*Yes* *Partial* *No* *Not reported*	*Partial* *Inclusion/ exclusion criteria not explicitly reported*
If there were specified inclusion/ exclusion criteria, were these appropriate?		*Yes* *Partial* *No* *Not reported*	*Partial*
Inclusion criteria		*Yes* *Partial* *No* *Not reported*	*Partial* *PCOS was diagnosed according to the criteria established by the European Society for Human Reproduction and Embryology (ESHRE) and the American Society for Reproductive Medicine (ASRM) in Rotterdam in 2003: (1) oligoanovulation, (2) hyperandrogenism (clinical or biochemical) and (3) presence of 12 or more follicles in each ovary measuring 2-9 mm in diameter, and/or increased ovarian volume (> 10 ml).*
Exclusion criteria		*Yes* *Partial* *No* *Not reported*	*Partial* *Diabetic subjects, smokers and alcohol users were excluded from the study.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	*Yes* *Partial* *No* *Not reported*	*Not reported* *Randomisation method not reported or how the randomisation was performed*
	Was allocation to intervention group concealed?	*Yes* *Partial* *No* *Not reported*	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	*Yes* *Partial* *No* *Not reported*	*No* *Randomised controlled trial stated – no mention of blinding. Participants might be easy to guess which group they were allocated*

			as the dosage form of the two groups was different, one in powder and the other in soft gel capsule. However, we contacted the author by email and the author confirmed that participants and investigators were blinded to intervention groups.
	Were investigators and care providers blind to intervention group?	*Yes* *Partial* *No* *Not reported*	*Not reported.* *However, we contacted the author by email and the author confirmed that participants and investigators were blinded to intervention groups.*
	Aside from the experimental intervention, were the groups treated the same?	*Yes* *Partial* *No* *Not reported*	*Not reported*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	*Yes* *Partial* *No* *Not reported*	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	*Yes* *Partial* *No* *Not reported*	*Not reported*
	Were outcomes assessed objectively and independently?	*Yes* *Partial* *No* *Not reported*	*Not reported*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	*X% treatment X% control/ comparison* *Not reported*	*Anthropometrics* *MI Group* *0/24 = 0%* *MI+DCI Group* *14/26 = 53.84%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	*Yes* *Partial* *No* *Not reported*	*Not reported*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	*Yes* *Partial* *No* *Not reported*	*Yes* *No protocol is available, but the outcomes reported in the methods are consistent with those reported in the results section.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	*Yes* *Partial* *No* *Not reported*	*Yes* *Statistical analysis revealed no significant differences between groups at baseline (age, BMI, waist to hip ratio, hormonal and lipids profile levels)*
	If confounding was present, was it controlled for?	*Yes* *Partial* *No* *Not reported*	*Yes*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	*Yes* *Partial* *No* *Not reported*	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	*Yes* *Partial* *No* *Not reported*	*Not reported* *No sample size calculation information was reported.*
	If statistical analysis was undertaken, was this appropriate?	*Yes* *Partial* *No* *Not reported*	*Yes* *To compare the two groups the unpaired t-test (parametric distribution) was used. The significance of differences between the pre- and posttreatment*

			measures (at first and third month) were analyzed using one-way ANOVAs. The source of the detected significances was determined by Bonferroni correction for repeated measures. p values less than 0.05 were considered statistically significant.
COMMENTS		*Lack of randomisation key reason for high RoB*	
What is the overall risk of bias?		*Low Moderate High Insufficient information*	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes high risk of bias*	

xiv.Khan 2022

Study ID	*Khan 2022*	
Study Citation	Khan, RB. Sarosh, M. Answer, S. (2022). Role of myo-inositol and D-Chiro-inositol in improvement of endocrine and clinical parameters in teenage girls affected by PCOS: A prospective cohort study. *Pakistan Journal of Medical and Health Sciences* 16(1),21-24.	
Study Country	*Pakistan*	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	*Women with PCOS (age 13-19 years old)*	
PCOS diagnostic criteria	*Not reported*	
Presence of infertility	*Not reported*	
Presence of other condition/s	*No*	
Medication History	*No*	
N per group	*Allocated/randomised: 106 (53 MI + DCI, 53 Placebo)* *Assessed at end of study: 106 (53 MI + DCI, 53 Placebo)*	
Setting	*Department of Gynaecology & Obstetrics, Avicenna Medical College and hospital, Lahore, Pakistan*	
Intervention	*MI + DCI (at the ratio of 40:1 (the physiologic ratio of two isomers in the body); Dose: 550 mg of MI, 13.8 mg of DCI, 200µg folic acid; twice a day; for 6 months*	
Comparison	*Placebo: Folic acid (200µg); twice a day; for 6 months*	
Co-interventions	*No*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Fasting glucose after 6 months of treatment*	
Follow up Duration	*6 months*	
Summary Result/s	*Combined therapy with MI plus DCI has promising results for treatment and improvement of clinical and lab parameters in teenage girls affected with PCOS compared to placebo.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*PartialThe aim was to evaluate the effectiveness of Myo-inositol and D-chiro-Inositol combination therapy in improvement of Endocrine and clinical parameters in teenage girls affected by PCOS.*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Partial*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial*
Inclusion criteria	Yes Partial No Not reported	*"106 eligible teen age girls, 13--19 years of age with PCOs were enrolled in the study after taking informed consent."* *Not report the criteria of PCOS used.*
Exclusion criteria	Yes Partial No Not reported	*"Patients with endocrine and metabolic disorders, Type I diabetes and thyroid disease were excluded."*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported* *It only stated that "The participants were randomly assigned to two groups A and B."*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*MI + DCI = 0/53=0%* *Placebo=0/53=0%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes* *No dropouts.*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *No protocol and registered record reported in the article. This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes* *Baseline information is in Table 1.* *"Patients in group A and group B did not differ significantly."*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Partial* *"Conflict of interest: Nil"* *Not reported the funding source.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No	*Partial* *Potential confounders were identified and taken into account in the analysis*

		Not reported	
COMMENTS		*Lack of randomisation, concealment, blinding, and no report of funding source are key reason for high RoB*	
What is the overall risk of bias?		Low Moderate High Insufficient information	High
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		The overall risk of bias: High Some objective outcomes such as FBG at low risk of bias, other subjective outcomes such as hirsutism and acne high risk of bias, due to lack of information regarding how outcomes were recorded.	

3f. MI+DCI v MI+DCI

xv.Nordio 2019

Study ID	*Nordio 2019*	
Study Citation	*Nordio et al., European Review for Medical and Pharmacological Sciences 23:5512–5521, 2019*	
Study Country	*Italy*	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	*Women with PCOS*	
PCOS diagnostic criteria	*Rotterdam*	
Presence of infertility	*Not reported*	
Presence of other condition/s	*No*	
Medication History	*No*	
N per group	*Allocated/randomised: 56 (DCI 0:1 alone = 8, MI/DCI 1:3.5 = 8, MI/DCI 2.5:1 = 8, MI/DCI 5:1 = 8, MI/DCI 20:1 = 8, MI/DCI 40:1 = 8, MI/DCI 80:1 = 8)* *Assessed at end of study: 55 (DCI 0:1 alone = 8, MI/DCI 1:3.5 = 8, MI/DCI 2.5:1 = 7, MI/DCI 5:1 = 8, MI/DCI 20:1 = 8, MI/DCI 40:1 = 8, MI/DCI 80:1 = 8)*	
Setting	*University teaching hospital with patients from gynecology/ endocrinology clinics, Glasgow, UK*	
Intervention	*Treated by oral route using the following formulations: DCI alone, and 1:3.5; 2.5:1; 5:1; 20:1; 40:1, 80:1 MI/DCI ratio. They received 2 g of inositols twice a day for 3 months.*	
Comparison		
Co-interventions	*After the enrolment, the patients were invited to avoid any change of usual habits both for food, physical activity and lifestyle.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*The primary outcome was ovulation (defined by mid luteal progesterone. but do not report threshold level) the secondary outcome included the improvement of FSH, LH, Sex Hormone Binding Globulin (SHBG), 17-beta-Estradiol (E2), free testosterone, basal and postprandial insulin levels, as well as HOMA index, BMI and menses.*	
Follow up Duration	*3 months*	
Summary Result/s	*We found that the 40:1 MI/DCI ratio is the best for PCOS therapy aimed at restoring ovulation and normalizing important parameters in these patients. The other formulations were less effective. In particular, a decreased activity was observed when the 40:1 ratio was modified in favour of DCI.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	*Yes* *Partial* *No* *Not reported*	*Partial* *The aim of this clinical trial was to evaluate the efficacy of seven different ratios between two inositols stereoisomers, myo-inositol (MI) and D-chiro-inositol (DCI), in the therapy of polycystic ovary syndrome (PCOS).*
Does the study have specified inclusion/exclusion criteria?	*Yes* *Partial* *No* *Not reported*	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	*Yes* *Partial* *No* *Not reported*	*Yes*
Inclusion criteria	*Yes* *Partial* *No*	*Yes*

		Not reported	*Inclusion criteria: age 18-45 years; PCOS diagnosed according to the Rotterdam ESHRE-ASRM consensus workshop group4 (PCOS diagnosed if 2 out of the 3 following conditions were met: a) oligo- or anovulation, b) clinical and/or biochemical signs of hyperandrogenism, and c) polycystic ovaries). Oligo-/anovulation or infertility > 1 year.*
Exclusion criteria		*Yes* *Partial* *No* *Not reported*	*Yes* *Exclusion criteria: presence of other pathologic or age-related conditions causing ovulatory dysfunction (such as hyperprolactinemia or hypothyroidism), androgen excess (such as adrenal hyperplasia or Cushing's syndrome) or poor ovarian reserve; the intake of other drugs that could potentially influence ovulation. Also, obese women (BMI > 29.9) were excluded, as well as women with partners with sperm abnormalities. In this way, we ruled out the concomitant factors that interfere with the possibility of becoming pregnant as potentially confounding variables. After the enrolment, the patients were invited to avoid any change of usual habits both for food, physical activity and lifestyle.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	*Yes* *Partial* *No* *Not reported*	*Yes* *Randomized (using SAS® software), Interventional, Open-label.*
	Was allocation to intervention group concealed?	*Yes* *Partial* *No* *Not reported*	*No - "open label"*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	*Yes* *Partial* *No* *Not reported*	*No*
	Were investigators and care providers blind to intervention group?	*Yes* *Partial* *No* *Not reported*	*No*
	Aside from the experimental intervention, were the groups treated the same?	*Yes* *Partial* *No* *Not reported*	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	*Yes* *Partial* *No* *Not reported*	*No*
	Were all outcomes measured in a standard, valid and reliable way?	*Yes* *Partial* *No* *Not reported*	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* *Partial* *No* *Not reported*	*Not reported*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	*X% treatment X% control/ comparison* *Not reported*	*DCI 0:1 alone = 0* *MI/DCI 1:3.5 = 0* *MI/DCI 2.5:1 = 1/8 = 12.5%* *MI/DCI 5:1 = 0* *MI/DCI 20:1 = 0* *MI/DCI 40:1 = 0* *MI/DCI 80:1 = 0* *All the fifty-six patients completed the study, except for one of the groups treated with 2.5:1 MI/DCI ratio, that withdrew for reasons not related to the clinical study.*
	Were all the subjects analysed in the groups to	*Yes* *Partial*	*Yes*

	which they were randomly allocated (ie intention to treat analysis)?	*No* *Not reported*	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	*Yes* *Partial* *No* *Not reported*	*Yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	*Yes* *Partial* *No* *Not reported*	*Yes* *The averages of patients' age and BMI at baseline did not display any significant difference among all the groups.*
	If confounding was present, was it controlled for?	*Yes* *Partial* *No* *Not reported*	*No*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	*Yes* *Partial* *No* *Not reported*	*No* *The Authors declare that they have no conflict of interests.*
	Was the study sufficiently powered to detect any differences between the groups?	*Yes* *Partial* *No* *Not reported*	*Not reported* *It is noteworthy that the difference between the effects due to the 40:1 treatment and those exerted by the other formulations was found **often** significant, especially when they were compared to the highest DCI dosages.*
	If statistical analysis was undertaken, was this appropriate?	*Yes* *Partial* *No* *Not reported*	*Yes* *Comparisons between the different times were performed using the one-way analysis of variance (ANOVA) and the post hoc Bonferroni adjustment. Comparisons in pairs between the different dosages were performed using the Chi-Square Test, while Student's t-test was used in order to compare quantitative variables between pairs of different dosages Statistical analyses were implemented at two-sided with a 0.05 significance level, using Stata version 8.2.*
COMMENTS		*Lack blinding key reason for moderate RoB*	
What is the overall risk of bias?		*Low Moderate High Insufficient information*	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes moderate risk of bias*	

xvi.Mendoza 2019

Study ID	Mendoza 2019
Study Citation	Mendoza et al., *Gynaecological Endocrinology* 35:8, 695-7004, 2019
Study Country	Spain
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS undergoing IVF with ICSI (between 18 and 40 years)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported (not explicitly reported but assumed given use of IVF)
Presence of other condition/s	
Medication History	*No*
N per group	*Allocated/randomised: 60 (30 study group, 30 control group)* *Assessed at end of study: 44 (25 study group, 19 control group)*
Setting	*Five clinical sites/ centers in Spain*
Intervention	*Oral soft gelatin capsules of 550 mg of MYO. 150 mg of DCI twice daily (3.6: 1) [Study group (SG)] over 12 weeks until the day of ovarian puncture.*
Comparison	*Oral soft gelatin capsules of 550 mg of MYO. 13.8 mg of DCI twice daily (40:1) [Control group (CG)] over 12 weeks until the day of ovarian puncture.*
Co-interventions	*Intake of other vitamins or antioxidants was not permitted during the study except for folic acid (400 mcg/ day), which was provided to all the patients.*

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)			*The primary outcome was the pregnancy rate, and the secondary outcomes were oocyte maturation, embryo quality, testosterone levels and insulin sensitivity. Pregnancy was defined as a positive test at 2 weeks from ET. Oocyte maturation was defined by the percentage of metaphase II (MII) oocytes. Embryos were assessed according to ESHRE criteria [14]. Participants who conceived were followed at the clinical site for ultrasound evidence of a viable intrauterine pregnancy and were referred for obstetrical care.*
Follow up Duration			*12 weeks*
Summary Result/s			*The participants comprised 60 women with PCOS undergoing ICSI. At baseline, no differences were found between the two groups regarding age, BMI, HOMA-IR or testosterone levels. The pregnancy and live birth rates were significantly higher in the SG than in the CG (65.5 vs. 25.9 and 55.2 vs. 14.8, respectively) [risk ratio (RR) . 0.4; 95%CI (0.2, 0.79); p..003 and RR.0.27; 95%CI (0.10, 0.70); p..002 respectively]. The risk of ovarian hyperstimulation syndrome (OHSS) was lower in the SG (3.44 vs. 18.5%, p..07). The combination of MYO-DCI at high doses of DCI improves the pregnancy rates and reduces the risk of OHSS in women with PCOS undergoing ICSI.*
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Yes*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Inclusion criteria: women aged between 18 and 40 years with PCOS according to the Rotterdam criteria [13] with a body mass index (BMI) <30 who were undergoing ICSI and signed the informed consent document. All participants were required to have a normal uterine cavity. Before randomization, the patients were offered the possibility of doing inseminations or ICSI.*
Exclusion criteria		Yes Partial No Not reported	*Exclusion criteria: Contraindications for ICSI, adrenal hyperplasia, hyperprolactinemia, thyroid disease, severe endometriosis, poor responder and severe male factor.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* The volunteers were randomly assigned to one of two groups according to a randomization scheme generated by a computer program (SIGESMUVR).
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Yes* *Quadruple masking is described (Participant, care provider, investigator and outcomes assessor).*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes* *This was a multicenter controlled, randomized, **double-blind** parallel group study*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Yes* *To maintain blinding, the investigator received a treatment allocation number for each subject from the IRT system.*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Yes*

	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Women with PCOS undergoing ICSI* *5/30 study group = 16.67% (2 for personal reasons, 2 spontaneous pregnancies after enrollment before IVF, 1 cancelled due to OHSS risk)* *11/30 control group = 36.67% (5 for personal reasons, 1 spontaneous pregnancy, 3 OHSS risk)*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes* *Intention to treat analysis is the comparison of the treatment groups including all patients as originally allocated after randomization. We mainly present the per-protocol analysis for primary and secondary outcomes. However, to compare results, avoid possible bias in the primary outcome and increase the credibility of the results, an intention to treat analysis was also presented using R project 3.3.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Partial* *At baseline, no differences were found between the two groups regarding age, BMI, HOMA-IR or testosterone levels. The pregnancy and live birth rates were significantly higher in the* *SG than in the CG (65.5 vs. 25.9 and 55.2 vs. 14.8, respectively) [risk ratio (RR) . 0.4; 95%CI (0.2, 0.79); p..003 and RR.0.27; 95%CI (0.10, 0.70); p..002 respectively]. The risk of ovarian hyperstimulation syndrome (OHSS) was lower in the SG (3.44 vs. 18.5%, p..07).*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Yes?* *Bivariate statistical tests for the personal variables were performed to determine the homogeneity of the women's characteristics between the treatment groups.*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Yes* *Dıaz-Ropero MP, Maldonado-Lob on JA, Olivares M, Fonoll a J are workers of Biosearch Life, a company that produces DCI from carob fruit. The remaining authors declare that they have no competing interests.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*No*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes* *Frequencies, percentages and chi-square tests were performed on qualitative variables. For quantitative variables, the mean, standard deviation (SD) and 95% confidence intervals were obtained, and the asymptotic ttest or bootstrap technique for the t-test was performed to compare groups. Additionally, statistical multivariate modeling was applied to check differences between groups regarding the evolution of parameters, which used multivariate linear mixed regression models and intra-subject random effect and was fitted with the patients' characteristics.*
COMMENTS		*Randomisation and blinding reasons for low RoB. Authors with possible conflict of interest key factor for moderate risk of bias*	

What is the overall risk of bias?	Low Moderate High Insufficient information	*Moderate – two authors work for a company that produces the intervention*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes moderate risk of bias*	

ix.MI Comparisons

xvii.Akbari Sene 2019

Study ID		Akbari Sene 2019	
Study Citation		Akbari Sene et al, *Archives of Gynecology and Obstetrics*, 299:1701-1707, 2019	
Study Country		Iran	
BRIEF CHARACTERISTICS OF RCT			
Patient/population/ participants		Infertile women with PCOS referred to an IVF Center in Tehran, Iran	
PCOS diagnostic criteria		Rotterdam criteria	
Presence of infertility		Yes all patients	
Presence of other condition/s		Not reported	
Medication History		*No hormonal treatment x 3mo prior to study*	
N per group		*Allocated/randomised: 60 (1 month of: 30 placebo – folic acid 400mcg/day; 30 intervention – 400mcg FA +4g MI daily)*	
Setting		*University based IVF center in Tehran, Iran*	
Intervention		*(Inofolic, LOLI Pharma, Rome, Italy) Myo inositol 4g + 400mcg folic acid daily x 1 month prior to egg retrieval*	
Comparison		*400mcg folic acid daily x 1 month prior to egg retrieval*	
Co-interventions		*IVF done after treatment period of 1 month*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Primary: Embryo quality, rate of mature oocytes, rate of fertilization* *Other: relative gene expression levels in mural granulosa cells,* ***cumulative pregnancy rate (only outcome of interest)***	
Follow up Duration		*Until IVF outcome*	
Summary Result/s		*The myoinostil treatment group had a higher percentage of mature oocytes, rate of fertilization and top quality embryos compared to placebo. Cumulative pregnancy rate was not different between the groups.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Yes– The aim of our study was to evaluate the effect of myo-Inositol administration as an adjuvant on expression of some of the genes related to oocyte quality and oxidative stress parameters in the follicular fluid as well as oocyte maturation, fertilization rate and embryo quality in PCOS patients during ART cycle.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Yes* - PCOS by Rotterdam criteria + candidate for IVF cycle, aged 20–35 years and with partner's normal semen analysis results (total volume > 1.5 cc, concentration > 15 million/ml and total motility > 40% as well as normal morphology > 4%, according to WHO 2010)
Exclusion criteria		Yes Partial No Not reported	Yes - excluded if they had other metabolic diseases such as diabetes, BMI above 35, had allergy to myo-Inositol or had received any hormonal medications for at least 3 months before the start of the study
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes – permuted block randomization*
	Was allocation to intervention group concealed?	Yes Partial No	*Yes*

		Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Not reported*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*83% (25/30) completed treatment and 83% (25/30) completed placebo treatment. Reason for drop out of 5 participants in each arm was not reported.*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported (no power calculation provided)*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*Yes – primary outcome was well defined, pregnancy rate was not well defined.*

xviii.Artini 2013

Study ID	Artini 2013	
Study Citation	Artini et al, *Gynecological Endocrinology*, 29:4, 375-379, 2013	
Study Country	Italy	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS with planned IVF treatment at a university based fertility clinic in Italy	
PCOS diagnostic criteria	(a) presence of micropolycystic ovaries at ultrasound, (b) mild to severe hirsutism and/or acne, (c) oligomenorrhea (menstrual cycle435 days) or amenorrhea, (d) absence of enzymatic adrenal deficiency and/or other endocrine disease, (e) normal PRL (Prolactin) levels (range 5–25ng/ml), (f) no hormonal treatment for at least six months before the study.	
Presence of infertility	All participants	
Presence of other condition/s	No	
Medication History	*No hormonal treatment for ≥6 months prior to study*	
N per group	*Allocated/randomised: 50 (12 weeks of: 25 placebo – folic acid 400mcg/day; 25 intervention – 400mcg FA +2g MI)*	
Setting	*University based Obgyn and fertility clinic*	
Intervention	*(Inofert, Italfarmaco, Milano Italy) Myo inositol 2g/day + 200mcg folic acid + additional 200mcg folic acid x 12 weeks*	
Comparison	*400mcg folic acid x 12weeks*	
Co-interventions	*IVF after completing 12 weeks of placebo or intervention*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*LH, FSH, PRL, E2, Testosterone, 17OHP, Androstendione, insulin (fasting), LH/FSH ratio, BMI, Glucose/insulin ratio, HOMA index, AUC insulin(2 hours after 75g OGTT), 30 min and 60 min 75g OGTT* *IVF outcomes: oocytes, top quality oocytes, fertilization rate, top quality embryos,* ***hcg positive, clinical pregnancy (pregnancy seen on US with + FHR),*** *delivery rate*	
Follow up Duration	*Until pregnancy resolution*	
Summary Result/s	*The myoinositol group had significantly lower fasting insulin and HOMA index as well as FSH/LH ratio at study completion. There was also a significantly higher rate of + hCG, clinical pregnancy and live birth in the myoinositol group.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	*The aim of our study was to evaluate the effects of MYO administration on hormonal and clinical parameters in a group of PCOS patients undergoing IVF.*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* - (a) presence of micropolycystic ovaries at ultrasound, (b) mild to severe hirsutism and/or acne, (c) oligomenorrhea (menstrual cycle435 days) or amenorrhea, (d) absence of enzymatic adrenal deficiency and/or other endocrine disease, (e) normal PRL (Prolactin) levels (range 5–25ng/ml), (f) no hormonal treatment for at least six months before the study.
Exclusion criteria	Yes Partial No Not reported	Yes – not meeting inclusion criteria
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Computer generated randomization*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Yes*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Yes*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*100% in both arms completed 12 weeks of treatment* *1/25 in treatment arm did not make it to retrieval due to OHSS (no IVF/pregnancy outcomes)* *4/25 in placebo arm did not make it to retrieval due to OHSS (no IVF/pregnancy outcomes)*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported (no power calculation provided)*

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Low*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – low to moderate risk of bias due to lack of power calculation*	

xix.Constantino 2009

Study ID	Contantino 2009	
Study Citation	Constantino et al, *European Review for Medical and Pharmacological Sciences*, 13: 105-110, 2009	
Study Country	Italy	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women 18-40yrs with PCOS	
PCOS diagnostic criteria	Oligomenorrhea (not defined), elevated free testosterone level and/or hirsutism and PCOS ovaries on ultrasound	
Presence of infertility	Not provided	
Presence of other condition/s	Impaired glucose tolerance (plasma glucose >140mg/dl and <200mg/dl after 75g 2 h OGTT)	
Medication History	*13/42 women were taking oral contraceptive or insulin sensitizers in the 2 months prior to study start*	
N per group	*Allocated/randomised: 42 (6 weeks of: 19 placebo – folic acid 400mcg/day; 23 intervention – 400mcg FA +4g MI daily)*	
Setting	*Not described*	
Intervention	*(Inofolic, LOLI Pharma, Rome, Italy) Myo inositol 4g + 400mcg folic acid daily x 6 weeks* *(methods describe 12-16 wk of treatment but then report measurements after 6 weeks)*	
Comparison	*400mcg folic acid daily x 6 weeks*	
Co-interventions	*None*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Blood pressure, BMI, WHR, T cholesterol, triglycerides, SBP, DBP, fasting. Insulin, fasting glucose, glucose AUC, insulin AUC, ISI comp, Testosterone total and free, androstendione, DHEAS, SHBG*	
Follow up Duration	*After 6-8 weeks of treatment*	
Summary Result/s	*Myoinostiol group had a greater reduction in triglycerides, total cholesterol, glucose AUC, insulin AUC, total and free testosterone after 6 weeks of treatment compared to placebo.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Partial – The aim of our study was to investigate the metabolic and hormonal effects of myoinositol in PCOS patients.*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Partial*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial – appropriate, but not clearly defined*
Inclusion criteria	Yes Partial No Not reported	*Yes* – Oligomenorrhea (not defined), elevated free testosterone level (value for elevated not provided) and/or hirsutism and PCOS ovaries on ultrasound (also not defined)
Exclusion criteria	Yes Partial No Not reported	Not reported
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Yes*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Yes*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Not reported*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*100% in both arms completed 6 weeks of treatment* *No dropout was reported*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes, there seems to be a difference in baseline total testosterone, but otherwise they appear similar*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported (no power calculation provided)*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No	*Yes*

		Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – high risk of bias for all outcomes due to lack of power calculation, no reporting of method of randomization, insufficient description of inclusion criteria, no description of the population from which the patients were recruited*	

xx.Genazzani 2008

Study ID	Genazzani 2008	
Study Citation	Genazzani et al, *Gynecological Endocrinology*, 24:3, 139-144, 2008	
Study Country	Italy	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS recruited from the Gynecological Endocrinology Center at the University of Modena	
PCOS diagnostic criteria	a) presence of micropolycystic ovaries at ultrasound, b) mild to severe hirsutism and/or acne; c) oligomenorrhea or amenorrhea d) absence of enzymatic adrenal deficiency and/or other endocrine disease, e) normal PRL levels (range 5–25 ng/ml), f) no hormonal treatment for at least 6 months before the study	
Presence of infertility	Not provided	
Presence of other condition/s	All had normal insulin sensitivity at baseline (HOMA >4.5)	
Medication History	*No hormonal treatment x 6mo prior to study*	
N per group	*Allocated/randomised: 20(12 weeks of: 10 placebo – folic acid 200mcg/day; 10 intervention – 200mcg FA +2g MI daily)*	
Setting	*University based GYN endocrinology center in Italy*	
Intervention	*(Inofolic, LOLI Pharma, Rome, Italy) Myo inositol 2g + 200mcg folic acid daily x 12 weeks*	
Comparison	*200mcg folic acid daily x 12weeks*	
Co-interventions	*None*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*BMI, fasting Insulin, fasting glucose, glucose AUC, insulin AUC, Testosterone, androstenedione, farriman gallway score, prolactin, FSH, LH, 17 OHP, estradiol, progesterone, c-peptide*	
Follow up Duration	*After 12 weeks of treatment*	
Summary Result/s	*Myoinostiol group had a significantly lower fasting insulin level and HOMA index compared to placebo at the end of 12 weeks of treatment. There was also a reduction in the ferrman gallway score though not statistically significant.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Partial – The aim of our study was to evaluate the effects of myoinositol administration on hormonal parameters in a group of oligomenorrheic/amenorrheic patients with PCOS*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* a) presence of micropolycystic ovaries at ultrasound, b) mild to severe hirsutism and/or acne; c) oligomenorrhea or amenorrhea d) absence of enzymatic adrenal deficiency and/or other endocrine disease, e) normal PRL levels (range 5–25 ng/ml), f) no hormonal treatment for at least 6 months before the study

COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – high risk of bias for all outcomes due to lack of power calculation, no reporting of method of randomization, or blinding.*	

xxi.Ozay 2017

Study ID		Ozay 2017	
Study Citation		Ozay et al, *Gynecological Endocrinology*, 33:7, 524-528, 2017	
Study Country		Turkey	
BRIEF CHARACTERISTICS OF RCT			
Patient/population/ participants		Women with infertility and PCOS age 18-35 with planned ovulation induction and IUI cycle at a university based fertility clinic in Turkey	
PCOS diagnostic criteria		Rotterdam criteria	
Presence of infertility		All participants	
Presence of other condition/s		Excluded smoking, hyperprolactinemia, hypogonadotropic hypogonadism, pregnancy, thyroid dyfunction, CAH, androgen secreting tumors and Cushing's Subgroup comparison of those with insulin resistance to without insulin resistance	
Medication History		*No hormonal treatment (OCPs or antiandrogens) for ≥6 months prior to study*	
N per group		*Allocated/randomised: 196 (12 weeks of: 98 placebo – folic acid 400mcg/day; 98 intervention – 400mcg FA +2g MI twice daily)*	
Setting		*University based Obgyn and fertility clinic in Turkey*	
Intervention		*(Inofolic, LOLI Pharma, Rome, Italy) Myo inositol 4g + 400mcg folic acid twice daily x 12 weeks*	
Comparison		*400mcg folic acid (unclear if 1 or 2x daily) x 12weeks*	
Co-interventions		*FSH + IUI after completing 12 weeks of placebo or intervention*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Pregnancy outcomes: clinical pregnancy (pregnancy seen on US with + FHR), miscarriage rate, number of singleton. Pregnancies and number of multiple pregnancies*	
Follow up Duration		*Not specified*	
Summary Result/s		*The myoinositol group had significantly higher clinical pregnancy rate compared to placebo group after use of FSH and IUI (18.6% vs 12.2% p0.02). They had a lower miscarriage rate but this was not statistically significant (12.5% v. 18.2% p0.07). In the MI group 2/16 pregnancies were multiple gestation compared to 1/11 in the placebo group.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		**Yes** Partial No Not reported	*The aim of our study was investigate the effect of MI on the pregnancy rate of patients with PCOS who undergo ovulation induction and IUI*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Yes – 2/3 of the following:* *oligomenorrhea(<6 cycles in the preceding year) and/or anovulation;* *clinical and/or biochemical hyperandrogenism; ≥12 2-9mm follicles/ ovary 2–9mm and/or increased ovarian volume(410mL)* *No use of hormonal meds in preceding 6 months*
Exclusion criteria		Yes Partial No Not reported	Yes – male infertility diagnosis, or other endocrine disorder (CAH, cushing's etc)
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No	*No* *Randomization was done according to protocol numbers (odd went into group 1 and even into group 2)*

		Not reported	
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Partial – unclear if the placebo was once or twice per day dosing*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*100% in both arms completed 12 weeks of treatment* *9/98 in MI arm conceived spontaneously and therefore not undergo FSH/IUI intervention* *3/98 patients in MI arm had cancelled cycles and were not included in analysis* *8/98 patients in placebo arm had cancelled cycles*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*No – patients with cancelled cycles or spontaneous pregnancies were not included in the analysis*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported (no power calculation provided)*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			

What is the overall risk of bias?	Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – high risk of bias due to lack of power calculation, method or randomization and failure to complete/report ITT analysis*	

xxii.Pacchiarotti 2016

Study ID	*Pacchiarotti 2016*	
Study Citation	*Pacchiarotti, Alessandro et al. "Effect of myo-inositol and melatonin versus myo-inositol, in a randomized controlled trial, for improving in vitro fertilization of patients with polycystic ovarian syndrome." Gynecological endocrinology : the official journal of the International Society of Gynecological Endocrinology vol. 32,1 (2016): 69-73. doi:10.3109/09513590.2015.1101444*	
Study Country	*Italy*	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	*Women with PCOS (Rotterdam criteria), between 27 and 38 years old, BMI of 20 to 26 kg/m2, and undergoing ICSI for the first time*	
PCOS diagnostic criteria	*Rotterdam*	
Presence of infertility	*Yes (primary and secondary infertility reported in Table 1).*	
Presence of other condition/s	*Not reported*	
Medication History	*Not reported*	
N per group	*Allocated/randomised: 569 recruited* ● *Folic acid alone: 211* ● *Myo-inositol + Folic acid:180* ● *Melatonin + Myo-inositol + Folic acid: 178* *Assessed at end of study: 526 (43 dropped out)* ● *Folic acid alone: 195 (16 dropped out; 9 low ovarian response, 7 excessive ovarian response)* ● *Myo-inositol + Folic acid:166 (14 dropped out; 8 low ovarian response, 6 excessive ovarian response)* ● *Melatonin + Myo-inositol + Folic acid: 165 (13 dropped out; 7 low ovarian response, 6 excessive ovarian response)*	
Setting	*Praxi Pro Vita IVF Center (Rome, Italy)*	
Intervention	*Myo-inositol (4000mg) + folic acid (400mcg) (Inofolic, Lo.Li.Pharma SRL, Rome Italy, twice daily)*	
Comparison	*Folic acid (400mcg) (Inofolic, Lo.Li.Pharma SRL, Rome Italy, twice daily)*	
Co-interventions	*All participants undergoing ICSI (for the first time).* *All the participating patients underwent a long down-regulation protocol with a gonadotropin-releasing hormone (GnRH) analogue (triptorelin, Decapeptyl; Ipsen, Milan, Italy) at 0.1 mg/ day on day 21 of their cycle. Moreover, they received a combined protocol at the beginning with 225 IU of acidic HMG (Menopur; Ferring, Milano, Italy) for the first 6 days starting from day 2 of the cycle, followed by 225 IU of less-acidic recombinant FSH (Puregon, MSD, Rome, Italy) until hCG administration.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary: oocyte and embryo quality, clinical pregnancy and implantation rates.* *Secondary: gonadotropin IU administered, days of stimulation, serum estradiol (E2) levels and endometrial thickness on the day of human chorionic gonadotropin (hCG) administration.*	
Follow up Duration	*14 days after embryo transfer*	
Summary Result/s	*Myo-inositol and Melatonin behaved synergistically at ovarian level, improving ovarian response to gonadotropin stimulation, with the result to increase oocyte and embryo quality.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Partial* *"This study was aimed at testing, in a significant number of PCOS patients, the synergistic effect of Myo-inositol and Metformin integrated in the common IVF protocols, on the main IVF outcomes."*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Partial*

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial*
Inclusion criteria		Yes Partial No Not reported	*Yes* *Women with PCOS, between 27 and 38 years old, with:* *(1) absence of tubal, uterine, genetics and male causes of infertility;* *(2) serum levels of FSH on day 3 of the ovarian cycle <512 IU/L;* *(3) Rotterdam criteria for PCOS;* *(4) normal uterine cavity (5) body mass index (BMI) of 20 to 26 kg/m2, and* *(6) first IVF treatment.*
Exclusion criteria		Yes Partial No Not reported	*Not reported*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *"Randomization was performed using a computer- based random assignment schedule for each patient and it was double-blinded."*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Partial* *"Randomization was performed using a computer- based random assignment schedule for each patient and it was double-blinded." – but it does not state who was double-blinded.*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*43 dropped out:* ● *Folic acid alone: 16 dropped out (9 low ovarian response, 7 excessive ovarian response) 195 of 211* ● *Myo-inositol + Folic acid: 14 dropped out (8 low ovarian response, 6 excessive ovarian response) 166 of 180* ● *Melatonin + Myo-inositol + Folic acid: 13 dropped out (7 low ovarian response, 6 excessive ovarian response) 165 of 178*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes* *"The differences among the three groups were not statistically significant"*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Partial* *One of the authors reported being an employee of a pharmaceutical company: "Gianfranco Carlomagno is employee at Farmares SRL, Rome"* *Other authors reported no CoI* *Funding – not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes* *"The statistical power calculation was based on a level of 0.05 with 80% power to detect a 20% difference with 50 evaluable patients per group. The sample size needed was estimated to be 214 (Confidence Interval 4; Confidence level 95%)."*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS		*"double-blinding" is not clear*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

xxiii.Papaleo 2009

Study ID	*Papaleo 2009*
Study Citation	*Papaleo, Enrico et al. "Myo-inositol may improve oocyte quality in intracytoplasmic sperm injection cycles. A prospective, controlled, randomized trial." Fertility and sterility vol. 91,5 (2009): 1750-4. doi:10.1016/j.fertnstert.2008.01.088*
Study Country	*Italy*
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS, aged <40 years old, undergoing ICSI*
PCOS diagnostic criteria	*Oligoamenorrhea (six or fewer menstrual cycles during a period of 1 year), hyperandrogenism (hirsutism, acne, or alopecia), or hyperandrogenemia (elevated levels of total or free T) and typical features of ovaries on ultrasound scan*
Presence of infertility	*Not reported, although the authors state: "All patients treated in our IVF department for a period of more than 12 months were asked to participate in the study"*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	*Allocated/randomised: 60 (30 myo-inositol + folic acid; 30 folic acid alone)* *Assessed at end of study: 60 (30 myo-inositol + folic acid; 30 folic acid alone)*
Setting	*IVF unit, Gynecologic-Obstetric Department, Istituto di Ricovera e Cura a Carattere Scientifico, San Raffaele Hospital, Vita-Salute University, Milan, Italy*
Intervention	*2 g myo-inositol twice a day combined + 400 µg folic acid (Inofolic, Lo.Li. Pharma, Rome, Italy)*
Comparison	*400 µg folic acid (Inofolic, Lo.Li. Pharma, Rome, Italy)*

Co-interventions		*Controlled Ovarian Hyperstimulation*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Primary: number of morphologically mature oocytes retrieved, embryo quality, and pregnancy and implantation rates.* *Secondary total number of days of FSH stimulation, total dose of gonadotropin administered, E2 level on the day of hCG administration, fertilization rate per number of retrieved oocytes, embryo cleavage rate, live birth and miscarriage rates, cancellation rate, and incidence of moderate or severe ovarian hyperstimulation syndrome.*	
Follow up Duration		*Not reported – the longest outcome (spontaneous miscarriage) was classified as "the loss of the pregnancy between the fifth and twelfth weeks of gestation"*	
Summary Result/s		*In patients with PCOS, treatment with myo-inositol and folic acid, but not folic acid alone, reduces germinal vesicles and degenerated oocytes at ovum pick-up without compromising total number of retrieved oocytes*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Yes* *Investigate the effects of myo-inositol on ovarian function in women with PCOS undergoing ovulation induction for intracytoplasmic sperm injection (ICSI), treated within a randomized placebo-controlled trial.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Yes* *Women aged <40 years, diagnosed with PCOS, undergoing ovulation induction for ICSI*
Exclusion criteria		Yes Partial No Not reported	*Yes* *Hyperinsulinemia, hyperprolactinemia, or hypothyroidism, or androgen excess, such as adrenal hyperplasia or Cushing syndrome.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Randomization table*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*

	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*There were no dropouts*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*No* ● *"live birth" is one of the secondary outcomes mentioned in the Abstract (under "Main Outcome Measures") but it is not reported in the paper.* *No trial registration number or protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes* *No differences were found between the two groups in mean age, BMI, and duration of infertility. The causes of infertility also did not differ after randomization between the two groups.*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors stated that they have "nothing to disclose"*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS		*See comment about "live birth" in reporting bias, plus blinding not reported*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

4b. MI + Metformin v Metformin alone

xxiv.Chirania 2017

Study ID	Chirania 2017
Study Citation	A randomised clinical trial comparing myoinositol and metformin in PCOS Chirania, Kishan; Misra, Sujata; Behera, Sandhya International Journal of Reproduction, Contraception, Obstetrics and Gynecology; Vol 6, No 5 (2017): May 2017DO - 10.18203/2320-1770.ijrcog20171563 2017;(): 2017
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (age not reported)

PCOS diagnostic criteria		Rotterdam	
Presence of infertility		Some participants had infertility but not all	
Presence of other condition/s		Lean or obese women were included	
Medication History		*No*	
N per group		*Allocated/randomised: This was very poorly reported. Final numbers were 26 MI, 28 Met and 22 MI + Met however the description of randomisation was "After randomisation each group comprised of 24 participants". Authors later reported "since patients already on treatment with either MI or met were also included in the study, the number of patients in each group slightly differed". This is hard to understand as there were fewer participants in the MI + Met group compared to the numbers randomised. It could be that 72 women were randomised and then a few more were added who were not randomised.* *Analysed: 72 (26 MI, 28 Met, 22 MI+ Met)*	
Setting		*Obstetric and gynaecology outpatient department in a medical college in India*	
Intervention		*Myo-inositol 1g/daily for 4 months*	
Comparison		*Metformin 1g daily for 4 months and* *MI + Metformin*	
Co-interventions		*Not reported*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Primary: resumption in spontaneous menstrual cycles and pregnancy rate* *Secondary: anthropometric, metabolic*	
Follow up Duration		*4 months*	
Summary Result/s		*No between-group comparisons were reported. Both MI and MI + Met resulted in resumption in spontaneous menstrual cycles and pregnancies. Metformin alone did not result in resumption of spontaneous menstrual cycles.* *All three interventions reduced weight. MI and Met alone reduced BMI. MI + Met combination reduced fasting insulin.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Partial* *Evaluate the effect of insulin sensitisers in improving clinical and hormonal alterations in cases of PCOS and improving the reproductive outcomes. Compare the effects of metformin and MI alone, with another group of patients taking a combination.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial* *Poorly described* *Unclear why some criteria were chosen eg AMH*
Inclusion criteria		Yes Partial No Not reported	*Rotterdam (oligomenorrhoea/amenorrhoea, with. Polycystic ovaries on US, with or without hyperandrogenism and/or obesity* *15-40* *"Patients who were already diagnosed with PCOS and on treatment with the drugs compared in this study"*
Exclusion criteria		Yes Partial No Not reported	*Partial* *Unclear why AMH is an exclusion* *Abnormal TSH, PRL, AMH* *Any chronic illness in the past or present – TB, thyroid disease, malabsorption* *Chemo/radio therapy in childhood*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported* *Only reported as randomised. It is also unclear how this was implemented: "since patients already on treatment with either MI or met were also included in the study, the number of patients in each group slightly differed"*
	Was allocation to intervention	Yes Partial No	*Not reported*

	group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Not reported*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Not reported*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Not reported*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Not reported*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Not reported*

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors report no COI*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Partial* *A sample size calculation was performed but unclear if it is appropriate* *"* *It was an equivalence trial where the null hypothesis was that both myoinositol* *and metformin are equally effective in PCOS.* *The sample size was calculated based on the formula, n=Z2×(p)×(1-p)/Δ2* *n is the sample size.* *Z is confidence interval i.e., 1.96 for 95%* *Δ is confidence level i.e., 0.05 for ±5%* *P is the proportion of the population with the disease under study i.e, 5% which in decimal converts to 0.05.* *So, n= (1.96)2×(0.05)×(1-0.05)/(0.05)2 n = 72"*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Not reported*
COMMENTS		*Insufficient information to make a judgement on the risk of bias*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Due to insufficient reporting it is not possible to make a judgement on the risk of bias.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes unclear ROB.*	

4c. MI v DCI

xxv.Unfer 2011

Study ID	Unfer 2011
Study Citation	*Myo*-inositol rather than D-*chiro*-inositol is able to improve oocyte quality in intracytoplasmic sperm injection cycles. A prospective, controlled, randomised trial. V.Unfer, G, Carlomagno, P. Rizzo, E. Raffone, S Roseff, Eur Rev Med Pharmacol Sci. 2011 Apr;15(4):452-7.
Study Country	Italy

BRIEF CHARACTERISTICS OF RCT			
Patient/population/ participants		Women with PCOS < 40 years that were diagnosed with euglycemia and attending an IVF clinic for ovulation induction for ICSI	
PCOS diagnostic criteria		Rotterdam	
Presence of infertility		Unclear if patients were diagnosed with infertility although criteria were that they had been visiting the IVF department for more than 12 months	
Presence of other condition/s		Nil reported	
Medication History		*No*	
N per group		*Allocated/randomised: 84 women (44 MI 2g twice a day, 41 DCI 0.6g always twice a day)* *Assessed at end of study: 84 women with, no reports of withdrawals from either group in the study*	
Setting		*IVF Clinic, Department of Obstetrics and Gynecology, University of Messina (Italy)*	
Intervention		*Pre-ICSI Myo-inositol 2g twice a day for 8 weeks*	
Comparison		*Pre-ICSI D-chiro inositol 0.6g twice a day for 8 weeks.*	
Co-interventions		*Controlled ovarian hyperstimulation (GnRH agonist then hCG then rFSH) and ICSI were performed after 8 weeks of MI or DCI*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Pregnancy*	
Follow up Duration		*8 weeks + one cycle of ICSI*	
Summary Result/s		*No. of oocytes retrieved did not differ in both groups. No. of mature oocytes was significantly increased in MI group compared to DI group. MI treated group showed increase in average no. of top-quality embryos and total no. of pregnancies.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Yes.* *The aim was to compare effects of myo-inositol and D-chiro-inositol on oocyte quality in euglycemic PCOS patients.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes* *Rotterdam criteria and age for inclusion criteria and insulin resistance/hyperglycaemia for exclusion criteria.*
Inclusion criteria		Yes Partial No Not reported	*Yes* *<40 years* *Euglycemic* *Undergoing fertility treatment at the IVF clinic*
Exclusion criteria		Yes Partial No Not reported	*Yes* *Insulin resistance* *Hyperglycaemia*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*

	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Not reported*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Not reported, however assuming 0% dropped out.*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Not reported*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported, not declared in paper*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Lack of randomisation, insufficient information, unsure how they accounted for any confounders if there were any.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Insufficient information*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes unclear risk of bias*	

4d. MI v Metformin

xxvi.Angik 2017

Study ID	Angik 2017
Study Citation	A comparative study of metabolic and hormonal effects of myoinositol vs. metformin in women with polycystic ovary syndrome: a randomised controlled trial Angik, Riju; Jajoo, Shubhada S.; Hariharan, C.; Chimote, Amogh International Journal of Reproduction, Contraception, Obstetrics and Gynecology; Vol 4, No 1 (2015): January-February 2015 2017;(): 2017
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS aged 15-40
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Some participants had been diagnosed with infertility but notn all
Presence of other condition/s	Nil reported
Medication History	*No*
N per group	*Allocated/randomised: 100 (50 MI, 50 Met)* *Analysed: not explicitly reported but assume 100 (50 MI, 50 Met) as there was no reporting of dropouts/withdrawals. Note also that percentages were calculated with 50 as the denominator*
Setting	*Obstetrics and Gynaecology outpatient department at a medical college in a tertiary healthcare centre in India*
Intervention	*Myo-inositol 1g twice daily for 6 months*
Comparison	*Metformin 500mg twice daily for 6 months*
Co-interventions	*Not reported*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Hormonal (mFG, Testosterone), metabolic (FBG, FINS, HOMA), anthropometric (BMI, WC, WHR), reproductive (menstrual regularity, pregnancy rate), AEs*
Follow up Duration	*6 months*
Summary Result/s	*Metformin was more effective than MI for WHR and HOMA-IR. There were no differences between groups for the other outcomes. This is based on the statistically significant*

		between-group differences reported in the manuscript. The authors reported that that there were within-group differences for FINS and HOMA-IR for MI but not for metformin. This is inconsistent with data reported in their table where HOMA-IR increased from 4.21 to 4.32 in the MI group and decreased from 3.5 to 3.39 in the Metformin group.
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Partial* *The aim was to compare the metabolic and hormonal effects in patients receiving myoinositol to those receiving metformin.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial* *Only Rotterdam and age for inclusion criteria*
Inclusion criteria		Yes Partial No Not reported	*15-40 years* *Rotterdam* *Attending the Outpatient department*
Exclusion criteria		Yes Partial No Not reported	*Yes* *Already on other drug treatment for PCOS e.g. OCP* *Kidney or liver dysfunction* *Thyroid disorders* *Known hypersensitivity to MI*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Computer generated*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Yes* *Sealed opaque consecutively numbered envelopes*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Not reported*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Not reported* *There was no reporting of how outcomes were collected or analysed*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Not reported*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Not reported, but assume 0% dropout as denominator for the percentages e.g. menstrual regularity was 50 in each group at 6 months*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Not reported*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *Authors declare no COI*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Unclear risk of bias. Although randomisation and allocation concealment were well described, other domains are poorly reported. There are also inconsistencies between the analysis and what was reported as the findings of the study which raises a red flag.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Insufficient information*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes unclear risk of bias.*	

xxvii.Chirania 2017

Study ID	Chirania 2017
Study Citation	A randomised clinical trial comparing myoinositol and metformin in PCOS Chirania, Kishan; Misra, Sujata; Behera, Sandhya International Journal of Reproduction, Contraception, Obstetrics and Gynecology; Vol 6, No 5 (2017): May 2017DO - 10.18203/2320-1770.ijrcog20171563 2017;(): 2017
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (age not reported)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Some participants had infertility but not all
Presence of other condition/s	Lean or obese women were included
Medication History	*No*
N per group	*Allocated/randomised: This was very poorly reported. Final numbers were 26 MI, 28 Met and 22 MI + Met however the description of randomisation was "After randomisation each group comprised of 24 participants". Authors later reported "since patients already on treatment with either MI or met were also included in the study, the number of patients in each group slightly differed". This is hard to understand as there were fewer participants in the MI + Met group compared to the numbers randomised. It could be that 72 women were randomised and then a few more were added who were not randomised.* *Analysed: 72 (26 MI, 28 Met, 22 MI+ Met)*
Setting	*Obstetric and gynaecology outpatient department in a medical college in India*
Intervention	*Myo-inositol 1g/daily for 4 months*
Comparison	*Metformin 1g daily for 4 months and* *MI + Metformin*

Co-interventions			*Not reported*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)			*Primary: resumption in spontaneous menstrual cycles and pregnancy rate* *Secondary: anthropometric, metabolic*
Follow up Duration			*4 months*
Summary Result/s			*No between-group comparisons were reported. Both MI and MI + Met resulted in resumption in spontaneous menstrual cycles and pregnancies. Metformin alone did not result in resumption of spontaneous menstrual cycles.* *All three interventions reduced weight. MI and Met alone reduced BMI. MI + Met combination reduced fasting insulin.*
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Partial* *Evaluate the effect of insulin sensitisers in improving clinical and hormonal alterations in cases of PCOS and improving the reproductive outcomes. Compare the effects of metformin and MI alone, with another group of patients taking a combination.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial* *Poorly described* *Unclear why some criteria were chosen eg AMH*
Inclusion criteria		Yes Partial No Not reported	*Rotterdam (oligomenorrhoea/amenorrhoea, with. Polycystic ovaries on US, with or without hyperandrogenism and/or obesity* *15-40* *"Patients who were already diagnosed with PCOS and on treatment with the drugs compared in this study"*
Exclusion criteria		Yes Partial No Not reported	*Partial* *Unclear why AMH is an exclusion* *Abnormal TSH, PRL, AMH* *Any chronic illness in the past or present – TB, thyroid disease, malabsorption* *Chemo/radio therapy in childhood*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported* *Only reported as randomised. It is also unclear how this was implemented: "since patients already on treatment with either MI or met were also included in the study, the number of patients in each group slightly differed"*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention,	Yes Partial No	*Not reported*

	were the groups treated the same?	Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Not reported*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Not reported*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Not reported*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Not reported*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors report no COI*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Partial* *A sample size calculation was performed but unclear if it is appropriate* *"* *It was an equivalence trial where the null hypothesis was that both myoinositol and metformin are equally effective in PCOS.* *The sample size was calculated based on the formula, n=Z2×(p)×(1-p)/Δ2* *n is the sample size.* *Z is confidence interval i.e., 1.96 for 95%* *Δ is confidence level i.e., 0.05 for ±5%* *P is the proportion of the population with the disease under study i.e, 5% which in decimal converts to 0.05.* *So, n= (1.96)2×(0.05)×(1-0.05)/(0.05)2 n = 72"*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Not reported*
COMMENTS		*Insufficient information to make a judgement on the risk of bias*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Due to insufficient reporting it is not possible to make a judgement on the risk of bias.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes unclear ROB.*	

xxviii.Nehra 2017

Study ID	Nehra 2017 + Nehra 2017 (2 separate manuscripts with different outcomes reported, same base population/study)
Study Citation	Nehra J, Kaushal J, Singhal, SR, Ghalaut VS. *International Journal of Pharmaceutical Sciences and Research*, Vol 8; 4 p 1664-1670, 2017 Nehra J, Kaushal J, Singhal, SR, Ghalaut VS. *International Journal of Pharmacy and Pharmaceutical Sciences*, Vol 9:4;144-148, 2017
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women age 15-45 with PCOS by AES criteria who were seen at a Gynecology clinic at a single hospital in India
PCOS diagnostic criteria	Androgen Excess Society 2006 criteria
Presence of infertility	Not reported
Presence of other condition/s	None
Medication History	*Excluded those with any history of anti diabetic drug use, or estrogen or progesterone, or other treatment in the past 3 months*
N per group	*Allocated/randomised: 71(35 MI, 36 Met)* *Assessed at end of study: 60 (30 MI, 30 Met)*
Setting	*Outpatients attending Department of Pharmacology and Obstetrics and Gynecology at Pt BD Sharma PGIMS Rohtak, India*
Intervention	*Myoinositol, 1g each pill, two doses daily for 3 months i.e. 2g daily dose*
Comparison	*Metformin, 500 mg each dose, three doses daily for 3 months i.e. 1500mg daily dose*

Co-interventions		*None reported.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*FSH, LH, insulin, glucose, glucose/insulin ratio, testosterone, HOMA-IR, FSH/LH ratio, total cholesterol, triglycerides, VLDL, LDL, HDL* *Weight, WHR, WC were reported in a separate manuscript (IJPPS 2017)*	
Follow up Duration		*24 weeks (outcomes were measured at 12 and 24 weeks of treatment)*	
Summary Result/s		*Both metformin and MI led to significant improvement in lipid profile with reduction of LDL, total cholesterol and triglycerides and increase in HDL. There was no significant difference when comparing metformin to MI. There were significant reductions in measures of insulin resistance from baseline to 24 week end point in both treatment groups, but the treatment were not compared to one another for these outcomes.* *Regarding weight and BMI, there were significant reductions in both the metformin and MI groups, but no significant difference between the two interventions. There was also not a significant change in waist circumference or WHR.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Partial* *This study was done to compare the effect of MI versus Met on biochemical profile in women with PCOS.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Yes* *Women with PCOS diagnosed according to AES criteria* *Age 15-45y*
Exclusion criteria		Yes Partial No Not reported	*Yes* *Women suffering from any neoplastic disease, hyperprolactinemia, Cushing's disease, Hypothyroidism / Hyperthyroidism, Pregnancy and nursing, Active liver disease, renal impairment, Established type 1 or type 2 diabetes mellitus, any history of drug intake- Anti diabetic (or) oestrogen and progesterone, history of any treatment taken in last 3 months, Smokers and alcoholic subjects, inability to come for regular follow ups.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Partial* *"computer generated random numbers"*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No – described as open-label study*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*No – described as open label study*
	Aside from the experimental intervention,	Yes Partial No	*Yes*

	were the groups treated the same?	Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*No – described as open label study*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Not reported* *No reporting of method of insulin, glucose, or hormone assay method*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*MYI – 5 lost to follow up 14.3%* *Met – 6 lost to follow up 16.6%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*No*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported* *Methods section states an adequate number of patients were screened and selected but no sample size calculation was reported.*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*No details of allocation concealment, open label study*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

xxix.Pourghasem 2019

Study ID	Pourghasem 2019
Study Citation	The effectiveness of inositol and metformin on infertile polycystic ovary syndrome women with resistant to letrozole. Pourghasem et al. Archives of Gynecology & Obstetrics 04// 2019;299(4):1193-1199

Study Country		Iran	
BRIEF CHARACTERISTICS OF RCT			
Patient/population/ participants		Women with PCOS and letrozole resistance	
PCOS diagnostic criteria		Rotterdam	
Presence of infertility		Yes	
Presence of other condition/s		Letrozole resistance, defined as no ovulation (no mature follicle on US) after 3 cycles (starting at 2.5mg, then 5mg and 7.5mg letrozole/daily from third day of menstrual cycle for 5 days). BMI categories (18.5-24.9; 25-29.9;30-24.9;35-39.9)	
Medication History		*No*	
N per group		*Allocated/randomised: 186 (62 folic acid only, 62 metformin + FA, 62 MI + FA)* *Assessed at end of study: 150 (50 FA only, 50 metformin + FA, 50 MI + FA)*	
Setting		*Infertility clinic in a University of Medical Sciences in Iran.*	
Intervention		*Myo-inositol (Amazing Nutrition, Jersey, USA) 2g + folic acid 200□g twice daily for 3 months*	
Comparison		1. *Metformin 1.5g daily (Apotex, Toronto, Canada) + folic acid 200□g daily for 3 months* 2. *Folic acid 200□g daily*	
Co-interventions		*Letrozole 7.5mg daily from third day of menstruation for 5 days in the third cycle (Also folic acid is essentially a co-intervention)*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Ovulation (presence of mature follicle ≥17mm seen on TVU), pregnancy (presence of gestational sac on US 5 weeks after HCG injection).*	
Follow up Duration		*3 months*	
Summary Result/s		*No difference in pregnancy rates between the three groups*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Yes* *Compare the effects of inositol and metformin on ovarian function and pregnancy in women with PCOS with letrozole resistance*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Age 15-38* *Rotterdam criteria* *Infertility (unable to fall pregnant despite frequent unprotected intercourse for one year)* *Absence of tubal, anatomic and male factor infertility* *Intact uterine cavity* *Normal thyroid function*
Exclusion criteria		Yes Partial No Not reported	*Other endocrine disorders e.g. hyperprolactinemia* *No desire for cooperation*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Random number table was used.*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported* *Only mentioned random number table*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes* *Presume yes because folic acid is described as a placebo, and the study was described as single-blind. No other descriptions of blinding.*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*

	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported – unlikely as study was only single-blind*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*FA only = 12/62 = 19.4%* *8 due to personal reasons, 4 fear of AEs and drug intolerance* *Metformin + FA = 12/62 = 19.4%* *9 due to personal reasons, 3 fear of AEs and drug intolerance* *MI + FA =12/62 = 19.4%* *7 due to personal reasons, 5 fear of AEs and drug intolerance*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Yes* *Post hoc analysis for duration of infertility and BMI*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors report no COI*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Partial* *The authors report a sample size calculation was done but it was not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Partial* *Potential confounders were identified and taken into account in the analysis although this was post-hoc*
COMMENTS		*High – due to lack of allocation concealment, blinding, high dropout rate.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes high risk of bias*	

xxx.Rajasekaran 2022

Study ID	Rajasekaran 2022
Study Citation	Rajasekaran K, Malhotra N, Mahey R, Khadgawat R, Kalaivani M. *Gynecological Endocrinology*, Vol 38: 2 ; 140-147, 2022
Study Country	India

BRIEF CHARACTERISTICS OF RCT			
Patient/population/ participants		*Women age 21-38 with PCOS who were undergoing their first IVF cycle*	
PCOS diagnostic criteria		Rotterdam	
Presence of infertility		Not explicitly stated but participants were attending an IVF and infertility clinic	
Presence of other condition/s		Excluded those with fibroids, history of ovarian drilling, known diabetes mellitus or those previously on hypoglycemic agents and those with disturbed liver or renal function	
Medication History		*Excluded those with any history of hypoglycemic agent use*	
N per group		*Allocated/randomised: 102(50 MI, 52 Met)* *Assessed at end of study: 100 (50 MI, 5 0 Met)*	
Setting		*Infertility and ART center of All India Institute of Medical Sciences (AIIMS) New Delhi*	
Intervention		*Pre-IVF Myoinositol, 2g each pill, two doses daily for at least 12 weeks i.e. 4g daily dose*	
Comparison		*Pre-IVF Metformin, 850 mg each dose, twice doses daily for 12 weeks i.e. 1700mg daily dose*	
Co-interventions		*IVF using a GnRH antagonist protocol after completion of MI or Met pre treatment x 12 weeks. Medications continued until day of oocyte retrieval*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Menstrual regularity, BMI, LH, FSH, LH/FSH ratio, SHBG, testosterone, fasting glucose, postprandial glucose, fasting insulin, HOMA IR, total cholesterol, LDL, HDL, AMH, AFC, ovarian volume, GI side effects, OHSS incidence with IVF, clinical pregnancy rate (spontaneous + IVF), pregnancy rate per IVF cycle*	
Follow up Duration		*Followed through end of pregnancy*	
Summary Result/s		*Both metformin and MI led to significant improvements in lipid profile, BMI, serum testosterone reduction and rise in SHBG. Both were also found to result in improvement in measures of insulin resistance with reduction in fasting glucose, and insulin and HOMA IR. MI led to a larger proportion of women with regular cycles prior to IVF than metformin and a greater number of clinical pregnancies (both spontaneous and resulting from IVF). There was also less report of GI side effects with MI compared to Met.* *There was no difference in incidence of OHSS which was the primary outcome.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Yes* *This study was done to compare the effect of MI versus Met pre treatment on the incidence of OHSS following IVF for women with PCOS*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Yes* *Women with PCOS diagnosed according to Rotterdam criteria* *Age 21-38y* *Presenting for first IVF cycle*
Exclusion criteria		Yes Partial No Not reported	*Yes* *Women with conditions unfavorable for implantation (fibroids distorting cavity and thin endometrium), prior ovarian drilling, known diabetes mellitus or previously on hypoglycemic agents and disturbed renal or liver function tests were excluded*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Block randomization with varying size*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Yes* *Sequentially numbered opaque sealed envelope (SNOSE) technique was used for allocation concealment*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No	*Yes*

		Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Yes*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Partial* *Allocation code was broken once the patients initiated the treatment cycle*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Partial* *No reporting of method of insulin, glucose, or hormone assay method*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*MYI – 0 lost to follow up* *Met – 2 lost to follow up 3.8% ("due to personal reasons")*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Partial* *ITT and PP analysis for the primary outcome (OHSS)* *Pregnancy rate and other secondary outcomes were all per protocol subjects*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Partial* *MI group had a lower mean AMH, FSH and AFC at baseline, and a higher LH/FSH ratio. This was attributed to chance*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Yes* *Only for the primary outcome of OHSS they controlled for AMH, FSH, AFC and LH/FAH ratio*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Low*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*Yes. Primary outcome analysed by intention to treat, but remaining outcomes analyzed by per protocol analysis so moderate risk of bias for other outcomes.*	

xxxi.Tagliaferri 2017

Study ID	Tagliaferri 2017	
Study Citation	Tagliaferri, V. Romualdi, D. Immediata, V. De Cicco, S. Di Florio, C. Lanzone, A. Guido, M. (2017). Metformin vs myoinositol: which is better in obese polycystic ovary syndrome patients? A randomized controlled crossover study. *Clinical Endocrinology*, 86, 725-730.	
Study Country	Italy	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Overweight/obese women with PCOS aged 18-35 years (mean age: 25·62 ± 4·7 years; mean BMI: 32·55 ± 5·67 kg/m2)	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s	Overweight (BMI >25 kg/m^2) or Obese (BMI >30 kg/m^2)	
Medication History	*No use of drugs able to interfere with gluco-insulinaemic metabolism for at least three months prior to entering the study.*	
N per group	*Allocated/randomised: 34 (No other data on group numbers)* *Assessed at end of study: 26 (13 MYI, 13 Met)*	
Setting	*Outpatients attending Department of Obstetrics and Gynaecology at Catholic University of Sacred Heart, Rome, Italy*	
Intervention	*Myoinositol, 500 mg each pill, two oral pills each dose, two doses daily for 6 months i.e. 2g daily dose*	
Comparison	*Metformin, 850 mg each dose, two doses daily for 6 months i.e. 1700mg daily dose*	
Co-interventions	*None reported. Participants advised to continue their usual diet and lifestyle.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*All measures apart from peripheral glucose utilisation were conducted early follicular phase of spontaneous or induced (medroxyprogesterone acetate 10mg/day for 7 days) menstrual cycles (day:3 ± 7)* *BMI, waist hip ratio, Ferriman-Gallwey score, Cycles in 6 months, FSH, LH, oestradiol, prolactin, testosterone, androstenedione, free androgen index, 17-hydroxyprogesterone, SHBG, dehydroepiandrosterone sulphate, anti-mullerian hormone, ovarian volume, total cholesterol, triglyceride, high-density lipoprotein, very low-density lipoprotein, low-density lipoprotein.* *AUC-Insulin, AUC-Glucose (OGTT for insulin and glucose sampling 15 min before and 30, 60, 90, 120 and 180 minutes after oral ingestion of 75g glucose).* *Day after OGTT:* *Peripheral glucose utilisation (M) via euglycaemic-hyperinsulinaemic clamp*	
Follow up Duration	*6 months*	
Summary Result/s	*Both MYI and metformin improved glyco-insulinaemic features in obese PCOS patients, but only metformin exerts a beneficial effect on endocrine features such as decreasing LH, oestradiol, androgens and anti-mullerian hormone levels, as well as clinical features such as body weight, menstrual pattern and Ferriman-Gallwey score.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Partial* *(Primary outcome measure not reported in publication: 'To investigate which is the more effective between metformin ad myoinositol on hormonal, clinical and metabolic parameters in obese patients with PCOS.'* *However, in Clinical trials registration, primary outcome reported as 'number of cycles in 6 months', and only two other secondary outcome measures were reported which were 'glyco-insulinemic metabolism as measured by AUC post OGTT, and M value of euglycaemic hyperinsulinaemic clamp).*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Partial* *Partially reported in publication, fully reported in clinical trials registration.*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No	*Yes*

		Not reported	
Inclusion criteria		Yes Partial No Not reported	*Yes* *Reported in publication:* *Women with PCOS diagnosed according to Rotterdam* *BMI >25 kg/m2* *Additionally reported in clinical trials registration:* *Age 18-35 years*
Exclusion criteria		Yes Partial No Not reported	*Yes* *Reported in publication:* *Pregnancy, nursing, significant liver or renal impairment, neoplasms, cardiovascular disease, other hormonal dysfunction (hypothalamic, pituitary, thyroidal or adrenal causes for clinical signs).* *Additionally reported in clinical trials registration:* *Unstable mental illness, diagnoses of diabetes mellitus or impaired glucose tolerance, use of drugs able to interfere with gluco-insulinaemic metabolism for at least three months prior to entering the study.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Simple randomisation with computer-generated random allocation sequence*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*MYI - 1 pregnant, 1/34=2.9%* *Met - 7 dropped out (mild gastrointestinal side effects), 7/34=20.6%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Not reported*

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*No* *Some important differences in details between Clinical trials registration details and publication.* *Even important outcomes reported in the method section of the publication were not reported in the results section.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Partial* *'At baseline, the two groups were well matched in terms of clinical, endocrine and metabolic characteristics.'* *No p values provided to compare baseline characteristics, and no information regarding baseline differences according to variables such as age or time since diagnosis.*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*No*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No.* *Reported in the "Source of finding" and "Declaration of interest". None to declare.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Partial* *Distribution of data was tested and Mann-Whitney U test was carried out since variables were not normally distributed.*
COMMENTS			*Possible selective outcome reporting bias. Primary outcome of menstrual cyclicity in clinical trials registration was not identified as primary measure in publication, and other secondary outcomes identified reported in publication had not been declared in the clinical trials registration.* *Doses of both metformin and MYI were different in clinical trials registration (1500mg daily dose for both) compared to described in publication (MYI 2g daily dose, metformin 1700mg daily dose).* *Publication does not clearly state those with existing diabetes or impaired glucose tolerance were excluded as was evident from clinical trials registration.*
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

4e. MI v Placebo

xxxii.Dona 2012

Study ID	Dona 2012
Study Citation	Inositol administration reduces oxidative stress in erythrocytes of patients with polycystic ovary syndrome Donà, G.; Sabbadin, C.; Fiore, C.; Bragadin, M.; Giorgino, F.L.; Ragazzi, E.; Clari, G.; Bordin, L.; Armanini, D. European Journal of Endocrinology 2012;166(4):703-710 2012
Study Country	Italy
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS 22-30 and normal BMI
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported

Presence of other condition/s		Obese (30 – 37 kg/m2) and morbid obese (above and equal to 37 kg/m2) No diabetes	
Medication History		*No*	
N per group		*Allocated/randomised: 26 (18 MI, 8 placebo)* *Analysed: 26 (18 MI, 8 placebo)*	
Setting		*Department of Medical and Surgical Sciences at a University in Italy*	
Intervention		*Myo-inositol 1.2g / day*	
Comparison		*Matched placebo powder*	
Co-interventions		*Subjects were instructed not to change their eating habits, activity level or lifestyle during the study.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Hormonal, metabolic, anthropometric*	
Follow up Duration		*3 months*	
Summary Result/s		*Within group improvement in weight, BMI, testosterone, androstenedione, insulin AUC and HOMA-IR in the MI group. Between-group differences for weight, BMI, testosterone, androstenedione, fasting inuslin, insulin AUC and HOMA-IR.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Partial* *To evaluate any effects on clinical, hormonal and glucose metabolism parameters in PCOS patietns before and after 12 weeks of inositol (no comparison described).*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Rotterdam*
Exclusion criteria		Yes Partial No Not reported	*BMI >25 kg/m^2* *Pregnancy* *Diabetes* *Hyperprolactinemia* *Thyroid dysfunction* *Cushing's syndrome* *Late-onset adrenal hyperplasia* *Diabetes* *Taken oral contraceptives, anati-inflammatory drugs or hormonal drugs in previous 3 months*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Computer-generated*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*

	Were outcome assessors blind to intervention group?	Yes Partial No Not reported	*Not reported*
DEDETECTION BIAS	**Were all outcomes measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*0% in both groups*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors declared no COI*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Low*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

4f. MI + monacolin K v Inositol v Met

xxxiii.Leo 2013

Study ID	Leo 2013 (referred to as Musacchio in Covidence)
Study Citation	Leo, V.D. Musacchio, M.C. Cappelli, V. Sabatino A.D. Tosti, C. Piomboni, P. (2013). A combined treatment with myo-inositol and monacolin K improve the androgen and lipid profiles of insulin-resistant PCOS patients. *J Metabolic Synd.2*:127
Study Country	Italy
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS and insulin resistance as evaluated by HOMA-index, aged 24-32 years
PCOS diagnostic criteria	Rotterdam

Presence of infertility		Not reported	
Presence of other condition/s		None. Other endocrinopathies were excluded.	
Medication History		*Not reported.*	
N per group		*Allocated and randomised: MI+monacolin K=20, inositol=20, metformin=20* *Analysed=No information*	
Setting		*Not reported.* *Presumed Obstetrics and gynaecology clinic at University of Siena, Italy (authors' affiliation).*	
Intervention		*Myo-inositol 1.5g + monacolin K 3g (AZELIP-ProgineFarmacuetici) each dose, two times daily for 6 months* *i.e. MI 3g + monacolin K 6g daily, for 6 months*	
Comparison		*Comparison 1: Galenic preparation containing inositol 1.5g each dose, two times daily for 6 months* *i.e. inositol 3g daily, for 6 months* *Comparison 2: Metformin 850 mg each dose, two times daily for 6 months* *Ie. Metformin 1700mg daily, for 6 months*	
Co-interventions		*Not reported*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		*Physical examination: BMI, FG score* *Hormonal: FSH, LH, Total testosterone, Free testosterone, SHBG, Androstenedione* *Metabolic: fasting glucose, fasting insulin, HOMA* *Lipid: total cholesterol, LDL, HDL, triglycerides* *Other: Menstrual regularity, gastrointestinal side effects*	
Follow up Duration		*6 months*	
Summary Result/s		*All treatments improved patients' clinical, hormonal and metabolic profiles with a tendency towards better results using the combination of myo-inositol and monacolin K.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Partial* *Primary outcome measure not specified in publication.*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Partial*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Partial* *PCOS patients diagnosed according to Rotterdam* *Insulin resistance as defined by HOMA* *Provided informed consent*
Exclusion criteria		Yes Partial No Not reported	*Partial* *Participants excluded for other endocrinopathies*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported* *'Randomly assigned' but no other information provided.*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No	*Not reported*

		Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Partial – yes for hormonal, lipid and metabolic outcomes. No information provided regarding BMI and FG-score assessments.*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Not reported* *It is reported that two women in the metformin group 'interrupted the treatment' due to side-effects, but it is unclear if they dropped out and if their data was included/excluded from final analysis.*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Not reported*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *No protocol or trial register to compare publication against.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Partial* *Baseline clinical, hormonal, metabolic and lipid profiles were comparable between the three study groups, but no information regarding age or time since diagnosis.*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Partial* *Unclear how menstrual cycle data was analysed.*
COMMENTS		*Lack of clarity regarding primary outcome measure, possible selective outcome reporting and lack of information regarding method of randomisation, eligibility criteria and dropout information.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

xxxiv. Fruzetti 2017

Study ID	Fruzzetti 2017
Study Citation	Franca Fruzzetti, Daria Perini, Marinella Russo, Fiorella Bucci & Angiolo Gadducci (2017) Comparison of two insulin sensitizers, metformin and myo-inositol, in women with polycystic ovary syndrome (PCOS), Gynecological Endocrinology, 33:1, 39-42, DOI: 10.1080/09513590.2016.1236078
Study Country	Italy
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (18-28 y.o.), attending reproductive endocrinology clinic, affected by insulin resistance and/or hyperandrogenism, acne and/or hirsutism, and with no abnormal glucose response to the OGTT.
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	Oligoamenorrhoea and clinical signs of hyperandrogenism. All women were affected by insulin resistance and/or hyperinsulinemia, acne and/or hirsutism, and with no abnormal glucose response to the OGTT.
Medication History	*No subject was using medication known to influence the endocrine and the metabolic profiles.*
N per group	*Allocated/randomised: 50 (25 metformin group, 25 myo-inositol group)* *Assessed at end of study: 46 (22 metformin group, 24 myo-inositol group)*
Setting	*Outpatient Clinic of Reproductive Endocrinology of the University of Pisa*
Intervention	*myo-inositol 4 g plus folic acid 400 mcg/daily*
Comparison	*metformin 1500 mg/daily (500 mg orally thrice daily)*
Co-interventions	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*HOMA-IR, AUC Insulin, Matsuda index, BMI, mF-G score, menstrual frequency, adverse events*
Follow up Duration	*6 months*
Summary Result/s	*Metformin and myo-inositol are equally effective in improving BMI, insulin sensitivity and menstrual cycle in PCOS patients.*
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* *Women with PCOS, aged from 18 to 28 years, referred to the Outpatient Clinic of Reproductive Endocrinology of the University of Pisa for oligoamenorrhea and clinical signs of hyperandrogenism.*
Exclusion criteria	Yes Partial No Not reported	*Yes* *Subjects with hyperprolactinemia, hypo or hyper- thyroidism, congenital adrenal hyperplasia, Cushing's syndrome or androgen-secreting tumors were excluded from this study.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Partial* *The allocation sequence of the treatments was decided by a third party (D.P. - one of the authors, Daria Perini) before the recruitment of patients by random-number tables.*
SELECTION BIAS **Was allocation to intervention group concealed?**	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS **Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS **Were investigators and care providers blind to intervention group?**	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS **Aside from the experimental intervention, were the groups treated the same?**	Yes Partial No Not reported	*Yes* *During the observation period, the patients did not modify their Mediterranean diet and did not follow a low-carbohydrate diet.*

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Metformin group: 25 recruited, 22 treated (3 dropouts due to gastrointestinal symptoms – diarrhoea and abdominal pain) 12% dropout* *Myo-inositol group: 25 recruited, 24 treated (1 dropout due to poor compliance) 4% dropout*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *"The study protocol was approved by the Institutional Review Board of Pisa University."*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Partial* *Funding not reported.* *The authors reported no conflict of interest.*

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Partial* *"in a post study power analysis the sample size of the study allowed us to identify an absolute difference between the groups in the frequency of normal cycles of 35% (with a rate of normal cycles of 45% in the control group and a power of 80%)."* *"Further randomized and properly sized studies are needed in order to confirm our data."*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

xxxv. Ravn 2022

Study ID	Ravn 2022
Study Citation	Ravn P, Gram F, Andersen MS, Glintborg D. Myoinositol vs. Metformin in Women with Polycystic Ovary Syndrome: A Randomized Controlled Clinical Trial. Metabolites. 2022; 12(12):1183. DOI:10.3390/metabo12121183
Study Country	Denmark
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Danish women (18-50 y.o.) with PCOS, not attempting pregnancy
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	
Medication History	*Pausing was required for MET and oral contraceptive pills for at least one and three months, respectively, before study entry.*

	No woman was on MI before the study. *Use of barrier contraception or copper intrauterine device during the study was optional.*
N per group	*Allocated/randomised: 45 (23 metformin, 22 myo-inositol)* *Assessed at end of study: 28 (12 metformin, 16 myo-inositol)*
Setting	*PCOS outpatient clinic, Department of Gynecology and Obstetrics in collaboration with the Department of Endocrinology, Odense University Hospital (OUH), Denmark*
Intervention	*2 mg MI and 200 mg folic acid (Inofolic®, BiO4U Ltd., Dublin, Ireland), one dose twice daily.*
Comparison	*one tablet of Metformin 500 mg (Metformin, Actavis, TEVA, Tel Aviv, Israel) twice daily for two weeks followed by two tablets twice daily.*
Co-interventions	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*The primary study outcome was HOMA-IR.* *Secondary outcomes were fasting glucose, serum lipids, anthropometric measures (weight, BMI, waist, and hip circumference), Ferriman–Galwey (FG) score, cycle length, gonadothrophins, testosterone, anti-Müllerian hormone (AMH), and scores of QoL and depression as well as adverse effects.*
Follow up Duration	*6 months*
Summary Result/s	*HOMA-IR and weight were unchanged during MI whereas MET had beneficial effects on weight, fasting blood glucose, and HDL cholesterol.* *Cycle length decreased to a similar extent during MI and MET.* *Adverse effects were less frequent during MI vs. MET.*

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *Aim was to examine MI vs. MET monotherapy in Danish women with PCOS not attempting pregnancy in an open-label, six-month RCT.*

Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* *PCOS diagnosed according to the Rotterdam criteria and age 18–50 years*
Exclusion criteria	Yes Partial No Not reported	*Yes* *Other causes of oligomenorrhea and/or hirsutism including abnormal values of prolactin, thyroid stimulating hormone, or 17-hydroxy-progesterone, postmenopausal values of FSH (>25 IE/L), and type 1 or 2 diabetes mellitus.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Randomization was conducted through the digital platform Research Electronic Data Capture (REDCap®) housed in The Unit for Good Clinical Practice, Odense Patient Explorative Network (OPEN) OUH.*
SELECTION BIAS – **Was allocation to intervention group concealed?**	Yes Partial No Not reported	*Yes* *RedCap*

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No* *Open label RCT*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*No* *Open label RCT*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes* *Study design included medical intervention without lifestyle intervention.*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*No* *Open label RCT*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Myo-inositol group: 6/22 (27.3% dropout)* *6 dropouts: 5 non-compliance, 1 adverse event (irregular menstruation – which was a change from amenorrhea, which was subjectively perceived as unwanted)* *Metformin group: 11/23 (47.8% dropout)* *11 dropouts: 2 non-compliance, 4 pregnancy, 2 adverse events (1 headache and 1 mood swing), 3 gastrointestinal adverse events*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes* Clincial trial registration: EudraCT number: 2016-004506-34
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Yes*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The trial medication and trial registration fee were funded by BiO4U Ltd., Dublin, Ireland.* *The authors declare no conflict of interest. The funder had no role in the design of the study, in the collection, analyses, interpretation of data, in the writing of the manuscript, or in the decision to publish the results.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Low*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

xxxvi. Raffone 2010

Study ID	Raffone 2010
Study Citation	*Emanuela Raffone, Pietro Rizzo & Vincenzo Benedetto (2010) Insulin sensitiser agents alone and in co-treatment with r-FSH for ovulation induction in PCOS women, Gynecological Endocrinology, 26:4, 275-280, DOI: 10.3109/09513590903366996*
Study Country	Italy

BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS, aged <35 y.o., attending IVF Department for infertility that lasted for a period of more than 14–16 months*
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*All patients attended our IVF Department for infertility that lasted for a period of more than 14–16 months.*
Presence of other condition/s	*Menstrual irregularities, chronic anovulation (ascertained by weekly plasma progesterone concentration below 2.5 ng/ml), and female infertility*
Medication History	
N per group	*Allocated/randomised: myo-inositol (n= 60), metformin (n= 60)* *Assessed at end of 6 months: myo-inositol (n=60), metformin (n= 60)*
Setting	*IVF Department, G. Martino Hospital, Messina, Italy*
Intervention	*4 g, myo-inositol + 400 µg folic acid (Inofolic®, Loli Pharma, Rome, Italy) as soluble powder, daily, continuously, until the end of the study or a positive pregnancy test*
Comparison	*Metformin 1500 mg/day (Glucophage®, Merck Pharma), orally, until the end of the study or a positive pregnancy test*
Co-interventions	*(after the initial 6 months) - if no pregnancy occurred, patients continuing insulin-sensitiser treatment underwent ovulation induction with recombinant FSH (Gonal-F1, Merk- Serono, SUI) for a maximum of three attempts.* *A very low-dose protocol (37.5 U/day) beginning from the day two of menstrual flow in a step up regime was selected.* *Urinary HCG (5000 UI Gonasi1 AMSA, Rome, Italy) was administrated until no more than two follicles of a diameter 417 mm were detected on ultrasound.*

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary endpoint was to evaluate the restoration of spontaneous ovarian activity, by weekly serum progesterone dosage (progesterone levels higher than 8.0 ng/ml), as well as transvaginal ultrasound scan documenting presence of follicular growth or luteal cyst.* *Secondary endpoints were myo- or metformin- resistance (percentage of patient who did not restore spontaneous ovulation), pregnancy rate (documented by positive b-hCG plasma level and foetal heart beat on ultrasound scan) and abortion rate.*	
Follow up Duration	*6 months*	
Summary Result/s	*Both metformin and myo-inositol, can be considered as first line treatment for restoring normal menstrual cycles in most patients with PCOS, even if myo-inositol treatment seems to be more effective than metformin.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *This study was designed to test and compare the effects of metformin and myo-inositol on restoring spontaneous ovulation and menstrual cycles and increasing rate pregnancy in women with PCOS.*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*A total of 120 women, aged <35 years, with PCOS, defined by Rotterdam Criteria, were enrolled.* *"All patients attended our IVF Department for infertility that lasted for a period of more than 14–16 months."*
Exclusion criteria	Yes	*Other medical condition causing ovulatory dysfunction:*

		Partial No Not reported	- ***Hyperprolactinemia or hypothyroidism, or androgen excess, adrenal hyperplasia or Cushing's syndrome, were excluded by hormonal tests.*** - ***Tubal defects: all women underwent assessment of tubal patency.*** - ***Semen parameters defects: all male partners were evaluated with two different sperm semen samples, without finding any defect.***
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Partial* *"Randomisation was performed with 'intention to treat' criteria."*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Myo-inositol: 7/60 (10.9% dropout)* *Side effects (not specified) and loss of follow up* *Metformin: 4/60 (8.3% dropout)* *Loss of follow up*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *No trial registration number or protocol*

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors report no conflicts of interest.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*No trial registration / protocol, no allocation, no randomization reported*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

xxxvii. Soldat Stankovic 2022

Study ID	Soldat-Stankovic 2022
Study Citation	Soldat-Stankovic, V. Popovic-Pejicic, S. Stankovic, S. Prtina, A. Malesevic, G. Bjekic-Macut, J. Livadas, S. Ognjanovic, S. Mastorakos, G. Micic, D. Macut, D. (2021) The effect of metformin and myoinositol on metabolic outcomes in women with polycystic ovary syndrome: role of body mass and adiponectin in a randomized controlled trial. Journal of Endocrinological Investigation, 45:583-595.
Study Country	Bosnia and Herzegovina
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (age 18-40 eligible but age range/mean age of those randomised not provided)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Yes for some patients, no data available on how many cases in each group.
Presence of other condition/s	Non-obese (BMI ≤25 kg/m2) and overweight/obese (BMI>25 kg/m2) Irregular menstrual cycles, infertility, hirsutism or acne
Medication History	*No subjects had received oral contraceptives, glucocorticoids, antiandrogens or other hormonal agents within 3 months prior to initiation of the study.*
N per group	*Allocated/randomised: 66 randomised and allocated (metformin 33, MI+FA 33)* *Assessed at end of study: 60 (metformin n=30, non-obese n=15, overweight/obese n=15; MI+FA n=30, non-obese n=15, overweight/obese n=15)*
Setting	*University clinical centre, outpatient endocrinology clinic, Banja Luka, Bosnia and Herzegovina*
Intervention	*Myoinositol (2g) + folic acid (200mcg), twice daily for 6 months (i.e. Myoinositol (4g) + folic acid (400mcg) daily)*
Comparison	*Metformin, 500 mg three times daily for 6 months (i.e. 1500mg daily)*
Co-interventions	*None*

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary outcomes: BMI, adiponectin levels, body composition, hormone profile and metabolism of glucose and insulin* *Secondary outcomes: Correlations of adiponectin with clinical and biochemical parameters, differences in clinical and biochemical parameters in groups of obese and non-obese women*	
Follow up Duration	*6 months*	
Summary Result/s	*Out study showed similar effects of metformin and MI+FA on BMI, body composition, hormonal profile, glucose and insulin metabolism and adiponectin level in PCOS patients.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*The aim was to compare the effects of metformin to MI+FA and establish whether both can upregulate serum adiponectin levels in PCOS 'with respect to their BMI'*
Does the study have specified inclusion/exclusion criteria?	Partial	*Description of characteristics of the women participating in the study, but unclear if inclusion/exclusion criteria*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	*Yes*
Inclusion criteria	Partial	*PCOS diagnosed according to Rotterdam* *Women aged 18-40* *No oral contraceptives, glucocorticoids, antiandrogens and other hormonal agents in 3 months prior to study initiation*
Exclusion criteria	Partial	*Thyroid dysfunction, hyperprolactinaemia, Cushing syndrome, non-classical congenital adrenal hyperplasia (NCAH) and androgen-secreting tumours* *Diabetes, hepatic, renal and cardiovascular disorders* *History of alcohol or drug abuse* *Breast or uterine cancer*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Not reported	*Not reported* *Stratification by BMI (≤25 kg/m2 and >25 kg/m2) and using random permuted blocks of size three. But not clear how the randomisation was done.*
	Was allocation to intervention group concealed?	Yes	*Yes*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*No*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No	*Yes*

		Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Metformin = 3/33 = 9.09%* *MI+FA = 3/33 = 9.09%* *Metformin = lost to follow up (n=0), discontinued due to adverse event (n=3)* *MI+FA = lost to follow up due to person reasons (n=2), discontinued due to pregnancy (n=1)*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported – no protocol available.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Not reported*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported.* *'There was no specific funding for this study'.*

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Lack of blinding and lack of published protocol key reasons for moderate RoB*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes at low risk of bias.*	

5. STUDY CHARACTERISTICS TABLES

x. D-Chiro Inositol v Placebo

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Iuorno et al. 2002 United States of America	studied 20 lean women (body mass index, 20.0 to 24.4 kg/m2), 18 to 40 years of age, with the polycystic ovary syndrome, as defined by the presence of oligomenorrhea (≤6 menstrual periods during the previous year) and hyperandrogenism (high serum free testosterone levels or hirsutism). Although not a criterion for inclusion in the study or for diagnosis, all the women underwent pelvic ultrasonography at baseline and were found to have ovarian morphologic features consistent with the polycystic ovary syndrome (20). The women	Randomized double-blind RCT	Placebo = 10 DCI = 10	D-Chiro Inositol (600 mg/daily)	Placebo identical daily	6-8 weeks	BMI, Fasting insulin, Fasting glucose, total testosterone, free testosterone, AUCinsulin, AUCglucose	DCI improved glucose tolerance, reduces circulating insulin, decreases serum androgen concentrations and ameliorates other metabolite abnormalities associated with insulin resistance in lean women with PCOS.	

	were recruited from the Hospital de Clinicas Caracas in Caracas, Venezuela								
Nestler, 1999	Women with PCOS/Hospital	Parallel double blind RCT	DCI=22 Placebo=22	Oral administration of 1200 mg of D-chiro-inositol once daily for six to eight weeks	Placebo once daily for six to eight weeks	8 weeks	Ovulaiton (progesterone) Androgens FBG FI AUC-insulin and glucose Lipid profile BMI WHR	D-Chiro-inositol increases the action of insulin in patients with the polycystic ovary syndrome, thereby improving ovulatory function and decreasing serum androgen concentrations, blood pressure, and plasma triglyceride concentrations.	

*RCT = Randomized controlled trial

*LH = levothyroxine

*FSH = follicle stimulating hormone

*AUC = Area Under Curve

xi. Myoinositol (MI) + DCI Comparisons

a. MI + DCI + FA v MI + FA

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]

Le Donne 2019	Women with PCOS (Rotterdam criteria), between 16 and 45 years; BMI ≥ 25kg/m2; no hormone therapy for less than 6 months; no concurrent medical disease; not taking medications or over-the-counter products at baseline with commitment not to take any throughout the 6-month duration of the study. Department of Human Pathology in Adulthood and Childhood "G. Barresi", University of Messina, Messina, Italy	RCT (patients were blind to the treatment)	MI + DCI + FA = 12 MI + FA = 10	MI + DCI + FA; 2x day for 6 months Manufactured by Lo.Li.Pharma (Rome, Italy), and each softgel capsule contains 550 mg MI, 13.8 mg DCI, and 200 µg folic acid.	MI + FA; 2x day. Manufactured by Lo.Li.Pharma (Rome, Italy), and each sachet contains 2000 mg MI and 200 µg folic acid.	Outcomes assessed at 3 months and 6 months	Menstrual cycle, Ferriman-Gallwey score, BMI, waist circumference, hip circumference, WHR, and body composition by bioimpedentiometry - measured at baseline, 3 and 6 months.	MI + DCI (+ FA) in association with diet seems to accelerate the weight loss and the fat mass reduction with a slight increase of per- cent lean mass, and this treatment contributes significantly in restoring the regularity of the menstrual cycle.	

b. MI+DCI+FA v FA only

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Co-interventions	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Benelli 2016	Women with PCOS (Rotterdam) and BMI > 30 Department of Clinical and Experimental Medicine, University of Pisa, Italy	RCT	MI + DCI + FA = 21 FA only = 25	MI + DCI combined treatment at the ratio of 40:1 in soft gel capsule containing 550 mg of MI, 13.8 mg of DCI + 200 µg of folic acid (INOFOLIC® COMBI, LO.LI.PHARMA) 2x day for 6 months	200 µg of folic acid (INOFOLIC® COMBI, LO.LI.PHARMA) 2x day for 6 months	None reported	6 months	Endocrine profile and insulin resistance	MI + DCI (+ FA) improved the endocrine and metabolic parameters in young women with PCOS and BMI > 30.	

c. MI + DCI + Met vs Met alone

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Bahadur 2021	Newly diagnosed women with PCOS, aged 18-45; obstetrics and gynaecology department	Parallel non-blinded RCT	Myoinositol + D-chiro-inositol + metformin = 36 Metformin only = 36	Myoinositol 550mg + D-chiro-inositol 150mg + metformin 500g twice daily orally Total daily dosages: Myoinsotiol 1100mg + D-chiro-inositol 300mg + metformin 1000mg daily	Metformin 500mg twice daily i.e. 1000mg daily	6 months	Clinical: menstrual cyclicity, mFG score, waist circumference, waist:hip ratio, BMI. Metabolic and hormonal: lipids, fasting blood sugar, fasting insulin, serum testosterone, DHEAS and HOMA-IR index.	Synergistic effect of metformin in combination with MYI+DCI in women with PCOS and insulin resistance in terms of improvement in cycle regularity, global acne score, LH levels, LH:FSH ratio, lipid profile including cholesterol, HDL and LDL levels and postprandial insulin.	

d. MI+DCI v MI

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Nordio 2012	Women with PCOS (BMI > 27 kg/m^2) mean age 28 years old, range 18 to 41.	RCT, parallel	MI = 24MI+DCI = 26	2 g of myo-inositol, twice daily	550 mg of myo-inositol plus 13.8 mg of D-chiro-inositol twice daily	6 months	Anthropomorphic (BMI, WHR), fasting insulin, insulin AUC, fasting glucose, glucose AUC, HOMA-IR, total testosterone, free testosterone, DHEAS, SHBG, androstenedione.	MI and MI+DCI groups showed an improvement of the metabolic parameters and no significant differences were found. As expected, the combined supplementation with MI and DCI resulted to be more effective,	

								compared to the MI group, after three months of treatment.	

e. MI + DCI v Placebo

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Khan et al. 2022	Teenage girls with PCOS; Department of Obstetrics and Gynaecology Avicenna Hospital	Parallel Prospective Cohort Study	MI + DCI = 53 Placebo = 53	MI + DCI (550 mg of MI, 13.8 mg of DCI, 200µg folic acid) twice a day	Placebo (Folic acid) 200µg twice a day	6 months	Fasting glucose,	Combined therapy with MI plus DCI has promising results for treatment and improvement of clinical and lab parameters in teenage girls affected with PCOS compared to placebo.	

f. MI+DCI v MI+DCI

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Nordio et al. 2019	Women with PCOS	RCT, open label	DCI 0:1 = 8 MI/DCI 1:3.5 = 8 MI/DCI 2.5:1 = 7 MI/DCI 5:1 = 8 MI/DCI 20:1 = 8 MI/DCI 40:1 = 8 MI/DCI 80:1 = 8	2g of inositols twice daily at different ratios		3 months	Ovulation (progesterone) FSH, LH, Sex Hormone Binding Globulin (SHBG), 17-beta-Estradiol (E2), free testosterone, basal and	40:1 MI/DCI ratio is the best for PCOS therapy aimed at restoring ovulation and normalizing important parameters	

							postprandial insulin levels, HOMA index, BMI, menses.		
Mendoza et al. 2019	Women with PCOS undergoing ICSI, 5 clinical sites/ centers	Multicentre controlled, randomised, double-blind, parallel group study	30 allocated to each Analyzed: Treatment: 25 Control: 19	550mg MYO + 150mg DCI twice daily (3.6:1)	550mg MYO + 13.8mg DCI twice daily (40:1)	3 months	Pregnancy rate, oocyte maturation, embryo quality, testosterone levels and insulin sensitivity	The combination of MYO-DCI at high doses of DCI improves the pregnancy rates and reduces the risk of OHSS in women with PCOS undergoing ICSI.	

xii. MI Comparisons

a. MI +FA v FA alone

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention / exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]	Co Intervention
Artini et al 2013	Women with PCOS presenting for planned IVF treatment at a university based fertility clinic in Italy	Parallel RCT (not clear if blinded)	Enrolled: MI+ FA = 25 FA alone = 25 Analyzed: MI+ FA = 25	MI+FA = 2g myoinositol + 400mcg Folic Acid	400mcg FA	12 weeks	LH, FSH, PRL, E2, Testosterone, 17OHP, Androstendione, insulin (fasting), LH/FSH ratio, BMI, Glucose/insulin ratio, HOMA index, AUC insulin(2 hours after 75g OGTT), 30 min and 60 min 75g OGTT IVF outcomes: oocytes, top quality oocytes, fertilization rate, top	The myoinositol group had significantly lower fasting insulin and HOMA index as well as FSH/LH ratio at study completion. There was also a significantly higher rate of + hCG, clinical pregnancy and live birth in the myoinositol group.		IVF

			FA alone = 25				quality embryos, hcg positive, clinical pregnancy (pregnancy seen on US with + FHR), delivery rate			
Ozay et al 2017	Women age 18-35 with PCOS and infertility planning to undergo ovulation induction and IUI	Parallel RCT blinding not specified	MI+FA = 98 vs FA alone = 98	MI+FA = 4g myoinositol + 400mcg Folic Acid BID	400mcg FA qD?	12 weeks	Pregnancy outcomes after FSH + IUI: clinical pregnancy (pregnancy seen on US with + FHR), miscarriage rate, number of singleton. Pregnancies and number of multiple pregnancies	The myoinositol group had significantly higher clinical pregnancy rate compared to placebo group after use of FSH and IUI (18.6% vs 12.2% p0.02). They had a lower miscarriage rate but this was not statistically significant (12.5% v. 18.2% p0.07). In the MI group 2/16 pregnancies were multiple gestation compared to 1/11 in the placebo group.	Treatment vs placebo was taken for 12 weeks then all patients underwent stimulation with rFSH followed by IUI, 9 patients in MI group conceived spontaneously prior to FSH/IUI and were not included in analysis. No patients in placebo group conceived spontaneously	FSH+IUI
Constantino 2009	Women age 18-40 with PCOS	Parallel double blind RCT	Enrolled and Analyzed: MI+FA = 23 vs FA alone = 19	MI+FA = 4g myoinositol + 400mcg Folic Acid qD	FA = 400mcg Folic Acid qD	6 weeks	Blood pressure, BMI, WHR, T cholesterol, triglycerides, SBP, DBP, fasting. Insulin, fasting glucose, glucose AUC, insulin AUC, ISI comp, Testosterone total and free, androstenedione, DHEAS, SHBG	Myoinostiol group had a greater reduction in triglycerides, total cholesterol, glucose AUC, insulin AUC, total and free testosterone after 6 weeks of treatment compared to placebo.		None
Genazzani 2008	Women with PCOS recruited from the Gynecological	RCT	Enrolled + Analyzed:	MI+FA = 2g myoinositol + 200mcg	FA = 200mcg folic acid qD	12 weeks	BMI, fasting Insulin, fasting glucose, glucose AUC, insulin AUC, Testosterone,	Myoinostiol group had a significantly lower fasting insulin level and HOMA index		None

	Endocrinology Center at the University of Modena		MI+FA = 10 vs FA alone = 10	folic acid qD			androstenedione, farriman gallway score, prolactin, FSH, LH, 17 OHP, estradiol, progesterone, c-peptide	compared to placebo at the end of 12 weeks of treatment. There was also a reduction in the ferriman gallway score though not statistically significant.		
Akbari Sene 2019	Women with infertility and PCOS who presented to an IVF center in Tehran	RCT	MI+ FA = 30 vs FA alone = 30	MI+FA = 4g myoinositol + 400mcg folic acid qD	FA = 400mcg folic acid qD	1 month prior to IVF treatment	Embryo quality, rate of mature oocytes, rate of fertilization, relative gene expression levels in mural granulosa cells, **cumulative pregnancy rate**	The myoinositol treatment group had a higher percentage of mature oocytes, rate of fertilization and top quality embryos compared to placebo. Cumulative pregnancy rate was not different between the groups.		IVF
Papaleo et al. 2009	Women with PCOS, aged <40 years old, undergoing ICSI IVF unit, Gynecologic-Obstetric Department, San Raffaele Hospital, Vita-Salute University, Milan, Italy	RCT	Myo-inositol + folic acid= 30 Folic acid alone= 30	2 g myo-inositol 2x day + 400 µg folic acid	400 µg folic acid	Not reported (up to 12 weeks of gestation?)	Primary: number of morphologically mature oocytes retrieved, embryo quality, and pregnancy and implantation rates. Secondary total number of days of FSH stimulation, total dose of gonadotropin administered, E2 level on the day of hCG administration, fertilization rate per number of retrieved oocytes, embryo cleavage rate, live birth and miscarriage rates, cancellation rate, and incidence of moderate or severe ovarian hyperstimulation syndrome.	In patients with PCOS, treatment with myo-inositol and folic acid, but not folic acid alone, reduces germinal vesicles and degenerated oocytes at ovum pick-up without compromising total number of retrieved oocytes		**IVF**
Pacchiarotti et al., 2016	Women with PCOS, between 27 and 38 years old, with: (1) absence of tubal, uterine, genetics and	Double-blind RCT	Myo-inositol + folic acid = 166	4000 mg myo-inositol + 400 mcg folic acid. Started treatment first	400 mcg folic acid	Followed until 5 weeks of gestation	Primary: oocyte and embryo quality, clinical pregnancy and implantation rates. Secondary: gonadotropin IU administered, days of	Myo-inositol and Melatonin behaved synergistically at ovarian level, improving ovarian response to gonadotropin stimulation,		**IVF**

	male causes of infertility; (2) serum levels of FSH on day 3 of the ovarian cycle <512 IU/L; (3) Rotterdam criteria for PCOS; (4) normal uterine cavity (5) body mass index (BMI) of 20 to 26 kg/m2, and (6) first IVF treatment. IVF Center (Rome, Italy)		Folic acid alone= 195 Myo-inositol + folic acid + Melatonin = 165	day of IVF cycle and continued until 14 days after embryo transfer			stimulation, serum estradiol (E2) levels and endometrial thickness on the day of human chorionic gonadotropin (hCG) administration.	with the result to increase oocyte and embryo quality.		
Pourghasem 2019	Women with PCOS and letrozole resistance	Parallel single-blind RCT	MI + FA = 50 FA alone = 50	Myoinositol 4g daily for 3 months + folic acid	Folic acid 400μg *daily for 3 months*	3 months	Pregnancy rate (primary), livebirth, ovulation	No differences between groups for pregnancy rate		Letrozole

b. MI + Metformin v Metformin Alone

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Chirania 2017	Women with PCOS; Outpatient obstetrics and gynaecology dept in a medical college in India	Parallel 3-armed RCT (described as equivalence trial)	MI + Met = 22 Met=28	MI 1g daily for 4 months + Metformin 1g daily for 4 months	Metformin 1g daily for 4 months	4 months	Reproductive, metabolic, hormonal	*No between-group comparisons were reported. Both MI and MI + Met resulted in resumption in spontaneous menstrual cycles and pregnancies. However, pregnancy data is*	

								difficult to understand as it was reported as "infertility". Metformin alone did not result in resumption of spontaneous menstrual cycles. *All three interventions reduced weight. MI and Met alone reduced BMI. MI + Met combination reduced fasting insulin.*	

c. MI v DCI

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Co-interventions	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Unfer 2011	Women with PCOS <40 attending IVF clinic for ovulation induction and ICSI and without insulin resistance or hyperglycemia	Parallel RCT	MI=43 DCI=41	Pre-ICSI Myoinositol 4g daily for 8 weeks	Pre-ICSI D-Chiro-Inositol 1.2g daily for 8 weeks	ICSI following 8 weeks of DCI/MI	8 weeks plus one cycle of ICSI	Reproductive only	*No. of oocytes retrieved did not differ in both groups. No. of mature oocytes was significantly increased in MI group compared to DI group. MI treated group showed increase in average no. of top-quality embryos and total no. of pregnancies.*	

d. MI v Metformin

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Pourghasem 2019	Women with PCOS and letrozole resistance; infertility clinic in University of Medical Sciences Iran	Parallel 3-armed RCT (Also compared against FA alone)	MI + FA = 50 Met + FA = 50	MI 2g + Folic Acid 200μg twice daily	Metformin 1.5g daily + Folic Acid 200μg *daily*	3 months	Ovulation, pregnancy	No difference in pregnancy rates across three groups	
Angik 2017	Women with PCOS 15-40 years; Outpatient obstetrics and gynaecology dept in tertiary healthcare centre, India	Parallel RCT	MI = 50 Met = 50	MI 2g daily for 6 months	Metformin 1g daily for 6 months	6 months	Hormonal, metabolic, anthropometric, reproductive, AEs	Metformin was more effective in lowering HOMA-IR and WHR	
Chirania 2017	Women with PCOS; Outpatient obstetrics and gynaecology dept in a medical college in India	Parallel 3-armed RCT (described as equivalence trial)	MI=26 Met=28	MI 1g daily for 4 months	Metformin 1g daily for 4 months	4 months	Reproductive, metabolic, hormonal	*No between-group comparisons were reported. Both MI and MI + Met resulted in resumption in spontaneous menstrual cycles and pregnancies. However, pregnancy data is difficult to understand as it was reported as "infertility". Metformin alone did not result in resumption of spontaneous menstrual cycles. All three interventions reduced weight. MI and Met*	

								alone reduced BMI. MI + Met combination reduced fasting insulin.	
Tagliaferri 2017	Overweight or obese women with PCOS; Outpatient department of obstetrics and gynaecology	Crossover RCT	Total randomised = 34 N per group not available for total randomised Total analysed = 26 Of which Myoinositol=13 Metformin=13	Myoinositol 2g daily	Metformin 1700mg daily	6 months	BMI, WHR, FG score, menstrual cyclicity, A, T, FAI, DHEAS, SHBG, AUC-insulin, AUC-glucose, peripheral insulin sensitivity (M), total cholesterol, triglyceride, HDL, LDL.	Both treatments improve glycol-insulinaemic features of obese PCOS patients, but only metformin exerts a beneficial effect on the endocrine and clinical features of the syndrome.	
Nehra 2017	Women age 15-45 with PCOS by AES criteria who were seen at a Gynecology clinic at a single hospital in India	Parallel RCT	Total randomized: 71 MI = 35 Met = 36 Total Analyzed MI = 30 Met = 30	Myoinositol 1g BID (2g daily)	Metformin 500mg TID (1500mg daily)	24 weeks (outcomes measured at 12 and 24 weeks)	FSH, LH, insulin, glucose, glucose/insulin ratio, testosterone, HOMA-IR, FSH/LH ratio, total cholesterol, triglycerides, VLDL, LDL, HDL, Weight, WHR, WC were reported in a separate manuscript (IJPPS 2017)	Both metformin and MI led to significant improvement in lipid profile with reduction of LDL, total cholesterol and triglycerides and increase in HDL. There was no significant difference when comparing metformin to MI. There were significant reductions in measures of insulin resistance from baseline to 24 week end point in both treatment groups, but the treatment were not compared to one another for these outcomes. Regarding weight and BMI, there were significant reductions in both the metformin and MI groups, but	Two separate papers, same study/population. Second paper reported only BMI, Weight, WHR

								no significant difference between the two interventions. There was also not a significant change in waist circumference or WHR.	
Rajasekaran 2022	Women age 21-38 with PCOS who were undergoing their first IVF cycle	Parallel double blind RCT	Total randomized: 102 MI = 50 Met = 52 Total analyzed: 100 MI = 50 Met = 50	Myoinositol 2g BID (4g daily)	Metformin 850mg BID (1700mg daily)	12 weeks treatment + outcome of IVF cycle until end of pregnancy	Menstrual regularity, BMI, LH, FSH, LH/FSH ratio, SHBG, testosterone, fasting glucose, postprandial glucose, fasting insulin, HOMA IR, total cholesterol, LDL, HDL, AMH, AFC, ovarian volume, GI side effects, OHSS incidence with IVF, clinical pregnancy rate, pregnancy rate per IVF cycle	Both metformin and MI led to significant improvements in lipid profile, BMI, serum testosterone reduction and rise in SHBG. Both were also found to result in improvement in measures of insulin resistance with reduction in fasting glucose, and insulin and HOMA IR. MI led to a larger proportion of women with regular cycles prior to IVF than metformin and a greater number of clinical pregnancies (both spontaneous and resulting from IVF). There was also less report of GI side effects with MI compared to Met. There was no difference in incidence of OHSS which was the primary outcome.	
Fruzzetti et al. 2017	Women with PCOS (Rotterdam), aged from 18-28 years,	3 arms: MI, MET, no PCOS	Myo-inositol (n= 24)	Myo-inositol 4 g	Metformin 1500 mg/daily	6 months	Metabolic and BMI, menstrual cycle,	Metformin and myo-inositol are equally effective in improving	In a post study power analysis, the sample size of the

	attending the Outpatient Clinic of Reproductive Endocrinology of the University of Pisa, Italy, for oligoamenorrhoea and clinical signs of hyperandrogenism.		Metformin (n= 22)	+ folic acid 400 mcg/daily	(500 mg orally 3x day)		hirsutism, acne, adverse events.	BMI, insulin sensitivity and menstrual cycle in PCOS patients.	study allowed us to identify an absolute difference between the groups in the frequency of normal cycles of 35% (with a rate of normal cycles of 45% in the control group and a power of 80%).
Ravn et al. 2022	Danish women with PCOS (Rotterdam) not attempting pregnancy, age 18–50 years. PCOS outpatient clinic, Department of Gynecology and Obstetrics in collaboration with the Department of Endocrinology, Odense University Hospital (OUH), Denmark.	Open label RCT	Myo-inositol (n= 16) Metformin (n= 12)	2 mg MI + 200 mg folic acid (Inofolic®, BiO4U Ltd., Dublin, Ireland) one dose twice daily.	Metformin: one tablet of 500mg (Metformin, Actavis, TEVA, Tel Aviv, Israel) 2xday for two weeks followed by two tablets twice daily.	6 months	The primary study outcome was HOMA-IR. Secondary outcomes were fasting glucose, serum lipids, anthropometric measures, FG score, cycle length, gonadothrophins, testosterone, AMH), and scores of QoL and depression as well as adverse effects.	HOMA-IR and weight were unchanged during MI whereas Metformin had beneficial effects on weight, fasting blood glucose, and HDL cholesterol. Cycle length decreased to a similar extent during MI and Metformin. Adverse effects were less frequent during MI vs. Metformin.	
Raffone et al. 2010	Women, aged <35 years, with PCOS (Rotterdam).		Myo-inositol (n= 60) Metformin (n= 60)	Myo-inositol 4g/day + folic acid 400 µg	Metformin 1500mg/day	6 months	Spontaneous ovarian activity, myo-inositol or metformin resistance, pregnancy	Both metformin and myo-inositol, can be considered first-line treatment in most patients with PCOS, for restoring normal menstrual cycles.	Furthermore, oral administration of myo-inositol is a simple and safe treatment that seems positively

	Attending IVF Department, G. Martino Hospital, Messina, Italy, for infertility that lasted for a period of more than 14-16 months.						(biochemical and clinical), and miscarriage rate.		correlated also to oocyte maturity, with the possibility in addition to increase spontaneous fertility.
Soldat-Stankovic, 2022, Bosnia and Herzegovina	Women with PCOS with irregular periods, infertility, hirsutism or acne, university outpatient endocrinology clinic	Parallel open-label randomised controlled trial	MI+FA=33 Metformin= 33	Myoinositol (4g) + Folic acid (400mcg) daily	Metformin 1500mg daily	6 months	Primary: BMI, adiponectin, body composition, hormonal profile, metabolism of glucose and insulin. Secondary: Correlations of adiponectin with clinical and biochemical parameters, ascertain differences in clinical and biochemical parameters in groups of obese and non-obese PCOS women	Metformin and MI+FA had similar effects on BMI, body composition, hormonal profile, metabolism of glucose and insulin and adiponectin level.	

e. MI v Placebo

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Dona 2012	Women with lean PCOS; University in Italy	Parallel placebo-controlled RCT	MI = 18 Placebo = 8	Myo-inositol 1.2g daily for 12 weeks	Matched placebo powder for 12 weeks	3 months	Hormonal, metabolic, anthropometric	*Within group improvement in weight, BMI, testosterone, androstenedione, insulin AUC and HOMA-IR in the MI*	

								group. Between-group differences for weight, BMI, testosterone, androstenedione, fasting inuslin, insulin AUC and HOMA-IR.	

f. MI + monacolin K v Inositol v Met

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Leo, 2013, Italy	Women with PCOS and insulin resistance	Parallel RCT	MI+moacolin K=20 Inositol=20 Metformin=20	MI 1.5 g + mocaolin K 3g (AZELIP-ProgineFarmaceutici), twice a day for 6 months i.e. MI 3g + moacolin K 6g daily for 6 months	Comparison 1: Inositol 1.5g each dose, twice a day for 6 months Ie. Inositol 35g daily for 6 months Comparison 2: Metformin 850mg each dose, twice a day for 6 months i.e. Metformin 1700mg daily for 6 months	6 months	FG score, free testosterone, total testosterone, SHBG, Androstenedione, fasting glucose, fasting insulin, HOMA, total cholesterol, LDL, HDL, TG, BMI, menstrual regularity, gastrointestinal side-effects	Combined treatment with moacolin K and MI is a valid and well tolerated alternative to metformin, improving PCOS-related symptoms and with minimal side-effects.	

GRADE ASSESSMENTS AND EVIDENCE PROFILE

COMPARISON: DCI vs Placebo

[1] downgraded two levels due to very serious risk of bias: Three studies contributed to this outcome. One of the three included studies is at unclear risk of bias for most domains, and one of the studies is at unclear risk for randomization.

[2] downgraded one level for serious imprecision: Small sample size (112 participants)

[3] downgraded one level due to serious risk of bias: One of the two included studies is at unclear risk of bias for most domains.

[4] downgraded two levels due to very serious imprecision: Very small sample size (70 participants).

[5] downgraded two levels due to very serious risk of bias: Five studies contributed to this outcome, four have unclear risk of bias in most domains, one has high risk of bias for randomization.

[6] downgraded one level for serious risk of bias: Three studies contributed to this outcome, one study has mostly unclear risk of bias across domains, and the other two studies have an unclear risk of bias in a blinding domain.

[7] downgraded one level for serious imprecision: small sample size for relatively rare events (160 participants).

COMPARISON: MI vs Metformin												
	Quality assessment						No. participants

[1]downgraded one level for serious risk of bias: high risk of bias for blinding and attrition

[2] downgraded two levels for very serious imprecision: single study

[3]downgraded one level for serious risk of bias: high risk of bias for blinding, unclear risk of bias for randomization, blinding of outcome assessors, incomplete outcome data and other bias.

[4]downgraded two levels for very serious risk of bias: Six studies that contribute to this outcome, one has unclear risk of bias in all domains including randomization and allocation concealment, another three studies having an unclear risk in one of the blinding domains, one study having a high risk of bias in both blinding domains, one study has high risk of bias for attrition bias. Half of studies are at unclear risk of bias for either randomization and/or allocation concealment.

[5]downgraded one level for serious inconsistency: point estimates vary

[6] downgraded two levels for very serious risk of bias: Five studies contributing to this outcome, the one with the greatest weight has unclear risk of bias for allocation concealment, blinding, selective outcome reporting and other bias and high risk of bias for attrition; four studies are at high or unclear risk of bias for blinding.

[7]downgraded one level for serious risk of bias: Two studies contributed to this outcome; randomization sequence was unclear in one study; blinding was unclear or high risk in both studies; selective outcome reporting and other bias were unclear in both studies.

[8]downgraded one level for serious imprecision: small sample size (160 participants)

[9]downgraded two levels for serious risk of bias: Four studies contributed to this outcome; two studies were at unclear risk of bias for randomization, one study for allocation concealment; two studies high risk for blinding; two studies unclear risk of bias for selective outcome reporting and three studies at unclear risk for other bias.

[10]downgraded one level for serious risk of bias: Two studies contributed to this outcome; one study was at high risk of bias due to lack of blinding.

[11] downgraded one level due to serious risk of bias: Four studies contribute to this outcome, all have unclear risk of bias in the blinding domain(s), and one study is at high risk of attrition bias.

[12] downgraded one level due to serious imprecision: Small sample size (420) given the relatively rare events of pregnancy.

[13]downgraded one level due to serious risk of bias: Six studies contribute to this outcome; three studies are at high risk of bias and two are unclear risk due to blinding of participants; all studies are at high or unclear risk of bias for blinding of outcome assessors; three studies are high risk of bias for attrition.

[14] downgraded one level due to serious risk of bias: Three studies contribute to this outcome, all three have unclear risk of bias in one or both of the blinding domains.

[15] downgraded one level due to serious risk of bias: Two studies contribute to this outcome, all three have unclear risk of bias in one or both of the blinding domains.

[16] downgraded one level for serious imprecision: small sample size (220 participants)

[17]downgraded one level due to serious risk of bias: Four studies contribute to this outcome; two are unclear risk of bias for randomization, one for allocation concealment; two are at high risk for blinding in one domain and one for blinding in one domain.

[18]downgraded one level due to serious risk of bias: Five studies contribute to this outcome; three are at unclear risk of bias for randomization, two for allocation concealment; two are high risk of bias due to blinding in one domain and one for blinding in another domain.

[19] downgraded one level due to serious risk of bias: Two studies contribute to this outcome. One study is at unclear risk of bias for randomization and allocation concealment, and at high risk of bias for both blinding domains.

[20] downgraded one level due to serious imprecision: Small sample size (160 participants).

[21]downgraded one level due to serious risk of bias: Three studies contribute to this outcome, all are at unclear risk of bias for randomization, two for allocation concealment; all are at high risk or unclear risk of bias for blinding in both domains.

[22]downgraded one level for serious imprecision: small sample size (174 participants).

6. SRMA Summary of Results

Evidence Summary:

Total of 43 studies were included after full text review. Fourteen were excluded after integrity check. The remaining 29 studies were included in the systematic review and 19 in the meta-analysis. Ten studies were assessed to have high risk of bias while 16 had low or moderate risk and three had unclear risk of bias. All included studies were RCTs. The studies were heterogenous in intervention and comparator. Two studies compared DCI with placebo (Iuorno 2002, Nestler 1999). Three studies compared combinations of myoinositol (MI) + d-chiro-inositol (DCI) to folic acid (FA) or placebo (Le Donne 2019, Benelli 2016, Khan 2022) and one compared MI+DCI+Metformin to Metformin alone (Bahadur 2021). One study compared MI alone to MI+DCI (Nordio 2012). Two studies compared varying ratios of MI + DCI (Nordio 2019, Mendoza 2019). A single study compared MI to

DCI (Unfer 2011). Eight studies compared MI+FA to FA alone (Akbari Sene 2019, Artini 2013, Constantino 2009, Genazzani 2008, Ozay 2017, Pacchiarotti 2016, Papaleo 2009, Pourghasem 2019). One study compared MI+Metformin to Metformin alone (Chirania 2017) while ten compared MI alone or with folic acid to Metformin (Angik 2017, Chirania 2017, Nehra 2017, Pourghasem 2019, Rajasekaran 2022, Tagliaferri 2017, Fruzetti 2017, Ravn 2022, Raffone 2010, Soldat-Stankovic 2022). One study compared MI to placebo (Dona 2012) and one had three groups comparing MI+monacolin K to inositol and also to metformin alone (Leo 2013).

Meta-Analysis/Descriptive analysis Summary:

MI v Placebo

There is preliminary evidence from one trial with serious risk of bias with only 26 adult women that MI is more efficacious than placebo for weight, BMI, Testosterone, Androstenedione, fasting insulin, insulin AUC and HOMA-IR (very low certainty).

MI+FA v FA

Evidence suggests that MI + FA is superior to FA alone for insulin/HOMA-IR, and for total testosterone and androstenedione. However, FA alone was superior to MI + FA for BMI. Evidence from single trials suggest improvements in lipids and free testosterone but not for clinical hyperandrogenism. The populations were heterogeneous with some having impaired glucose tolerance, some populations with infertility and normal or unknown insulin sensitivity. There was no difference in pregnancy rate between groups though interventions for fertility were also heterogenous.

MI v Met

Pooled evidence suggests that MI has fewer GI adverse effects than metformin. Wide confidence intervals for other outcomes (TT, FBG, lipids and weight) limit the ability to conclude on equivalence for these outcomes. Metformin was superior to MI for FINS, WHR, WC, and Ferriman-Gallwey score. MI was superior to metformin in resumption of regular menses. A trend to lower BMI and HOMA-IR was observed with metformin in pooled analysis but there were no significant differences between groups. There is low certainty evidence from a single trial that adding MI + DCI to MET was better than MET alone for cycle regularity and lipids.

DCI v Placebo

Low certainty evidence suggests DCI improves free testosterone, total testosterone, androstenedione, DHEAS and lipids compared to placebo. There was no data on QoL, HOMA-IR or 2-hr Gluc. Placebo is superior to DCI for BMI (MD 0.67).

MI+DCI v MI alone

There were no differences between MI+DCI and MI alone for critical outcomes (HOMA-IR, BMI, FG score). There were improvements in some metabolic outcomes at 3 months but not at 6 months in one trial. There was no difference for hormonal and anthropometric outcomes.

Question 4.7.

In adolescents and adults with PCOS, is inositol alone or in combination with other therapies, effective for management of hormonal and clinical PCOS features, weight and reproductive outcomes**?**

BACKGROUND:

Women with PCOS are commonly treated with insulin sensitizing agents due to insulin resistance and hyperinsulinemia, common features of the syndrome both in women of healthy and of higher weight. Due to gastrointestinal side effects related to metformin and more serious adverse effects related to glitazones other medical options are needed in treating insulin resistance in women with PCOS.

Inositol is a nutrient supplement that acts as a second messenger in insulin and FSH signalling. There are nine stereo-isomers of inositol of which myo-inositol (MI) is the most abundant in the human body (1) . Myo-inositol promotes GLUT4 translocation to the plasma membrane for glucose uptake (2) and is also involved in FSH mediated pathways which regulate the proliferation and maturation of granulosa cells (3). Under the stimulus of insulin, MI is converted to D-chiro-inositol/DCI (4) , which stimulates glycogen production and facilitates additional uptake of glucose through mobilisation of GLUT4 transporters (5). It has been hypothesised that overproduction of insulin in PCOS enhances MI to DCI conversion which results in an increased DCI and decreased MI concentration in follicular fluid. In women without PCOS, ovarian MI:DCI ratio is 100:1 but in women with PCOS the ratio is 0.2:1 (6) . MI is also postulated to enhance aromatase synthesis in granulosa cells and therefore reducing androgen production (7) . It has been suggested that a 40:1 ratio of MI:DCI is physiological, and provision of inositol in this ratio has reverted PCOS phenotypes in mouse models (8).

GRADE evidence table

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
o **Comparison 1:** MI v Placebo **Recommendation:** We are unable to make a recommendation on myoinositol 1.2g daily alone for premenopausal women with lean PCOS.	⨁◯◯◯ VERY LOW
o **Comparison 2.** MI + FA vs FA **Recommendation:** In premenopausal women with PCOS, myoinositol could be considered as an adjunct to folic acid for improving androgens, lipids and metabolic outcomes in women with PCOS. Myoinositol should not be recommended as an adjunct to folic acid for weight management.	⨁◯◯◯ VERY LOW
o **Comparison 3:** MI + MET v MET alone **Recommendation:** We are unable to make a recommendation on whether adding MI to MET is more useful than MET alone.	⨁⨁◯◯ LOW
o **Comparison 4.** MI vs Metformin **Recommendation:** MET should be recommended instead of MI for improving menstrual regularity central adiposity and insulin. We are unable to make a recommendation on hormonal outcomes and lipids.	⨁⨁◯◯ LOW
o **Comparison 5**. DCI vs Placebo **Recommendation:** In premenopausal women with PCOS, low dose DCI could be considered for improving biochemical hyperandrogenism but not for weight management.	⨁⨁◯◯ LOW
o **Comparison 6**. MI + DCI + FA v Placebo + FA **Recommendation:** We are unable to provide a recommendation on whether to use MI + DCI + FA.	⨁⨁◯◯ LOW
o **Comparison 7.** MI + DCI + FA v FA only – single trial **Recommendation:** We are unable to provide a recommendation on whether to use MI + DCI + FA.	⨁◯◯◯ VERY LOW
o **Comparison 8**. MI + DCI v MI – single trial **Recommendation:** We are unable to recommend a combination of MI + DCI for adolescents/women who are of above healthy weight (BMI >27) over MI alone.	⨁◯◯◯ VERY LOW
o **Comparison 9.** MI + DCI + diet + FA v MI + diet + FA – single trial **Recommendation:** We are unable to recommend a combination of MI + DCI for adolescents/women who are above healthy weight (BMI >27) over MI alone.	⨁◯◯◯ VERY LOW
o **Comparison 10.** MI + DCI + MET v MET alone – single trial	⨁⨁◯◯

Recommendation: We are unable to recommend MI + DCI + metformin over metformin alone for biochemical/clinical hyperandrogenism, metabolic outcomes, and weight in premenopausal women with PCOS.	LOW
o **Comparison 11.** MI + DCI v MI+DCI **Recommendation:** We are unable to make a recommendation about effectiveness of different ratios of MI:DCI in premenopausal women with PCOS.	⨁◯◯◯ VERY LOW

Critical outcomes: FT, HOMA-IR, 2hr glucose, BMI, QoL.

Evidence to Recommendations Framework

COMPARISONS

Myoinositol v Placebo
DCI vs placebo
Myoinositol vs Metformin
Myoinositol + folic acid vs folic acid

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Inositol (in any form) could be considered in women with PCOS based on individual preferences and values, given limited harm, potential for reduced biochemical hyperandrogenism and metabolic measures, with limited evidence for clinical benefits for ovulation, hirsutism, or excess weight.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **EBR:** Metformin should be considered over inositol for metabolic measures, hirsutism, cycle regulation and central adiposity, noting that metformin has more gastrointestinal side effects than inositol.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)
PP: Women taking inositol and other complementary therapies are encouraged to advise their health professional. PP: Specific types, doses or combinations of inositol cannot currently be recommended in adults and adolescents with PCOS, due to a lack of quality evidence. PP: Shared decision making should include discussion that regulatory status and quality control of inositol in any form (like other nutrient supplements) differs from those for pharmacological products and that dose and quality may vary. PP: Policy makers and health professionals have a responsibility to ensure women have access to unconflicted, evidence-based information to inform shared-decision making, whilst also acknowledging and respecting individual values and preferences, including for complementary therapies.
GRADE CONSIDERATIONS
Justifications: There is a strong consumer voice on the need to inform women on the efficacy, limited quality evidence and the concerns around misinformation surrounding these products, as well as considering the costs. Conflicts of interest may also present concerns in this field of research.
Subgroup considerations: Participants in this trial had a normal BMI No adolescents in the study Different types of inositol
Implementation considerations: Regulation of nutrient supplements varies around the globe, therefore the quality of nutrient supplements that are purchased by consumers may vary. There is a need for education in Health professionals and women about evidence-based approaches. There is a need for strategies to limit misinformation.
Monitoring and evaluation considerations: Monitor commercial conflicts of interest and the claims made by industry are evidence-based.
Research priorities: AEs should be included as outcomes. The impact on QoL and psychological outcomes should be evaluated. There is a strong consumer interest in these products and therefore independent funding bodies should fund large scale clinical trials that are adequately-powered.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

High quality systematic review performed; extensive discussions occurred.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Using agents without any evidence of clinical efficacy that come at cost.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Certainty of the evidence was very low due to very serious imprecision and unclear/moderate risk of bias.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☒ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

It is acknowledged that there are many stakeholders with different values, perspectives and preferences and these were considered.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

Panel discussion:

Detailed systematic review.

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☒ Moderate savings	☐ Large savings

Research evidence:

No research evidence was sought

Panel discussion:

Metformin - 500 mg tablets for 3 months is approximately $12 (SD)

Myo-Inositol - a three month supply at a dose of 2000 mg daily can be purchased for approximately $65 (US).

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was sought

Panel discussion:

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was found.

Panel discussion:

No evidence.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was sought

Panel discussion:

Possibly increasing equity by reducing cost by not recommending agents with no clear clinical benefit.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was sought

Panel discussion:

It is acknowledged that there are many stakeholders with different values, perspectives and preferences and these were considered.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Challenges with education and regulations.

GDG 4

Question 4.8.

Is permanent hair reduction alone or in combination with other therapies, effective for management of hirsutism in adolescents and adults with PCOS?

1. SELECTION CRITERIA

Table 1. PICO Criteria for Inclusion – Not to be adapted To be used by evidence team to decide which studies will be included when screening search results.	
Question	Q 4.8) Is permanent hair reduction alone or in combination with other therapies, effective for the management of hirsutism in adolescents and adults with PCOS?
Clinical leads (key contacts)	**Dr Daniela Romauldi** Obstetrician-Gynaecologist Fondazione Policlinico Universitario Agostino Gemelli, Italy daniela.romualdi@policlinicogemelli.it **Prof Terhi Piltonen** Obstetrician-Gynaecologist, Reproductive endocrinologist Oulu University Hospital, University of Oulu, Finland terhi.piltonen@oulu.fi **A/Prof Jacqueline Boyle** Obstetrician-gynaecologist Monash University, Australia Jacqueline.Boyle@monash.edu
Allocation ranking	Level 1- New systematic review

	Participants (P)	**Intervention (I)**	**Comparison (C)**	**Outcomes (O)**	**Study type (S)**	**Limits** *(language, year)*
Inclusion	Hirsute females with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity and weight. Subgroups: adolescents (10-19y), adults, pregnancy, post-menopausal. Subgroups: Different skin colour; BMI informed by the most frequent presentation of the data.	Permanent mechanical hair removal (electrolysis, lasers and pulsed light devices) alone or in combination with other treatments	Each long-term mechanical hair removal method vs another, Placebo/no-hair removal, Other non-permanent or short-term hair removal method-epilation (shaving, chemical depilation, plucking, threading, waxing, and bleaching) alone or in combination with other pharmacological or non-pharmacological treatments (eg. Eflornithine hydrochloride topical cream, OCP alone or antiandrogens + OCP not associated with mechanical hair removal, Metformin or other metabolic treatments, associated or not with OCP-hormonal drugs)	FG-score/some other scoring/tricoscopic methods (hair shaft thickness, hair shaft colour, terminal vs. vellus hair ratio and hair density per cm2) for hirsutism evaluation. self-reported data on hirsutism QoL, safety (skin scars, skin spots), safety in pregnancy, cost	Systematic reviews Evidence-based guidelines Comparative cohort studies (can include cross sectional or case control if it compares PCOS and non- PCOS) RCTs	English Language
Exclusion	Females without PCOS. Non-Hirsute women

5. STUDY CHARACTERISTICS TABLE

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings
Example et al. 2021	Women with PCOS and infertility; Fertility clinic	Parallel double blind RCT	Metformin= 59 Placebo=65	Metformin 500-2500g daily	Placebo identical daily		6 months	Pregnancy rate (primary), livebirth, ovulation	Metformin was more effective in achieving pregnancy and livebirth versus placebo
Clayton WJ, et al. 2005	Women with PCOS and facial hirsutism; Dermatology of dermatology	Single blinded RCT	Intervention group (high-fluence laser) = 51 Control (low-fluence laser)= 37	High Fluence Alexandrite laser (23.6 J cm^-2), 755nm pulse width 20ms spot size 12.5 (Apogee 6200; Cynosure, Chelmsford, MA, USA), 4-6 weekly for 6 months	Low fluence Alexandrite laser equivalent to ineffective/no laser (4.8 J cm ^-2), 755nm pulse width 20ms spot size 12.5 (Apogee 6200; Cynosure, Chelmsford, MA, USA), 4-6 weekly for 6 months		6 months	**1. Self-reported severity of facial hair** **2. Hair free period** **3. Depression & anxiety,** **4. quality of life** **5. time spent removing hair** **6. self-esteem**	Laser treatment reduces facial hirsutism severity and reduces time spend on hair removal. Laser treatment also alleviates depression and anxiety in women with PCOS.
Dorgham, N et al. 2021	Women with PCOS and facial hirsutism; "single centre" setting not otherwise specified	RCT	Group 1 (laser hair removal only): 50 women Group 2 (laser hair removal + metformin 500mg): 50 women Group 3 (laser hair removal + COCP Diane-35): 50 women	Laser & COCP (Diane-35). Assume once daily COCP. LightSheer DUET; Lumenis, Yokneam, Israel) was applied for hair removal for a total of six initially monthly sessions followed by two follow-up sessions at three and six months after the initial six sessions	Laser + 500mg Glucophage metformin hydrochloride – frequency of metformin not specified	Laser only	6 months	**1. DLQI** **2. HLQI** **3. Overall hirsutism - analog scale (subjectively assessed by treating physician)**	bination of hormonal treatment with laser hair removal can achieve greater hair reduction, significant improvements in patients' quality of life and better maintenance compared to combination of metformin + laser or laser alone
McGill DJ et al. 2007 (RCT)	Women with PCOS and facial hirsutism; University teaching hospital with patients from	RCT	31, split face	GentleLase Alexandrite laser; 755nm wavelength, 3 millisecond pulse duration	Lumina IPL, 650-1100nm filter - 6-weekly, total of 6 full treatments		6 months	**1. Hair counts completed prior and at 1,3- and 6-months following treatment** **2. Patient satisfaction questionnaires completed**	The alexandrite laser resulted in significantly longer hair-free intervals, larger reductions in hair

	gynecology/ endocrinology clinics, Glasgow, UK			6-weekly, total of 6 full treatments				**prior at 1,3- and 6-months following treatment** **3. Hair free intervals, defined as the time to first hair re-growth (as measured by patient) following each treatment**	counts and greater patient satisfaction than the IPL
Rezvanian,H et al. 2009	Women with PCOS and facial hirsutism; Dermatology clinic of St. Al-Zahra Hospital in Iran	Prospective RCT	Intervention (IPL/Metformin) = 35 Control (IPL only) = 35	IPL & Metformin IPL for 5 laser sessions at 45-day intervals 500mg Metformin TDS	IPL only for 5 laser sessions at 45-day intervals			**1. Reduction of hair count** **2. Reduction in hair width/thickness** **3. Degree of hair reduction (50% in hair count and 30% in hair diameter) as determined by dermatologists**	Hirsutism was significantly better controlled in participants who had combination IPL and metformin vs. IPL only. Patients satisfaction was also significantly better in IPL/Metformin group.
Karn, D et al. 2014	Women with PCOS and women without hyperandrogenism or US findings of PCOS (Controls), who presented to department of dermatology in Dhulikhel Hospital Kathmandu University Hospital, Dhulikhel, Nepal	Prospective cohort study	PCOS: 30 women Non-PCOS: 30 women	All patients received 1064nm longpulse Nd-YAG laser with 50 J/cm^2 energy and 50 msec pulse duration. Laser therapy was repeated every four weeks and number of settings was noted for substantial hair reduction.	Nil – all participants received the same treatment		Not reported, only reported number of sessions needed to reach 50% reduction in facial hirsutism, nil timeframe specified	Number of laser treatment sessions required to reach more than 50% reduction in hair count Method	Patients with PCOS require more laser treatment sessions compared to patients without PCOS to achieve at least 50% reduction in hair count
McGill, D.J. et al. (2) 2007	Women with PCOS and facial hirsutism who were referred to an outpatient department for laser hair removal	Prospective cohort study	60 women received the same intervention, nil comparison group	All participants treated with a 755nm GentleLase Alexandrite Laser (Candela Corp., Wayland, MD, USA). Initial patch test and then 6 treatments at 6 weekly intervals – then maintenance treatment as required	Nil – all participants received the same treatment		Patients followed up for maintenance laser treatments but unclear what this follow-up time period was over/when	**1. Hair counts** **2. Hair free interval** **3. Patient satisfaction**	Women with PCOS experience poorer than expected reduction in hair and HFI following laser treatment and more than 6 laser treatment sessions may have prolong HFI and overall patient satisfaction

Nabi, N et al. 2022	Women with PCOS-related hirsutism and idiopathic hirsutism who were seen in a non-specified outpatient dermatology department of an Indian hospital	Prospective cohort study	PCOS: 50 Controls (idiopathic hirsutism): 50	Nd: YAG laser with wavelength of 1064nm (Gentle YAGTM,Candela Corporation, Boston, USA). For a total of 6 sessions	Nil – all participants received the same treatment		3 months	**1. Efficacy of hair reduction** **2. Effect of laser on trichoscopic features**	Patients with PCOS-associated hirsutism have poorer response to Nd:YAG laser compared to patients with idiopathic hirsutism
Pai, GS et al. 2011	Women with PCOS and facial hirsutism who presented to a non-specified single-centre	Prospective cohort study	51 , split face	Low-fluence but high-repetition laser with Soprano® XL (Alma Lasers Ltd, Caesarea, Israel) in SHR mode using a technique of maintaining the handpiece in constant motion, with a fluence up to 10 J/cm^2, 10 Hz, and a 20-ms pulse duration as recommended by the manufacturers.	High fluence, single-pass Light- SheerTM (Lumenis, Inc., Santa Clara, CA, USA) using a conventional single-pass fluence to tolerance (25–35 J/cm^2), 2 Hz, and a 30-ms pulse duration (which was the pulse width found safest in our patient population based on past experiences on skin types IV and V).		Not reported. Only comment that subjects received 6 sessions with every 4-6 weeks. Nil other timeframe or total duration specified.	**1. Hair count** **2. Hair density** **3. Pain during treatment**	

6.1. FINDINGS

EVIDENCE SUMMARY:

Total of eight studies were included in the systematic review: four RCTs and four cohort studies. Meta-analysis was not performed due to significant heterogeneity of the types of permanent mechanical hair removal techniques used, and varying outcomes assessed across the studies. There were also significantly variable follow up durations, ranging from no follow-up or unspecified follow-up duration, to 3 or 6-months. Five studies had high risk of bias, the remaining three had moderate risk of bias, no studies were assessed to have low risk of bias. Overall, certainty of evidence in all 8 studies was rated low or very low due to imprecision, risk of bias, lack of meta-analysis, small sample numbers and single studies noted in outcome as per the GRADE evidence profile.

DESCRIPTIVE ANALYSIS SUMMARY:

No meta-analyses were performed due to non-consistent methods and outcomes across all eight studies. Overall, laser treatment was reported as an effective method of permanent hair removal technique for facial hirsutism. The combination of laser treatments with systemic hormonal agents such as metformin or the oral contraceptive pill seemed to better control hirsutism compared to laser treatment alone. Similar findings were noted when IPL treatments alone were compared to treatments in combination with metformin. No studies investigated whether the combination of IPL and systemic agents would lead to differing results when compared to the combination of laser and systemic agents, however one study reported laser treatments alone to be superior to IPL treatment alone.

Of the four studies that reported on psychological outcomes such as patient satisfaction, quality of life, depression and anxiety scores, treatment with permanent hair removal technique was found to improve all measures, more so when combined with systemic agents.

6.2. DATA EXTRACTION TABLES – DICHOTOMOUS OUTCOMES

OUTCOME: Reduction in Hair shaft thickness					**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Nd:YAG laser - PCOS vs. Non-PCOS									
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**P-value**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Nabi,N et al. 2022	N & %	Trichoscopy - Hair shaft thickness determined after comparing micrographs of trichoscopic images pre- and post- laser, unclear definition of 'reduction', by how much and who examined images	PCOS group N=15 (30%)	50	Idiopathic Hirs N=35 (70%)	50	<0.001	Crude	NA

OUTCOME: Reduction in Hair shaft colour					**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Nd:YAG laser - PCOS vs. Non-PCOS									
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**P-value**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Nabi,N et al. 2022	N & %	Trichoscopy - determined after comparing micrographs of trichoscopic images pre- and post- laser, unclear definition of 'decreased colour', or by how much and who examined images	PCOS group N=24 (48%)	50	Idiopathic Hirs N=31 (62%)	50	P=0.159	Crude	NA

OUTCOME: Reduction in terminal: vellus hair ratio					**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Nd:YAG laser - PCOS vs. Non-PCOS									
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**P-value**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Nabi,N et al. 2022	N & %	Calculated by the number of hairs counted in a $1*1cm^2$ cardboard window with the help of trichoscope	PCOS group N=23 (46%)	50	Idiopathic Hirs N=34(68%)	50	P=0.026	Crude	NA

APPENDIX. QUALITY APPRAISAL TABLES

Randomised Controlled Trial #1	
Study ID	Clayton W.J. 2005
Study Citation	Clayton, W. J.; Lipton, M.; Elford, J.; Rustin, M.; Sherr, L. (2005). A randomised controlled trial of laser treatment among hirsute women with polycystic ovary syndrome. British ournal of Dermatology, 2005;152(5):986-992. Doi: 0.1111/j.1365-2133.2005.06426.x
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS aged 18 years and over
PCOS diagnostic criteria	Research team did not take part in establishing diagnosis, accepted PCOS diagnosis of specialist colleagues
Presence of infertility	*Not reported*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	*Allocated/randomised: 98* Intervention group (high-fluence laser): 51 Control (low-fluence laser): 37 *Assessed at end of study: 75* Intervention group (high-fluence laser): 44 Control (low-fluence laser): 31
Setting	*Department of Dermatology - Recruited from gynaecology, endocrinology and dermatology outpatient departments at a long teaching hospital and from PCOS patient support group called Verity*
Intervention	*High Fluence Alexandrite laser (23.6 J cm^-2), 755nm pulse width 20ms spot size 12.5 (Apogee 6200; Cynosure, Chelmsford, MA, USA), 4-6 weekly for 6 months*
Comparison	*Low fluence Alexandrite laser that was known to be relatively ineffective, but convincing to be used as a control (4.8 J cm ^-2), 755nm pulse width 20ms spot size 12.5 (Apogee 6200; Cynosure, Chelmsford, MA, USA), 4-6 weekly for 6 months*

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	**Main outcomes:** **1. Self-reported severity of facial hair** **- Scale 1 (least severe) to 10 (most severe)** **2. Self-reported Hair free period (days)** **3. Anxiety and depression scores (measured with Hospital Anxiety and Depression Scale – HADS)** **4. Quality of life (WHOQOL-BREF), scored between 1-5, high scores – higher QoL** **- Psychological health** **- Social relationship** **- Environment** **- Physical health.** Others: **1. Self-esteem** **2. Time spent a week removing hair**	
Follow up Duration	*6 months*	
Summary Result/s	*Laser treatment reduces facial hirsutism severity and reduces time spend on hair removal. Laser treatment also alleviates depression and anxiety in women with PCOS.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes –* *The study was designed to test the hypothesis that laser treatment would reduce the impact of facial hair and its associated psychological morbidity in women with facial hirsutism*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	***Yes*** ***1. PCOS, diagnosed by other specialists (endocrinologists, gynaecologists, dermatologists) – not confirmed by researchers*** ***2. Facial hirsutism with dark hair and Fitzpatrick skin types I to pale V***

			3. Suitable for alexandrite laser (assessed by asking potential participants about skin and hair colour & visual examination by clinician)
Exclusion criteria		Yes Partial No Not reported	*Yes* ***1. White, blonde or ginger facial hair*** ***2. Fitzpatrick skin types medium V, dark V and VI*** ***3. Previous laser hair removal*** ***4. Insufficient English to complete questionnaires*** ***5. Age under 18 years***
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Partial* *Participants randomised by the treating physician using a random numbers table, not clear how the randomisation was done.*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Yes*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*No* *All questionnaires based on participant subjective perceptions.*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Intervention with high-fluence laser* *7/51 = 14%* *Control with low-fluence laser* *6/37 = 16%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*No* *Did not report on randomisation process*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*

	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Yes.* *First author and 4th author have a private hair removal practice* *Study was funded by Dermatrust*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*No*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Inadequate method of randomisation, only participants were blinded, physicians assessing however it was inappropriate for physicians to be blinded as they needed to give the right intervention. Conflicts of interest*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Randomised Controlled Trial #2	
Study ID	Dorgham,N 2021
Study Citation	Dorgham, N.; Sharobim, A.; Haggag, H.; El-Kalioby, M.; Dorgham, D. (2021). Adding combined oral contraceptives or metformin to l aser treatment in polycystic ovarian syndrome hirsute patients. Journal of drugs in dermatology: JDD 2021;20(3)302-306. Doi: 10.36849/JDD.5652
Study Country	Cairo, Egypt
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS aged 18-40 years
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	*Nil – participants with other dermatological and/or systemic diseases were ineligible for inclusion*
Medication History	*No*
N per group	*Allocated/randomised: 150* *Group 1 (laser hair removal only): 50 women* *Group 2 (laser hair removal + metformin 500mg): 50 women* *Group 3 (laser hair removal + COCP Diane-35): 50 women* *Assessed at end of study: 150* *Group 1 (laser hair removal only): 50 women* *Group 2 (laser hair removal + metformin 500mg): 50 women* *Group 3 (laser hair removal + COCP Diane-35): 50 women*
Setting	*Single centre, not otherwise specified*
Intervention	*Group 3: Laser + COCP Diane-35* *Frequency of COCP not specificized, assume daily* *LightSheer DUET; Lumenis, Yokneam, Israel) was applied for hair removal for a total of six initially monthly sessions followed by two follow-up sessions at three and six months after the initial six sessions*

Comparison #1	*Group 2: Laser + 500mg Glucophage metformin hydrochloride – frequency of metformin not specified*	
Comparison #2	*Group 1: Laser only*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	***1. DLQI*** ***2. HLQI*** ***3. Visual analogue scale (subjectively assessed by treating physician)*** ***- 1 = worse*** ***- 2 = no change*** ***- 3 = <30% improvement*** ***- 4 = 30-60% improvement*** ***- 5 = >60% improvement***	
Follow up Duration	*3 & 6 months*	
Summary Result/s	*Combining hormonal treatment with laser hair removal can achieve greater hair reduction, significant improvements in patients' quality of life and better maintenance as compared with when combining metformin with laser hair removal or conducting alone.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The aim was to assess the impact of COCP or metformin to laser hair removal on the quality of life of women with PCOS with hirsutism*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes	*Yes* ***1. Age 18-40***

		Partial No Not reported	***2. Confirmed PCOS diagnosis according to Rotterdam criteria*** ***3. Facial hirsutism assessed by Ferriman-Gallwey score***
Exclusion criteria		Yes Partial No Not reported	*Yes* ***1. Other dermatological and/or systemic diseases*** ***2. Patients with any contraindications to receiving laser or hormonal treatments (e.g. history of DVT)***
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes, an independent person created the allocation sequence using computer-generated random numbers. Allocation was concealed using sequentially numbered, opaque sealed envelopes kept by the attending nurse*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Yes*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Partial* *Self-reported DLQI and HLQI – standard, valid, and reliable* *Subjective VAS assessment – unclear if same clinician assessed all patients – hence 'partial'*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Partial* *Self-reported DLQI and HLQI – subjectively assessed based on participant perceptions* *Subjective VAS assessment – unclear if same clinician assessed all patients and not reported if clinicians were specifically trained.*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Not reported*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*No* *Did not specify which clinician assessed VAS, if it was the same clinician or if this clinician had training to assess VAS*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*

	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Adequate randomisation method, but nil blinding for either patients or investigators, outcomes partially reported subjectively/objectively and not all outcomes measured in a standardised method*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*Yes* *VAS outcome was high risk* *DLQI/HDLQI was moderate risk*	

Randomised Controlled Trial #3	
Study ID	McGill, DJ 2007
Study Citation	McGill, D. J.; Hutchison, C.; McKenzie, E.; McSherry, E.; Mackay, I. R.(2007). A randomised, split-face comparison of facial hair removal with the alexandrite laser and intense pulsed light system. Lasers in surgery and medicine 2007;39(10):767-772. Doi: 10.1002/lsm.20584
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS and facial hirsutism, aged 16-69
PCOS diagnostic criteria	Researchers did not attempt to independently establish diagnosis – all patients diagnosed having PCOS prior to referral to study (through gynaecology or endocrinology clinics)
Presence of infertility	*Not reported*
Presence of other condition/s	*Recorded, but not disclosed in paper*
Medication History	*Recorded, but not disclosed in paper*
N per group	*Allocated/randomised: 31, split-face* *Assessed at end of study: 31, split-face*
Setting	*University teaching hospital with patients from gynecology/ endocrinology clinics, Glasgow, UK*
Intervention	*GentleLase Alexandrite laser; 755nm wavelength, 3 millisecond pulse duration* *6-weekly, total of 6 full treatments*
Comparison	*Lumina IPL, 650-1100nm filter - 6-weekly, total of 6 full treatments*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	***1. Hair counts completed prior and at 1,3- and 6-months following treatment*** ***2. Patient satisfaction questionnaires completed prior at 1,3- and 6-months following treatment*** ***3. Hair free intervals, defined as the time to first hair re-growth (as measured by patient) following each treatment***
Follow up Duration	*1,3- and 6-months following treatment*

Summary Result/s	*The alexandrite laser resulted in significantly longer hair-free intervals, larger reductions in hair counts and greater patient satisfaction than the IPL*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The aim was to compare the efficacy of Alexandrite laser with Lumina IPL system on facial hirsutism in women with PCOS*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* ***1. Diagnosis of PCOS*** ***2. Facial hirsutism comprising brown or black hair*** ***3. Fitzpatrick skin types I-V*** ***4. Age >16 years***
Exclusion criteria	Yes Partial No Not reported	*Yes* ***1. Idiopathic and non-facial hirsutism*** ***2. Patients with blonde, red, grey or white hair*** ***3. Patients aged younger than 16 years***
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Envelopes were made up randomising IPL treatment to either right or left and alexandrite treatment to the opposite side.* - ***Envelopes opened immediately prior to first treatment***
SELECTION BIAS – **Was allocation to intervention group concealed?**	Yes Partial	*Partial*

		No Not reported	- ***Participants initially received an envelope that randomly allocated which side of face would receive which treatment*** - ***Unable to continue concealment of allocation after this***
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes – same participants receiving both treatments*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Yes* - ***Three experienced members of laser suite were blinded to treatment allocation and independently calculated hair counts from pictures to ensure accuracy***
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes* - ***Hair counts measured under video microscope by members of laser suite*** - ***Patient satisfaction measured on standardised questionnaire***
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Partial* - ***Hair counts measured relatively objectively as there were 3 independent assessors, although paper does not report whether 'experienced members of laser suite' were provided additional training as to video microscopy reading*** - ***Patient satisfaction is subjective***
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Not reported*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Yes* *First author D.J.M disclosed potential financial conflict of interest*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Unclear whether participants were blinded for their intervention. Assessors measuring hair counts were independent and blinded. Split-face and randomly allocated – same patients receiving both treatments so nil differences in patient characteristics.*	

What is the overall risk of bias?	Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No*	

Randomised Controlled Trial #4	
Study ID	Rezvanian,H 2009
Study Citation	Rezvanian,H, H.; Adibi, N.; Siavash, M.; Kachuei, A.; Shojaee-Moradie, F.; Asilian, A.)2—0_. Increased insulin sensitivity by metformin enhances intense-pulsed-light-assisted hair removal in patients with polycystic ovary syndrome. Dermatology 2009;218(3):231-236. Doi: 10.1159/000187718
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS and facial hirsutism*
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	*Allocated/randomised: 70* *Intervention (IPL/Metformin) = 35* *Control (IPL only) = 35* *Assessed at end of study:52* *Intervention (IPL/Metformin) = 22* *Control (IPL only) = 30*
Setting	*Dermatology clinic of St. Al-Zahra Hospital in Iran*

Intervention	*IPL & Metformin* *IPL for 5 laser sessions at 45-day intervals* *500mg Metformin TDS*	
Comparison	*IPL only for 5 laser sessions at 45-day intervals*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	***1. Reduction of hair count*** ***- Self-assessed by patients who also assessed degree of improvement before and after treatment using Visual Analog Scale (0-100%)*** ***2. Reduction in hair width/thickness*** ***3. Degree of hair reduction (50% in hair count and 30% in hair diameter) as determined by dermatologists***	
Follow up Duration	*6 months*	
Summary Result/s	*Hirsutism was significantly better controlled in participants who had combination IPL and metformin vs. IPL only. Patients satisfaction was also significantly better in IPL/Metformin group.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *Does laser hair removal treatment reduce severity of facial hirsutism and reduce psychological morbidity in women with PCOS?*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Ye Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* ***1. Diagnosis of PCOS based on presence of at least two:*** ***- Oligoanovulation, clinical and/or biochemical signs of hyperandrogenisms and observation of polycystic ovaries on USS*** ***2. Hirsutism defined based on Ferriman-Gallwey score >8.***

Exclusion criteria		Yes Partial No Not reported	*Yes* ***1. Renal and liver dysfunction*** ***2. History of significant CCF*** ***3. Hx of significant alcohol abuse*** ***4. Hx of hyperprolactinemia, ovarian or adrenal tumours*** ***5. Hx of diabetes and congential renal hyperplasia*** ***6. Known Cushing's syndrome*** ***7. Participation in any hair removal program in previous 3 months***
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Partial* *Patients were divided into two groups based on random numbers table, but not clear how the randomisation was done.*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No	*Not reported*

		Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes* *Self-assessment of patient perception for hirsutism improvement assessed on standardised questionnaire* *Hair counts/width assessed under videomicroscopy* *Degree of hair reduction assessed by dermatologist's consensus = not standard, not reliable/replicable*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*No* *Subjective participant self-assessment for degree of improvement* *Hair thickness assessed under microscopy, although not reported who counted/who measured and if they received additional training*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Intervention (IPL/Metformin) = 13/35 = 37.1%* *Control (IPL only) = 5/35 = 14.3%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*No* *Information regarding blinding and allocation not reported, not reported who assessed hair count, or how the dermatologist assessed degree of hair reduction overall.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*

	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Many missing fields re: method of randomisation, blinding & allocation, outcomes (particularly hair count measurement) not adequately reported*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

COHORT STUDIES

Cohort study #1		
Study ID	*Karn,D 2014*	
Study Citation	Karn, D.; K C, S.; Timalsina, M.; Gyawali, P. (2014). Hormonal profile and efficacy of long pulse Nd-YAG laser in treatment of hirsutism. Journal of Nepal Health Research Council, 2014; 12(26):59-62. Doi: 10.33314/jnhrc.v0i0.440	
Study Country	*Nepal*	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women PCOS and women without hyperandrogenism or US findings of PCOS (controls)* *Age= Overall 27.9 ±9.6 years* *BMI= 63% of patients had BMI>25*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*The number of participants that were:* ○ ***Screened = Not reported*** ○ ***Enrolled = 60*** ○ ***Allocated/randomised: PCOS= 30, controls= 30*** ○ ***Assessed (duration not specified): PCOS=30, controls= 30*** ○ ***Followed up = not reported***	
Setting	Department of dermatology, Dhulikhel Hospital Kathmandu University Hospital, Dhulikhel, Nepal.	
Intervention/ indicator	All patients received 1064nm longpulse Nd-YAG laser with 50 J/cm^2 energy and 50 msec pulse duration. Laser therapy was repeated every four weeks and number of settings was noted for substantial hair reduction.	
Comparison/ Control	*N/A*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	***1.*** **Number of laser treatment sessions required to reach more than 50% reduction in hair count** - ***Method of measurement to determine 50% reduction not specified***	
Inclusion criteria reported?	*Yes*	*PCOS based on having both and ultrasonographic findings "*had high androgen (total testosterone and dehydroepiandrosterone sulfate) or elevated LH: FSH ratio consistent with PCOS "Every patient underwent abdomino-pelvic ultrasound to meet the diagnosis of PCOS using Rotterdam's Criteria and adrenal tumor was ruled out among all
Exclusion criteria reported?	Yes Partial No	*Partial* - **USS to rule out adrenal tumour, nil other explicit exclusion criteria reported**

	Not reported	
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Partial* - Only inclusion criteria explicitly reported, partial exclusion criteria as noted above.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Duration of follow-up not reported, only reported on number of sessions needed to reach 50% reduction in facial hirsutism, timeframe not specified
Was matching performed?	Yes Partial No Not reported	*No*

Summary of Result/s		*Patients with PCOS require more laser treatment sessions compared to patients without PCOS to achieve at least 50% reduction in hair count*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	*Yes*	
	Was the exposed cohort truly representative?	Yes Partial No Not reported	*Method of participant recruitment not reported*
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	*Yes – all patients had hirsutism prior to start of study*
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No	*Method of measuring 'reduction in 50%' facial hirsutism not reported.*

		Not reported	
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Not reported*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	*0%*	*All participants included in final analysis*
	What percentage of the individuals were not included in the analysis?	*0*	*As above*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	No. Method of measuring hair reduction/baseline not reported, physician/person conducting laser not reported, timeframe of laser sessions not reported. Patient baseline characteristic not reported.
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	*Not reported – patient baseline characteristics not reported or compared*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS		Many fields not further reported in paper, would not be able to replicate study.	
What is the overall risk of bias?		*High*	*Nil specification of why 50% reduction in hair loss was the primary measure outcome, unclear where or how participants were recruited, unclear who assessed 50% reduction, against which measure and if they received specific training and if this was the same person assessing all participants*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Cohort study #2	
Study ID	*McGill DJ, 2007*
Study Citation	McGill, D. J.; Hutchison, C.; McKenzie, E.; McSherry, E.; Mackay, I. R. (2007). Laser hair removal in women with poilycystic ovary syndrome. Journal of plastic, reconstructive & aesthetic surgery: JPRAS 2007;60(4):426-31. doi :10.1016/j.bjps.2006.11.006
Study Country	*UK*
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*60 women with PCOS* *Age = 24 years (range 17-72)* *BMI = Not reported*
PCOS diagnostic criteria	*PCOS diagnosis not established by researchers, diagnosis accepted from referring specialist colleagues*
N per group	*The number of participants that were:* ○ ***Screened = Not reported*** ○ ***Enrolled = 60*** ○ ***Allocated/randomised: NA*** ○ ***Assessed***

	- ***37/60 patients assessed for pre- and post-treatment hair counts*** - ***All 60 patients assessed for hair-free intervals*** ○ ***Followed up = 43/60 completed the post-treatment follow-up questionnaire***	
Setting	*New referrals to hospital department, not otherwise specified*	
Intervention/ indicator	All participants treated with a 755nm GentleLase Alexandrite Laser (Candela Corp., Wayland, MD, USA). Initial patch test and then 6 treatments at 6 weekly intervals – then maintenance treatment as required	
Comparison/ Control	*N/A*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	***1. Hair counts*** ***- Measured using videomicroscope, independently counted by 3 laser nurse practitioners with a 4th practitioner in the case of discrepancies*** ***2. Hair-free interval following each treatment*** ***- Self-reported measurements by patients of the time to new facial hair growth following treatment*** ***3. Patient Satisfaction questionnaires***	
Inclusion criteria reported?	*Yes*	***1. Diagnosis of PCOS (as diagnosed by other specialists)*** ***2. Facial hirsutism comprising brown or black hair*** ***3. Fitzpatrick skin types I-V*** ***4. Age >16***
Exclusion criteria reported?	Yes Partial No Not reported	*Yes* ***1. Idiopathic and non-facial hirsutism*** ***2. Patients with blonde, grey or white hair*** ***3. Patients under age of 16***
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Yes*

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Partial – patients followed up for maintenance laser treatments but unclear what this follow-up time period was*
Was matching performed?		Yes Partial No Not reported	*No – NA*
Summary of Result/s		*Women with PCOS experience poorer than expected reduction in hair and HFI following laser treatment and more than 6 laser treatment sessions may have prolong HFI and overall patient satisfaction*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	*NA*	*NA*
	Was the exposed cohort truly representative?	Yes Partial No Not reported	*Partial* *Severity of hirsutism not reported, only captured women with access to hospital outpatient setting of non-specified department.*
	Is it clear that the outcome of interest was not	Yes Partial	*Yes* *All patients prior to study commencement had hirsutism*

	present at the start of study?	No Not reported	
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes.*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*No*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes* □ **Hair counts** - ***Measured using videomicroscope, independently counted by 3 laser nurse practitioners with a 4th practitioner in the case of discrepancies*** □ **Hair-free interval following each treatment** - ***Self-reported measurements by patients of the time to new facial hair growth following treatment – standardised questionnaire designed for the purpose of this study*** □ **Patient Satisfaction questionnaires, *standardised survey designed for the purpose of this study***
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Partial – all outcomes assessed independently, however questionnaires for HFI and satisfaction were subjective*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	*Overall = 17 (28.3%)*	*17/60 patients lost to follow-up patient satisfaction survey*

	What percentage of the individuals were not included in the analysis?	*0*	*All patients included in the analysis*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	*NA*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		*Moderate*	*HFI and patient satisfaction were subjectively assessed*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*Yes:* *Low RoB for outcome re: reduction in hair count* *Moderate RoB for outcome re: HFI and patient satisfaction which were assessed on a survey designed only for this study and patients may not have accurately counted HFI/HFI counting may differ between patients*	

Cohort study #3		
Study ID	*Nabi,N 2022*	
Study Citation	Nabi, N.; Bhat, Y. J.; Dar, U. K.; Hakeem, A.; Mir, S. A.; Shah, I. H.; Tilwani, M. R. (2022). Comparative study of the clinic-trichoscopic response to treatment of hirsutism with long pulsed (1064nm) Nd:YAG laser in idiopathic hirsutism and polycystic ovarian syndrome patients. Lasers in medical science 2022;37(1):545-553. Doi: 10.1007/s10103-021-03295-0	
Study Country	*India*	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with PCOS-related hirsutism and idiopathic hirsutism (controls)* *Age= PCOS: median 28.5± 9.72 years, controls: median 33.6±11.69 years* *BMI= not reported*	
PCOS diagnostic criteria	*Androgen Excess Society (AES)=PCOS Society guidelines (2006)*	
N per group	*The number of participants that were:* ○ ***Screened = Not reported*** ○ ***Enrolled = 100*** ○ ***Allocated/randomised: PCOS= 50, controls= 50*** ○ ***Assessed): PCOS= 50, controls= 50*** ○ ***Followed up = all participants***	
Setting	*Outpatient dermatology department in a non-specified hospital*	
Intervention/ indicator	Nd: YAG laser with wavelength of 1064nm (Gentle YAGTM,Candela Corporation, Boston, USA). For a total of 6 sessions	
Comparison/ Control	*N/A*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	***1. Efficacy of hair reduction – based on interval changes from trichoscopic images taken before each session and at follow-up of 3 months*** ***- Graded on a 4-point visual scale (poor -> excellent)*** ***- Poor = <25% reduction in hair from baseline*** ***- Fair <25-50% reduction in hair from baseline*** ***- Good <50-75% reduction in hair from baseline*** ***- Excellent >75% reduction in hair from baseline*** ***2. Effect of laser on trichoscopic features*** ***- Measured via tracheoscopy counted in a 1*1cm^2 cardboard window in a fixed area of the face (the chin)*** ***- Hair shaft thickness, hair shaft colour, terminal vs. vellus hair ratio, decrease density of hair per cm^2***	
Inclusion criteria reported?	*Yes*	***1. PCOS*** ***2. Facial hirsutism in patients presenting to outpatient department*** ***3. Age >18 years***

Exclusion criteria reported?	Yes Partial No Not reported	*Yes* ***1. Patients with fine, vellus hair (mFG score <8)*** ***2. Previous laser treatment to study area*** ***3. Gross hormongl dysfunction (not further defined0*** ***4. Chemical epilation of electrolysis within 6 weeks*** ***5. Associated photo-aggravated diseases*** ***6. Active skin infection*** ***7. History of keloid scarring*** ***8. Pregnancy/lactation*** ***9. Patients on immunosuppressants, oral hormonal treatment, anti-androgens, insulin sensitisers***
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	*Would not be able to replicate study based off of this paper.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Cohort study #4	
Study ID	*Pai, GS 2011*
Study Citation	Pai, G. S.; Bhat, P. S.; Mallya, H.; Gold, M. (2011) Safety and efficacy of low-fluence, high-repetition rate versus high-fluence, low-repetition rate 810-nm diode laser for permanent hair removal A split-face comparison study. Journal of Cosmetic and Laser Therapy 2011;13(4):134-137. Doi: 10.3109/14764172.2011.594057
Study Country	*USA*
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Women with PCOS and facial hirsutism* *Age= 18 years +, not otherwise specified* *BMI= Not specified*
PCOS diagnostic criteria	*PCOS confirmed by ultrasonography*
N per group	*The number of participants that were:* ○ ***Screened = not reported*** ○ ***Enrolled = 51*** ○ ***Allocated/randomised: NA – split-face*** ○ ***Assessed = 42***

	○ ***Followed up = Not reported***	
Setting	*USA not otherwise specified*	
Intervention/ indicator	1 side of face: Low-fluence but high-repetition laser with Soprano® XL (Alma Lasers Ltd, Caesarea, Israel) in SHR mode using a technique of maintaining the handpiece in constant motion, with a fluence up to 10 J/cm^2, 10 Hz, and a 20-ms pulse duration as recommended by the manufacturers. Subjects treated 6 times at intervals of 4-6 weeks	
Comparison/ Control	Other side of face treated with high fluence, single-pass Light- SheerTM (Lumenis, Inc., Santa Clara, CA, USA) using a conventional single-pass fluence to tolerance (25–35 J/cm^2), 2 Hz, and a 30-ms pulse duration (which was the pulse width found safest in our patient population based on past experiences on skin types IV and V). Subjects treated 6 times at intervals of 4-6 weeks	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	**1. Hair count** **- Measured in 2x2cm area using hair analysis system SIF-1 for accuracy** **2. Hair density** **- Measured in 2x2cm area using hair analysis system SIF-1 for accuracy** **3. Pain during treatment** **- Measured subjectively by patients on a 0-10 visual analog scale (0=no pain, 10=unbearable pain)**	
Inclusion criteria reported?	*Yes*	*PCOS based ultrasonographic findings of polycystic ovaries*
Exclusion criteria reported?	Yes Partial No Not reported	*Yes* ***1. Patients with obvious skin disease*** ***2. Patients with history of chronic skin disease other than moderate facial acne vulgaris, keloidal or hypertrophic scar tendency*** ***3. Skin types I,II,III and VI*** ***4. Severe photosensitivity*** ***5. Pregnant patients***
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*

Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*No – outcomes only assessed at the end of the 6th laser session, not followed-up to assess long-term effects "The subjects were treated six times at intervals of 4–6 weeks with each device to permit hair regrowth and mimic real-life laser hair removal." Nil further elaboration on follow-up or total duration of treatment*
Was matching performed?		Yes Partial No Not reported	*NA*
Summary of Result/s		*Low-fluence with high-repetition laser resulted in statistically insignificant increase in hair reduction compared to high-fluence laser but did show significant reduction in hair thickness and a low pain score*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	*NA*	*NA*
	Was the exposed cohort truly representative?	Yes Partial No Not reported	*No* *Participants recruited only included women with PCOS with ultrasonographic findings – nil biochemical markers reviewed or considered in the inclusion criteria*
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	*Yes – all participants had hirsutism prior to study commencement*
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA – split-faced study, same participants received both treatments*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes* - Baseline hair density and final hair counts after the sixth session were made within a predetermined square-shaped area (2x2 cm^2 area from the tip of the ear lobule to the jaw line) by using the hair analysis system SIF-1 for accuracy. Pain scores measured on a standardised visual analog scale (0-10)
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No	*Partial* Subjective pain scores reported by patients, not objective

		Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	*NA*	*Nil follow-up reported*
	What percentage of the individuals were not included in the analysis?	*17.65%*	*9 additional patients were enrolled but did not finish the protocol and were excluded from the results*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Partial* - ***Not reported who counted hair density***
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	*NA – split faced study, all participants received both treatments*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Yes, Dr Gold speaks on behalf of Alma Lasers and Lumenis*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	*No blinding of either participants or assessors, and no follow-up. Results from after the 6th laser session analysed. Will never know if this is true in the longterm 3-6 months.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*

Question 4.8.

Are mechanical laser and light therapies for hair reduction, alone or in combination with other therapies, effective for management of hirsutism in adolescents and adults with PCOS?

BACKGROUND:

Hirsutism, in particular facial hirsutism, is a distressing symptom of hyperandrogenism in women with PCOS at any age (see Chapter 1: Screening, diagnostic assessment, risk assessment and life-stage). Actually, excessive hair growth may display a negative impact on emotional wellbeing and QoL (see section 2 on emotional wellbeing). Cosmetic and COCP are considered first-line treatment for hirsutism in women, including in PCOS (1).

Several forms of mechanical hair removal are commonly used by women with PCOS with the aim to limit hirsutism including shaving, waxing, pharmacological topical treatments (eg. Eflornithine hydrochloride cream (2).

Selective thermolysis has revolutionised the approach to mechanical hair removal, as it was reported to be effective and safe. Different devices are commercially available: Intense Pulsed Light technology, long-pulsed ruby (694 nm), long-pulsed alexandrite (755 nm), diode (800–980 nm), and long-pulsed Nd:YAG (1064 nm) (3).

Laser hair removal is extensively practiced with advanced technology in clinics. Laser hair removal beams highly concentrated light onto hair follicles, with the pigment absorbing the light. The light energy is converted to heat, which destroys hair follicles, inhibiting or delaying future hair growth. Intense Pulsed Light (IPL) systems work on the same principles as lasers in that light energy is absorbed into particular target cells with colour (chromophores) in the skin. The light energy is again converted to heat energy, which causes damage to the specific target area. IPL systems are different to lasers in that they deliver many wavelengths (or colours) in each pulse of light instead of just one wavelength. The effectiveness differs based on the skin/hair colour, which introduces a degree of variability in the response to treatment, depending upon ethnicity and/or subjective characteristics (4).

Due to the high priority given to clinical hyperandrogenism outcomes during guideline development and revision, this clinical question was prioritised. A total of 8 studies (4 RCTs and 4 prospective cohort studies) on selective thermolysis techniques were selected based on appraisal criteria established a priori in the PICO question. We did not identify any specific evidence in adolescents with PCOS (age range of studies participants 16-79 years). No further studies on other forms of mechanical hair removal (shaving, waxing) were retrieved.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
o **Comparison 1:** IPL plus metformin vs. IPL alone	⊕○○○ VERY LOW
o **Comparison 2:** High-fluence laser vs. low-fluence laser (effectively placebo)	⊕○○○ VERY LOW
o **Comparison 3:** IPL vs. Alexandrite laser	⊕⊕○○ LOW
o **Comparison 4:** LightSheer Laser only vs. LightSheer Laser & Metformin vs. LightSheer laser & COCP	⊕⊕○○ LOW
o **Comparison 5:** Soprano XL laser vs. LightSheer laser	⊕⊕○○ LOW
o **Comparison 6:** Nd:YAG laser - PCOS vs. Non-PCOS	⊕⊕○○ LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Laser (high fluence) vs no laser
Intense Pulse light plus metformin vs Intense Pulse Light alone
High Fluence laser vs Low Fluence laser
Intense Pulse Light vs. Alexandrite laser
Laser (HF)alone vs Laser (HF) plus metformin vs Laser (HF) plus COCP
Laser in PCOS vs laser in non PCOS

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Mechanical laser and light therapies should be considered for reducing facial hirsutism and for related depression, anxiety and quality of life in women with PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **EBR:** A greater number of laser treatment sessions may be required in women with PCOS, compared to women with idiopathic hirsutism, to achieve hair reduction.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **CR:** Adverse effects appear limited in the hands of experienced and suitably qualified providers, and women should be encouraged to seek hair reduction therapies from such providers.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

- **PP:** Where laser hair removal is prescribed, the following need to be considered:
  - Wavelength and delivery of laser treatment varies by skin and hair colour
  - Laser is relatively ineffective in women with fair skin and blond, grey or white hair
  - The addition of COCP, with or without anti-androgens, to laser treatment may provide greater hair reduction and maintenance
  - Low and high fluence laser appear to have similar efficacy in reducing facial hair, while low fluence laser has reduced associated pain

- **PP:** Hair removal with Intense Pulse Light (IPL) could be considered, albeit benefits may be less pronounced compared to laser treatment. There is no evidence on home-based IPL kits.

- **PP:** Policy makers should consider funding this evidence-based effective therapy for women with PCOS to alleviate distressing symptoms of hirsutism, and related negative impact on quality of life, body image and psychological health.

GRADE CONSIDERATIONS

Justifications:
Based on three studies, women with PCOS may experience poorer than expected reduction in hirsutism compared with women who have idiopathic hirsutism (women without PCOS) after mechanical hair removal. Nevertheless, overall, the studies reported reduction of facial hair, less time spent on hair removal and improvement of depression, anxiety and psychological quality of life. We found a high heterogeneity in methods of treatment, treatment schedules and methods for efficacy assessment. Just one study reported data on pain during the procedure, documenting the worst pain VAS score in high fluence compared with low fluence laser. However, the undesirable effects, when reported, were mild and on balance, evidence was felt to probably favour laser use in hirsute PCOS women.

Subgroup considerations:
- Most studies excluded specific skin or hair colours
- Ethnicity/skin colour: Studies were conducted in the UK, India, Iran, Nepal. No subgroups based on skin colour were specifically identified. In one study white, blonde or ginger facial hair were considered exclusion criterion
- Pregnant women with PCOS: this was not addressed
- Adolescent and postmenopausal women: not specifically addressed

Implementation considerations:
Whilst the laser was most effective, it may not be applicable in all settings due to cost, availability of equipment and adequately qualified practitioners.
Policy makers will need to implement funding to support permanent hair reduction therapy for women with PCOS.
IPL whilst not as effective could be considered for treatment if more accessible and more affordable. The addition of other PCOS therapies may improve control of hirsutism and the woman's satisfaction

Monitoring and evaluation considerations:
Monitor equitable access to affordable services with appropriately qualified practitioners.
Patient satisfaction (including psychological aspects), hair free intervals following each treatment.
Adverse effects should be monitored.

Research priorities:
COCP alone or COCP + antiandrogens vs laser
Feasibility and efficacy of laser treatment of hirsutism in different age subgroups
Feasibility and efficacy of laser treatment of hirsutism in breastfeeding women
More clarity on best laser treatment by skin type (given the heterogeneity of skin types in the studies)
Evaluation of laser efficacy in general body areas other than face.
Adverse events and side effects should be reported.
Cost effectiveness of laser treatment

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Individual outcomes and studies have low grades of evidence however taken together evidence is stronger.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

It is acknowledged that different stakeholders may value the outcome differently.

Facial hirsutism is considered one major concern for PCOS women.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Based on evidence

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Women currently pay for their own permanent hair reduction treatment. If implemented, the recommendation will shift some of those costs to other payers and if use is increased costs may be moderate to large including training and expanding the workforce.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

No evidence.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

No data available

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

No data available, but probably laser technology could be poorly accessible in some socio-economic environments or in countries with limited health resources.

High personal costs.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

High value for women but challenging for funders.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☒ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Will need funding to implement.

Evidence processing: Studies were selected and appraised by two reviewers in consultation with the evidence team/key contact using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by 2 reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently and all conflicts were resolved by consensus. In total, 10 studies met the inclusion criteria for this review.

5. STUDY CHARACTERISTICS TABLE

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings
Abiad et al., 2018, Lebanon	Females with PCOS and obesity; University hospital	Cohort	PCOS – 6 Non-PCOS - 16	Sleeve Gastrectomy	Females with obesity without PCOS	12 months	Anthropometric Metabolic	Both groups lost >30% body weight.
Ahmed et al., 2022, UK	Women with PCOS undergoing bariatric surgery; University Hospital	Cohort	PCOS - 30 Non-PCOS - 60	Roux-en-Y gastric bypass surgery	Women without PCOS undergoing bariatric surgery	24 months	% Total Weight Loss	Similar loss of total body weight between women with and without PCOS
Benito et al., 2022, Spain	Premenopausal women with PCOS; University Hospital	Cohort	PCOS – 49 Non-PCOS – 120	Bariatric surgery (RYGB, adjustable gastric banding, sleeve gastrectomy, revisional surgery)	Premenopausal women without PCOS	Up to 24 months	Anthropometric Metabolic Pregnancy	Pregnancy rates higher among PCOS than non-PCOS. Other outcomes similar.
Bhandari et al., 2022, India	Females with PCOS and obesity; University Hospital	Cohort	PCOS – 43 Non-PCOS - 32	Sleeve gastrectomy	Females with obesity without PCOS	6 months	AMH level Anthropometric Reproductive	AMH levels decreased in both groups post-surgery with no difference between groups
Buyukkaba et al., 2021, Turkey	Females with PCOS and obesity; University Hospital	Cohort	PCOS – 23 Non-PCOS - 47	Metabolic surgery - 62 laparoscopic sleeve gastrectomy, 8 Roux-en-Y gastric bypass	Females with obesity without PCOS	6 months	Body composition, metabolic health markers, AMH	AMH increased following bariatric surgery in women with and without PCOS with no significant difference between groups.
Cai et al., 2021, China	Females with PCOS and obesity; University Hospital	Cohort	PCOS – 83 Non-PCOS – 70	Laparoscopic sleeve gastrectomy	Females with obesity without PCOS	12 months	Anthropometric Metabolic	Both women with and without PCOS had improvements in body composition following LSG.
Casals et al., 2021, Spain	Women with PCOS; University Hospital	Cross-sectional	PCOS – 43 Non-PCOS - 165	Bariatric surgery	Women without PCOS	8+ years	Reproductive Anthropometric	Improvement in menstrual regularity with bariatric surgery.
Chiofalo et al., 2017, Italy	Women with obesity and PCOS; University Hospital	Cohort	PCOS – 29 Non-PCOS – 26	Bariatric surgery	Women with obesity without PCOS	12 months	AMH	AMH levels were reduced in both groups
Hu et al., 2022, China	Women with obesity and PCOS; University Hospital	Non-randomized trial	Bariatric surgery - 40 Medical therapy - 41	Laparoscopic sleeve gastrectomy	Metformin 2000 mg/day x 12 months + OCP 35 mg ethinyl-estradiol + 2 mg cyproterone acetate x 6 months	12 months	Anthropometric Metabolic	Greater reduction in BMI in the surgery group than the medical group, and improvement in signs and symptoms of PCOS associated with change in BMI
Tatarchuk et al., 2022, Ukraine	Premenopausal women with PCOS; Three metabolic surgery centres	Cohort	PCOS: Bariatric surgery – 33 Conservative - 27 Non-PCOS & surgery - 40	Gastric sleeve resection	Conservative management (no surgery or medical therapy) Non-PCOS	15 months	Anthropometric Metabolic Reproductive	Menstrual irregularity improved. Ovulation improved in more than half of these patients at 6–15 months. These effects were more evident in women with PCOS.

6. FINDINGS

Comparisons included:

Comparison 1. Bariatric Surgery vs Medical Therapy

Comparison 2. Bariatric Surgery vs Conservative Management

Comparison 3. Bariatric Surgery Among Individuals with PCOS vs. Non-PCOS

COMPARISON 1. Bariatric Surgery vs Medical Therapy

EVIDENCE SUMMARY:

One non-randomized trial (Hu et al, 2022) compared bariatric surgery (laparoscopic sleeve gastrectomy) to medical therapy (oral contraceptive pill and metformin). This study was conducted in Shanghai, China from September 2017 to July 2020. Eligible patients chose whether they wished to pursue surgical or medical therapy and were assigned to a group based on their intentions. Patients in the medical therapy group were prescribed six months of an oral contraceptive pill (35 mcg ethinyl-estradiol and 2 mg cyproterone acetate) and twelve months of metformin. Outcomes were evaluated at baseline and twelve months. Reported outcomes of relevance included adverse events, anthropometric outcomes (body weight, BMI), metabolic outcomes (fasting glucose, fasting insulin, lipids, hemoglobin A1C), total testosterone, and sex hormone binding globulin (SHBG). This study had a high risk of bias as it was non-randomized, and investigators were not blinded.

META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:

It was not possible to perform a meta-analysis as only one study compared bariatric surgery to medical therapy in women with PCOS. The outcomes reported in this study are presented in the below table. The authors found that bariatric surgery compared with medical therapy led to improvements in metabolic outcomes (fasting glucose, fasting insulin, triglycerides, LDL-cholesterol, and hemoglobin A1C), anthropometric measures (body weight, BMI), as well as total testosterone and sex hormone binding globulin. These results are of low certainty given that they are derived from a single study with a high risk of bias and serious imprecision.

COMPARISON 2. Bariatric Surgery vs Conservative Management

EVIDENCE SUMMARY:

One prospective, non-randomized study (Tatarchuk et al, 2022) compared bariatric surgery (gastric sleeve resection) to conservative management in women with and without PCOS. This study was conducted in three metabolic surgery centres in Ukraine. Eligible patients chose whether they wished to pursue surgical or conservative management and were assigned to a group based on their intentions. Patients in the conservative management group did not receive bariatric surgery or medical therapy. Outcomes were evaluated at baseline and every three months until fifteen months. Reported outcomes of relevance included % total weight loss, intermenstrual length, and ovulation. This study had a high risk of bias as it was non-randomized, and investigators were not blinded.

META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:

It was not possible to perform a meta-analysis as only one study compared bariatric surgery to conservative management in women with PCOS. The outcomes reported in this study are presented in the below table. The authors found that bariatric surgery compared with conservative management had improved ovulation, % total weight loss, and intermenstrual length among women with PCOS. These results are of low certainty given that they are derived from a single study with a high risk of bias and serious imprecision.

Outcome	Studies	n	Effect Estimate: OR [95%CI], M-H, random	P-Value	Favours	Certainty
Ovulation	1	60	25.87 [6.50, 103.06]	<0.00001	Bariatric Surgery	⊕◯◯◯ Very Low
Outcome	**Studies**	**n**	**Effect Estimate: Mean Difference [95%CI], M-H, random**	**P-Value**	**Favours**	**Certainty**
Intermenstrual Length	1	60	-43.00 [-46.28, -39.72]	<0.00001	Bariatric Surgery	⊕◯◯◯ Very Low
% Total Weight Loss	1	60	29.80 [29.07, 30.53]	<0.00001	Bariatric Surgery	⊕◯◯◯ Very Low

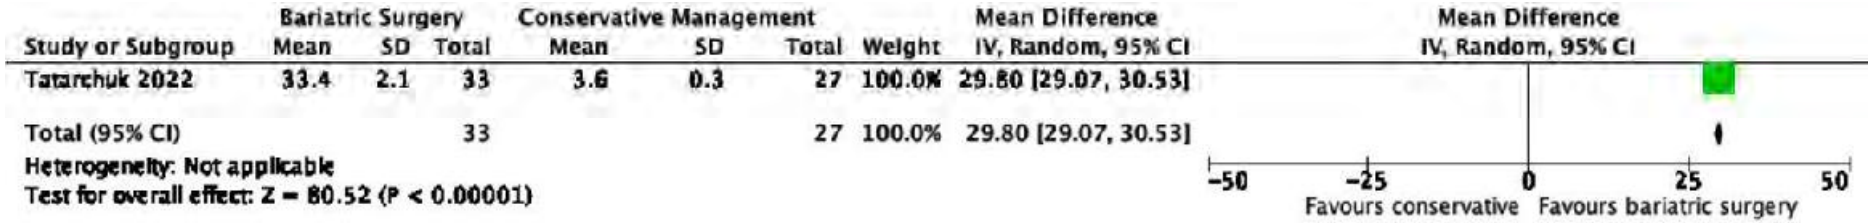
2.3.2. Forest Plot for Included Study Comparing Bariatric Surgery with Conservative Management for % Total Weight Loss



COMPARISON 3. PCOS vs. Non-PCOS

EVIDENCE SUMMARY:

Nine studies compared the effect of bariatric surgery in women with and without PCOS. Eight of these studies were cohort studies (Abiad et al., 2018, Ahmed et al., 2022, Benito et al., 2020, Bhandari et al., 2016, Buyukkaba et al., 2021, Cai et al., 2021, Chiofalo et al., 2017, Tatarchuk et al., 2020) and one was a cross-sectional study (Casals et al., 2022). All studies were published between 2016 and 2022.

Six studies looked at reproductive outcomes within their surgical cohorts. One study (Benito et al., 2020) looked at the effect of bariatric surgery on reproductive and pregnancy outcomes in women with and without PCOS. Another study (Tatarchuk et al, 2020) examined the effect of bariatric surgery on reproductive outcomes (i.e., ovulation, intermenstrual length, and menstrual regularity) in women with and without PCOS. Three studies (Bhandari et al., 2016, Buyukkaba et al., 2021, Chiofalo et al., 2017) looked at the effect of bariatric surgery on anti-Mullerian hormone (AMH) levels in women with and without a diagnosis of PCOS. These studies are all at high risk of bias as they are surgical cohorts where investigators were not blinded to the outcomes.

Eight studies reported on non-reproductive outcomes (Abiad et al., 2018, Ahmed et al., 2022, Benito et al., 2020, Bhandari et al., 2016, Buyukkaba et al., 2021, Cai et al., 2021, Casals et al., 2022, Tatarchuk et al., 2020) including anthropometric, metabolic, and hormonal outcomes. The cross-sectional study by Casals et al., 2022 contacted female patients who had bariatric surgery at their centre between January 2005 and December 2010 with and without PCOS and conducted an interview to determine pregnancy and reproductive outcomes following surgery. They found there was an improvement in menstrual regularity among women with PCOS following bariatric surgery, but not in pregnancy outcomes. This study is at a high risk of bias due to non-response bias, and recall bias with self-reporting of outcomes. There was no data reported in any of the studies included in this comparison on prevalence of type 2 diabetes or hypertension, hirsutism, cost-effectiveness, or quality of life.

META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:

It was not possible to perform a meta-analysis for the majority of the reproductive and pregnancy outcomes as only one study reported on each outcome for all but anti-Mullerian hormone. The outcomes reported are presented in the below table. The majority of results are of low certainty given that they are derived from a single or few studies with high risk of bias.

For the non-reproductive outcomes, two or more studies provided data on most of the outcomes of interest (as indicated in the table below) and therefore meta-analyses were performed. There is low certainty in the results of these meta-analyses due to high risk of bias in each of the included studies. The cross-sectional study (Casals et al., 2022) was excluded from all meta-analyses below due to an inability to compare outcomes across study designs.

Reproductive and Pregnancy Outcomes

Outcome	Studies	n	Effect Estimate: OR [95%CI], M-H, random	P-Value	Favours	Certainty
Regular Menstrual Cycles	1	75	3.36 [1.29,8.84]	0.01	PCOS	⊕◯◯◯ Very Low

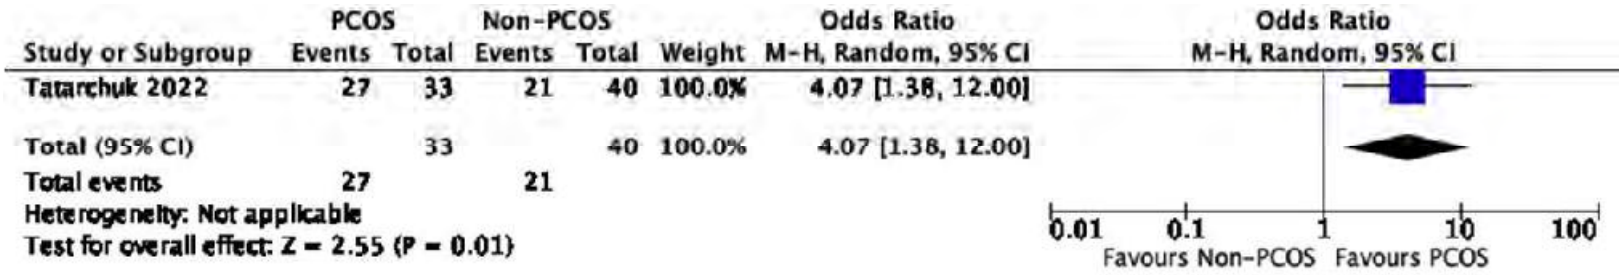
OUTCOME 3.1. Ovulation

3.1.1. Individual Study Data Table

OUTCOME: Ovulation					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Tatarchuk et al., 2022	Count	Investigator	27	33	21	40	Crude	N/A

3.1.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Ovulation

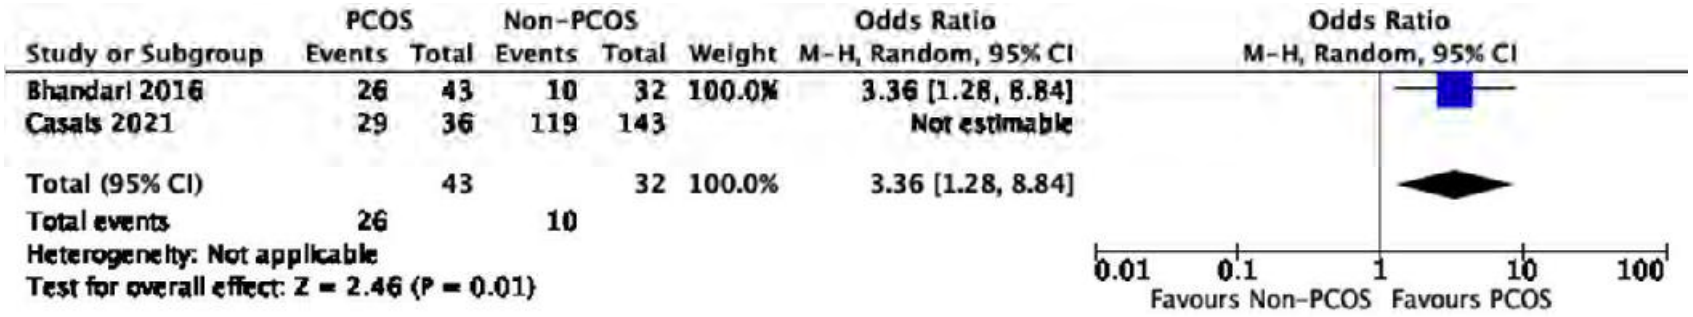


OUTCOME 3.2. Regular Menstrual Cycles

3.2.1. Individual Study Data Table

OUTCOME: Regular menstrual cycles				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Bhandari et al. 2016	Count	Investigator	26	43	10	32	Crude	N/A
Casals et al., 2021	Count	Investigator	29	43	119	165	Crude	N/A

3.2.2. Forest Plot for Included Studies Comparing Bariatric Surgery in Women With and Without PCOS for Regular Menstrual Cycles

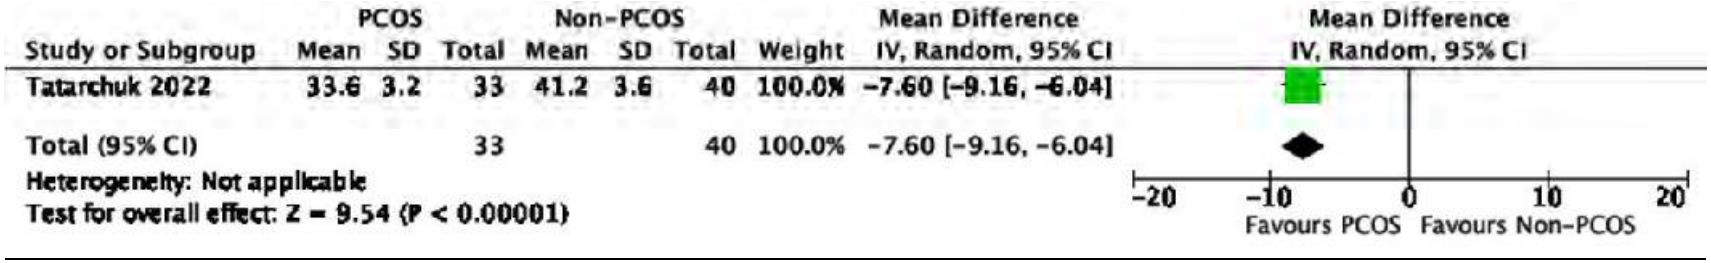


OUTCOME 3.3. Intermenstrual Length

3.3.1. Individual Study Data Table

OUTCOME: Intermenstrual length							**OUTCOME TYPE:** Continuous			
		COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Tatarchuk et al., 2022	Days	Investigator	33.6	3.2	33	41.2	3.6	40	Crude	NA

3.3.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Intermenstrual Length

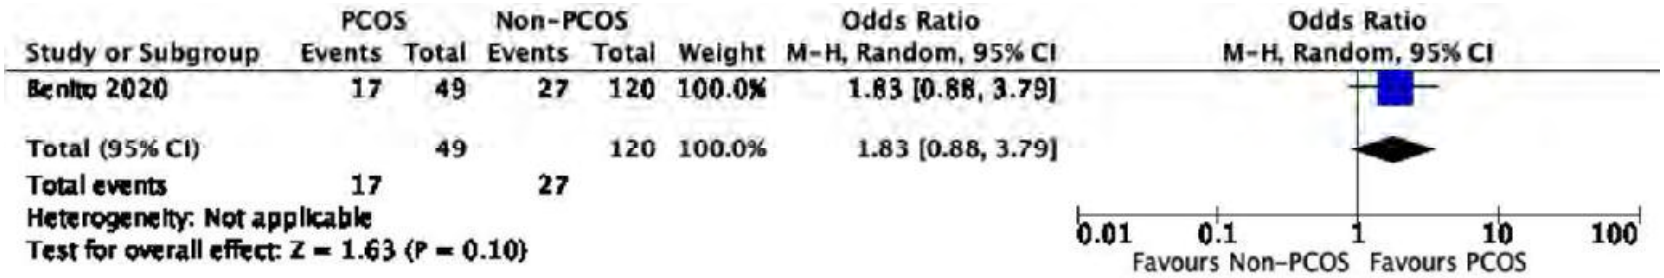


OUTCOME 3.4. Live Birth Rate

3.4.1. Individual Study Data Table

OUTCOME: Live birth rate				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al., 2020	Count	Investigator	17	49	27	120	Crude	N/A

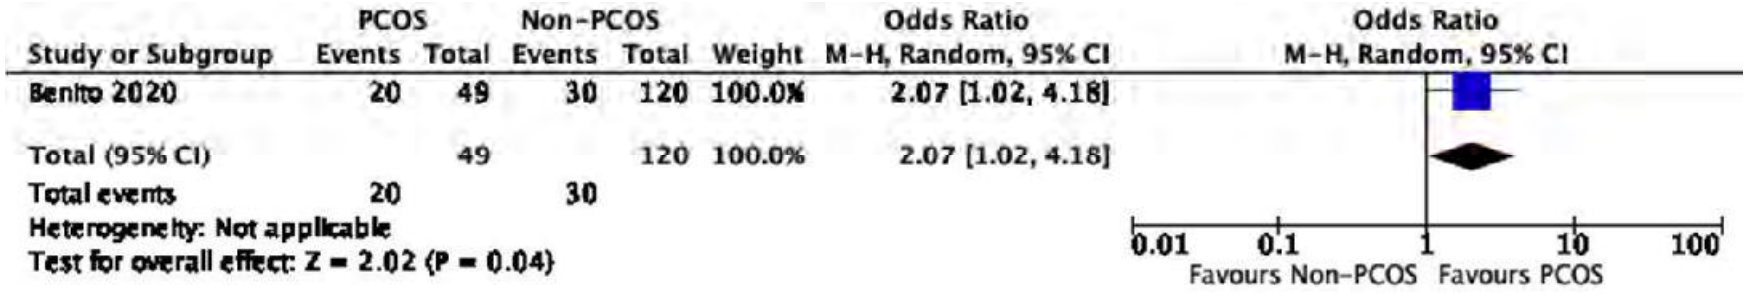
3.4.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Live Birth Rate



OUTCOME 3.5. Pregnancy Rate
3.5.1. Individual Study Table

OUTCOME: Pregnancy rate				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	20	49	30	120	Crude	N/A

3.5.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Pregnancy Rate



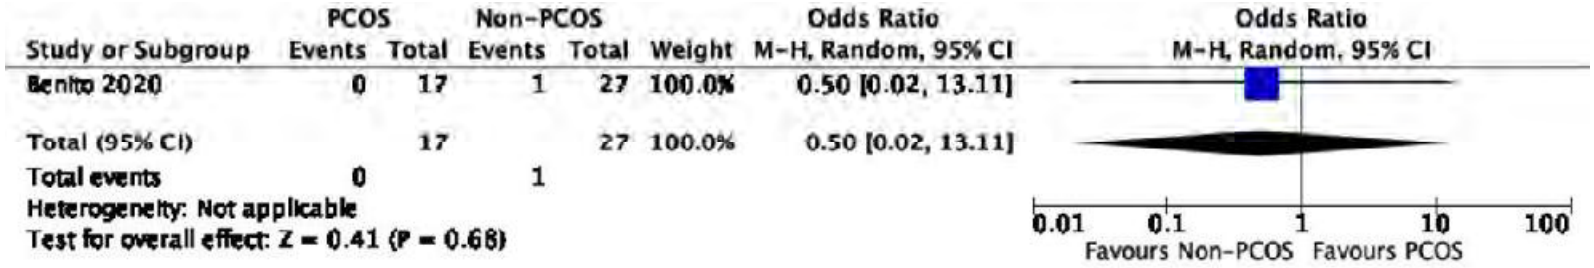
OUTCOME 3.6. Multiple Gestations

3.6.1. Individual Study Data Table

OUTCOME: Multiple gestations					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group***	**N events in control / comparison group**	**N total in control/ comparison group***	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	0	17	1	27	Crude	N/A

*N total is the number of live births

3.6.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Multiple Gestations



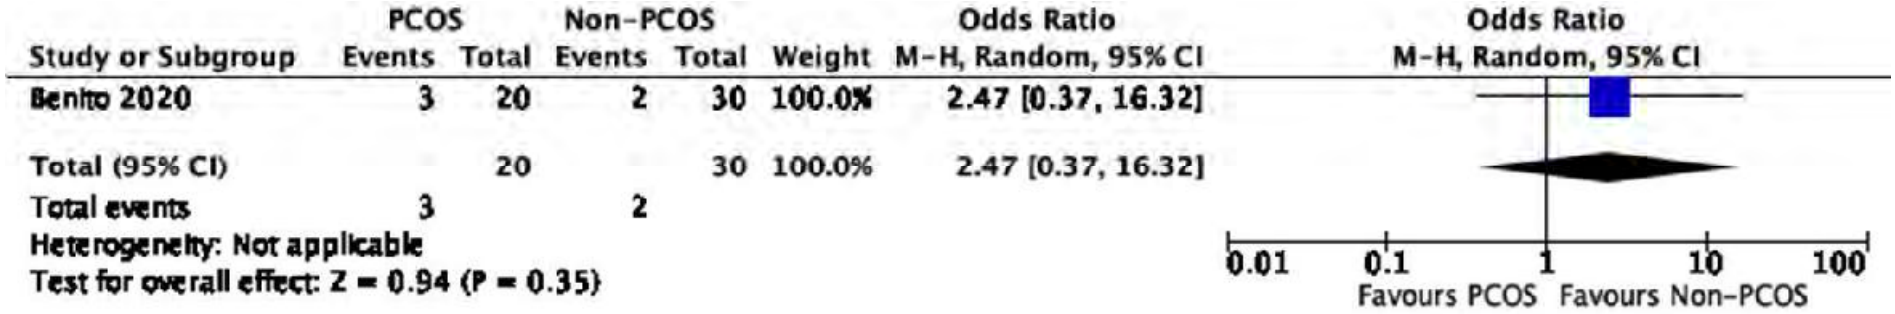
OUTCOME 3.7. Miscarriage Rate

3.7.1. Individual Study Data Table

OUTCOME: Miscarriage rate				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group***	**N events in control / comparison group**	**N total in control/ comparison group***	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	3	20	2	30	Crude	N/A

*N total includes all pregnancies

3.7.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Miscarriage Rate

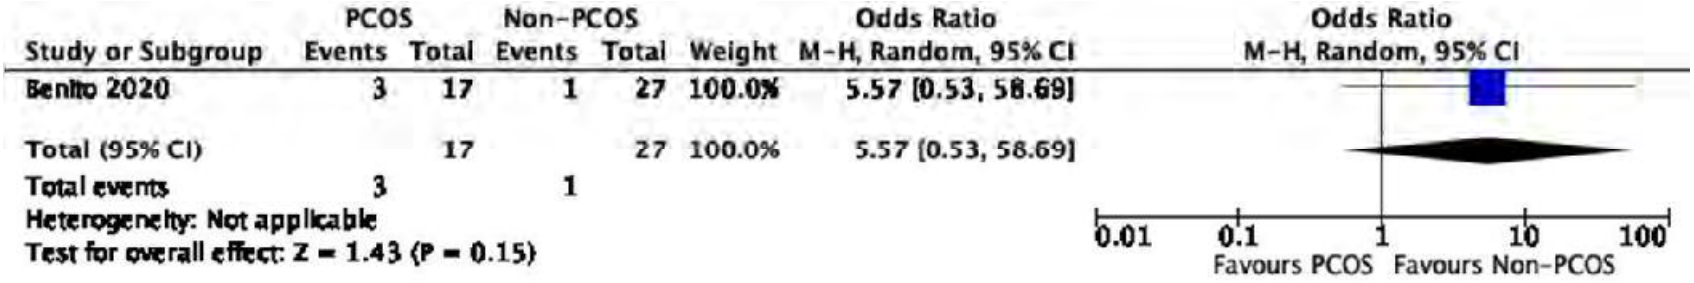


OUTCOME 3.8. Preterm Birth
3.8.1. Individual Study Data Table

OUTCOME: Preterm birth					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	3	17	1	27	Crude	N/A

*N total is the number of live births

3.8.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Preterm Birth



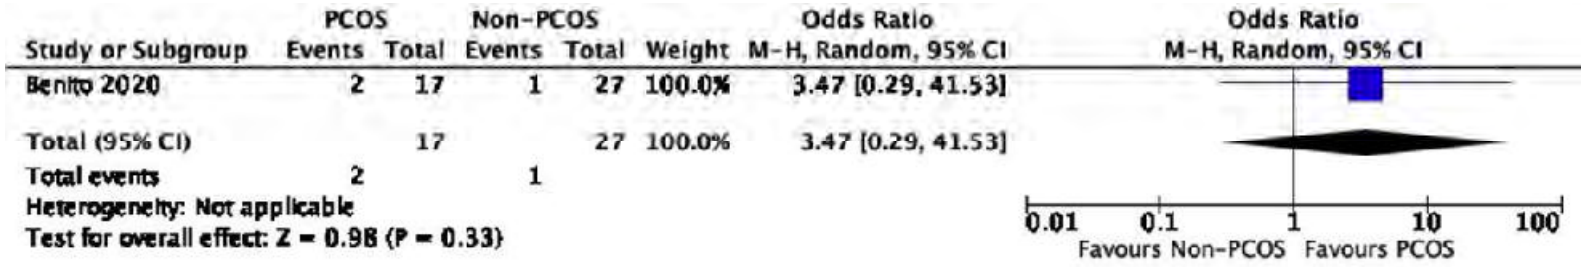
OUTCOME 3.9. Pre-eclampsia

3.9.1. Individual Study Data Table

OUTCOME: Pre-eclampsia					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	2	17	1	27	Crude	N/A

*N total is the number of live births

3.9.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Pre-Eclampsia

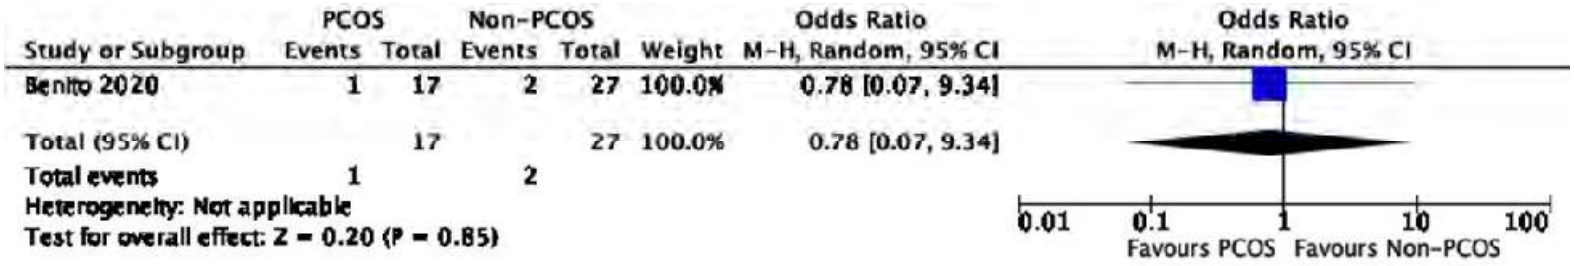


OUTCOME 3.10. Gestational Diabetes
3.10.1. Individual Study Data Table

OUTCOME: Gestational diabetes					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	1	17	2	27	Crude	N/A

*N total is the number of live births

3.10.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Gestational Diabetes



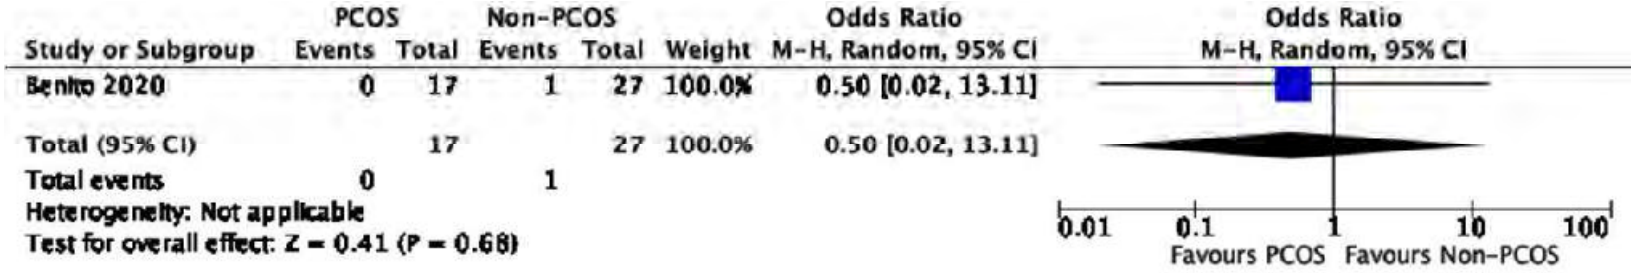
OUTCOME 3.11. Severe Iron Deficiency in Pregnancy

3.11.1. Individual Study Data Table

OUTCOME: Severe iron deficiency in pregnancy					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	0	17	1	27	Crude	N/A

*N total is the number of live births

3.11.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Severe Iron Deficiency in Pregnancy



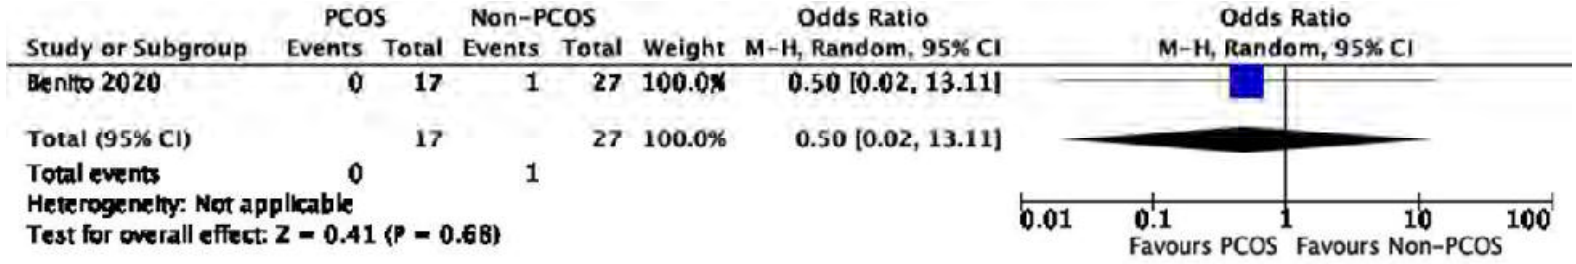
OUTCOME 3.12. Placenta Previa

3.12.1. Individual Study Data Table

OUTCOME: Placenta previa					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	0	17	1	27	Crude	N/A

*N total is the number of live births

3.12.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Placenta Previa

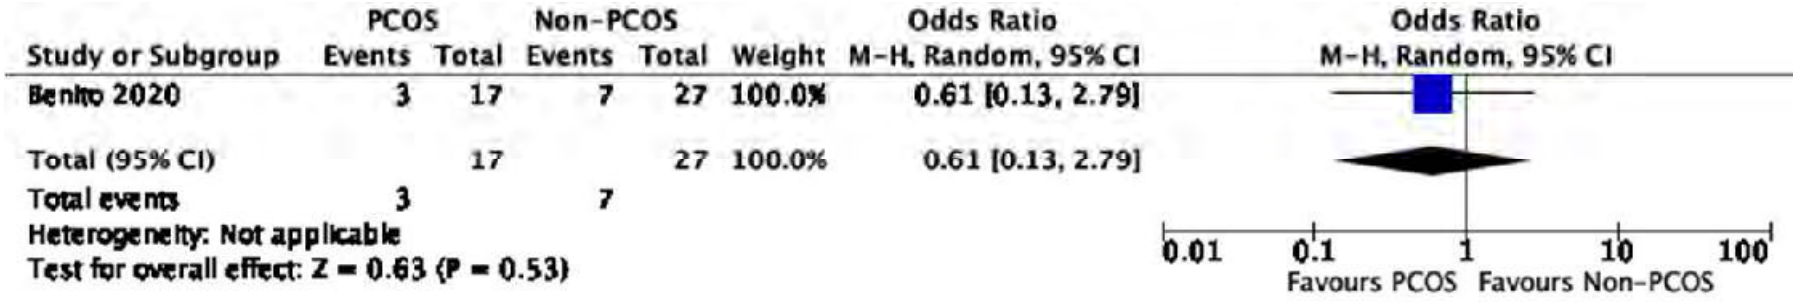


OUTCOME 3.13. Caesarean Section
3.13.1. Individual Study Data Table

OUTCOME: Caesarean section				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	3	17	7	27	Crude	N/A

*N total is the number of live births

3.13.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Caesarean Section



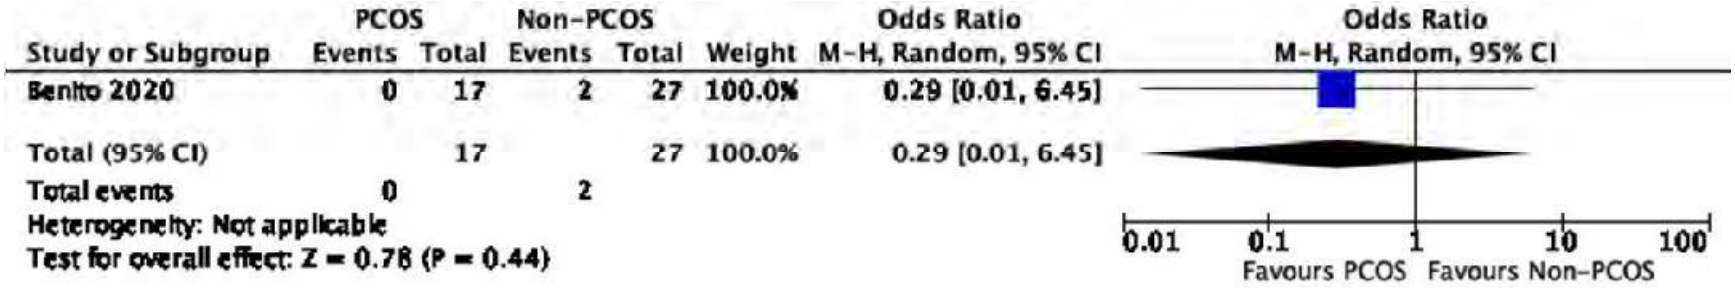
OUTCOME 3.14. Labour Induction

3.14.1. Individual Study Data Table

OUTCOME: Labour induction					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	0	17	2	27	Crude	N/A

*N total is the number of live births

3.14.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Labour Induction



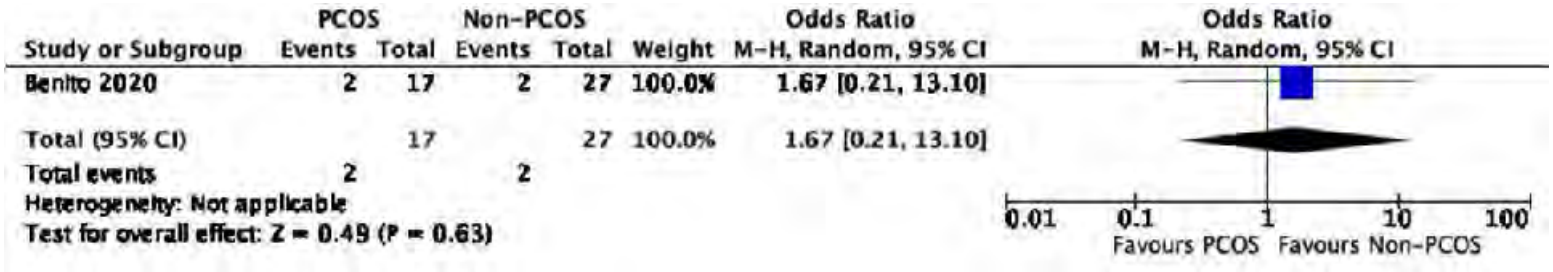
OUTCOME 3.15. Instrumental Delivery

3.15.1. Individual Study Data Table

OUTCOME: Instrumental delivery					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	2	17	2	27	Crude	N/A

*N total is the number of live births

3.15.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Instrumental Delivery



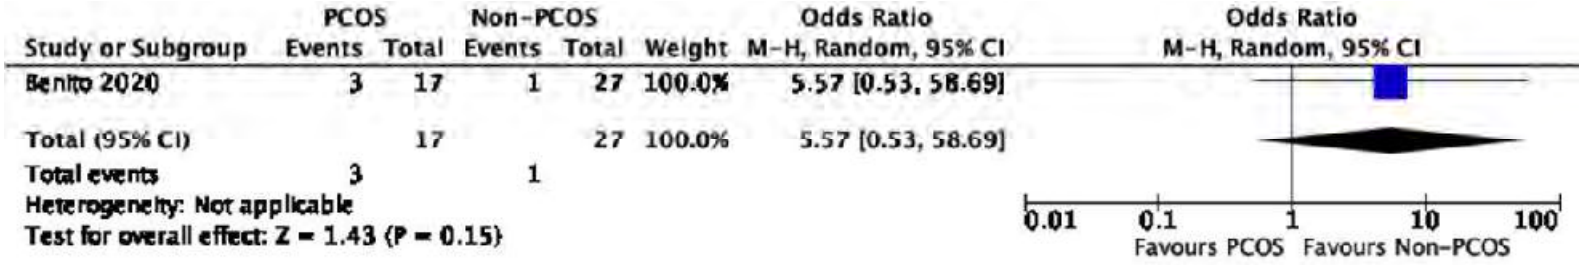
OUTCOME 3.16. Low Birth Weight

3.16.1. Individual Study Data Table

OUTCOME: Low birth weight				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	3	17	1	27	Crude	N/A

*N total is the number of live births

3.16.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Low Birth Weight



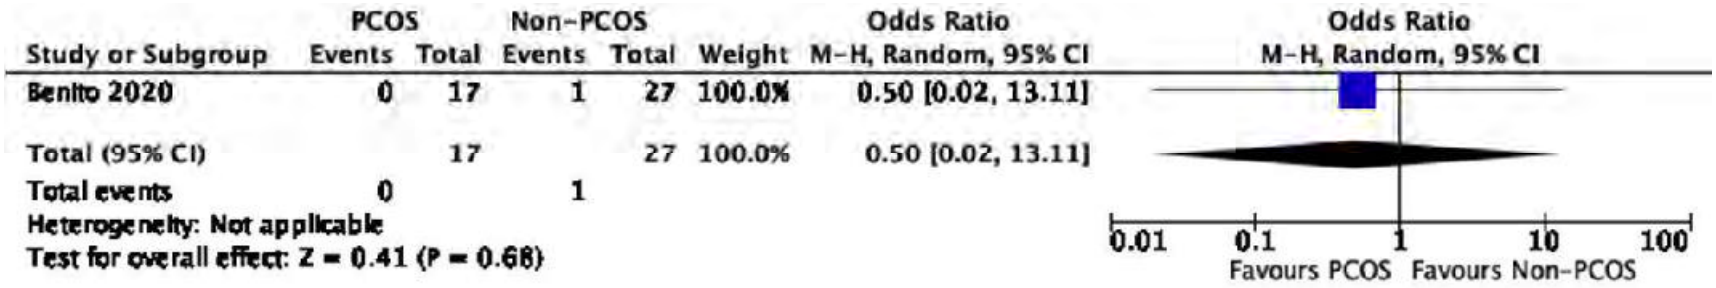
OUTCOME 3.17. Chromosomal Abnormalities

3.17.1. Individual Study Data Table

OUTCOME: Chromosomal abnormalities					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	20	49	30	120	Crude	N/A

*N total is the number of live births

3.17.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Chromosomal Abnormalities



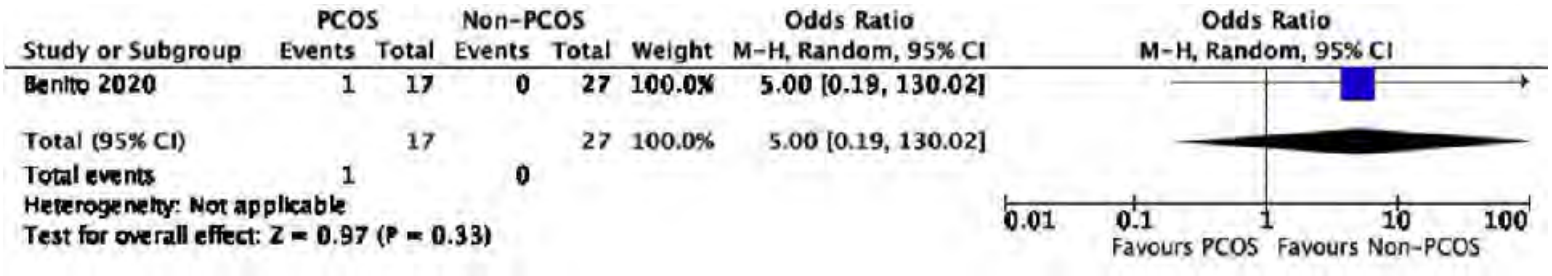
OUTCOME 3.18. Congenital Malformations

3.18.1. Individual Study Data Table

OUTCOME: Congenital malformations				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	20	49	30	120	Crude	N/A

*N total is the number of live births

3.18.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Congenital Malformations



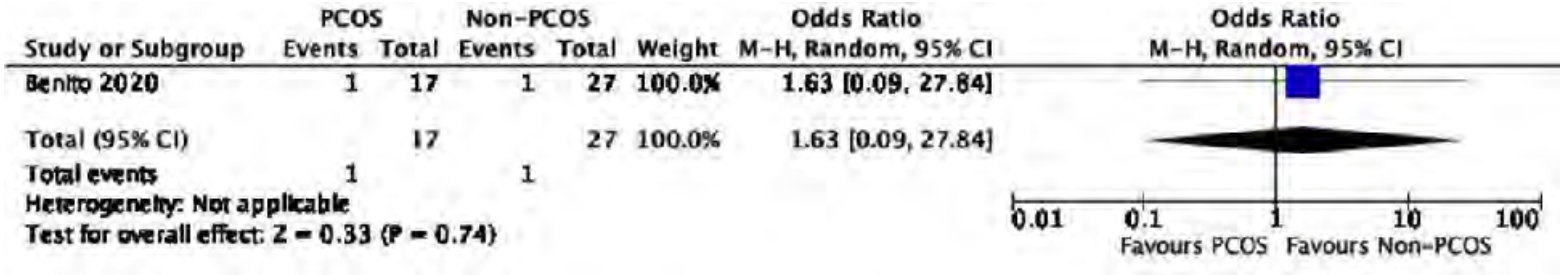
OUTCOME 3.19. Neonatal Jaundice

3.19.1. Individual Study Data Table

OUTCOME: Neonatal jaundice					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	1	17	1	27	Crude	N/A

*N total is the number of live births

3.19.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Neonatal Jaundice



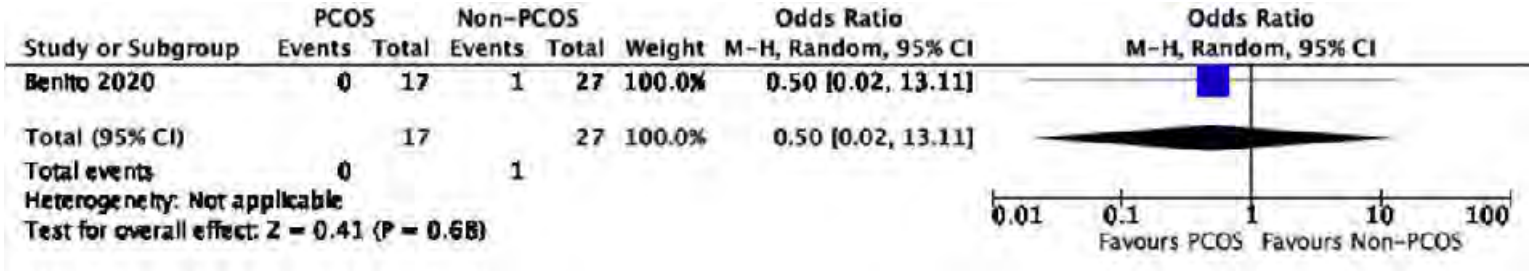
OUTCOME 3.20. Neonatal Hypoglycemia

3.20.1. Individual Study Data Table

OUTCOME: Neonatal hypoglycemia				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Benito et al. 2020	Count	Investigator	0	17	1	27	Crude	N/A

*N total is the number of live births

3.20.2. Forest Plot for Included Study Comparing Bariatric Surgery in Women With and Without PCOS for Neonatal Hypoglycemia



OUTCOME 3.21. Neonatal Hypotonia

3.21.1. Individual Study Data Table

OUTCOME: Neonatal hypotonia					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): PCOS vs non-PCOS								
Author, year	**Unit of outcome**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**

APPENDIX. STUDY CHARACTERISTICS AND QUALITY APPRAISAL

Study ID	Abiad 2018	
Study Citation	Abiad, F., Khalife, D., Safadi, B., Alami, R., Awwad, J., Khalifeh, F., & Ghazeeri, G. (2018). The effect of bariatric surgery on inflammatory markers in women with polycystic ovarian syndrome. *Diabetes and Metabolic Syndrome: Clinical Research and Reviews*, 12(6), 999-1005. https://dx.doi.org/10.1016/j.dsx.2018.06.013	
Study Country	Lebanon	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Females with obesity and PCOS presenting to the bariatric surgery unit	
PCOS diagnostic criteria	Rotterdam	
N per group	PCOS – 6 Non-PCOS - 16	
Setting	University Hospital	
Intervention/ indicator	Sleeve gastrectomy	
Comparison/ Control	Females with obesity who did not have a diagnosis of PCOS presenting to the bariatric surgery unit	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: Change in inflammatory markers (CRP and adiponectin) and anthropometric measurements after bariatric surgery Secondary: Rate of improvement in these parameters; correlation between change in CRP, adiponectin and metabolic profile after weight loss via sleeve gastrectomy	
Inclusion criteria reported?	Yes	Female Age 18-45 Eligible for sleeve gastrectomy surgery for management of obesity
Exclusion criteria reported?	Yes	Exclusion criteria were: pregnancy, BMI <40, Hx of cancer or liver disease, Hx of previous bariatric surgery, tying to conceive.
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Yes
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Were the outcomes measured appropriate?	Yes Partial No Not reported	Yes

Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		16 women without PCOS and 6 with PCOS underwent sleeve gastrectomy. At 12-months follow up, both groups lost >30% BW (36.28% PCOS and 33.04% non-PCOS).	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Yes
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes All anthropometrical measurements were made by the same trained staff.
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**		3/19 were lost from the control group at 6 months; 0/6 from the PCOS group. It appears more were lost to follow up that are not reported according to the limitations but this is not clear.
	What percentage of the individuals were	Not reported	As above

	not included in the analysis?		
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported.
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported – No report of a power calculation and small sample size but significant differences were found
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		High	Few criteria have been fulfilled and the conclusions of the study are likely to be affected.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No All outcomes high risk of bias	

Study ID	Ahmed 2022	
Study Citation	Ahmed, B., Ammori, B.J., Akhtar, K., Senapati, S., New, J.P., & Syed, A.A. (2022). Weight loss and metabolic outcomes in women with or without polycystic ovarian syndrome after Roux-en-Y gastric bypass: A case-matched study. *The Surgeon: Journal of the Royal Colleges of Surgeons of Edinburgh and Ireland*, 20(3), 137-141. https://dx.doi.org/10.1016/j.surge.2021.02.012	
Study Country	UK	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Women with PCOS undergoing gastric bypass surgery	
PCOS diagnostic criteria	Rotterdam	
N per group	PCOS - 30 Non-PCOS - 60	
Setting	University Hospital	
Intervention/ indicator	Roux-en-Y gastric bypass surgery	
Comparison/ Control	Women without PCOS undergoing gastric bypass surgery	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: post-operative weight loss as measured by percent total weight loss or percent excess BMI loss at 12 and 24 months following gastric bypass Secondary: A1C, remission in DM, BP, remission in hypertension, OSA remission	
Inclusion criteria reported?	Yes	Patients who underwent primary RYGB
Exclusion criteria reported?	Yes	Patients who had single anastomosis gastric bypass or revisional surgery
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Yes

Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Were the outcomes measured appropriate?	Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Yes
Was matching performed?	Yes Partial No Not reported	Yes Age (+/- 5 years) Preoperative BMI (+/- 5 kg/m2) Presence of T2DM
Summary of Result/s	Women with and without PCOS had similar reduction in %TWL as well as improvement in A1C, resolution of OSA and improvement in blood pressure.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Other than the exposure under investigation, were the groups selected from similar populations?**	Yes	Yes
SELECTION BIAS – **Was the exposed cohort truly representative?**	Yes Partial No Not reported	Yes
SELECTION BIAS – **Is it clear that the outcome of interest was not present at the start of study?**	Yes Partial No Not reported	Yes

PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Not reported. There is no information about how these data were collected.
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**		83.3% follow up rate (does not specify difference in dropout rate between the groups) 6/30 lost to follow-up in 1st 12 months from PCOS group; 9/60 from non-PCOS.
	What percentage of the individuals were not included in the analysis?		20% in PCOS group, 15% in non-PCOS
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported.

CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported – No report of a power calculation and small sample size but significant differences were found
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		High	Few criteria have been fulfilled and the conclusions of the study are likely to be affected.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No All outcomes high risk of bias	

Study ID	Benito 2020
Study Citation	Benito, E., Gomez-Martin, J.M., Vega-Pinero, B., Priego, P., Galindo, J., Escobar-Morreale, H.F., & Botella-Carretero, J.I. (2020). Fertility and pregnancy outcomes in women with polycystic ovary syndrome following bariatric surgery. *Journal of Clinical Endocrinology and Metabolism*, 105(9), E3384-E3391. https://dx.doi.org/10.1210/clinem/dgaa439
Study Country	Spain
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Premenopausal women with PCOS presenting for bariatric surgery
PCOS diagnostic criteria	NIH

N per group	PCOS - 49 Non-PCOS - 120	
Setting	University Hospital	
Intervention/ indicator	Bariatric surgery	
Comparison/ Control	Premenopausal women without PCOS presenting for bariatric surgery	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Fertility and pregnancy outcomes (investigator reported)	
Inclusion criteria reported?	Yes Partial No Not reported	Not reported.
Exclusion criteria reported?	Yes Partial No Not reported	Not reported.
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Yes
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Not reported
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Not reported
Were the outcomes measured appropriate?	Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Yes
Was matching performed?	Yes Partial No Not reported	No
Summary of Result/s	In women seeking fertility, pregnancy and live birth rates were higher among women with PCOS than without PCOS. The time to achieve the first pregnancy after surgery was similar between groups, as were maternal and neonatal complications.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Yes
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial Some outcomes were measured at sites outside of the original study centre, therefore it is not clear if these were standardized.
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Partial Some outcomes were measured at sites outside of the original study centre, therefore it is not clear if these were standardized.
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**		Full data for 49 women with PCOS and 120 women without PCOS.
	What percentage of the individuals were not included in the analysis?		Only women with complete data were included in the study and analysis.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported.
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported – No report of a power calculation and small sample size but significant differences were found
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		High	Few criteria have been fulfilled and the conclusions of the study are likely to be affected.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No All outcomes high risk of bias	

Study ID	Bhandari 2016	
Study Citation	Bhandari, S., Ganguly, I., Bhandari, M., Agarwal, P., Singh, A., Gupta, N., & Mishra, A. (2016). Effect of sleeve gastrectomy bariatric surgery-induced weight loss on serum AMH levels in reproductive aged women. *Gynecological Endocrinology*, 32(10), 799-802. https://dx.doi.org/10.3109/09513590.2016.1169267	
Study Country	India	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Females aged between 20 and 35 years with PCOS and BMI >35 kg/m2 undergoing sleeve gastrectomy	
PCOS diagnostic criteria	Rotterdam	
N per group	PCOS – 43 Non-PCOS - 32	
Setting	Tertiary Care Hospital	
Intervention/ indicator	Bariatric surgery (sleeve gastrectomy)	
Comparison/ Control	Females aged between 20 and 35 years and BMI >35 kg/m2 undergoing sleeve gastrectomy without PCOS	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: change in AMH level Secondary: change in weight, BMI, and menstrual cycle regularity	
Inclusion criteria reported?	Yes Partial No Not reported	Yes. Surgery between 2012 and 2015 Age 20-35 Female BMI >35 Premenopausal with intact uterus and ovaries
Exclusion criteria reported?	Yes	Yes.

		Partial No Not reported	Hormonal treatment Fertility drugs Systemic disease (e.g., hypothyroidism, hyperprolactinemia) Did not report for follow up Had a surgical complication
Does the study have a clearly focused question?		Yes Partial No Not reported	Yes
Is a cohort study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Does the study have specified inclusion/ exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial. Participants with surgical complications or who did not report for follow up were excluded from the study/analysis.
Were the outcomes measured appropriate?		Yes Partial No Not reported	Partial.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	No. Only 6 months of follow-up
Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		There was a statistically significant change in AMH and normalization of menstrual irregularity with bariatric surgery in women with and without PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes Partial No Not reported	Partial. Unclear. No baseline demographics aside from age, BMI and weight.
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Yes
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes

PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**		Not reported.
	What percentage of the individuals were not included in the analysis?		Outcomes were reported for all of the participants included in the study.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported.
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported – No report of a power calculation and small sample size but significant differences were found
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			

What is the overall risk of bias?	High	Few criteria have been fulfilled and the conclusions of the study are likely to be affected.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	No All outcomes high risk of bias	

Study ID	Buyukkaba 2021	
Study Citation	Buyukkaba, M., Turgut, S., Ilhan, M. M., Ekinci, I., Yayllm, I., Zeybek, S. U., Turan, S., Tasan, E., & Karaman, O. (2021). Anti-Mullerian Hormone Levels Increase after Bariatric Surgery in Obese Female Patients with and Without Polycystic Ovary Syndrome. *Hormone and Metabolic Research,* 54(3), 194-198. https://dx.doi.org/10.1055/a-1756-4798	
Study Country	Turkey	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Females with obesity and PCOS of reproductive age	
PCOS diagnostic criteria	Rotterdam	
N per group	PCOS – 23 Bon-PCOS – 47	
Setting	University Hospital	
Intervention/ indicator	Metabolic surgery - 62 laparoscopic sleeve gastrectomy, 8 Roux-en-Y gastric bypass	
Comparison/ Control	Females with obesity of reproductive age without PCOS	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: the effect of weight loss on AMH levels after bariatric surgery	
Inclusion criteria reported?	Yes Partial No Not reported	Yes. Age 18-39 Undergoing bariatric surgery
Exclusion criteria reported?	Yes Partial No Not reported	Yes. Hormonal replacement use Fertility treatment use (e.g., oral contraceptives) Systemic disease - overt DM, hypothyroidism Menopausal status
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes This study aimed to investigate the effect of weight loss after bariatric surgery on AMH levels in morbidly obese female patients with and without PCOS in the reproductive age group.
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Yes
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes.
Were the outcomes measured appropriate?	Yes Partial No Not reported	Yes.

Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	No. Only 6 months of follow-up
Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		AMH increased following bariatric surgery in women with and without PCOS with no significant difference between groups.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes Partial No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No Small sample size
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFOR MANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Not reported
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**		22/92 participants did not complete the six-month follow up. They were excluded from the study.
	What percentage of the individuals were		Only individuals who completed the six-month follow-up were included in this study.

	not included in the analysis?		
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported.
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported – No report of a power calculation and small sample size but significant differences were found
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		High	Few criteria have been fulfilled and the conclusions of the study are likely to be affected.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No All outcomes high risk of bias	

Study ID	Cai 2021	
Study Citation	Cai, M., Gao, J., Du, L., Cheng, X., Zhou, D., Zhu, J., Qu, S., & Zhang, M. (2021). The Changes in Body Composition in Obese Patients with Polycystic Ovary Syndrome After Laparoscopic Sleeve Gastrectomy: A 12-Month Follow-Up. *Obesity Surgery*, 31(9), 4055-4063. https://dx.doi.org/10.1007/s11695-021-05496-6	
Study Country	China	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Females with obesity and PCOS between the ages of 18 and 45 years who underwent LSG from May. 2013-Sept 202 at the Shanghai Tenth People's Hospital	
PCOS diagnostic criteria	Rotterdam	
N per group	PCOS – 83 Non-PCOS - 70	
Setting	University Hospital	
Intervention/ indicator	Laparoscopic sleeve gastrectomy	
Comparison/ Control	Females with obesity without PCOS between the ages of 18 and 45 years who underwent LSG from May. 2013-Sept 202 at the Shanghai Tenth People's Hospital	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: Body composition Secondary: Metabolic outcomes	
Inclusion criteria reported?	Yes Partial No Not reported	Yes.
Exclusion criteria reported?	Yes Partial No Not reported	Yes. Age <18, Age >45, Secondary obesity due to endocrine disorders, severe hepatic, renal dysfunction, and/or heart failure, mental illnesses that caused ability to provide informed consent.
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes - the aim was to investigate the effect of LSG on body fat distribution in premenopausal PCOS patients with obesity over a period of 12 months and explore the predictive factors for their body compositions after LSG
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Yes
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes.
Were the outcomes measured appropriate?	Yes Partial No Not reported	Yes.

Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	No. Due to attrition, very few were followed for an extended length of time.
Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		Both women with and without PCOS had improvements in body composition following LSG.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes Partial No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No Difficult to say. Attrition rate is high.
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFOR MANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Not reported
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**		At three months, only. 48/83 in the PCOS group and 26/70 in the non-PCOS group were seen in follow up. This number decreased at 6 and 12 months.
	What percentage of the individuals were		Only those that participated in the follow up visit were included in the analysis

	not included in the analysis?		
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported.
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported – No report of a power calculation and small sample size but significant differences were found
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		High	Few criteria have been fulfilled and the conclusions of the study are likely to be affected.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No All outcomes high risk of bias	

Study ID	Casals et al., 2021
Study Citation	Casals, G., Andreu, A., Barral, Y., Ventosa, S., Redondo, M., Torres, F., Ibarzabal, A., Manau, D., Carmona, F., Vidal, J., & Flores, L. (2021). Bariatric Surgery on Reproductive Outcomes: the Impact According to the Diagnosis of Polycystic Ovarian Syndrome and Surgical Procedures. *Obesity Surgery,* 31(6), 2590-2598. https://dx.doi.org/10.1007/s11695-021-05297-x
Study Country	Spain
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Women with PCOS according to the 2003 Rotterdam criteria between the ages of 18-39 years who had bariatric surgery between January 2005 and December 2010
Control population	Women without PCOS according to the 2003 Rotterdam criteria between the ages of 18-39 years who had bariatric surgery between January 2005 and December 2010
PCOS diagnostic criteria	Rotterdam 2003
N per group	PCOS – 43 Non-PCOS - 165
Setting	University hospital

Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		Reproductive outcomes (self-reported) - menstrual regularity, time to pregnancy, pregnancy, miscarriage, live birth Anthropometric outcomes (self-reported) - weight, BMI	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes. Women age 18-39 who underwent bariatric surgery from Jan 2005 to Dec 2010
Exclusion criteria		Yes Partial No Not reported	Not reported.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial. Only inclusion criteria reported
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	No.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes.
Was matching performed?		Yes Partial No Not reported	No.
Summary Result/s		There was an improvement in menstrual regularity and some perinatal outcomes following bariatric surgery, but there was no change in fertility observed following bariatric surgery.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFOR MANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes

DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Partial. Participants in the phone interview were asked to recall these outcomes a variable amount of time after bariatric surgery
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial because of nature of study
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial because of nature of study
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not relevant to cross-sectional study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported 217/298 women who had surgery during that time period responded to the phone survey - this data is not broken down by PCOS/non-PCOS
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Not reported
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No

GDG 4

Question 4.9.

In adults and adolescents with PCOS, is bariatric surgery effective for management of hormonal and clinical PCOS features and weight?

BACKGROUND:

Obesity is increasing in prevalence throughout the world (1). Depending on the dataset and ethnicity, 38-88% of women with PCOS are obese and have insulin resistance adversely affecting fertility and psychological health and increasing metabolic risks including type 2 diabetes mellitus and metabolic syndrome (2,3). Weight loss improves outcomes as previously outlined.

In class II (BMI 35-40 kg/m^2) and class III (≥40 kg/m2) obesity, lifestyle interventions are not durably effective, whereas bariatric/metabolic surgery has been demonstrated to provide substantial durable weight loss with accompanying improvement in health, well-being and longevity. (4)

The NICE guidelines (CG189) in the UK recommend surgery to aid weight loss for those with a class III obesity or class II obesity with other significant disease that would improve with weight loss (e.g. Type 2 diabetes or high blood pressure) when appropriate non-surgical measures have been tried (5) . Expedited referral for bariatric surgery assessment is recommended for those with class II or more obesity and a diagnosis of recent onset of Type 2 diabetes (i.e. in the last ten years) (5). They also recommend to consider referral for those with Class 1 obesity and recent onset of T2DM and to consider a lower threshold for referral in people of Asian backgrounds (5). Recent guidelines from the American Society for Metabolic and Bariatric Surgery and International Federation (ASMBS) for the Surgery of Obesity and Metabolic Disorders (IFSO) have lower thresholds recommending surgery for all those with a BMI $\geq$ 35kg/m2 and for surgery to be considered for those with a BMI between 30- 34.9 kg/m2 with associated metabolic co-morbidity (6). They also recommend adjusting thresholds for the Asian population such that those with a BMI $\geq$ 27.5kg/m2 are offered Bariatric/metabolic surgery (6).

Vertical Sleeve Gastrectomy (VSG)and Roux-en-Y gastric bypass (RYGB) are the most commonly performed type of weight loss surgery and are usually performed using minimally invasive surgical techniques. They are typically performed with low morbidity and mortality[3]. High quality RCTs of bariatric surgery versus medical management in DM2 show persistent benefits and superiority of weight loss and bariatric surgery in improvement or remission of diabetes, hypertension and dyslipidaemia (5-7).

The early onset of obesity in PCOS also sets challenges for weight managements as women at fertile age, pregnancies need to be taken into consideration when choosing the treatment modality. Women who undergo bariatric/metabolic surgery prior to pregnancy have improved ovulation and fertility and are less likely to experience comorbidities associated with obesity such as gestational diabetes and pregnancy induced hypertension. However, bariatric/metabolic surgery can cause nutrient deficiencies important for fetal development. This can contribute to an increased risk of adverse outcomes including perinatal mortality, pre-term birth and small for gestation age and this may vary with type of surgery (8,9).

Given the significant concerns of women with PCOS about weight, long term health and reproductive and pregnancy outcomes understanding the risks and benefits of metabolic and bariatric surgery is of importance for women and health professionals.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
o **Comparison 1.** Bariatric Surgery vs Medical Therapy	⨁◯◯◯ VERY LOW
o **Comparison 2**. Bariatric Surgery vs Conservative Management	⨁◯◯◯ VERY LOW
o **Comparison 3.** Bariatric Surgery Among Individuals with PCOS vs. Non-PCOS	⨁◯◯◯ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

1. **Bariatric Surgery compared with medical management**
2. **Bariatric Surgery vs Conservative Management**
3. **Bariatric Surgery PCOS vs non PCOS**

CONSENSUS RECOMMENDATION(S)

- **CR:** Bariatric/ metabolic surgery could be considered to improve weight loss, hypertension, diabetes (prevention and treatment), hirsutism, irregular menstrual cycles, ovulation and pregnancy rates in women with PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **CR:** Bariatric/ metabolic surgery in women with PCOS should be informed by general population guidelines.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **CR:** PCOS is a metabolic condition and could be considered an indication at a lower BMI threshold for bariatric/ metabolic surgery similarly to other metabolic conditions including diabetes.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **CR:** Women should be strongly counselled on the likelihood of rapid return of fertility and the need to commit to effective contraception, ideally prior to surgery. Even when pregnancy is desired, contraception should be

continued until a stable weight is achieved, usually after one year, to avoid significantly increased risk of growth restriction, prematurity, small for gestational age, pregnancy complications and prolonged hospitalisation of the infant.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT

(Cannot find this section in the recommendation document LP- 21/02/2023)

GRADE CONSIDERATIONS

Justifications:

1. Bariatric Surgery compared with medical treatment

There was only one non-randomized and non-blinded trial undertaken in women with PCOS and BMI>27.5kg/m2 or WC >85 cm) in China that compared laparoscopic sleeve gastrectomy to medical therapy (oral contraceptive pill (35mcg EE/2 mgCPA) for 6 months and (and metformin 12 months).

Outcomes were assessed at twelve months and the main outcome was return of regular cycles or pregnancy which is not a recommended outcome within 12 months of surgery.

At 12 months post treatment women in the surgical group had a greater improvement in anthropometric measures (weight, BMI, waist circumference, hip circumference, W/H), hormonal measures (total testosterone, free androgen index), metabolic measures (fasting glucose, fasting insulin, triglycerides, LDL-cholesterol, and haemoglobin A1C),

There was no assessment of adverse outcomes for either group

2. Bariatric Surgery/metabolic (GSR) vs Conservative Management (no GSR) in women with and without PCOS

There was only one prospective non-randomised study comparing gastric sleeve resection (GSR) to conservative management in women (BMI >40 kg/m2 or >35 kg/m2 with comorbidity) with and without PCOS. Main outcome was ovulation and-menstrual regularity. Other measures included weight loss and HOMA-IR.

Total weight loss was greatest in the first 3-4 months post GSR for both women with and without PCOS and plateaued afterwards. The proportion of total weight loss was significantly greater for GSR compared to controls for women with and without PCOS.

3. Bariatric/metabolic Surgery PCOS vs non PCOS

Nine studies compared bariatric/metabolic surgery in women with PCOS compared to women without PCOS. Eight studies reported on non-reproductive outcomes including anthropometric, metabolic, and hormonal outcomes. None of these were randomised controlled trials. The majority were surgical cohorts, one was a non-randomised study and one a cross sectional study with self-reported symptoms years after surgery.

For the non-reproductive outcomes, two or more studies provided data on most of the outcomes of interest and therefore meta-analyses were performed. There is low certainty in the results of these meta-analyses due to high risk of bias in each of the included studies.

There were improvements in women with and without PCOS across weight loss and metabolic markers such as lipids.

For women with PCOS: There was more improvement post bariatric/metabolic surgery in fasting glucose and BMI.

There was no significant difference between women with and without PCOS post bariatric/metabolic surgery in total weight loss, total testosterone, sex hormone binding globulin, AMH, total cholesterol, LDL, triglycerides, HDL.

Subgroup considerations: Whilst some women in the studies had comorbidities (e.g. T2DM), data for the subgroups were either not reported by PCOS status or were reported by resolution.
Implementation considerations: Bariatric surgery is often underfunded by payers, leaving the financial burden to individual patients and can be difficult to access to women globally. Often access to these surgeries is inequitable. Some general population guidelines recommend alternative BMI categories for Asian populations in general but this has not been addressed for women with PCOS.
Monitoring and evaluation considerations: Monitoring in individual and patient cohorts long-term is critical, including pregnancy and child outcomes.
Research priorities: Further research on bariatric surgery in PCOS is a strong priority by ethnicity Bariatric surgery compared to anti-obesity medication in PCOS Differences in outcomes by type of bariatric/metabolic surgical procedures Pre-conception and pregnancy requirements post bariatric/metabolic surgery Cost effectiveness studies Individual and patient cohorts long-term is critical, including psychological, pregnancy and child outcomes.

Table 4.2. Excluded Studies (on full text assessment)- *add more rows as needed*

Reference	Reason
Sagle, 1988	Study groups were women with and without recurrent miscarriage
Braat, 1989	They reported pooled pregnancy outcomes. There were 24 pregnancies in PCOS patients and 188 in non-PCOS which included hypoandrogenic, normoandrogenic, corpus luteum deficiency and uncertain diagnosis. The outcomes have been only reported among hypoandrogenic women (174) not the whole 188.
Homburg, 1989	There was no comparison between women with and without PCOS; it was just a comparison between women with and without polycystic ovary morphology
Balen, 1993	There was no comparison between women with and without PCOS; it was just a comparison between women with and without polycystic ovary morphology
Naether, 1994	All participants had PCOS and androgen levels were assessed before and after laparoscopic electrocautery of the ovarian surface (LEOS) among
Lanzone, 1995	Missing/Unacceptable PCOS diagnostic criteria
Kumar, 1997	Systematic review and meta-analysis

Liddell, 1997	Study groups were women with and without recurrent miscarriage and polycystic ovary morphology
Anttila, 1998	There was no comparison between women with and without PCOS; it was just a comparison between women with and without polycystic ovary morphology
de Vries, 1998	Missing/Unacceptable PCOS diagnostic criteria
Hirahara, 1998	There was no comparison between women with and without PCOS; it was just a comparison between women with and without recurrent miscarriage
Radon, 1999	Missing/Unacceptable PCOS diagnostic criteria
Rai, 2000	There was no comparison between women with and without PCOS; it was just a comparison between women with and without polycystic ovary morphology
Glueck, 2003	None of outcomes of interest have been reported
Mulders, 2003	There was no comparison between women with and without PCOS; it was just a comparison between women with and without anovulatory infertility
Urman, 2004	Systematic review
Bjercke, 2005	None of outcomes of interest have been reported
Boomsma, 2006	Systematic review and meta-analysis
Lo, 2006	Missing/Unacceptable PCOS diagnostic criteria
Turner, 2006	No comparison with healthy controls
Vanky, 2006	No comparison with healthy controls
Boomsma, 2008	Systematic review and meta-analysis
Buckett, 2008	Study groups were based on various ART treatment received for the current pregnancy
Kashanian, 2008	Comparison between women with and without GDM
Koivunen, 2008	Missing/Unacceptable PCOS diagnostic criteria
Thomann, 2008	None of outcomes of interest have been reported
Beydoun, 2009	Missing/Unacceptable PCOS diagnostic criteria
Bolton, 2009	Missing/Unacceptable PCOS diagnostic criteria
Jammah, 2009	No comparison with healthy controls
Palomba, 2009	Systematic review and meta-analysis
Sugiura-Ogasawara, 2009	Study groups were women with and without recurrent miscarriage
Toulis, 2009	Systematic review and meta-analysis
Aali, 2010	There was no comparison between women with and without PCOS; it was just a comparison between women with and without Preeclampsia
Alshammari, 2010	Missing/Unacceptable PCOS diagnostic criteria
Sun, 2010	No comparison with healthy control
Vanky, 2010	No comparison with healthy controls
Azizia, 2011	Systematic review
Han, 2011	Outcomes have been reported per cycle of infertility treatment not per pregnancy
Kjerulff, 2011	Systematic review and meta-analysis
Roos, 2011	Missing/Unacceptable PCOS diagnostic criteria
Aziz, 2012	Study protocol
Carlsen, 2012	No comparison with healthy controls
Khan, 2012	Systematic review
Kosus 2012	None of outcomes of interest have been reported
Oteng-Ntim, 2012	Systematic review and meta-analysis
Palomba, 2012	None of outcomes of interest have been reported
Galazis, 2013	Systematic review and meta-analysis
Hong, 2013	There was no comparison between women with and without PCOS; it was just a comparison between women with and without recurrent miscarriage
Lautatzis, 2013	Systematic review
Qin, 2013	Systematic review and meta-analysis
Rogenhofer, 2013	There was no comparison between women with and without PCOS; it was just a comparison between women with and without recurrent miscarriage
Zheng, 2013	Systematic review and meta-analysis
Banu, 2014	Only recurrent miscarriage has been assessed not miscarriage
De Frene, 2014	No comparison with healthy controls
Gaafar, 2014	None of outcomes of interest have been reported
Hart, 2014	None of outcomes of interest have been reported
Joham, 2014	Only pooled miscarriage and stillbirth has been reported and there are no outcomes of interest reported separately.

Joham, 2014	Missing/Unacceptable PCOS diagnostic criteria
West, 2014	Only cumulative incidence was reported
Zhuo, 2014	Systematic review and meta-analysis
Doherty, 2015	Missing/Unacceptable PCOS diagnostic criteria
Feng, 2015	Systematic review and meta-analysis
Hart, 2015	Outcomes have been reported per number of PCOS/non-PCOS patients not per pregnancy in PCOS/non-PCOS
Huang, 2015	Systematic review and meta-analysis
Lovvik, 2015	Missing/Unacceptable PCOS diagnostic criteria
Palomba, 2015	Systematic review
Pan, 2015	Missing/Unacceptable PCOS diagnostic criteria
Brunisholz, 2016	There was no comparison between women with and without PCOS; it was just a comparison between women with and without prediabetes
Li, 2016	No comparison with healthy controls
Provost, 2016	Study groups were based on BMI categories not PCOS status.
Rodino, 2016	None of outcomes of interest have been reported
Szafarowska, 2016	None of outcomes of interest have been reported
Tan, 2016	Systematic review and meta-analysis
Yu, 2016	Systematic review and meta-analysis
Zeng, 2016	Systematic review and meta-analysis

5. FINDINGS

Comparison: Women with PCOS versus controls

Outcomes included:

Outcome 1. Miscarriage

Outcome 2. Gestational diabetes

Outcome 3. Pregnancy-induced/gestational hypertension

Outcome 4. Pre-eclampsia

Outcome 5. Eclampsia

Outcome 6. Preterm birth

Outcome 7. Low birth weight

Outcome 8. Small for gestational age

Outcome 9. Macrosomia

Outcome 10. Large for gestational age

Outcome 11. Intrauterine growth restriction

Outcome 12. Instrumental delivery/Induction of labour

Outcome 13. Caesarean Section

Outcome 14. Perinatal depression

Outcome 15. Gestational weight gain

Outcome 16. Birthweight

Outcome 17. Body mass index

- ## EVIDENCE SUMMARY:

Miscarriage

Forty-three studies were included in the meta-analysis for miscarriage in women with and without PCOS. Twenty-one studies were prospective cohort studies and twenty-two were retrospective cohort studies. Thirty studies had high risk of bias, seven had moderate risk of bias and the remaining six had low risk of bias.

One study reported miscarriage in women who continue taking metformin during pregnancy and one study (Benito 2020) reported miscarriage in pregnancies post bariatric surgery. These were excluded from meta-analysis on a sensitivity analysis. Six studies matched women on the basis of BMI and seven matched on the basis of age. Twenty-nine studies reported miscarriage in post ART pregnancies.

Gestational diabetes

Fifty-seven studies were included in the meta-analysis for gestational diabetes in women with and without PCOS. Twenty-two studies were prospective cohort studies and thirty-five were

retrospective cohort studies. Thirty-four studies had high risk of bias, fifteen had moderate risk of bias and the remaining eight had low risk of bias.

Five studies reported gestational diabetes in women who continue taking metformin during pregnancy and one study (Benito 2020) reported gestational diabetes in pregnancies post bariatric surgery. These were excluded from meta-analysis on a sensitivity analysis. Seven studies matched women on the basis of BMI and fourteen matched on the basis of age. Nine studies reported gestational diabetes in post ART pregnancies.

Pregnancy-induced hypertension

Forty studies were included in the meta-analysis for pregnancy-induced hypertension in women with and without PCOS. Seventeen studies were prospective cohort studies and twenty-three were retrospective cohort studies. Twenty-one studies had high risk of bias, nine had moderate risk of bias and the remaining ten had low risk of bias.

Three studies reported pregnancy-induced hypertension in women who continue taking metformin during pregnancy. These were excluded from meta-analysis on a sensitivity analysis. Seven studies matched women on the basis of BMI and twelve matched on the basis of age. Ten studies reported pregnancy-induced hypertension in post ART pregnancies.

Pre-eclampsia

Thirty-six studies were included in the meta-analysis for pre-eclampsia in women with and without PCOS. Eighteen studies were prospective cohort studies and eighteen were retrospective cohort studies. Nineteen studies had high risk of bias, eleven had moderate risk of bias and the remaining six had low risk of bias.

Two studies reported pre-eclampsia in women who continue taking metformin during pregnancy and one study (Benito 2020) reported pre-eclampsia in pregnancies post bariatric surgery. These were excluded from meta-analysis on a sensitivity analysis. Seven studies matched women on the basis of BMI and ten matched on the basis of age. Two studies reported pre-eclampsia in post ART pregnancies.

Eclampsia

Two studies reported eclampsia in women with and without PCOS. One study (Hu 2007) had no women affected by eclampsia; therefore one study (Wan 2015) with retrospective cohort design was included in the meta-analysis for eclampsia. The study had moderate risk of bias.

In this study women were not taking metformin during pregnancy. It matched women on the basis of age and reported eclampsia in post ART pregnancies.

Preterm birth

Fifty-five studies reported preterm birth in women with and without PCOS. One study (Dmitrovic 2011) had no infant born premature; therefore fifty-four studies were included in the meta-analysis. Twenty-one studies were prospective cohort studies and thirty-five were retrospective cohort

studies. Thirty-six studies had high risk of bias, nine had moderate risk of bias and the remaining nine had low risk of bias.

Four studies reported preterm birth in women who continue taking metformin during pregnancy and one study (Benito 2020) reported preterm birth in pregnancies post bariatric surgery. These were excluded from meta-analysis on a sensitivity analysis. Nine studies matched women on the basis of BMI and twelve matched on the basis of age. Fourteen studies reported preterm birth in post ART pregnancies.

Low birth weight

Fifteen studies were included in the meta-analysis for low birth weight in women with and without PCOS. Two studies were prospective cohort studies and thirteen were retrospective cohort studies. Ten studies had high risk of bias, four had moderate risk of bias and the remaining one had low risk of bias.

In these studies women were not taking metformin during pregnancy but one study (Benito 2020) reported low birth weight in pregnancies post bariatric surgery. This study was excluded from meta-analysis on a sensitivity analysis. There were no studies reporting low birth weight in BMI/age matched women. Seven studies reported low birth weight in post ART pregnancies.

Small for gestational age

Twenty-six studies reported small for gestational age in women with and without PCOS. One study (Dmitrovic 2011) had no infant born small for gestational age; therefore twenty-five were included in the meta-analysis for small for gestational age. Twelve studies were prospective cohort studies and thirteen were retrospective cohort studies. Fifteen studies had high risk of bias, six had moderate risk of bias and the remaining four had low risk of bias.

One study reported small for gestational age in women who continued taking metformin during pregnancy. This study was excluded from meta-analysis on a sensitivity analysis. Six studies matched women on the basis of BMI and six matched on the basis of age. Five studies reported small for gestational age in post ART pregnancies.

Macrosomia

Twenty-three studies were included in the meta-analysis for macrosomia in women with and without PCOS. Six studies were prospective cohort studies and seventeen were retrospective cohort studies. Sixteen studies had high risk of bias, four had moderate risk of bias and the remaining three had low risk of bias.

One study reported macrosomia in women who continue taking metformin during pregnancy. This study was excluded from meta-analysis on a sensitivity analysis. Two studies matched women on the basis of BMI and two matched on the basis of age. Six studies reported macrosomia in post ART pregnancies.

Large for gestational age

Twenty-five studies reported large for gestational age in women with and without PCOS. Two studies (Dmitrovic 2011 and Foroozanfard 2020) had no infant born large for gestational age; therefore twenty-three studies were included in the meta-analysis for large for gestational age.

Thirteen studies were prospective cohort studies and ten were retrospective cohort studies. Fourteen studies had high risk of bias, five had moderate risk of bias and the remaining four had low risk of bias.

One study reported large for gestational age in women who continued taking metformin during. This study was excluded from meta-analysis on a sensitivity analysis. Five studies matched women on the basis of BMI and five matched on the basis of age. Two studies reported large for gestational age in post ART pregnancies.

Intrauterine growth restriction

Twelve studies reported intrauterine growth restriction in women with and without PCOS. Two studies (Elkholi 2014 and Foroozanfard 2020) had no infant born large for gestational age; therefore ten studies were included in the meta-analysis for intrauterine growth restriction.

Four studies were prospective cohort studies and six were retrospective cohort studies. Five studies had high risk of bias, two had moderate risk of bias and the remaining three had low risk of bias.

In these studies women were not taking metformin during pregnancy. Three studies matched women on the basis of BMI and four matched on the basis of age. One study reported intrauterine growth restriction in post ART pregnancies.

Instrumental delivery

Ten studies were included in the meta-analysis for instrumental delivery in women with and without PCOS. Six studies were prospective cohort studies and four were retrospective cohort studies. Five studies had high risk of bias, two had moderate risk of bias and the remaining three had low risk of bias.

One study (Benito 2020) reported instrumental delivery in pregnancies post bariatric surgery. This study was excluded from meta-analysis on a sensitivity analysis. Four studies matched women on the basis of BMI and four matched on the basis of age. No studies reported instrumental delivery in post ART pregnancies.

Induction of labour

Eight studies were included in the meta-analysis for induction of labour in women with and without PCOS. Six studies were prospective cohort studies and two were retrospective cohort studies. Five studies had high risk of bias, two had moderate risk of bias and the remaining one had low risk of bias.

One study (Benito 2020) reported instrumental delivery in pregnancies post bariatric surgery. This study was excluded from meta-analysis on a sensitivity analysis. One study matched women on the basis of BMI and one matched on the basis of age. No studies reported instrumental delivery in post ART pregnancies.

Caesarean section

Thirty-seven studies were included in the meta-analysis for caesarean section in women with and without PCOS. Sixteen studies were prospective cohort studies and twenty-one were retrospective cohort studies. Twenty-three studies had high risk of bias, seven had moderate risk of bias and the remaining seven had low risk of bias.

One study reported miscarriage in women who continue taking metformin during pregnancy and one study (Benito 2020) reported caesarean section in pregnancies post bariatric surgery. These were excluded from meta-analysis on a sensitivity analysis. Six studies matched women on the basis of BMI and nine matched on the basis of age. Seven studies reported caesarean section in post ART pregnancies.

Perinatal depression

Only one retrospective cohort study with moderate risk of bias was included in the meta-analysis for perinatal depression in women with and without PCOS.

In this study women were not taking metformin during pregnancy. Women were not matched on the basis of BMI/age and were not recruited of post ART pregnancies.

Gestational weight gain

Sixteen studies were included in the meta-analysis for gestational weight gain in women with and without PCOS. Six studies were prospective cohort studies and ten were retrospective cohort studies. Eight studies had high risk of bias, five had moderate risk of bias and the remaining three had low risk of bias.

In these studies women were not taking metformin during pregnancy. Four studies matched women on the basis of BMI and seven matched on the basis of age. One study reported gestational weight gain in post ART pregnancies.

Birthweight

Forty-five studies were included in the meta-analysis for birthweight in women with and without PCOS. Eighteen studies were prospective cohort studies and twenty-seven were retrospective cohort studies. Twenty-six studies had high risk of bias, twelve had moderate risk of bias and the remaining seven had low risk of bias.

Four studies reported birthweight in women who continue taking metformin during pregnancy and one study (Benito 2020) reported birthweight in pregnancies post bariatric surgery. These were excluded from meta-analysis on a sensitivity analysis. Ten studies matched women on the basis of BMI and thirteen matched on the basis of age. Seven studies reported birthweight in post ART pregnancies.

Body mass index

Sixty-two studies were included in the meta-analysis for body mass index in women with and without PCOS. Twenty-one studies were prospective cohort studies and forty-one were retrospective cohort studies. Thirty-four studies had high risk of bias, eighteen had moderate risk of bias and the remaining ten had low risk of bias.

Three studies reported body mass index in women who continue taking metformin during pregnancy and one study (Benito 2020) reported body mass index in pregnancies post bariatric surgery. These were excluded from meta-analysis on a sensitivity analysis. Twelve studies matched women on the basis of BMI and sixteen matched on the basis of age. Seventeen studies reported body mass index in post ART pregnancies.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

On pooled and sensitivity meta-analyses, women with PCOS had significantly higher odds of miscarriage, gestational diabetes, gestational hypertension, pre-eclampsia, preterm birth, low birth weight, intrauterine growth restriction, and caesarean section; and also women with PCOS had significantly higher gestational weight gain, and body mass index but had significantly lower birthweight. Eclampsia, small for gestational age, macrosomia, large for gestational age, instrumental delivery and perinatal depression were similar in women with and without PCOS, on both pooled and sensitivity meta-analyses. Induction of labour was similar on pooled meta-analysis but higher in women with PCOS on sensitivity meta-analysis.

On subgroup analyses, in BMI matched studies significantly higher odds of miscarriage, gestational diabetes, gestational hypertension, pre-eclampsia, and caesarean section, and also significantly lower birthweight were retained in women with PCOS. Small for gestational age turned to be significantly higher in women with PCOS.

On subgroup analyses, in age matched studies significantly higher odds of miscarriage, gestational diabetes, gestational hypertension, pre-eclampsia, preterm birth, and caesarean section, and also significantly lower birthweight were retained in women with PCOS. Small for gestational age turned to be significantly higher in women with PCOS.

On subgroup analyses, in post ART pregnancies significantly higher odds of miscarriage, gestational diabetes, gestational hypertension, pre-eclampsia, preterm birth, low birth weight, and also significantly higher body mass index were retained in women with PCOS. Small for gestational age turned to be significantly higher in women with PCOS.

On subgroup analyses, in high quality studies significantly higher odds of miscarriage, gestational diabetes, gestational hypertension, pre-eclampsia, preterm birth, and caesarean section, and also significantly lower birthweight were retained in women with PCOS. Small for gestational age turned to be significantly higher in women with PCOS.

Outcome	N. studies	Effect size [95% CI]	P Value	I^2
Miscarriage	43	OR 1.50 [1.20, 1.87]	**<0.001**	83.2%

6. STUDY CHARACTERISTICS TABLE

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	RoB
Diamant 1982, Israel	Women with and without PCOS / Note stated	Observational	PCOS: 70 Non-PCOS: 2071	Two or more of the following: hirsutism, oligomenorrhea, anovulation, elevated level of either serum Testosterone or urinary KS +PCOM	Anovulatory Non-PCOS/Non- PCOS with Spontaneous Pregnancy	NA	PE, BW, Instrumental delivery, CS	After induction of ovulation, in infertile women are accompanied by an increased incidence of PET. This was suggested as early as 20 yr ago by Stallworthy (1960). However, according to our results, the rate of PET differs significantly between the PC0 and A-NPCO patients. While the incidence of PET in A-NPCO group was only slightly elevated as compared to the normal control group, and even lower than in the control primipara group, PC0 women developed PET in more than 28% of the cases. This rate was almost 12 times higher than in the normal control group and more than 2.5 times higher than in the control primiparae.	High ROB
Levran 1990, Israel	Women with and without PCOS / Infertility treatment centre for PCOS, Outpatient clinic for Non-PCOS	Observational	PCOS: 76 Non-PCOS: 95	Anovulation with oligo/amenorrhea+obesity+hirsutism+PCOM	Normal menstrual pattern and spontaneous pregnancy	NA	GDM	GDM was higher in PCOS.	High ROB
Wortsman 1991, USA	Women with and without PCOS / e endocrine/gynaecology services	Observational	PCOS: 53 Non-PCOS: 2306	Menstrual irregularities, Hirsutism and/or infertility from ovulatory dysfunction and the presence of a biochemical profile showing serum LH levels≥25 mIU/m, LH/FSH ratio≥2 and/or elevated serum concentrations of the androgens testosterone, free testosterone, androstenedione and deydroepiandrosterone sufat+laparascopy or sonography	Non-PCOS	NA	GDM, BW, Macrosomia	GDM, BW and macrosomia were similar in PCOS and Non-PCOS.	High ROB
Urman 1992, Canada	Women with and with probably infertility treatment centre out PCOS /	Observational	PCOS: 4 Non-PCOS: 10	Hirsutism, oligoanovulation, LH/FSH>2, Hyperandrogenism	Non-PCOS and Infertility because of tubal factor	NA	Miscarriage	Miscarriage was similar in PCOS and Non-PCOS.	Low ROB
Homburg 1993, Israel	Women with and without PCOS / IVF centre	Observational	PCOS: 47 Non-PCOS: 38	PCOM+Anovulation+Infertility+Oligomenorrhea/hirsutism	tubal infertility, underwent IVF	NA	Miscarriage	Miscarriage was similar in PCOS and Non-PCOS.	Moderate ROB
Lesser 1997, USA	Women with and without PCOS / Infertility treatment at the reproductive endocrinology clinic of the	Observational	PCOS: 24 Non-PCOS: 45	Oligoanovulation AND clinical OR biochemical hyperandrogenism OR obesity OR hirsutism OR acantosis AND PCOM	Non-PCOS and Infertility unrelated to PCOS	NA	GWG, GDM	GWG and GDM were similar in PCOS and Non-PCOS.	High ROB

	University of Arizona Health Sciences Centre								
Urman 1997, Turkey	Women with and without PCOS / Infertility treatment centre	Observational	PCOS: 47 Non-PCOS: 100	Anovulation, oligoamenorrhea, hirsutism, luteinizing hormone /follicle-stimulating hormone ratio >2 and varying degrees of hyperandrogenism	Non-PCOS	NA	GWG, GDM, GH, PE, PTB, LBW and Macrosomia	GWG, PTB and macrosomia were similar in PCOS and Non-PCOS. GDM, GH, PE and LBW were higher in PCOS.	Moderate ROB for GDM, GH, PE, (Poor for GWG, PTB, LBW and Macrosomia)
Fridstrom 1999, Sweden	Women with and without PCOS / The IVF unit at Huddinge University Hospital	Observational	PCOS: 33 Non-PCOS: 66	Anovulation+PCOM	Non-PCOS and tubal damage infertility , endometriosis, unexplained infertility, or male infertility	NA	GWG, GDM, GH, PE, PTB, BW, CS	GWG, GDM, GH, PE, PTB, CS were similar in PCOS and Non-PCOS BW were lower in PCOS.	Low ROB for PTB, BW, CS (Moderate ROB for GWG, GDM, GH, PE)
Kashyap 2000, Canada	Women with and without PCOS / Infertility centre	Observational	PCOS: 22 Non-PCOS: 27	Irregular menstrual cycles, increased serum testosterone, and LH/FSH >2 or PCOM on US	Non-PCOS and Infertility due to tubal factor, unexplained, luteal phase deficiency and male factor.	NA	GH	GH was higher in PCOS	High ROB
Vollenhoven 2000, Australia	Women with and without PCOS / Infertility treatment centre (OI) for PCOS and antenatal care and delivery for Controls	Observational	PCOS: 60 Non-PCOS: 60	Infertile with Oligomenorrhea and or hirsutism, PCOM on US±LH/FSH≥3, Testosterone>3.5 nmol/L and or DHEAS> 7.5 nmol/L	Non-PCOS	NA	GDM, BW, Instrumental delivery	GDM, BW, Instrumental delivery were similar in PCOS and Non-PCOS.	Moderate R OB
Mikola 2001, Finland	Women with and without PCOS / The Department of Obstetrics and Gynaecology of Helsinki University Central Hospital	Observational	PCOS: 99 Non-PCOS: 737	(i) PCOM on US and ≥ 2 of the following: (ii) serum LH/FSH ratio >2; (iii) hyperandrogenemia or (iv) clinical picture of menstrual irregularities, hirsutism, or infertility from anovulation	Non-PCOS and all with normal US at 16-18 weeks of gestation.	NA	GDM, GH, PE, PTB, BW, Macrosomia, CS	GDM and PTB were higher in PCOS GH, PE, BW were similar in PCOS and Non-PCOS.	High ROB
Wang 2001, Australia	Women with and without PCOS / The Reproductive Medicine Unit, Department of Obstetrics and Gynaecology	Observational	PCOS: 373 Non-PCOS: 645	Testosterone>2.5 nmol/l or elevated androstenedione, SHBG<20 nmol/l, PCOM on US	Non-PCOS	NA	Miscarriage	GWG and GDM were similar in PCOS and Non-PCOS.	High ROB
Bjercke 2002, Norway	Women with and without PCOS / probably infertility treatment centre	Observational	PCOS: 52 Non-PCOS: 355	PCOM on ultrasonography+ ≥3 of the following: oligomenorrhea, amenorrhoea, hirsutism, hyperandrogenemia, elevated LH/FSH ratio >2 and chronic anovulation	Non-PCOS and Singleton pregnancies + ART pregnancies	NA	GDM, GH, PE, PTB, Instrumental delivery and CS	GDM, GH were higher in PCOS PE, PTB, Instrumental delivery and CS were similar in PCOS and Non-PCOS.	High ROB

Sir-Petermann 2002, Chile	Women with and without PCOS / Unit of Reproductive Medicine for PCOS, The antenatal care unit for Controls.	Observational	PCOS: 20 Non-PCOS: 26	Chronic oligo/amenorrhoea, clinical signs of hyperandrogenism with no virilization, clinical signs of hyperinsulinaemia (waist:hip ratio >0.85), serum testosterone >0.6 ng/ml and/or FAI >5.0, different grades of hyperinsulinaemia evaluated by an OGTT, and PCOM on US.	Non-PCOS and Regular menstrual cycles, No hirsutism and other manifestations of hyperandrogenism, No galactorrhoea, thyroid dysfunction and family history of DM. All were healthy and were not receiving any drug therapy.	NA	GDM	GDM was higher in PCOS.	Moderate R OB
Haakova 2003, Czech Republic	Women with and without PCOS / Department of Obstetrics and Gynaecology	Observational	PCOS: 66 Non-PCOS: 66	Rotterdam	Non-PCOS - those who had undergone US at the same department	NA	GWG, GDM, GH, PTB, BW, CS	GWG was higher in PCOS GDM, GH, PTB, BW, CS were similar in PCOS and Non-PCOS.	Low ROB
Turhan 200, Turkey	Women with and without PCOS / The outpatient clinic of the Department of Obstetrics and Gynecology of Fatih University Hospital	Observational	PCOS: 38 Non-PCOS: 136	Rotterdam	Non-PCOS - randomly selected	NA	GWG, GDM, GH, PE, PTB, IUGR, BW, Macrosomia, IOL, CS	GWG was higher in PCOS GDM, GH, PE, PTB, IUGR, BW, Macrosomia, IOL, CS were similar in PCOS and Non-PCOS.	High ROB
Glueck 2004, USA	Women with and without PCOS / The Jewish hospital for PCOS and a suburban community practice of obstetrics for Controls	Observational	PCOS: 122 Non-PCOS: 252	Rotterdam	Non-PCOS - Community healthy controls; Reglar menstrual cycles, no clinical signs of hyperandrogenism, had never been diagnosed with PCOS by Obstetricians	NA	GDM , PE, PTB	GDM, PE, PTB were similar in PCOS and Non-PCOS.	High ROB
Glueck 2004, USA	Women with and without PCOS / The Jewish hospital for PCOS and a suburban community practice of obstetrics for Controls	Observational	PCOS: 97 Non-PCOS: 252	Rotterdam	Non-PCOS- Healthy women not known to have PCOS, with ≥ 1 live birth, consecutively delivered in a suburban-urban community practice	NA	GDM, PE, PTB, BW, Macrosomia	GDM, PE, PTB, BW, Macrosomia were similar in PCOS and Non-PCOS.	High ROB
Weerakiet 2004, Thiland	Women with and without PCOS / Reproductive endocrinology and infertility unit	Observational	PCOS: 47 Non-PCOS: 264	Homburg (menstrula irregularity, clinical hyperandrogenism such as acne, seborrhea and hirsutism, and bilaterla PCOM on US	Non-PCOS and normal menstruation	NA	GWG, GDM, GH, PE, CS	GH,CS were higher in PCOS GWG, GDM, PE were similar in PCOS and Non-PCOS.	Moderate ROB

High ROB
Elshewy 2020, China	Women with and without PCOS / Infertility centre	Observational	PCOS: 33 Non-PCOS: 35	Rotterdam (Anovulatory +PCOM)	Non-PCOS - Ovulatory non-PCOS	NA	Miscarriage	Miscarriage was similar in PCOS and Non-PCOS.	High ROB

Foroozanfard 2020, Iran	Women with and without PCOS / Infertility centre	Observational	PCOS: 40 Non-PCOS: 40	Rotterdam	Non-PCOS	NA	BMI, Miscarriage, GDM, GH, PE, PTB, CS	BMI, Miscarriage, GDM, GH, PE, PTB, CS were similar in PCOS and Non-PCOS.	High ROB
Liu 2020, China	Women with and without PCOS / Shenzhen Zhongshan Urology Hospital (SZUH)	Observational	PCOS: 666 Non-PCOS: 7012	Rotterdam	Non-PCOS + ART	NA	BMI, Miscarriage, GDM, GH, PTB, CS	Miscarriage, GH, PTB were higher in PCOS GDM, CS were similar in PCOS and Non-PCOS.	High ROB
Tobiasz 2020, USA	Women with and without PCOS / Hospital	Observational	PCOS: 28 Non-PCOS: 18	NIH	Non-PCOS	NA	BMI, PTB, IUGR, BW, CS	BMI, PTB, IUGR, BW, CS were similar in PCOS and Non-PCOS.	Moderate ROB
Abdulkhalikova 2021, Slovenia	Women with and without PCOS / IVF/ICSI centre	Observational	PCOS: 73 Non-PCOS: 196	Rotterdam - oligo- and/or anovulation, clinical and/or biochemical signs of hyperandrogenism and polycystic ovaries	Non-PCOS - participants who received IVF/ICSI	NA	GWG, GDM, GH, PE, PTB, BW, LBW, SGA, Macrosomia, CS	GWG, GDM, GH, PE, PTB, BW, LBW, SGA, Macrosomia, CS were similar in PCOS and Non-PCOS.	Low ROB
Cai 2021, China	Women with and without PCOS / Infertility centre	Observational	PCOS: 2357 Non-PCOS: 19463	Rotterdam	Non-PCOS	NA	BMI, Miscarriage, GDM	BMI, Miscarriage, GDM were higher in PCOS	Moderate ROB
Diboun 2021, Qatar	Women with and without PCOS / Research Center	Observational	PCOS: 16 Non-PCOS: 52	Qatar	Non-PCOS	NA	BW	BW was lower in PCOS	Moderate ROB
Feichtinger 2021, Austria	Women with and without PCOS / PCOS: 31 Non-PCOS: 36	Observational	PCOS: 31 Non-PCOS: 36	Rotterdam	Non-PCOS	NA	GDM	GDM was higher in PCOS	High ROB
Gongadashetti 2021, India	Women with and without PCOS / Infertility centre	Observational	PCOS: 43 Non-PCOS: 57	Rotterdam	Non-PCOS - Tubal infertility	NA	Miscarriage	Miscarriage was similar in PCOS and Non-PCOS.	High ROB
Hu 2021, China	Women with and without PCOS / Infertility centre	Observational	PCOS: 557 Non-PCOS: 3526	Rotterdam (Anovulatory +PCOM)	Non-PCOS - Non-hyperandrogenic	NA	GDM, PTB, BW, LBW, Macrosomia, CS	BW was higher in PCOS GDM, PTB, LBW, Macrosomia, CS were similar in PCOS and Non-PCOS.	High ROB
Jiang 2021, China	Women with and without PCOS / Infertility centre	Observational	PCOS: 100 Non-PCOS: 100	Rotterdam	Non-PCOS - Tubal infertility	NA	BMI, GDM, GH, PTB, LBW, Macrosomia, Instrumental delivery, CS	BMI was higher in PCOS GDM, GH, PTB, LBW, Macrosomia, Instrumental delivery, CS were similar in PCOS and Non-PCOS.	High ROB
Kaing 2021, USA	Women with and without PCOS / PCOS : Infertility Centre; Controls : Multiple university-affiliated hospitals	Observational	PCOS: 118 Non-PCOS: 146	Rotterdam with chronic anovulation	Non-PCOS - unexplained infertility	NA	BMI, BW	BMI was higher in PCOS BW was lower in PCOS	High ROB
Kollmann 2021, Austria	Women with and without PCOS / academic tertiary hospital	Observational	PCOS: 80 Non-PCOS: 420	Rotterdam	Non-PCOS	NA	BMI, GDM, GH, PE, IUGR, SGA, LGA	GDM were higher in PCOS BMI, GH, PE, IUGR, SGA, LGA were similar in PCOS and Non-PCOS.	Moderate ROB

Lin 2021, China	Women with and without PCOS / Infertility centre	Observational	PCOS: 1167 Non-PCOS: 9995	Rotterdam	Non-PCOS - tubal or male factor	NA	PTB, BW, LBW, Macrosomia, LGA	BW was lower in PCOS PTB, BW, LBW, were higher in PCOS Macrosomia, LGA were similar in PCOS and Non-PCOS.	High ROB
Liu 2021, China	Women with and without PCOS / Center for Reproductive Medicine, Shandong University	Observational	PCOS: 86 Non-PCOS: 60	Rotterdam	Non-PCOS - + ART	NA	BMI, Miscarriage	BMI, Miscarriage were higher in PCOS	High ROB
Mai 2021, China	Women with and without PCOS / Centre for Reproductive Medicine in Sun Yat-Sen Memorial Hospital	Observational	PCOS: 263 Non-PCOS: 526	Rotterdam	Non-PCOS - tubal factor infertility	NA	Miscarriage	Miscarriage was similar in PCOS and Non-PCOS.	High ROB
Pouya 2021, Turkey	Women with and without PCOS / university hospital infertility center	Observational	PCOS: 88 Non-PCOS: 90	Rotterdam	Non-PCOS	NA	Miscarriage	Miscarriage was similar in PCOS and Non-PCOS.	High ROB
Wang 2021, China	Women with and without PCOS / Dongyang Women and Children's Hospital	Observational	PCOS: 29 Non-PCOS: 116	Rotterdam	Non-PCOS	NA	BMI, GWG, BW, CS	BMI, GWG, BW, CS were similar in PCOS and Non-PCOS.	Moderate ROB
Wu 2021, China	Women with and without PCOS / Reproductive Medicine Center of The Sixth Affiliated Hospital of Sun Yat-sen University	Observational	PCOS: 1489 Non-PCOS: 1489	Rotterdam	Non-PCOS - tubal factor, incretion factor and immunity factor	NA	Miscarriage, PTB	Miscarriage, PTB were similar in PCOS and Non-PCOS.	Low ROB
Zhu 2021, China	Women with and without PCOS / Infertility centre	Observational	PCOS: 429 Non-PCOS: 890	Rotterdam	Non-PCOS - unexplained infertility and tubal factor infertility	NA	Miscarriage, GDM, GH, PTB, LBW	Miscarriage, GDM, GH, PTB, LBW were similar in PCOS and Non-PCOS.	High ROB
Liu 2022, China	Women with and without PCOS / Beijing Obstetrics and Gynaecology Hospital	Observational	PCOS: 1431 Non-PCOS: 6700	Rotterdam	Non-PCOS	NA	GDM, GH, PE, PTB, IUGR, Macrosomia	GDM, GH, PE, PTB, , Macrosomia were higher in PCOS IUGR was similar in PCOS and Non-PCOS.	High ROB
Ni 2022, China	Women with and without PCOS / Ninth People's Hospital	Observational	PCOS: 1376 Non-PCOS: 1376	Rotterdam	Non-PCOS - tubal factor or male infertility	NA	Miscarriage, PTB, LBW, Macrosomia	Miscarriage, PTB, LBW, Macrosomia were higher in PCOS	High ROB
Song 2022, China	Women with and without PCOS / Shandong University-affiliated Reproductive Hospital	Observational	PCOS: 115 Non-PCOS: 214	Rotterdam	Non-PCOS	NA	Miscarriage	Miscarriage was similar in PCOS and Non-PCOS.	High ROB
Stokkeland 2022, Norway, Sweden, Iceland	Women with and without PCOS / multiple centres in Sweden, Noway and Iceland	Observational	PCOS: 358 Non-PCOS: 258	Rotterdam	Non-PCOS - selected from the Training in Pregnancy (TRIP) study	NA	BMI, BW	BMI was higher in PCOS BW was similar in PCOS and Non-PCOS.	High ROB

Tu 2022, China	Women with and without PCOS / Center for Reproductive Medicine, Women's Hospital	Observational	PCOS: 48 Non-PCOS: 48	Rotterdam	Non-PCOS - Tubal factor or male infertility	NA	Miscarriage, BW	Miscarriage was lower in PCOS BW was similar in PCOS and Non-PCOS.	High ROB
Wang 2022, China	Women with and without PCOS / Centre for Reproductive Medicine	Observational	PCOS: 1186 Non-PCOS: 5546	Rotterdam	Non-PCOS	NA	Miscarriage, GDM, PTB, CS	Miscarriage, GDM, PTB, CS were similar in PCOS and Non-PCOS.	High ROB
Yang 2022, China	Women with and without PCOS / Reproductive Medicine Center of Xiangya Hospital	Observational	PCOS: 450 Non-PCOS: 3165	Rotterdam	Non-PCOS	NA	Miscarriage	Miscarriage was similar in PCOS and Non-PCOS.	High ROB

OUTCOME: Gestational diabetes			**OUTCOME TYPE:** Dichotomous					
COMPARISON (if applicable): PCOS vs. Non-PCOS								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Levran 1990	Count	OGTT at 28th week of gestation, based on O'Suullivan and Mahan Criteria	15	76	9	95	Crude	NA
Wortsman 1991	Count	a 50 g OGTT at 24-28 weeks of gestation. When 1-hr≥130 mg/dL, a further confirmatory test, based on the modified O'Suullivan's criteria: ≥2 of the followings: FBS≥100 mg/dl, 1 h OGTT≥180 mg/dl and 2 h OGTT≥160 mg/dl and 3 hr≥140 mg/dl	4	53	153	2036	Crude	NA
Lesser 1997	Count	a 50 g OGTT at 20-28 weeks of gestation. When 1 hour >135 mg/dL, a further confirmatory test, i.e., 3 hours 100 g OGTT and GDM was diagnosed based on NDDG criteria.	4	24	3	44	Crude	NA
Urman 1997	Count	a 50 g OGTT at 24-28 weeks of gestation. When ≥140 mg/dL, a further confirmatory test using 100 g OGTT and GDM was diagnosed based on NDDG criteria.	6	47	2	100	Crude	NA
Fridstrom 1999	Count	A 75 g OGTT with a 2-h value of ≥ 9 mmol/L	1	9	1	10	Crude	NA
Vollenhoven 2000	Count	a 75 g OGTT at 26-28 weeks of gestation; if 1-hr>8mmol/l, a 75 g fasting 2-hr OGTT which is considered abnormal if FBS≥5.5 mmol/l and or 2-hr ≥8 mmol/l	13	60	10	60	Crude	NA
Mikola 2001	Count	A 75 g OGTT, FBS>4.5, 1-hr>9.1, 2-hr>7.9 mmol/l; For capillary blood and venous plasma: FBS>4.8 1-hr>10.0, 2-hr>8.7 mmol/l	20	99	66	737	Crude	NA
Bjercke 2002	Count	a 75 g GTT. When 2h>11.1 mmol/L	4	52	2	355	Crude	NA
Sir-Petermann 2002	Count	FBS>126 mg/dl; 2 h OGTT>140 mg/dl after a 75 g OGTT were classified as having gestational diabetes mellitus.WHO criteria	3	20	0	26	Crude	NA
Haakova 2003	Count	A 75 g OGTT, FBS>5.5, 1-hr>8.8, 2-hr>7.7 mmol/l; Having two of them together would met the diagnosis of GDM.	3	66	8	66	Crude	NA
Turhan 2003	Count	a 50 g OGTT at 24-28 weeks of gestation. When >130 mg/dL, a further confirmatory test, i.e., 3 hours 100 g OGTT and if ≥2 of 4 following: FBS: 95; 1-hr: 180; 2-hr: 155; and 3-hr: 140 mg/dl	1	38	11	136	Crude	NA
Glueck 2004	Count	At 26-28th week of gestation, based on O'Suullivan and Mahan Criteria, ADA. PE: Based on ISSHP; SBP>140 or DBP>90 mmHg± proteinuria after 20 weeks.	9	119	40	251	Crude	NA
Glueck 2004	Count	-	9	95	40	251	Crude	NA
Weerakiet 2004	Count	a 100 g OGTT at 24-28 weeks of gestation. According to one-step method of the ADD: FBS≥95 mg/dl, 1-hr≥180 mg/dl, 2-hr≥155 mg/dl, 3-hr≥140 mg/dl.	8	36	18	100	Crude	NA

Sir-Petermann 2005	Count	a 75 g OGTT at 22-28 weeks of gestation. GDM was diagnosed based on WHO criteria	6	47	1	180	Crude	NA
Al-Ojaimi 2006	Count	a 50 g OGTT at 24 weeks of gestation. When 140 mg/dL, a further confirmatory test, i.e., 3 hours OGTT ≥2 of the following: FBS>95, 1-hr>180, 2-hr>155, 3-hr>140 mg/dl (5.3/10/8.6/7.8 mmol/l)	29	134	61	479	Crude	NA
Dokras 2006	Count		5	46	5	108	Crude	NA
Kovo 2006	Count	-	16	33	3	66	Crude	NA
Sir-Petermann 2007	Count	a 75 g OGTT at 22-28 weeks of gestation. GDM was diagnosed based on WHO criteria (FBS>126 mg/dl; 2-hr 140 mg/dl).	6	48	1	51	Crude	NA
Gupta 2009	Count	a 100 g OGTT . FBS>105 mg/dl; 1hrOGTT>190 mg/dl; 2hrOGTT>165 mg/dL; 3hrOGTT>145 mg/dL	8	56	2	56	Crude	NA
Palomba 2010	Count	WHO: Recognition of two abnormal values (FBS>105 mg/dl; 1hrOGTT>190 mg/dl; 2hrOGTT>165 mg/dL; 3hrOGTT>145 mg/dL) at 26 weeks of gestation	15	93	4	69	Crude	NA
Palomba 2010	Count	At 26 weeks of gestation; GDM was diagnosed based on ADA criteria.	13	70	4	69	Crude	NA
De Leo 2011	Count		0	98	12	110	Crude	NA
Dmitrovic 2011	Count	a 75 g OGTT at 6-10, 12-16, 24-28 and 34-38 weeks of gestation. When 130-140 mg/dL, a further confirmatory test, i.e., 3 hours 100 g OGTT and GDM was diagnosed based on WHO and ADA criteria.	10	17	2	17	Crude	NA
Nouh 2011	Count	-	12	40	0	40	Crude	NA
Reyes-Munoz 2012	Count	a 50 g OGTT at 14-24 weeks of gestation. When ≥130 mg/dL, a further confirmatory test, i.e., 3 hours 100 g OGTT and GDM was diagnosed based on ADA criteria i.e 2 of the following: FBS≥95 mg/dL, 1-hr≥180 mg/dL, 2-hr≥155 mg/dL and 3-hr≥140 mg/dL.	14	52	5	52	Crude	NA
Wang 2013	Count	a 75 g OGTT at 24-28 weeks of gestation. GDM was diagnosed with having 2 of the following: FBS≥5.1mmol/L, 1-hr≥10.0mmol/L, 2-hr≥8.5mmol/L. PIH: SBP>140 or DBP>90 mmHg.	79	144	85	594	Crude	NA
Ashrafi 2014	Count	a 50 g OGTT at 24-28 weeks of gestation. When 1-hr≥7.8 mmol/L or 140 mg/dL, a further confirmatory test 1-2 weeks later, with a 100 g 3-hr and GDM diagnosis based on ADA: ≥2 of the followings: FBS≥95 mg/dl, 1 h OGTT≥180 mg/dl and 2 h OGTT≥155 mg/dl and 3 hr≥140 mg/dl.	104	234	87	468	Crude	NA
Elkholi 2014	Count	a 50 g OGTT at 24 weeks of gestation. When ≥140 mg/dL, a further confirmatory test, i.e., 75 g OGTT and GDM was diagnosed based on the Fifth International Work Shop Conference on Gestational Diabetes. ≥2 of the followings: FBS≥95 mg/dl, 1 h OGTT≥180 mg/dl and 2 h OGTT≥155 mg/dl.	10	131	14	177	Crude	NA

OUTCOME: Depression								
OUTCOME TYPE: Dichotomous								
COMPARISON (if applicable): PCOS vs. Non-PCOS								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
March 2021	Count	**All self-reported** a pregnancy of more than20 weeks were asked whether they had experienced depression when pregnant or postnatal (Cross-checked against another section of the structured inter-view concerning depression, in which women provided details of episodes, whether these were clinically diagnosed, and any treatment.);	19	52	137	514	Crude	NA

[8] Downgraded once as the majority of evidence did not include the outcome as an outcome of interest in PICO or downgraded twice as majority of evidence is secondary analyses of studies with aims other than pregnancy outcomes

APPENDIX. QUALITY APPRAISAL OF INCLUDED STUDIES

Study ID	Harborne 2005
Study Citation	Harborne et al., *J Clin Endocrinol Metab* 90:4593–4598, 2005
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (age not reported)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	*Obese (30 – 37 kg/m2) and morbid obese (above and equal to 37 kg/m2)* *No diabetes*
Medication History	*No*
N per group	*Allocated/randomised: 83 (42 obese: 21 met 1500mg, 21 met 2550mg; 41 morbid obese: 21 met 1500mg, 20 met 2550mg)* *Assessed at end of study: 68 (35 obese: 18 met 1500mg, 17 met 2550mg; 33 morbid obese: 18 met 1500mg, 15 met 2550mg)*
Setting	*University teaching hospital with patients from gynecology/ endocrinology clinics, Glasgow, UK*
Intervention	*Metformin (Glucophage, Merck & Co., West Drayton, UK) dose was 850 mg, three times daily for 8 months*
Comparison	*Metformin (Glucophage, Merck & Co., West Drayton, UK) dose was 500 mg, three times daily for 8 months*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Changes in body mass, circulating hormones, markers of inflammation, and lipid profiles after 4 months (T4) and 8 months (T8) of treatment*
Follow up Duration	*8 months*
Summary Result/s	*In the obese group, metformin xx was more effective in reducing xx compared with xx* *In the morbid obese group, metformin xx was effective in reducing BMI, but not …*
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*The aim was to determine whether different doses of metformin (1500 or 2550 mg/ d) would have different effects on body weight, circulating hormones, markers of inflammation, and lipid profiles*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*The diagnosis of PCOS included at least two of the three features: - oligomenorrhea (fewer than eight cycles per year)/amenorrhea (fewer than two cycles per year), - polycystic ovaries determined by ultrasonography using the criteria of Adams et al. (12), - or an elevated free androgen index.*
Exclusion criteria	Yes Partial No Not reported	*Contraindications to metformin or its use within the previous 4 months or oral contraceptive use within the previous 2 months. None of the women had thyroid dysfunction, hyperprolactinemia, diabetes mellitus, or late-onset or congenital adrenal hyperplasia. Women taking medication known to affect weight loss, gonadal or adrenal function, or carbohydrate or lipid metabolism were also excluded.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported* *Block randomisation based on dose and BMI, but not clear how the randomisation was done.*
SELECTION BIAS – **Was allocation to intervention group concealed?**	Yes Partial No Not reported	*Not reported*

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Obese women with PCOS* *Met 1500mg = 3/21 = 14.2%* *Met 2550mg = 4/21 = 19%* *Morbid obese women with PCOS* *Met 1500mg = 3/21 = 14.2%* *Met 2550mg = 5/20 = 25%*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Partial* *Ages of the participants were not reported*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Partial* *Outcomes not adjusted for age*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Partial* *Potential confounders were identified and taken into account in the analysis*
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	

What is the overall risk of bias?	Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes high risk of bias*	

CROSS-SECTIONAL or CASE-CONTROL STUDIES

Study ID	*Acmaz, 2013*	
Study Citation	*Açmaz, G., Albayrak, E., Acmaz, B., Başer, M., Soyak, M., Zararsız, G., & İpekMüderris, İ. (2013). Level of anxiety, depression, self-esteem, social anxiety, and quality of life among the women with polycystic ovary syndrome. The Scientific World Journal, 2013.*	
Study Country	*Turkey*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*86 patients diagnosed with PCOS according to 2003 Rotterdam Criteria, had no physical disease but PCOS, did not receive any treatment (before the treatment) for PCOS and had at least primary school degree.*	
Control population	*47 healthy volunteer participants in reproductive age*	
PCOS diagnostic criteria	*Rotterdam 2003*	
N per group	*PCOS were classified according to the complaints at the time of polyclinic admission.* *- Infertility group (concern with having child)* *- Oligomenorrhea-hirsutism group (concerns with hirsutism)* *- Overweight-obesity group (concerns with losing weight and had a BMI 30 or more)*	
Setting	*Hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary outcomes:* *- SF-36 Quality of Life Scale (Short-Form 36)* *Outcomes not relevant:* *- LSAS (Liebowitz' Social Anxiety Scale)* *- RSES (Rosenberg' Self-Esteem Scale)* *- Beck Anxiety Inventory (BAI)* *- Beck Depression Inventory (BDI)*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes*

Inclusion criteria	Yes Partial No Not reported	*Yes, no physical disease but PCOS, did not receive any treatment (before the treatment) for PCOS and had at least primary school degree.*
Exclusion criteria	Yes Partial No Not reported	*Yes, Those who had thyroid disorders, DM, Cushing' disease, positive malignancy, congenital adrenal hyperplasia, psychotic disorders and used antidepressants or steroidal hormone drugs and mood stabilizers were excluded. Patients with personality disorders assessed by SCID-I and SCID-II were not included.*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes, which design?*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant to this systematic review*
Was matching performed?	Yes Partial No Not reported	*Yes, age and BMI*
Summary Result/s	*Xx was associated with a, b, and c, independent of xx.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	*Partial* *Control group using healthy volunteer participants in reproductive age, unknown whether also recruit at the hospital.*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
PERFORMANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Partial because of nature of study*

	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Partial because of nature of study*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	*Not relevant to cross-sectional study*
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	*Not reported*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *No protocol or PROSPERO*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	*Yes* *Demographic difference between group in marital status, number of children, obesity due to the aim of the study*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial	*Partial* *Some reported in median and percentiles without stating reasons.*

		No Not reported	
COMMENTS		*Unknown where they recruited healthy volunteer in control group*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*Yes* *All outcomes moderate risk of bias except for primary outcome which had low risk of bias due to better attrition and more reliable measurement tool than remaining outcomes*	

COHORT STUDIES

Study ID	*Diamant 1982*
Study Citation	*Diamant, Y. Z.; Rimon, E.; Evron, S. (1982): High incidence of preeclamptic toxemia in patients with polycystic ovarian disease. Eur J Obstet Gynecol Reprod Biol 14, 3, 199-204*
Study Country	*Israel*
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Women with and without PCOS* *Age= PCOS: 31 years, Non-PCOS: 27.2 years*
PCOS diagnostic criteria	*Two or more of the following: hirsutism, oligomenorrhea, anovulation, elevated level of either serum Testosterone or urinary KS +PCOM.*
N per group	***PCOS: 70*** ***Non-PCOS: 2071***
Setting	*Note stated; possibly all PCOS from infertility treatment centre and Non-PCOS partially from infertility treatment centre.*
Intervention/ indicator	N/A
Comparison/ Control	*Anovulatory Non- PCOS/Non- PCOS with Spontaneous Pregnancy*

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*PE, BW, Instrumental delivery, CS*	
Inclusion criteria reported?	*Yes*	*All PCOS were anovulatory and conceived by OI*
Exclusion criteria reported?	Yes Partial No Not reported	*Not reported*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Partial - Only inclusion criteria reported*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial	*Yes*

		No Not reported	
Was matching performed?		Yes Partial No Not reported	*No*
Summary of Result/s		After induction of ovulation, in infertile women are accompanied by an increased incidence of PET. This was suggested as early as 20 yr ago by Stallworthy (1960). However, according to our results, the rate of PET differs significantly between the PC0 and A-NPCO patients. While the incidence of PET in A-NPCO group was only slightly elevated as compared to the normal control group, and even lower than in the control primipara group, PC0 women developed PET in more than 28% of the cases. This rate was almost 12 times higher than in the normal control group and more than 2.5 times higher than in the control primiparae.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	*Yes*	Not reported
	Was the exposed cohort truly representative?	Yes Partial No Not reported	*No* *Infertility treatment centre*
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*

DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	Yes Partial No Not reported	Not reported
	What percentage of the individuals were not included in the analysis?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*

CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Partial one group of anovulatory non-PCOS women were age matched with anovulatory PCOS
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	*Levran 1990*	
Study Citation	*Levran, D.; Shoham, Z.; Habib, D.; et al. (1990): Glucose tolerance in pregnant women following treatment for sterility. Int J Fertil 35, 3, 157-159*	
Study Country	*Israel*	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with and without PCOS*	
PCOS diagnostic criteria	*Anovulation with oligo/amenorrhea+obesity+hirsutism+PCOM*	
N per group	***PCOS: 76*** ***Non-PCOS: 95***	
Setting	*Infertility treatment centre for PCOS, Outpatient clinic for Non-PCOS*	
Intervention/ indicator	N/A	
Comparison/ Control	*Normal menstrual pattern and spontaneous pregnancy*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*GDM*	
Inclusion criteria reported?	*Yes*	*All husbands had a normal sperm count*
Exclusion criteria reported?	Yes Partial No Not reported	*Not reported*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*

Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Partial - Only inclusion criteria reported*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	Yes - *Age, weight, familial diabetic history and past medical history*
Summary of Result/s	GDM was higher in PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	No
SELECTION BIAS – **Was the exposed cohort truly representative?**	Yes Partial No Not reported	*No* *Infertility treatment centre*

	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	*Not reported*

COMMENTS			
What is the overall risk of bias?		*Moderate*	
Did risk of bias differ by outcome *(eg. primary outcome*		*No*	

was low risk but rest were high)?	

Study ID	*Mikola 2001*	
Study Citation	*Mikola, M.; Hiilesmaa, V.; Halttunen, M.; et al. (2001): Obstetric outcome in women with polycystic ovarian syndrome. Human Reproduction 16, 2, 226-229*	
Study Country	*Finland*	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with and without PCOS*	
PCOS diagnostic criteria	*(i) PCOM on US and ≥ 2 of the following: (ii) serum LH/FSH ratio >2; (iii) hyperandrogenemia or (iv) clinical picture of menstrual irregularities, hirsutism, or infertility from anovulation*	
N per group	***PCOS: 99*** ***Non-PCOS: 737***	
Setting	*The Department of Obstetrics and Gynaecology of Helsinki University Central Hospital*	
Intervention/ indicator	N/A	
Comparison/ Control	*Non-PCOS and all with normal US at 16-18 weeks of gestation.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*GDM, GH, PE, PTB, BW, Macrosomia, CS*	
Inclusion criteria reported?	Yes Partial No Not reported	Not reported
Exclusion criteria reported?	Yes Partial No Not reported	Partial - *Miscarriage or abortion before 22 weeks for controls*

Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Partial
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	No
Summary of Result/s	*GDM and PTB were higher in PCOS* *GH, PE, BW were* similar in PCOS and Non-PCOS.	

INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Not reported
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Yes
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*

	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	0	
	What percentage of the individuals were not included in the analysis?	0	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	No
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial	***Yes***

		No Not reported	
COMMENTS			
What is the overall risk of bias?		*High*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Study Country	*Australia*	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with and without PCOS*	
PCOS diagnostic criteria	*Testosterone>2.5 nmol/l or elevated androstenedione, SHBG<20 nmol/l, PCOM on US*	
N per group	***PCOS: 373*** ***Non-PCOS: 645***	
Setting	*The Reproductive Medicine Unit, Department of Obstetrics and Gynaecology*	
Intervention/ indicator	N/A	
Comparison/ Control	*Non-PCOS*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*GWG, Miscarriage*	
Inclusion criteria reported?	Yes Partial No	Partial - *All patients underwent ART. Three treatment modalities: IVF, gamete intraFallopian tube transfer (GIFT), and intracytoplasmic sperm injection*

	Not reported	
Exclusion criteria reported?	Yes Partial No Not reported	Not reported
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Partial
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes	No

		Partial No Not reported	
Summary of Result/s		GWG and GDM were similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Not reported
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- infertility treatment centre
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Partial
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*

	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	0	
	What percentage of the individuals were not included in the analysis?	0	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	No – No matching, PCOS were younger and had higher BMI.
	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*No*

OTHER BIAS	**Was the study sufficiently powered to detect any differences between the groups?**	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	*Weerakiet 2004*

Study Citation	Weerakiet, S.; Srisombut, C.; Rojanasakul, A.; et al. (2004): Prevalence of gestational diabetes mellitus and pregnancy outcomes in Asian women with polycystic ovary syndrome. Gynecological Endocrinology 19, 3, 134-140	
Study Country	*Thiland*	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with and without PCOS*	
PCOS diagnostic criteria	*Homburg (menstrula irregularity, clinical hyperandrogenism such as acne, seborrhea and hirsutism, and bilaterla PCOM on US*	
N per group	***PCOS: 47*** ***Non-PCOS: 264***	
Setting	*Reproductive endocrinology and infertility unit*	
Intervention/ indicator	N/A	
Comparison/ Control	*Non-PCOS and normal menstruation*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*GWG, GDM, GH, PE, CS*	
Inclusion criteria reported?	Yes Partial No Not reported	Not reported
Exclusion criteria reported?	Yes Partial No Not reported	Yes - *Those who delivered elsewhere, did not receive antenatal care in the hospital or had miscarriage before 20 weeks of gestation*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*

Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Partial – Age matched, BMI higher in PCOS
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Partial
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	Partial -Age matched, BMI higher in PCOS
Summary of Result/s	*GH,CS were higher in PCOS* *GWG, GDM, PE* were similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Not reported
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- infertility treatment centre
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes

		Not reported	
Was matching performed?		Yes Partial No Not reported	Partial- similar age, and SES
Summary of Result/s		*GDM was higher in PCOS and obesity* GH was similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- infertility treatment centre
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*

	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	0	
	What percentage of the individuals were not included in the analysis?	0	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Partial- similar age, and SES but BMI higher in PCOS

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*Moderate*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Study Country	*USA*
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Women with and without PCOS*
PCOS diagnostic criteria	*NIH*
N per group	***PCOS: 69*** ***Non-PCOS: 69***
Setting	*Analyses of existing records probably from an infertility treatment Centre*
Intervention/ indicator	N/A

Comparison/ Control	*Non-PCOS - underwent IVF/ICSI*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Miscarriage*	
Inclusion criteria reported?	Yes Partial No Not reported	Partial - For PCOS: having at least 1 visit in the fertility centre, at least one IVF/ICSI cycle over the considered time. For Controls: an IVF=ICSI cycle at the fertility centre within the same time period
Exclusion criteria reported?	Yes Partial No Not reported	Yes - *Age<18 or>45 years, Only experiment type of treatment such as preimplantation genetic diagnosis (PGD), and testicular sperm aspiration (TESA), Unknown type of IVF/ICSI*
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Partial – Age and date of IVF/ICSI similar but BMI higher in PCOS
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	No- Age and date of IVF/ICSI similar but BMI higher in PCOS
Summary of Result/s	*Miscarriage was* similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- infertility treatment centre

PCOS diagnostic criteria	*Rotterdam*	
N per group	***PCOS: 98*** ***Non-PCOS: 110***	
Setting	*The infertility and in vitro fertilization (IVF) unit for PCOS and Low-risk antenatal clinic for Controls;*	
Intervention/ indicator	N/A	
Comparison/ Control	*Non-PCOS - healthy*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Miscarriage, GDM, GH, PE, PTB, BW*	
Inclusion criteria reported?	Yes Partial No Not reported	Yes - *All PCOS patients with hyperinsulinemia, All treated with metformin 3-4 months prior to infertility treatment until 37 weeks of gestation,*
Exclusion criteria reported?	Yes Partial No Not reported	Not reported
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	No – *hyperinsulinemic PCOS but normal controls*
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*No*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*

Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		*Miscarriage, GDM, GH, PTB were higher in PCOS* *PE, BW* were similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	No
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- Hyperinsulinemic
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study**	0	

	were lost to follow up?		
	What percentage of the individuals were not included in the analysis?	0	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	No
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Study Country	*USA*	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with and without PCOS*	
PCOS diagnostic criteria	*chronic oligo/anovulation and the presence of hyperandrogenemia*	
N per group	***PCOS: 17*** ***Non-PCOS: 17***	
Setting	*Not stated for PCOS, Control group were volunteers recruited through advertisements or referrals*	
Intervention/ indicator	N/A	
Comparison/ Control	*Non-PCOS - Normal menstrual cycles before pregnancy and an absence of hirsutism and other manifestations of hyperandrogenism.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*BMI, GDM, PTB, BW, SGA, LGA*	
Inclusion criteria reported?	Yes Partial No Not reported	Partial - Singleton pregnancies
Exclusion criteria reported?	Yes Partial No Not reported	Yes - DM2, family history of DM2,taking medication to treat DM2 such as metformin
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Partial - Singleton pregnancies and similar age but higher BMI in PCOS
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial

Were the outcomes measured appropriate?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Yes*
Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		*BMI was higher in PCOS* *GDM, BW, PTB, SGA, LGA* were similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	No

EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with and without PCOS*	
PCOS diagnostic criteria	*NIH*	
N per group	***PCOS: 41*** ***Non-PCOS: 110***	
Setting	*Hospital (The 2nd Department of Obstetrics and Gynecology)*	
Intervention/ indicator	N/A	
Comparison/ Control	*Non-PCOS - Healthy controls (Regular menstrual cycles, normal plasma androgen levels, and no acne or hirsutism before conception)*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*BMI, BW, SGA, LGA*	
Inclusion criteria reported?	Yes Partial No Not reported	Partial - *All had GDM,*
Exclusion criteria reported?	Yes Partial No Not reported	Yes - *Smoking, twin pregnancies, and pregnancy achieved through IVF techniques, concurrent medical complications known before or developed during pregnancy, such as diabetes mellitus type 1 or 2 and vascular and inflammatory diseases*
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Partial- Age and BMI were similar and multiple and post ART pregnancies excluded.
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No	*Yes*

		Not reported	
Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		*BMI, BW, SGA, LGA* were similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- all had GDM
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study**	0	

	were lost to follow up?		
	What percentage of the individuals were not included in the analysis?	0	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Partial
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*Moderate*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	*Wang 2013*

Inclusion criteria reported?	Yes Partial No Not reported	*Yes - All IVF/ICSI*
Exclusion criteria reported?	Yes Partial No Not reported	*Yes - >38 years, serum FSH levels >12 IU/L, a history of ovarian surgery, ovarian cyst or tumour, hydrosalpinx, endometriosis, and endocrine or systemic illnesses. In case of a positive Chlamydia test, women received routine antibiotics treatment. IVF was performed once the test became negative*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	No- Age and BMI similar at preconception group but not reported in those who got pregnant
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	No
Summary of Result/s	*Miscarriage was* similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- infertility treatment centre
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	0	
	What percentage of the individuals were not included in the analysis?	0	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Study Citation	de Wilde, M. A.; Lamain-de Ruiter, M.; Veltman-Verhulst, S. M.; et al. (2017): Increased rates of complications in singleton pregnancies of women previously diagnosed with polycystic ovary syndrome predominantly in the hyperandrogenic phenotype. Fertility & Sterility 108, 2, 333-340.
Study Country	*Netherlands*
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Women with and without PCOS*
PCOS diagnostic criteria	*Rotterdam*
N per group	***PCOS: 188*** ***Non-PCOS: 2889***
Setting	*PCOS: hospitals; Controls: December 2012 until December 2013 in 31 midwifery practices and six hospitals*

Intervention/ indicator	N/A	
Comparison/ Control	*Non-PCOS - women enrolled at a booking appointment in the first trimester of their pregnancy*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*GDM, GH, PE, PTB, SGA, LGA, IOL, CS*	
Inclusion criteria reported?	Yes Partial No Not reported	*Yes - Only singleton*
Exclusion criteria reported?	Yes Partial No Not reported	*Yes – Pre-existing type 1 or type 2 diabetes, when their age was <18 or >45 years, or when there was a language barrier; multiple pregnancies*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	No – Younger age and higher BMI in PCOS (at preconception not pregnancy)
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	No
Summary of Result/s	*GDM, PE, IOL, PTB were higher in PCOS* *GH, CS SGA, LGA* were similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes

Intervention/ indicator	N/A

Comparison/ Control	*Non-PCOS*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Postnatal depression*	
Inclusion criteria reported?	Yes Partial No Not reported	*Yes - Around 30 years later, the 2199 eligible female births were traced. The 1984 (90.2%) women who were confirmed still to be living, without any severe impairment; parous*
Exclusion criteria reported?	Yes Partial No Not reported	*No*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Partial – Similar age but higher BMI in PCOS
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	No
Summary of Result/s	*Postnatal depression was higher in PCOS*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Yes
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	0	
	What percentage of the individuals were not included in the analysis?	0	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Partial – Similar age but higher BMI in PCOS
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*Moderate*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Intervention/ indicator	N/A

Comparison/ Control	*Non-PCOS - Non-PCOS + ART*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*BMI, Miscarriage, GDM, GH, PTB, CS*	
Inclusion criteria reported?	Yes Partial No Not reported	*Yes - ART*
Exclusion criteria reported?	Yes Partial No Not reported	*Yes - HBV, HCV, HIV, and syphilis, aged > 38, treated with GnRH antagonist controlled ovarian hyperstimulation protocols, the cycles missing embryo information and clinical pregnancy data, patients suffering from a chromosomal abnormality, intrauterine death, a medical abortion, stillbirth, or ectopic pregnancy, nonclassic adrenal hyperplasia, thyroid dysfunction, hyperprolactinemia, type 2 diabetes mellitus or cardiovascular disease*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	No – Younger age and higher BMI in PCOS at preconception; not reported for those who got pregnant
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	No
Summary of Result/s	*Miscarriage, GH, PTB were higher in PCOS* *GDM, CS* were similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- infertility treatment centre
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	0	
	What percentage of the individuals were not included in the analysis?	0	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	No – Younger age and higher BMI in PCOS at preconception; not reported for those who got pregnant
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Patient/population/ participants	*Women with and without PCOS*
PCOS diagnostic criteria	*Rotterdam*
N per group	***PCOS: 100*** ***Non-PCOS: 100***
Setting	*Infertility centre*
Intervention/ indicator	N/A

Comparison/ Control	*Non-PCOS - Tubal infertility*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*BMI, GDM, GH, PTB, LBW, Macrosomia, Instrumental delivery, CS*	
Inclusion criteria reported?	Yes Partial No Not reported	*Yes - (1) age between 20 and 40 years old; (2) definite diagnosis issued by the hospital; (3) normal intelligence level and reading ability; and (4) voluntary participation in this study and signing of informed consent*
Exclusion criteria reported?	Yes Partial No Not reported	*Yes - (1) serious physical or mental diseases; (2) pregnancy, lactation, or menopause; and (3) recent (within a month) use of contraceptives or other drugs that affect sex hormone levels*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	No – Younger age and higher BMI in PCOS
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	No
Summary of Result/s	*BMI was higher in PCOS* *GDM, GH, PTB, LBW, Macrosomia, Instrumental delivery, CS* were similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- infertility treatment centre
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	0	
	What percentage of the individuals were not included in the analysis?	0	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	No – Younger age and higher BMI in PCOS
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Patient/population/ participants	*Women with and without PCOS*
PCOS diagnostic criteria	*Rotterdam*
N per group	***PCOS: 1489*** ***Non-PCOS: 1489***
Setting	*Reproductive Medicine Center of The Sixth Affiliated Hospital of Sun Yat-sen University*
Intervention/ indicator	N/A

Comparison/ Control	*Non-PCOS - tubal factor, incretion factor and immunity factor*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Miscarriage, PTB*	
Inclusion criteria reported?	Yes Partial No Not reported	*Yes -*
Exclusion criteria reported?	Yes Partial No Not reported	*Yes -*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes – A*ge, BMI, infertility duration, parity history matched
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*
Was matching performed?	Yes Partial No Not reported	*Yes – A*ge, BMI, infertility duration, parity history matched
Summary of Result/s	*Miscarriage, PTB* were similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- infertility treatment centre
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes	*Yes*

		Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	0	
	What percentage of the individuals were not included in the analysis?	0	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	*Yes – A*ge, BMI, infertility duration, parity history matched
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***

COMMENTS		
What is the overall risk of bias?	*Low*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No*	

Study ID	*Zhu 2021*

Study Country	*China*	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with and without PCOS*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	***PCOS: 429*** ***Non-PCOS: 890***	
Setting	*Infertility centre*	
Intervention/ indicator	N/A	
Comparison/ Control	*Non-PCOS - unexplained infertility and tubal factor infertility*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Miscarriage, GDM, GH, PTB, LBW*	
Inclusion criteria reported?	Yes Partial No Not reported	*Yes - aged between 20–40 years*

Exclusion criteria reported?	Yes Partial No Not reported	*Yes - surgery including laparoscopic ovarian drilling, ovarian endometrioma stripping and unilateral oophorectomy; 4) congenital (septate uterus, duplex* *uterus, uterus bicornis and uterus unicornis) or acquired (intrauterine adhesion, submucosal myomas and adenomyosis) uterine anomalies; 5) recurrent spontaneous abortion for three or more times; 6) abnormal chromosomal karyotype in either of the partners; and 7) any other etiologies of hyperandrogenism hyperprolactinemia), and thyroid disease.*
Does the study have a clearly focused question?	Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Partial – Similar age but higher BMI in PCOS
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Yes*

Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		*Miscarriage, GDM, GH, PTB, LBW* were similar in PCOS and Non-PCOS.

PCOS diagnostic criteria	*Rotterdam*
N per group	***PCOS: 450*** ***Non-PCOS: 3165***
Setting	*Reproductive Medicine Center of Xiangya Hospital*
Intervention/ indicator	N/A
Comparison/ Control	*Non-PCOS -*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Miscarriage*

Inclusion criteria reported?		Yes Partial No Not reported	*Yes - Age 20-40; ART; normal lipid profile (Tg <1.7 mmol/l, TC <5.2mmol/l, LDL <3.4mmol/l and HDL>= 1.0 mmol/l)*
Exclusion criteria reported?		Yes Partial No Not reported	*Yes - diabetes mellitus or had a history of hypoglycemic and hypolipidemic medications within three months before the ART treatment;severe hydrosalpinx and did not receive tubal ligation or salpingectomy; severe adenomyosis; endometrial abnormalities such as endometrial polyps, endometrial hyperplasia, submucosal fibroids, intrauterine adhesions or chronic endometritis without management; genital tuberculosis; other severe systemic comorbidities, such as hypertension, prethrombotic conditions, autoimmune connective tissue diseases and malignant tumor*
Does the study have a clearly focused question?		Yes Partial No Not reported	*Yes*
Is a cohort study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Does the study have specified inclusion/ exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Were the outcomes measured appropriate?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Yes*
Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		*Miscarriage was* similar in PCOS and Non-PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes No Not reported	Yes

	Was the exposed cohort truly representative?	Yes Partial No Not reported	No- infertility treatment centre
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	*NA*
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	*NA*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	*Yes* Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	0	
	What percentage of the individuals were not included in the analysis?	0	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Yes*
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	No

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported –* *No report of a power calculation but significant differences were found*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	***Yes***
COMMENTS			
What is the overall risk of bias?		*High*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Question 4.10.

Are women with PCOS at increased risk of adverse pregnancy outcomes?

BACKGROUND:

PCOS was originally considered as a condition impairing infertility with little attention paid to obstetric outcomes. However, well-known symptoms and related comorbidities associated with the condition, such as high BMI, metabolic disturbances, hyperandrogenism and infertility would all presume a higher risk of adverse pregnancy outcomes. The first reports on pregnancy complications in women with PCOS emerged in the 1980ies (1). Although publications from both clinical and register data on pregnancy outcomes have increased immensely since, guidelines are scarce on how to manage PCOS pregnancies and identify possible risk factors. During pregnancy, PCOS symptoms like irregular cycles, hyperandrogenism or polycystic ovarian morphology are difficult to detect, thus, the condition is seldom considered in everyday obstetric practice. During antenatal care, delivery and postpartum, there is little attention paid among patients and health personnel that PCOS-diagnosis may constitute a risk of poorer pregnancy outcomes.

There is a lack of quality evidence on pre-pregnancy management of women with PCOS.

The narrative review informing the 2018 International PCOS Guideline concluded that women with PCOS should undergo preconception lifestyle management to reduce weight. They should also be screened for hypertension and risk for diabetes before pregnancy. Emotional, mental health screening is probably useful.

Generalizability

Studies were conducted mostly at university hospitals, covering countries across North-America, South-America, Europe, Mid-East, Australia, China and India.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
o **Comparison 1:** Women with PCOS versus controls	⨁◯◯◯ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Adverse pregnancy outcomes in women with PCOS vs. controls

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Women with PCOS have higher risk pregnancies, and health professionals should ensure that PCOS status is identified during antenatal care, and appropriate monitoring and support is provided.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **EBR:** Health professionals should recognise that pregnant women with PCOS, independent of age and BMI, have an increased risk of:
  - Excess gestational weight gain
  - Early miscarriage
  - Gestational diabetes
  - Hypertension in pregnancy and preeclampsia
  - Intrauterine growth restriction, small for gestational age babies and low birth weight
  - Preterm delivery
  - Caesarean section

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **EBR:** Assisted reproductive technology in women with PCOS should be considered as not conferring additional risk of miscarriage, preterm birth, impaired fetal growth and caesarean section, over that observed in women without PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

EBR: Women with PCOS should be considered as not having an increased risk of large for gestational age babies, macrosomia and instrumental delivery.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

Early lifestyle intervention should be offered to pregnant women with PCOS, given the risk of higher prepregnancy weight, excess gestational weight gain and pregnancy complications.
Blood pressure measurement should be performed when planning pregnancy or seeking fertility treatment, given the high risk of hypertensive disorders in pregnancy and the associated comorbidities in women with PCOS.
An oral glucose tolerance test (OGTT) should be offered to all women with PCOS when planning pregnancy or seeking fertility treatment, given the high risk of hyperglycaemia and associated comorbidities in pregnancy. If not performed in the preconception phase, an OGTT should be offered at the first antenatal visit, and repeated at 24-28 weeks gestation.

GRADE CONSIDERATIONS

Justifications:
For the critical outcomes PHT, PE, GDM and preterm delivery certainty varies from moderate to low indicating higher risk in PCOS.
For the critical outcome eclampsia certainty is very low indicating no difference in PCOS vs controls.

Subgroup considerations:
Pregnancies after assisted reproductive technology may play a role in risk evaluation in PCOS-pregnancies.
Consideration of preconception BMI and GDM status may affect evaluation of pregnancy risks.
Potential risk associated with phenotype is not evaluated

Implementation considerations:
Very high priority for education to Health professionals and women.

Monitoring and evaluation considerations:
Monitoring the identification of PCOS status during antenatal care and if implementation of recommendation improves pregnancy outcomes in women with PCOS.
This includes dedicated fields in electronic medical records and pregnancy registries.

Research priorities:
Identify PCOS-status at the antenatal care and follow-up PCOS vs non- PCOS, registering predefined variables of adverse outcomes.
Exploring how phenotype, preconception body mass index, assisted reproductive technology affect adverse outcomes in addition to PCOS-status.
The potential impact of ethnicity on pregnancy outcomes in PCOS.
The role of prevention in pregnant women with PCOS.
Cost effectiveness of recommendation.

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Many studies, robust evidence.

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Language is important and stigma should be avoided.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	X☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Strong and robust evidence across the globe about general increase in pregnancy complications.

Evidence is rated low due to data coming from observational studies but this type of study design is appropriate for the question.

Six outcomes were predefined as critical.

Eclampsia is one of them. Only two studies and very few events. Graded as very low certainty.

The others were graded as low to moderate certainty.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☒ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

No disagreements.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☒ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Higher cost to screen for adverse outcomes in pregnancies of women with PCOS.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

No judgement could be made.

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Increased screening for pregnancy complications will increase equity.

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Funders may be against increased screening and increasing interventions.

More anxiety in relation to pregnancy, delivery and post-partum is also a potential scenario.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Funders may be against increased screening and increasing interventions.

5. STUDY CHARACTERISTICS TABLE

Author, year, country	Population/ Setting	Study Design	PCOS criteria	Sample Size per group (analysed)	Intervention/ exposure	Comparison/ control	Follow up Duration	Outcomes	Summary of findings	Risk of Bias
Jamal, 2012, Iran	Women with PCOS attending infertility outpatient clinic	RCT (single-blind)	> 8 subcapsular follicles 3-9 mm diameter and oligo-menorrhea or hirsutism or testosterone >2 nmol/L); all were taking metformin before study entry	N= 35 metformin; n= 35 aspirin; n=35 no intervention	Metformin 2000 mg/d	Aspirin (80 mg/d) ***OR*** No intervention	12 weeks GA to delivery	Uteroplacental circulation; GDM; PE; PTB; IUGR; birthweight (primary NR)	Reduced uteroplacental circulation with metformin or aspirin compared with placebo but no effects on other outcomes	High (all outcomes)
Begum, 2009, Bangladesh	Women with PCOS taking metformin + ovulation inducing agent attending infertility care centre	RCT (blinding NR)	Rotterdam 2003	N= 29 continued metformin through pregnancy N= 30 discontinued metformin at 8 wk GA	Continuation of metformin until delivery (1500-2500 m/d);+ ovulation induction 6-12 mo preconception	Discontinuation of metformin at 8 wk GA);+ ovulation induction 6-12 mo pre-conception	6-12 months pre-conception to delivery	GDM*; Abortion rate*; Live birth rate*; Congenital anomaly*; Condition of newborn at birth*; Birthweight; neonatal death; PTB; GA; birth asphyxia; LBW; macrosomia	GDM incidence, birth asphyxia and birthweight were lower and APGAR at 5 min higher with metformin use in pregnancy. No difference in abortion, LBW, GA, PTB, congenital anomalies. One neonatal death in controls.	High (all outcomes)
Lovvik, 2019, Norway	Women aged 18-45 with PCOS; at 6 to 12+6 weeks GA; singleton	DB, PC, RCT	Rotterdam 2003	N= 238 metformin N= 240 placebo (variable for different outcomes)	Metformin 1000 mg/d at week 1 then 2000 mg/d for the rest of pregnancy	Placebo	Median 10-11 weeks GA to delivery	Composite incidence of late miscarriage (week 13 - 22 + 6) and PTB (week 23 - 36 + 6)*. GDM preeclampsia, hypertension treatment with vaginal progesterone to prevent PTB, vaginal bleeding during pregnancy, admission to hospital; NICU admission + number of days, GWG, birthweight, length, head circumference, 5-min Apgar, cord pH, malformations.	In pregnant women with PCOS, metformin treatment from the late first trimester until delivery might reduce the risk of late miscarriage and preterm birth, but does not prevent gestational diabetes.	Low (primary outcomes) Moderate (secondary/ post-hoc outcomes)
Morin-Papunen, 2012, Finland	Women with PCOS and anovulatory infertility	DB, PC, RCT	Rotterdam 2003	During pregnancy: N= 79 metformin N= 56 placebo	Metformin 500 mg/d in wk 1, increased by 500 mg/d weekly steps up to 1500 mg/d in non-obese and 2000 mg/d in obese women; for max 9 months (or until GW 12). After 3 months, if no pregnancy, CC was added; if ovulating, CC continued with met or placebo for 4-6 cycles or until 12 GW; if no	Placebo	Preconception until 12 weeks GA	Early pregnancy loss (miscarriage)*; pregnancy rate and live birth rate	3 months metformin pre-treatment improves pregnancy rate in obese women, and live birth rate in obese and non-obese women, with anovulatory infertility	Low (primary outcomes) Moderate (secondary/ post-hoc outcomes)

					pregnancy, aromatase inhibitors or gonado-trophins were used. For male infertility, IVF/ICSI was used.					
Vanky, 2004, Norway	Women aged 18-40 with PCOS pre-pregnancy; GA 5-12 wk; singleton	DB, PC, RCT	Rotterdam 2003	N= 17 metformin N= 21 placebo	Metformin 850 mg/d at week 1 then 1700 mg/d for the rest of pregnancy	Placebo	5-12 weeks GA (mean 7-8.5 weeks) until delivery	DHEAS*, androstenedione*, testosterone*, SHBG*, free testosterone*, pregnancy outcomes and complications	Severe pregnancy complications occurred more frequently in the placebo group compared to metformin, with no change in androgens	Low (primary outcomes) Moderate (secondary/ post-hoc outcomes)
Vanky, 2010, Norway	Women aged 18-45 with PCOS pre-pregnancy; GA 5-12 wk; singleton	DB, PC, RCT	Rotterdam 2003	N= 135 metformin N= 135 placebo	Metformin 1000 mg/d at week 1 then 2000 mg/d for the rest of pregnancy	Placebo	Mean 10-11 weeks GA to delivery	Prevalence of PE, PTB and GDM and a composite of the three (1 or more)	Metformin treatment from first trimester to delivery did not reduce pregnancy complications in PCOS.	Low (primary outcomes) Moderate (secondary/ post-hoc outcomes)
Zolghadri, 2008, Iran	Women with PCOS + unexplained recurrent abortions (≥3 consecutive) with impaired GTT (75g OGTT 2h 140-200 mg/dl)	Prospective RCT	Chronic oligomenorrhea; clinical/ biochemical hyperandrogenism; >10 follicles 2-10mm diameter; increased ovarian stroma density; excluding other causes.	Of the 29 with recurrent abortions and impaired GTT; only 7 had PCOS. N=4 metformin, N=3 placebo	Metformin 1500 mg/d	Placebo	Preconception until delivery (timing preconception NR)	Normal ongoing pregnancies ≥14 weeks*, and absence or presence of anomaly in the baby after delivery *	Abortion rate decreased with metformin compared with placebo in women without PCOS but this was not significant in women with PCOS.	High (all outcomes)

* denotes primary outcomes defined in individual studies. DB, double-blind; GA, gestational age; GTT, glucose tolerance test; LBW, low birthweight; OGTT, oral glucose tolerance test; PC, placebo-controlled; PCOS, polycystic ovary syndrome; PTB, preterm birth; RCT, randomised controlled trial

6. FINDINGS

Comparisons included:

- **Comparison 1:** Metformin versus Placebo / or Control

Outcomes included:

- **Outcome 1.** GDM
- **Outcome 2.** Fasting glucose
- **Outcome 3.** Two-hour glucose
- **Outcome 4.** Hypertension in pregnancy
- **Outcome 5.** Pre-eclampsia
- **Outcome 6.** Preterm birth
- **Outcome 7.** Miscarriage
- **Outcome 8.** Gestational weight gain
- **Outcome 9.** Gestational age at delivery
- **Outcome 10.** Neonatal hypoglycaemia
- **Outcome 11.** Neonatal birthweight
- **Outcome 12.** Low birth weight
- **Outcome 13.** Macrosomia
- **Outcome 14.** Neonatal length
- **Outcome 15.** Neonatal head circumference
- **Outcome 16.** APGAR score
- **Outcome 17.** Neonatal icterus/ jaundice
- **Outcome 18.** Fetal malformations
- **Outcome 19.** Neonatal/ perinatal death
- **Outcome 20.** Asphyxia/ respiratory distress

COMPARISON 1: Metformin versus Placebo / or Control

▪ EVIDENCE SUMMARY:

Seven studies compared metformin versus placebo or control in pregnant women with PCOS, of which three had a high risk of bias and the remaining had a low risk for the primary outcomes (moderate risk for post-hoc or secondary outcomes). Only two of the seven RCTs were not placebo-controlled. For these two studies, one compared metformin with aspirin or no intervention, where only the no intervention comparator was used in this analysis (Jamal et al. 2012); and the other compared metformin continuation in pregnancy with discontinuation at 8 weeks gestation (Begum et al. 2009). Where applicable, sensitivity analyses were performed to exclude these two studies from the overall analysis to examine their impact on results.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Pooled analysis showed that treatment with metformin resulted in a lower incidence of preterm birth (<37 weeks) and gestational age at delivery, less gestational weight gain, and larger neonatal head circumference, compared with placebo or control/no intervention. There were no differences in glycaemic measures including GDM, or in preeclampsia, neonatal anthropometry, or any measures of fetal well-being. Effects did not vary meaningfully in sensitivity analyses of only placebo-controlled RCTs. Certainty in the evidence was high for preterm birth and gestational age at delivery but low to moderate for the remaining outcomes, due mainly to downgrading for risk of bias (high or moderate risk of bias for studies or outcomes), inconsistency due to heterogeneity and/or varying estimates, and indirectness for some outcomes which used different cut-offs/criteria or tools to assess outcome measures.

Outcome or Subgroup	Studies	n	Effect Estimate; MD or OR [95% CI]	P	Favours	Certainty
Gestational diabetes (GDM)	6	990	0.76 [0.40, 1.44]	0.4	No difference	⊕⊕◯◯ LOW
Fasting glucose (24-36 wk) [mmol/L]	3	706	-0.03 [-0.20, 0.15]	0.8	No difference	⊕⊕◯◯ LOW
Two-hour post-OGTT glucose (24-36 wk) [mmol/L]	3	622	0.05 [-0.17, 0.27]	0.7	No difference	⊕⊕⊕◯ MODERATE
Hypertension in pregnancy	3	791	1.12 [0.62, 2.02]	0.7	No difference	⊕⊕◯◯ LOW
Pre-eclampsia	5	942	0.74 [0.36, 1.50]	0.4	No difference	⊕⊕◯◯ LOW
Preterm birth	6	1017	0.48 [0.28, 0.82]	**0.007**	**Metformin** (lower with MET)	⊕⊕⊕⊕ HIGH
Miscarriage	5	949	0.65 [0.32, 1.32]	0.2	No difference	⊕⊕◯◯ LOW
Gestational weight gain [kg]	3	700	-1.65 [-2.90, -0.40]	**0.01**	**Metformin** (lower with MET)	⊕⊕⊕◯ MODERATE
Gestational age at delivery [weeks]	5	953	0.31 [0.06, 0.56]*	**0.02**	**Metformin** (higher with MET)	⊕⊕⊕⊕ HIGH
Neonatal hypoglycaemia	3	777	1.28 [0.40, 4.05]	0.7	No difference	⊕⊕◯◯ LOW
Neonatal birthweight [g]	6	1005	40.92 [-72.23, 154.06]	0.5	No difference	⊕⊕◯◯ LOW
Low birth weight	5	940	0.88 [0.49, 1.57]	0.7	No difference	⊕⊕⊕◯ MODERATE
Macrosomia	5	940	1.00 [0.71, 1.40]	1.0	No difference	⊕⊕⊕◯ MODERATE
Neonatal length [cm]	3	770	0.33 [-0.13, 0.79]	0.2	No difference	⊕⊕⊕◯ MODERATE
Neonatal head circumference [cm]	3	775	0.47 [0.20, 0.74]	**0.0007**	**Metformin** (higher with MET)	⊕⊕⊕◯ MODERATE
APGAR score	5	908	-0.02 [-0.15, 0.11]	0.8	No difference	⊕⊕⊕◯ MODERATE
Neonatal icterus/ jaundice/ hyperbilirubinemia	3	778	0.78 [0.41, 1.48]	0.4	No difference	⊕⊕⊕◯ MODERATE

3	RCT	serious[1]	no serious inconsistency	no serious indirectness	no serious imprecision	none	18/ 388 (4.6%)	23/ 390 (5.9%)	OR 0.78 [0.41, 1.48]	No difference	⊕⊕⊕◯ MODERATE	CRITICAL
Outcome: Fetal malformations												
2	RCT	serious[1]	serious[2]	no serious indirectness	no serious imprecision	none	12/ 379 (3.2%)	11/ 381 (2.9%)	OR 1.13 [0.38, 3.38]	No difference	⊕⊕◯◯ LOW	IMPORTANT
Outcome: Neonatal/ perinatal death												
3	RCT	serious[1]	serious[2]	no serious indirectness	no serious imprecision	none	2/ 379 (0.5%)	1/ 378 (0.3%)	OR 1.01 [0.17, 5.87]	No difference	⊕⊕◯◯ LOW	IMPORTANT
Outcome: Asphyxia/ respiratory distress												
4	RCT	serious[1]	no serious inconsistency	serious[3]	no serious imprecision	none	15/ 417 (3.6%)	26/ 419 (6.2%)	OR 0.64 [0.33, 1.24]	No difference	⊕⊕◯◯ LOW	IMPORTANT

[1] Downgraded once due to high or moderate risk of bias for some studies or outcomes
[2] Downgraded once for inconsistency due to variations in effect estimate directions and/or CIs, or heterogeneity as determined by the I^2 statistic
[3] Downgraded once for indirectness due to the use of different criteria and/or tools/ methods across included studies
[4] Downgraded once for including high risk studies, then upgraded once since the effect persisted in sensitivity analysis which included only the low risk of bias studies
[5] Upgraded once if the effect was not meaningfully changed when indirectness was addressed through sensitivity analysis
*fixed effect model used since the unit of age is measured consistently across studies

Appendix 1. Full List of Excluded Studies from Main Systematic Review Search

	Author	Year	Title	Reason for exclusion
1.	Singh I.	2001	Increased pregnancy rates with metformin and clomiphene citrate in non-obese patients with polycystic ovary syndrome: prospective randomized study	Conference Abstract
1.	Letonturier P.	2001	[Gestational diabetes: an alternative to insulin therapy?].	No full text available
2.	Lao T.	2001	A randomised controlled pilot study of the management of gestational impaired glucose tolerance.	Letter to Editor
3.	George S.S.	2003	Sequential treatment of metformin and clomiphene citrate in clomiphene-resistant women with polycystic ovary syndrome: a randomized, controlled trial	Not during pregnancy
4.	Palomba S.	2004	Metformin administration versus laparoscopic ovarian diathermy in clomiphene citrate-resistant women with polycystic ovary syndrome: a prospective parallel randomized double-blind placebo-controlled trial.	Not during pregnancy
5.	Glueck C.J.	2004	Height, weight, and motor-social development during the first 18 months of life in 126 infants born to 109 mothers with polycystic ovary syndrome who conceived on and continued metformin through pregnancy	Not randomised
6.	Palomba S.	2005	Prospective parallel randomized, double-blind, double-dummy controlled clinical trial comparing clomiphene citrate and metformin as the first-line treatment for ovulation induction in nonobese anovulatory women with polycystic ovary syndrome.	Not during pregnancy
7.	Moore L.E.	2005	A randomized trial of metformin compared to glyburide in the treatment of gestational diabetes.	Conference abstract
8.	Hwu Y.M.	2005	Ultra-short metformin pretreatment for clomiphene citrate-resistant polycystic ovary syndrome.	Not during pregnancy
9.	Vanky E.	2006	Metformin reduces pregnancy complications in PCOS women- could increased flow in the uterine arteries be an explanation? - Results of a prospective, randomized, double-blind study	Duplicate
10.	Moll E.	2006	Effect of clomifene citrate plus metformin and clomifene citrate plus placebo on induction of ovulation in women with newly diagnosed polycystic ovary syndrome: randomised double blind clinical trial.	Not during pregnancy
11.	Anonymous	2006	Metformin use during pregnancy does not increase the risk of major malformation	Letter/ Commentary
12.	Rowan J.	2007	A trial in progress: gestational diabetes. Treatment with metformin compared with insulin (the Metformin in Gestational Diabetes [MiG] trial).	
13.	Qublan, H.S.	2007	Dietary intervention versus metformin to improve the reproductive outcome in women with polycystic ovary syndrome. A prospective comparative study.	Not during pregnancy
14.	Ogunyemi D.	2007	Comparison of glyburide versus insulin in management of gestational diabetes mellitus	Letter to Editor; metformin not used
15.	Feig D.S.	2007	Oral antidiabetic agents in pregnancy and lactation: a paradigm shift?	Narrative review
16.	Carlsen S.M.	2007	Homocysteine levels are unaffected by metformin treatment in both nonpregnant and pregnant women with polycystic ovary syndrome.	No outcomes of interest
17.	Stridsklev S.	2008	Histopathological examination of pcos placentas - metformin or placebo in pregnancy	Conference Abstract
18.	Moore L.E.	2008	A randomized controlled trial of metformin and glyburide in gestational diabetes.	Conference abstract
19.	-	2008	Metformin (alone or with insulin) was as effective as insulin for preventing perinatal complications in gestational diabetes.	Duplicate of Xiong 2018 excluded study
20.	Zain M.M.	2009	Comparison of clomiphene citrate, metformin, or the combination of both for first-line ovulation induction, achievement of pregnancy, and live birth in Asian women with polycystic ovary syndrome: a randomized controlled trial	Not in pregnancy
21.	Wensel T.M.	2009	Role of metformin in the treatment of gestational diabetes	Review
22.	Johnson N.P.	2009	PCOSMIC-polycystic ovarian syndrome, metformin for infertility with clomiphene: a multi-centre double-blind randmised controlled trial	Conference abstract (and PCOSMIC was not performed during pregnancy)
23.	Rowan J.	2010	Glycemia and its relationship to outcomes in the metformin in gestational diabetes trial.	Observational assessment of baseline MiG data
24.	Martinez P.	2010	A randomized study comparing metformin and insulin in the treatment of gestational diabetes mellitus. Interim results.	Conference Abstract
25.	Irct 201011295272N	2010	The effect of metformine on the uteroplacental circulation in comparison with Aspirin in pregnant women with poly cystic ovary syndrome.	Protocol
26.	Carlsen S.M.	2010	Metformin influence on hormone levels at birth, in PCOS mothers and their newborns.	Sub-analysis of included trial
27.	Abu Hashim H.	2010	N-acetyl cysteine plus clomiphene citrate versus metformin and clomiphene citrate in treatment of clomiphene-resistant polycystic ovary syndrome: a randomized controlled trial	Not during pregnancy
28.	Li C.	2011	Prognostic value of total testosterone for pregnancy during treatment in patients with clomiphene-citrate-resistant polycystic ovary syndrome: a pilot study.	Not during pregnancy
29.	De Leo V.	2011	The administration of metformin during pregnancy reduces polycystic ovary syndrome related gestational complications.	Not randomised
30.	Davar R.	2011	Metformin-letrozole in comparison with Metformin-clomiphene citrate in clomiphene-resistance PCOS patients undergoing IUI.	Not during pregnancy/ metformin used in both groups
31.	Abu Hashim H.	2011	Combined metformin and clomiphene citrate versus laparoscopic ovarian diathermy for ovulation induction in clomiphene-resistant women with polycystic ovary syndrome: a randomized controlled trial	Not during pregnancy
32.	Vanky E.	2012	Breast size increment during pregnancy and breast feeding in PCOS mothers: A follow-up study of a randomized controlled trial on metformin vs. placebo	Conference abstract

33.	Vanky E.	2012	Breast size increment during pregnancy and breast feeding in PCOS mothers: A follow-up study of a randomized controlled trial on metformin vs. placebo	Conference abstract
34.	Vanky E.	2012	Metformin-effect on newborn head size, maternal and infant weight development: A follow-up study of an RCT on PCOS	Conference Abstract
35.	Navali N.	2012	Comparing therapeutic effects of Metformin and Pioglitazone in Polycystic ovary syndrome (PCOS).	Not during pregnancy
36.	Ghasemi N.	2012	Effectiveness of Metformin in treatment of infertility and recurrent pregnancy loss in polycystic ovarian syndrome	Conference Abstract
37.	Carlsen S.M.	2012	Metformin effect on newborn head size, maternal and infant weight gain: a follow-up study of an RCT on PCOS.	Conference Abstract
38.	Bahado-Singh R	2012	Fetal male gender and the benefits of treatment of mild gestational diabetes mellitus.	Not using metformin
39.	Ainuddin J.	2012	Metformin: A safe alternative to insulin therapy in gestational diabetes.	Conference Abstract
40.	Zinnat A.N.	2013	Can metformin be used in place of insulin for the treatment of GDM for low resource countries?	Conference abstract
41.	Mesdaghinia, E.	2013	Comparison of newborn outcomes in women with gestational diabetes mellitus treated with metformin or insulin: A randomised blinded trial.	Conference Abstract
42.	Hosseini M.A.	2013	Metformin treatment in different phenotypes of polycystic ovary syndrome.	Not during pregnancy
43.	Glueck C.J.	2013	Effects of metformin-diet intervention before and throughout pregnancy on obstetric and neonatal outcomes in patients with polycystic ovary syndrome	Not randomised
44.	Gatford K.L.	2013	Vitamin B<inf>12</inf> and homocysteine status during pregnancy in the metformin in gestational diabetes trial: Responses to maternal metformin compared with insulin treatment.	Duplicate
45.	Battin M.R.	2013	Neurodevelopmental outcome at 24-months in children following a randomized trial of metformin versus insulin treatment for gestational diabetes (mig trial).	
46.	Barrett H.L.	2013	Maternal and neonatal circulating markers of metabolic and cardiovascular risk in the metformin in gestational diabetes (MiG) trial: responses to maternal metformin versus insulin treatment.	
47.	Abd Elgafor I.	2013	Efficacy of combined metformin-letrozole in comparison with bilateral ovarian drilling in clomiphene-resistant infertile women with polycystic ovarian syndrome	Duplicate MiG Abstract
48.	Reyes-Munoz	2014	Medical nutrition therapy plus metformin for preventing gestational diabetes among high-risk women.	Conference abstract
49.	Coiner J.	2014	The treatment of diabetes in pregnancy; metformin vs glyburide and insulinebiomedical evidence of fetopathy	Conference Abstract and no outcomes of interest
50.	Christiansen SC	2014	The effect of exercise and metformin treatment on circulating free DNA in pregnancy.	No outcomes of interest
51.	Ardilouze J.L.	2014	Gestational diabetes mellitus: A randomized study comparing insulin therapy to a combination of half-maximal dosages of metformin and glyburide	Abstract / Poster EASD
52.	Ardilouze J.L.	2014	Gestational diabetes mellitus: The first prospective randomised study of metformine-glyburide vs insulin	Abstract Poster
53.	Ardilouze J.L.	2014	Gestational diabetes mellitus: A randomized study comparing insulin therapy to a combination of half maximal dosages of metformin and glyburide.	Conference Abstract
54.	Wali A.	2015	A phase-three, open-label randomized controlled trial to compare the efficacy of oral hypoglycemic agents with insulin in the treatment of gestational diabetes mellitus	Conference Poster
55.	Thom E.A.	2015	A randomised study of metformin versus insulin in gestational diabetes: early childhood outcomes	Mini Commentary
56.	Smith J.	2015	Metformin improved lipid profiles in women with gestational diabetes in the first six weeks postpartum	Conference Abstract
57.	Refuerzo J.S.	2015	The effects of metformin on weight loss in women with gestational diabetes: a pilot randomized, placebo-controlled trial.	Not during pregnancy
58.	Nachum Z.	2015	A comparison between two oral hypoglycemics: Glyburide and metformin and their combination for the treatment of gestational diabetes mellitus e a prospective randomized controlled study.	Conference Abstract
59.	Li S.S.	2015	Metformin and auxiliary acupuncture in the treatment of obese women infertility with polycystic ovary syndrome for 75 cases	Not during pregnancy
60.	De Bacco G.	2015	High rate of hypoglycemia in diabetic pregnant women on use of glyburide.	Conference Abstract
61.	Carroll D.M.	2015	In women with gestational diabetes requiring drug treatment, glibenclamide may be inferior to insulin and metformin: Metformin (plus insulin when required) performs better than insulin.	Commentary
62.	-	2015	Does maternal body mass index influence treatment effect in women with mild gestational diabetes?	Duplicate of Huhtala 2018 included study
63.	-	2015	Neurodevelopment of Two-Year-Old Children Exposed to Metformin and Insulin in Gestational Diabetes Mellitus.	Not using metformin
64.	Trouva A.	2016	Thyroid hormone function in pregnant women with polycystic ovary syndrome treated with metformin or placebo	Conference Abstract
65.	Tamer L.H	2016	Effect of metformin on the thyroid function in pregnant women with PCOS	Conference Abstract
66.	Steurer J.	2016	Metformin has no effect on median birth weight score in pregnant non-diabetic women with BMI >35	Full text not available
67.	Mumby C.	2016	Randomised controlled trial of metformin treatment versus standard diabetes antenatal care in women with mild fasting hyperglycaemia diagnosed in pregnancy: A pilot study.	Conference Abstract
68.	Huang W.	2016	Comparison of clomiphene citrate and letrozole for ovulation induction in women with polycystic ovary syndrome: A prospective randomized trial.	Conference Abstract
69.	Feig D.S.	2016	Metformin in women with type 2 diabetes in pregnancy (MiTy): a multi-center randomized controlled trial.	Protocol
70.	Dunne F.	2016	EMERGE: A randomized placebo controlled trial of early metformin in addition to usual care in the reduction of gestational diabetes mellitus effects.	Conference Abstract
71.	Balani J.	2016	Metformin versus Placebo in Obese Pregnant Women without Diabetes.	Letter to the Editor
72.	Wouldes T.	2017	Neurodevelopmental Outcome at 2 Years in Offspring of Women Randomised to Metformin or Insulin Treatment for Gestational Diabetes	Duplicate of Wouldes 2016
73.	Underdal M.O.	2017	Metabolic health in women with PCOS-5-11 years' followup after metformin or placebo in pregnancy	Conference Poster

74.	Singh N.	2017	Efficacy of metformin in improving glycaemic control & perinatal outcome in gestational diabetes mellitus: A non-randomized study	non-randomised
75.	Rezk M.	2017	Clomiphene citrate combined with metformin versus letrozole for induction of ovulation in clomiphene-resistant polycystic ovary syndrome: a randomized clinical trial.	Duplicate
76.	Reynolds R.M.	2017	Glibenclamide and metfoRmin versus stAndard care in gEstational diabeteS (GRACES): a feasibility open label randomised trial	No control group: Both groups receiving metformin
77.	Huhtala Y.M.	2017	Amino acid profile in metformin vs insulin treated women with gestational diabetes	Conference Abstract
78.	Hoffman C.B.	2017	Effect of metformin in the lipid profile of the obese pregnant women.	Conference Abstract
79.	Hjorth-Hansen A	2017	Head size and growth in utero and at birth in metformin exposed children born to mothers with PCOS-a randomized controlled trial	Conference Abstract
80.	Hanem L.G.E.	2017	Intrauterine metformin exposure influences offspring growth,-a 4-year follow-up of children born to mothers with polycystic ovary syndrome.	Conference Abstract of included study: Hanem 2018
81.	-	2017	Amino acid profile in metformin vs insulin treated women with gestational diabetes.	Conference Abstract
82.	Zhen X.M	2018	Longer-term outcomes in offspring of GDM mothers treated with metformin versus insulin	Review
83.	Xiong K.	2018	Clinical efficacy of metformin combined with clomiphene in patients with polycystic ovary syndrome and their effect on serum sex hormones	Not in pregnancy
84.	Tahseen S.	2018	Comparison of metformin versus insulin in females presenting with gestational diabetes during third trimester of pregnancy	Conference Abstract
85.	Souza M.	2018	Use of metformin for prevention of unfavorable obstetric outcomes in obese pregnant women	Conference Abstract
86.	Rezk M.	2018	Clomiphene citrate combined with metformin versus letrozole for induction of ovulation in clomiphene-resistant polycystic ovary syndrome: a randomized clinical trial	Not during pregnancy: for ovulation
87.	Lovvik T.S.	2018	Metformin treatment of pregnant women with polycystic ovary syndrome-a randomized, nordic multi-center trial.	Conference Abstract
88.	Huhtala Y.M.	2018	Inflammation markers and insulin like growth factor binding protein 1 in women with gestational diabetes treated with metformin or insulin	Conference abstract
89.	Hughes R.C	2018	Prediabetes in pregnancy, can early intervention improve outcomes? A feasibility study for a parallel randomised clinical trial.	No control group; metformin and insulin provided in both groups and early versus standard care assessed
90.	Ghomian N.	2018	The efficacy of metformin compared with insulin in regulating blood glucose levels during gestational diabetes mellitus: a randomized clinical trial.	Duplicate
91.	Gajardo F.M.	2018	Diet versus metformin plus diet for the treatment of mild gestational diabetes in obese patients.	Conference Abstract
92.	Dodd J.M.	2018	Metformin and dietary advice for pregnant women who are overweight or obese to promote gestational restriction of weight-the grow randomized trial.	Conference Abstract
93.	Dodd J.M.	2018	Metformin for women who are overweight or obese during pregnancy for improving maternal and infant outcomes	Conference Abstract
94.	Dienstmann G.	2018	Effect of metformin hydrochloride in the lipid profile and body mass index of obese pregnant women.	Conference Abstract
95.	Das V.	2018	Metformin vs insulin for management of gestational diabetes mellitus in developing nations: RCT.	Conference Abstract
96.	Anzolin G.	2018	Use of metformin prophylatic in gestacional diabetes mellitus	Letter/ Commentary

APPENDIX 2. QUALITY APPRAISAL OF RANDOMISED CONTROLLED TRIALS

Study ID	Begum 2008	
Study Citation	Begum MR, Khanam NN, Quadir E, et al. Prevention of gestational diabetes mellitus by continuing metformin therapy throughout pregnancy in women with polycystic ovary syndrome. *J Obstet Gynaecol Res*. 2009;35(2):282-286. doi:10.1111/j.1447-0756.2008.00876.x	
Study Country	Bangladesh	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS and CC resistance and insulin resistance who conceived while taking metformin	
PCOS diagnostic criteria	Rotterdam criteria	
Presence of infertility	Yes, no ovulation with 150 mg CC daily for 5 days (D3-D7) for 2 consecutive cycles (defined as CC resistant)	
Presence of other condition/s	Insulin resistance defined by HOMA-IR but non-diabetic	
Medication History	Not reported	
N per group	Allocated/ randomised: 59 (attrition not reported) Assessed at end of study: 59 (attrition not reported)	
Setting	Infertility Care Centre	
Intervention	**Continuation of Metformin until delivery** at a dose of 1500 mg daily for BMI ≤29; 2000 mg daily for BMI 30-32 and 2500 mg daily for BMI >32 (ovulation induction agents + metformin were provided for 6-12 months preconception until pregnancy)	
Comparison	**Discontinuation of Metformin at 8 weeks gestation** (ovulation induction agents + metformin were provided for 6-12 months preconception until pregnancy)	
Outcomes (primary and other) with definition (e.g. self-reported, fasting etc.)	**Primary**: GDM; Abortion rate; Live birth rate; Congenital anomaly; Condition of newborn at birth. **Other**: Birthweight; neonatal death; preterm birth; gestational age; birth asphyxia; low birthweight; macrosomia	
Follow up Duration	Preconception to delivery	
Summary Result/s	GDM incidence, birth asphyxia were lower in women continuing metformin (significance not clear). Birthweight was lower and APGAR at 5 min higher with continuing metformin use in pregnancy, statistically significant ($p<0.05$) No difference in abortion, low birthweight, gestational age, preterm labour or congenital anomalies. One neonatal death in controls- significance not clear.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Partial- Describes aim to determine whether metformin reduces GDM but primary outcomes include a range of outcomes not specific to GDM
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	No explicit criteria reported

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Not reported
Inclusion criteria		Yes Partial No Not reported	Partial- Non-diabetic on OGTT, CC-resistant, insulin resistant (HOMA; cut-off not specified), with PCOS using Rotterdam.
Exclusion criteria		Yes Partial No Not reported	Not reported
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	States patients were divided by lottery method but no further detail provided (i.e., by whom, how?)
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported but likely not since the controls did not take placebo
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Not reported but likely not since the controls did not take placebo
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Not reported
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Not clear from the paper, as not double-blinded or controlled with placebo
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Two hour postprandial sugar used to determine GDM with no further information on cut-off/ criteria; whether this was during OGTT or post-meal, etc. Other measures not described at all.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Attrition not reported

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Attrition not reported and no mention of ITT
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	No- Difficult to determine since there is no protocol. Would likely be 'No' because for example it is reported that there were no differences in baseline characteristics but then in Table 1, there is a statistically significant difference in age between groups. Also pre-eclampsia mentioned in discussion but no data or results provided for this outcome.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Partial- Metformin group was older and had lower LH at baseline
	If confounding was present, was it controlled for?	Yes Partial No Not reported	No- No Adjustment for age differences
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	No- no power calculation or protocol
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial- potential confounders were not taken into account in the analysis; no protocol with predetermined primary outcomes
COMMENTS		Lack of blinding and no placebo control are key reasons for high RoB; also cannot determine conflicts of interest or attrition; poor analysis and reporting of study methods and results, groups not balanced at baseline, and no explicit criteria for exclusion, criteria for diagnoses (eg.GDM) or detail around randomization methods	
What is the overall risk of bias?		Low Moderate High Insufficient information	High due to the above
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No – all outcomes high risk of bias	

Study ID	Jamal 2012	
Study Citation	Jamal A, Milani F, Al-Yasin A. Evaluation of the effect of metformin and aspirin on utero placental circulation of pregnant women with PCOS. Iran J Reprod Med, 2012. 10 (3); 265-270.	
Study Country	Iran	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS attending infertility clinic	
PCOS diagnostic criteria	More than 8 subcapsular follicles of 3-9mm diameter and oligomenorrhea (> 35 days or hirsutism or testosterone >2 nmol/L) and all women took metformin before study entry.	
Presence of infertility	Not reported but assumed as patients were attending infertility clinic	
Presence of other condition/s	Not reported	
Medication History	Not reported; except patients were taking 1mg folate, one multivitamin tablet and one ferrous sulfate tablet	
N per group	Allocated/ randomised: 105; Assessed at end of study: 105 (no patients discontinued or lost to follow up or excluded according to CONSORT; all zero)	
Setting	Infertility outpatient clinic at University Hospital	
Intervention	**Metformin** (two tablets twice daily, 2000 mg) until the end of pregnancy	
Comparison	**Aspirin** (one tablet 80 mg daily) or **No intervention** until the end of pregnancy	
Outcomes (primary and other) with definition (e.g. self-reported, fasting etc.)	Uteroplacental circulation and pregnancy complications (unclear which is primary), including GDM, PE, preterm labour and IUGR	
Follow up Duration	6-12 weeks until delivery	
Summary Result/s	Mean uterine pulsatility index reduced in all groups but was more pronounced in metformin and aspirin groups than controls. No differences in any pregnancy complications assessed (GDM, PE, PTB, IUGR, birthweight)	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Only inclusion criteria reported
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Only inclusion criteria reported
Inclusion criteria	Yes Partial No Not reported	Diagnosis of PCOS before the pregnancy; age 18-40 years; gestational age 6-12 weeks; single viable fetus; and no history of diabetes or hypertension.

Exclusion criteria		Yes Partial No Not reported	Not reported
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Not reported
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Single blinded- not sure which side- no mention of how concealment was achieved if done (except for ultrasound exams)
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Single blinded- not sure which side
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Single blinded- not sure which side
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	No, some women received insulin, some diet controlled GDM, not stratified analysis
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Examiner was blinded to group status during ultrasound examinations
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	GDM criteria not specified
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Only noted for ultrasound- unclear about other measures
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% treatment 0% control/ comparison Not reported	Apparent perfect retention- all zero for drop outs, exclusions or loss to follow up
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Apparent perfect retention- all zero for drop outs, exclusions or loss to follow up
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	No - Difficult to determine since there is no protocol. Would likely be 'No' because for example it is reported that there were no differences in baseline characteristics with reference to Figure 1, but this does not state any baseline characteristic data.

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Cannot be determined, says in the text that groups were homogenous for BMI, age and gravidity and refers to Figure 1, which is a CONSORT with no baseline data!
	If confounding was present, was it controlled for?	Yes Partial No Not reported	No- No stratified analysis for different GDM treatments or adjustment for insulin use or any other potentially confounding/ effect modifying variable
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	No- no power calculation or protocol, unlikely powered for GDM and adverse outcomes and not clear for uterine artery pulsatility
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial- potential confounders were not taken into account in the analysis; no protocol with predetermined primary outcomes
COMMENTS		Lack of blinding and no placebo control are key reasons for high RoB; also cannot determine conflicts of interest; perfect attrition seems unlikely; lacking analysis and study methods, unclear if groups were balanced at baseline, and no explicit criteria for exclusion or detail around randomization or allocation concealment methods	
What is the overall risk of bias?		Low Moderate High Insufficient information	High due to the above
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No – all outcomes high risk of bias	

Study ID	Zolghadri 2008	
Study Citation	Zolghadri J, Tavana Z, Kazerooni T, Soveid M, Taghieh M. Relationship between abnormal glucose tolerance test and history of previous recurrent miscarriages, and beneficial effect of metformin in these patients: a prospective clinical study. *Fertil Steril*. 2008;90(3):727-730. doi:10.1016/j.fertnstert.2007.06.079	
Study Country	Iran	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with history of recurrent spontaneous abortion and women with a history of normal full term pregnancy, with and without PCOS	
PCOS diagnostic criteria	Chronic oligomenorrhea (≤6 menses/ year); clinical and biochemical hyperandrogenism (hirsutism, severe acne, high levels of total or free testosterone, androstenedione and DHEAS); exclusion of hypothyroidism, hyperprolactinemia, and congenital adrenal hyperplasia; ancillary criteria: presence of >10follicles of 2-10mm diameter and increased density of ovarian stroma in transvaginal sonography.	
Presence of infertility	Included women with history of unexplained recurrent spontaneous abortions (RSA): ≥3 consecutive abortions with normal karyotype, hormonal assay (thyroid function + PRL), hysterosalpingogram or hysteroscopy, anticardiolipin antibodies, lupus anticoagulant, PT and PTT.	
Presence of other condition/s	PCOS or no PCOS	
Medication History	Not reported	
N per group	Allocated/ randomised: **Step 1:** 164 RSA and 74 normal allocated. **Step 2:** 29 RSA women included as PCOS (n=7) or non-PCOS (n= 22) and divided into 4 groups. Assessed at end of study: **Step 1:** 162 RSA (2 excluded due to DM)+ 74 normal. **Step 2:** No drop outs reported.(n=29 total; 7 with PCOS)	
Setting	University affiliated hospital	
Intervention	**Metformin** (1500 mg daily) before conception until the end of pregnancy	
Comparison	**Placebo** before conception until the end of pregnancy	
Outcomes (primary and other) with definition (e.g. self-reported, fasting etc.)	Normal ongoing pregnancies ≥14 weeks, and absence or presence of anomaly in the baby after delivery.	
Follow up Duration	Preconception to delivery	
Summary Result/s	Abortion rate decreased with metformin compared with placebo in women without PCOS but this was not significant in women with PCOS.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Partial- Unclear if GTT was an inclusion criteria, also unclear what inclusions/exclusions applied for normal pregnancies

If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	No exclusion except for PCOS diagnosis
Inclusion criteria	Yes Partial No Not reported	Partial- Women with history of unexplained recurrent spontaneous abortions (RSA): ≥3 consecutive abortions with normal karyotype, hormonal assay (thyroid function + PRL), hysterosalpingogram or hysteroscopy, anticardiolipin antibodies, lupus anticoagulant, PT and PTT. Women with at least 2 normal full term pregnancies.
Exclusion criteria	Yes Partial No Not reported	Not reported; except for PCOS criteria to exclude other causes
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes- Computer randomization method
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Partial- Medication were given in a double-blind manner- unclear how this was achieved
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Yes- assumed from the double-blind terminology
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Yes- assumed from the double-blind terminology
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Not reported- unclear if women received any treatment for abnormal GTT
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Not reported- unclear how sugars were assessed or hormones etc. for PCOS diagnosis
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% treatment 0% control/ comparison Not reported	No loss to follow up in group of 29 PCOS of interest to this analysis
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Partial- Not for Step 1, 2 were excluded; for Step 2 which is of interest here, no loss to follow up.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	No - Difficult to determine since there is no protocol, but one of the outcomes - fetal anomaly- was not reported in any results despite being prespecified.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Patient group had more abnormal GTTs than controls. Only age described in relation to step 2 for PCOS comparisons, no other prognostic baseline variables reported such as BMI, etc.
	If confounding was present, was it controlled for?	Yes Partial No Not reported	No- No stratified analysis for different GDM treatments or adjustment for insulin/medication use or any other potentially confounding/ effect modifying variable; sample size was too small for this anyway
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	No- no power calculation or protocol, unlikely powered given the very small sample size
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial- potential confounders were not taken into account in the analysis; no protocol with predetermined primary outcomes; small sample size of only 7 with PCOS
COMMENTS		Cannot determine conflicts of interest; lacking proper analysis and very small sample size, unclear population differences and if groups were balanced at baseline, and no explicit criteria for exclusion or detail around randomization or allocation concealment methods	
What is the overall risk of bias?		Low Moderate High Insufficient information	High due to the above
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No – all outcomes high risk of bias	

Study ID	Vanky 2004	
Study Citation	Vanky E, Salvesen KA, Heimstad R, Fougner KJ, Romundstad P, Carlsen SM. Metformin reduces pregnancy complications without affecting androgen levels in pregnant polycystic ovary syndrome women: results of a randomized study. *Hum Reprod*. 2004;19(8):1734-1740. doi:10.1093/humrep/deh347.	
Study Country	Norway	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS	
PCOS diagnostic criteria	Rotterdam 2003	
Presence of infertility	Assumed for some based on setting for recruitment (infertility outpatient clinic). Also, 10 had IVF/ICSI and 4 received CC	
Presence of other condition/s	Not reported except as per exclusion criteria	
Medication History	Metformin at conception; 1 tablet folate daily + 1 multivitamin; CC at conception (n=4); IVF/ICSI at conception (n=10); no other medication reported.	
N per group	Allocated/ randomised: 40 Assessed at end of study: 38	
Setting	Gynaecological and infertility outpatient clinic at University affiliated hospital	
Intervention	**Metformin** (425mg capsules) at 5-12 weeks until delivery- once daily for Week 1 (850mg) then twice daily for the rest of pregnancy (1700 mg)	
Comparison	**Placebo** at 5-12 weeks until the end of pregnancy	
Outcomes (primary and other) with definition (e.g. self-reported, fasting etc.)	**Primary**: DHEAS, androstenedione, testosterone, SHBG, free testosterone. **Secondary**: pregnancy outcomes and complications	
Follow up Duration	5-12 weeks until delivery (some used metformin preconception and had ≥2 day washout)	
Summary Result/s	Severe pregnancy complications occurred more frequently in the placebo group compared to metformin, with no change in androgens.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No	The inclusion criteria for the study were: (i) diagnosis of PCOS

		Not reported	before the actual pregnancy, (ii) age 18–40 years, (iii) gestational age between 5 and 12 weeks, and a singleton viable fetus judged by ultrasonography.
Exclusion criteria		Yes Partial No Not reported	The exclusion criteria were known liver disease, creatinine >130 mmol/l, known alcohol abuse, previously known diabetes mellitus, fasting plasma glucose >5.6 mmol/l, treatment with oral glucocorticoids or use of drugs known to interfere with metformin.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes- Randomization was performed with sealed envelopes. The envelopes were ordered in a random manner and given a randomization number by a pharmacist who did not belong to the research group. Randomization was performed in blocks of 10 and women were stratified according to whether or not they used metformin at conception.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	As above
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Yes
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Yes
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes- All participants received individual, verbal and written, diet and lifestyle counselling at inclusion. All patients were followed up and treated during pregnancy according to standard antenatal care.
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Yes- A blinded evaluation of all maternal and infant diagnoses was performed by one of the authors
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes- assays reported, criteria reported for GDM and OGTT methods defined.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported- unclear where blood analyses were performed and by whom
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% treatment 0% control/ comparison Not reported	No loss to follow up in group of 29 PCOS of interest to this analysis

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Partial- Not for Step 1, 2 were excluded; for Step 2 which is of interest here, no loss to follow up.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Partial - Difficult to determine since there is no protocol, but primary and secondary outcomes outlined clearly in the paper
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Not applicable for study design and balanced randomisation
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not clearly stated
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	For the primary outcome but sample size is small for other outcomes
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial- no protocol with predetermined primary outcomes; small sample size
COMMENTS		Clearly reported and includes key relevant details. Minor issues only including not being powered for individual pregnancy complications and reporting this as a composite of severe complications	
What is the overall risk of bias?		Low Moderate High Insufficient information	Overall low risk of bias. Moderate risk for pregnancy complications due to being underpowered and no clear protocol or indication of statistical significance of individual complications; also the drop outs were included in the analysis? unclear how this was achieved or why given they withdrew 2 weeks into the study and did not take the study medication
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		Hormones- low risk of bias Secondary outcomes/ pregnancy complications: moderate risk of bias	

Study ID	Vanky 2010	
Study Citation	Vanky E, Stridsklev S, Heimstad R, et al. Metformin versus placebo from first trimester to delivery in polycystic ovary syndrome: a randomized, controlled multicenter study. *J Clin Endocrinol Metab*. 2010;95(12):E448-E455. doi:10.1210/jc.2010-0853	
Study Country	Norway	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS	
PCOS diagnostic criteria	Rotterdam 2003; based on documentation before the actual pregnancy, all diagnosed by a gynaecologist.	
Presence of infertility	Assumed since 13.3 and 15.9% undergoing IVF/ICSI and 29.6 and 22.5 receiving CC treatment at baseline.	
Presence of other condition/s	GDM at inclusion in 7.4 and 9.4% of metformin and placebo groups. Other conditions not reported outside of those mentioned in exclusion criteria.	
Medication History	Metformin at conception; Women who used metformin at conception and in early pregnancy had a washout period of at least 7 d before inclusion in the study. Patients were advised to take 0.8 mg folate daily and one daily multivitamin tablet. Other concomitant medication collected but not reported in main paper.	
N per group	Allocated/ randomised: 274 pregnancies in 258 women (1 excluded after randomization due to 21-hydroxylase deficiency) Assessed at end of study: 270 (3 LFTU and 1 with deficiency as above)	
Setting	11 study centres: three university hospitals, seven local hospitals, and one gynaecological specialist practice.	
Intervention	**Metformin** (500 mg oral tables): one tablet twice daily during the first week (1000mg) and two tablets twice daily (2000 mg) for the rest of the study period.	
Comparison	**Placebo** - matching in the same form as above	
Outcomes (primary and other) with definition (e.g. self-reported, fasting etc.)	**Primary**: prevalence of PE, PTB and GDM and a composite of the three (≥1) **Secondary**: Weight, BP, HR, mode and length of delivery. SAE, including fatal events to mother or baby, life-threatening conditions or events requiring prolonged hospitalisation.	
Follow up Duration	First trimester to delivery	
Summary Result/s	Metformin treatment from first trimester to delivery did not reduce pregnancy complications in PCOS.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To test the hypothesis that metformin use in PCOS pregnancy reduces preeclampsia, preterm delivery, and/or GDM.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes- below
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No	Yes- below

		Not reported	
Inclusion criteria		Yes Partial No Not reported	1) PCOS diagnosed according to the Rotterdam criteria (4), 2) age 18 – 45 yr, 3) gestational age between 5 and 12 wk, and 4) a singleton viable fetus shown on ultrasonography.
Exclusion criteria		Yes Partial No Not reported	Alanine aminotransferase >90 IU/L, serum creatinine >1.70 mg/dl, known alcohol abuse, previously diagnosed diabetes or fasting serum glucose >126 mg/dl at the time point of inclusion, treatment with oral glucocorticoids, or use of drugs known to interfere with metformin.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes- Randomization was performed at the Trondheim University Hospital Pharmacy in blocks of 10 (five metformin and five placebo) and stratified according to metformin use at conception. The method was random drawing of an envelope (ordered in groups of 10: five metformin and five placebo) by two pharmacy employees, one executing the drawing and the other monitoring the drawing.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	The enrolling doctor at the study centres faxed patient details to the university pharmacy. The participants were allotted to placebo or metformin, and the study medication was subsequently mailed to the participants. The participants and care providers were blinded for treatment allocation.
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Yes- The participants and care providers were blinded for treatment allocation.
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Yes- The participants and care providers were blinded for treatment allocation.
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes- All participants received written and individual verbal counselling on diet and lifestyle at inclusion. All patients were advised to take 0.8 mg folate daily and one daily multivitamin tablet
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Yes- One of the authors (R.H.) evaluated and quality checked (blinded) all outcomes and diagnoses. Assumed since all analyses were conducted before the randomization code was broken.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial- Methods used for laboratory or on site analysis of glucose were not specified (assay/ CV/ equipment) to assess reliability
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes- One of the authors (R.H.) evaluated and quality checked (blinded) all outcomes and diagnoses.
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0.7% treatment 2.2% control/ comparison Not reported	1 from metformin and 3 from placebo LFTU/ excluded

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes – ITT for most participants except LFTU for spontaneous abortion
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Yes- although to note, small effects may have been masked by tight and thorough pregnancy follow-up and lifestyle intervention provided to all women
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Power calculation required 152 women in each group but only 135 were analysed. Possibly underpowered for some outcomes.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		Clearly reported and includes key relevant details. Minor issues only including not being powered for individual pregnancy complications and reporting this as a composite of severe complications	
What is the overall risk of bias?		Low Moderate High Insufficient information	Overall low risk of bias. Moderate for post-hoc or secondary outcomes which were not adjusted for multiple testing.
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		Primary outcomes- all low risk of bias Post-hoc analyses or non-primary outcomes- moderate risk of bias	

Study ID	Lovvik 2019	
Study Citation	Løvvik TS, Carlsen SM, Salvesen Ø, et al. Use of metformin to treat pregnant women with polycystic ovary syndrome (PregMet2): a randomised, double-blind, placebo-controlled trial. Lancet Diabetes Endocrinol. 2019;7(4):256-266. doi:10.1016/S2213-8587(19)30002-6	
Study Country	Norway, Sweden and Iceland	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS	
PCOS diagnostic criteria	Rotterdam 2003	
Presence of infertility	Not explicitly reported but can be derived from mode of conception, with ~43% having ovulation induction medication, IVF/ICSI or gonadotrophin releasing hormone analogues.	
Presence of other condition/s	Yes but not reported in the main study: only that 267 (55%) of the participants suffered from one or more chronic conditions or had a history of bariatric surgery.	
Medication History	Metformin use at conception; other medication collected but not reported in primary study	
N per group	Allocated/ randomised: 487 Assessed at end of study: 478 included in ITT analysis	
Setting	14 hospitals in Norway, Sweden, and Iceland.	
Intervention	**Metformin** oral tablets; 500 mg twice daily (1000 mg/ day)during the first week of treatment, with the dose increased to 1000 mg twice daily (2000 mg/day) from week 2 until delivery.	
Comparison	**Placebo** from enrolment until delivery	
Outcomes (primary and other) with definition (e.g. self-reported, fasting etc.)	**Primary**: composite incidence of late miscarriage (between week 13 and week 22 and 6 days) and preterm birth (between week 23 and week 36 and 6 days), including spontaneous birth, induced vaginal deliveries, and operative deliveries for medical indications **Secondary**: GDM (WHO 1999); preeclampsia (any form) and hypertension (including pre-existing), treatment with vaginal progesterone to prevent imminent preterm delivery, vaginal bleeding during pregnancy, admission to hospital of patients during pregnancy, except for delivery and postpartum; admission to NICU and the total number of days in NICU per baby. **Tertiary**: weight gain in pregnancy (inclusion- 36wk, excluding participants with delivery < 36 wk or those without weight at 36wk). Neonatal birthweight, birth length, head circumference, 5-minute Apgar score, and umbilical cord pH, malformations (listed separately as adverse events).	
Follow up Duration	Enrolment (6-12+6 gestational weeks; Median 10-11 weeks gestation) to delivery	
Summary Result/s	In pregnant women with PCOS, metformin treatment from the late first trimester until delivery might reduce the risk of late miscarriage and preterm birth, but does not prevent gestational diabetes.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To test the hypothesis that metformin prevents late miscarriage and preterm birth in pregnant women with PCOS
Does the study have specified inclusion/exclusion criteria?	Yes Partial No	Yes- below

		Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes- below
Inclusion criteria		Yes Partial No Not reported	Patients were eligible for inclusion if they had an established diagnosis of PCOS according to the Rotterdam 2003, were aged 18–45 years, were pregnant by any mode of conception with a singleton viable fetus (determined by ultrasound) between gestational week 6 and week 12 plus 6 days, had a minimum of 7 days washout of metformin (if used before inclusion), and were able to communicate in a Scandinavian language or English. If there was no certain PCOS diagnosis before inclusion, anamnestic data were gathered and medical files were checked to confirm the diagnosis.
Exclusion criteria		Yes Partial No Not reported	Patients were excluded if they had diabetes, known liver or kidney failure, conditions that could induce tissue hypoxia (ie, emphysema, severe asthma, or heart failure), known hypersensitivity to metformin, known alcohol or drug misuse, were using drugs known to interfere with metformin, were breastfeeding, or were unsuitable for participation for other reasons.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes- randomly assigned women (1:1) to receive metformin or placebo via computer-generated random numbers. Randomisation was in blocks of ten for each country and centre; the first block had a random size between one and ten to assure masking. Randomisation of treatment packages was computer generated and was done before inclusion by personnel not involved in the trial. At inclusion, the local principal investigator logged on to a website and was given a randomisation number from one of the medication packages.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Yes - Placebo tablets and metformin tablets were identical and allocated in a blinded fashion as above.
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Yes - Placebo tablets and metformin tablets were identical.
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Yes- the local principal investigator logged on to a website and was given a randomisation number from one of the medication packages.
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes- All women received diet and lifestyle advice according to national guidelines. No dietary supplements were recommended while the women participated in the study, with the exception of 0·4 mg folic acid and one multivitamin tablet per day.
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Yes- In addition to masking of participants and study personnel, obstetricians not involved in the care or treatment of participants assessed the study outcomes, a statistician masked to the treatment allocation did the

			statistical analyses, and the design of tables and figures were planned before the results were known
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial- detailed outcome measures reported in protocol in suppl material except for biochemical measures (e.g. glucose); no mention of assays/kits used, CV%, laboratory, etc.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial - unclear where blood analyses were performed and by whom
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	2.5% treatment 1.2% control/ comparison Not reported	6 of the 244 metformin and 3 of the 243 placebo participants excluded from the ITT analysis as below
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes – ITT conducted with most participants included except where there were protocol violations/ accidental inclusions or missing data/ evaluation could not be performed
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Protocol outlines all primary and secondary outcomes and reported clearly in the paper
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Partial- groups were similar except for the combined Asian group when south and east Asian were compared together across groups
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Not applicable for study design and balanced randomisation
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	ISP reports personal fees for teaching and for being part of a review board panel from Gedeon Richter and Bayer, outside the current study. All other authors declare no competing interests.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	No- sample size reduced to 500 despite sample size calculation of 1000 determined due to feasibility issues. Although IPD was conducted to increase power, this was still below the n=1000 required and was likely insufficient power to detect significant differences for some outcomes.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes- except for sample size issues as above
COMMENTS		Clearly reported and includes key relevant details. Minor issues only including not being powered but this isreported transparently and attempts to validate results through IPD	
What is the overall risk of bias?		Low Moderate	Overall low risk of bias for this study- post hoc analyses would be moderate risk of bias.

	High Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	All prespecified outcomes low risk of bias. Post-hoc analyses moderate risk of bias	

Study ID	Morin Papunen 2015	
Study Citation	Morin-Papunen L, Rantala AS, Unkila-Kallio L, et al. Metformin improves pregnancy and live-birth rates in women with polycystic ovary syndrome (PCOS): a multicenter, double-blind, placebo-controlled randomized trial. *J Clin Endocrinol Metab*. 2012;97(5):1492-1500. doi:10.1210/jc.2011-3061.	
Study Country	Finland	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with anovulatory infertility and PCOS	
PCOS diagnostic criteria	Rotterdam 2003	
Presence of infertility	Anovulatory infertility for at least 6 months but all had patent tubes on sonosalpingography	
Presence of other condition/s	Male factor infertility, but normal tubal patency. No other conditions listed outside of exclusion criteria below.	
Medication History	Washout of infertility treatments for at least 3 months. No other medications mentioned.	
N per group	Allocated/ randomised: 320 Assessed at end of study: 320 (61 LFTU or discontinued but included in ITT)	
Setting	All University hospitals of Finland (5 sites)	
Intervention	**Metformin** oral tablets: 500 mg once daily during the first week, with the dose increased by one tablet/day in weekly steps up to 3 tablets daily in non-obese women and 4 tablets daily in obese women: (1000 mg/day in week 2; 1500 mg/day in week 3; 2000 mg/day in week 4) for up to 9 months maximum (or if pregnancy was achieved, until gestational week 12). After 3 months, if no pregnancy occurred, CC was added; if ovulation occurred CC continued with met or placebo for 4-6 cycles or until 12 weeks gestation; if pregnancy did not occur, aromatase inhibitors or gonadotrophins were used. For male infertility, IVF/ICSI was used.	
Comparison	**Placebo** in the same process as above	
Outcomes (primary and other) with definition (e.g. self-reported, fasting etc.)	**Primary**: decrease in early pregnancy loss. **Secondary**: improve pregnancy rates and live birth rates	
Follow up Duration	Preconception for 9 months or until gestational week 12 if pregnancy is achieved	
Summary Result/s	3 months pre-treatment with metformin is particularly beneficial for obese women in terms of improving pregnancy rate with similar benefits for live birth rate in both obese and non-obese women with anovulatory infertility	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To assess whether metformin decreases early pregnancy loss, and the second one was to clarify whether it improves pregnancy rates (PR) and livebirth rates (LBR) in women with anovulatory infertility and PCOS.

Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	
Inclusion criteria		Yes Partial No Not reported	Eligible participants were women aged 18 –39 yr at entry, with a body mass index (BMI) greater than 19 kg/m and diagnosed with PCOS according to Rotterdam criteria (19). All the subjects had polycystic ovaries at ultrasound according to ESHRE/ASRM, and a large majority had oligo-amenorrhea, 44.7% had hyperandrogenism or hirsutism or both. The women had suffered from anovulatory infertility for at least 6 months and a washout period of at least 3 months since the last infertility treatment was required.
Exclusion criteria		Yes Partial No Not reported	Exclusion criteria were type 2 diabetes mellitus, active liver disease (alanine aminotransferase >100 IU/liter), history of cardiac or renal failure, hormone medication, alcohol use, and regular smoking.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes- Randomization (after simple randomization procedures) was performed by the hospital pharmacy with 1:1 allocation in random blocks of 10 using two computer-generated lists, one for the nonobese and one for the obese women.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Yes- Metformin and placebo tablets were provided by Leiras (Turku, Finland) and prepacked in opaque identical containers of 100 tablets and consecutively numbered for each woman according to the randomization schedule. Each woman was assigned a number and received the tablets in the corresponding container.
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Yes- Randomization codes remained blinded until the database lock had taken place. The patients and all study site personnel were blinded to the study drug codes.
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Yes- Randomization codes remained blinded until the database lock had taken place. The patients and all study site personnel were blinded to the study drug codes.
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	No- some women received CC, others received AI or GnRH or IVF/ICSI.
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Yes- assumed so since all personnel were blinded until database lock had taken place
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes- assays reported, criteria reported for GDM and OGTT methods defined.

	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported- unclear where blood analyses were performed and by whom
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	17% treatment 21% control/ comparison Not reported	27 and 34 LFTU/ discontinued in metformin and placebo groups respectively. Included in ITT analysis
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	ITT was performed where data were available
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Different treatments may affect pregnancy outcomes for the purpose of this review/ analysis. Different doses in obese and non-obese groups
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Weight loss should have been used as a time-dependent covariate in the intent-to-treat analysis as this may have been the key influence on the results
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	150 needed for each group, 160 included in ITT
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes, but although exclusion of IVF/ICSI was performed for most of the primary analyses, other ovulation induction meds including CC and GnRH/AI were not excluded to examine the effects on results
COMMENTS		Clearly reported and includes key relevant details. Issues for the present analysis are outside the aims of this study - since we are interested in pregnancy outcomes and the study itself was designed to assess pregnancy rate/ LBR	
What is the overall risk of bias?		Low Moderate High Insufficient information	Overall low risk of bias for the study and primary outcomes. Moderate risk of bias for pregnancy complications outside of miscarriage/ LBR/ PR, due to different baseline treatments within groups. Most outcomes will need to be derived from IPD, not from the main published paper.
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		Primary and pre-specified outcomes - low risk of bias Other pregnancy complications- moderate risk of bias

Question 4.11.

In women with PCOS in pregnancy, is metformin compared to placebo/standard care effective in reducing pregnancy complications and adverse neonatal outcomes?

BACKGROUND:

Metformin is an oral medication commonly used to treat type 2 diabetes mellitus. It is commonly available and affordable worldwide. Metformin has glucose-lowering properties by reducing hepatic gluconeogenesis, increasing insulin sensitivity, and enhancing uptake of peripheral glucose (1) Metformin is actively transported through cell membranes mainly by organic cation transporters (2). The drug was first introduced in 1980's, to treat diabetes in pregnancy (3). In PCOS, the related insulin resistance has promoted the use of metformin. During the last two decades, metformin has been used to facilitate weight management, improve fertility and regular menstrual cycles in affected women, and also aiming to reduce the risk for early miscarriage and pregnancy complications.

Pregnancy in women with PCOS is associated with a strong early mobilization of inflammatory and other serum cytokines persisting throughout pregnancy, indicating a more activated immune status. These findings provide a new insight to the connection between PCOS and pregnancy complications (4). During pregnancy, renal metformin clearance is increased, and serum concentration drops to about 70% compared to a non-pregnant state (5, 6). Metformin crosses the placenta, and consequently, the fetus is exposed to therapeutic concentrations (7). Dosages and treatment protocols (immediate vs. extended release) are diverging, 500-2500 mg daily being most often reported. Common practices also vary regarding the start of the drug therapy (prior pregnancy or early pregnancy) and the time of cessation (pregnancy test positive, throughout the pregnancy). Side effects are mostly mild, transient gastrointestinal symptoms and potential reduction on vitamin B-12 levels. Teratogenicity is not reported (8), however, lately there has been more concern on long-term metabolic effects of metformin on offspring health (9, 10).

Methodological quality/risk of bias

Only RCTs (n=7) were included. Risk of bias for the included studies varied. Studies on preterm delivery and gestational age were rated as of low risk of bias. Studies focusing on GDM, glucose homeostasis, PE, hypertension, miscarriage, and gestational weight gain were rated as high risk of bias and should be interpreted with caution. The bias was often related to underpowered study set-up. Studies on neonatal outcomes were rated as high risk of bias and should be interpreted with caution. The most common reasons for the ratings assigned include: 1) allocation to the intervention group was not blinded (two studies); 2) power calculations were not reported; 3) insufficient number of patients in the trials, and 4) a lack of conflict-of-interest statements. These methodological issues may have an impact on the direction of bias and reliability of the findings.

Generalizability

Studies were conducted at university hospitals, infertility clinics in hospitals and laboratories covering countries across the world; Norway, Finland, Iran and Bangladesh.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Metformin versus placebo/ control	⊕⊕◯◯ LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Metformin vs. placebo/ standard care

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Metformin could be considered in some circumstances (e.g. risk for preterm birth), to reduce preterm delivery and limit excess gestational weight gain, in pregnant women with PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **EBR:** Healthcare professionals should be aware that metformin in pregnant women with PCOS has not been shown to prevent:
  - Gestational diabetes
  - Late miscarriage (12 weeks+1 day to 21 weeks +6 days gestational age)
  - Hypertension in pregnancy
  - Pre-eclampsia
  - Macrosomia or birthweight ≥ 4000 g

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☒ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

Women should be counselled that the consequences of metformin exposure on long-term offspring health remain unclear and there is a suggestion of increased childhood weight, although causality is not certain.

Side effects of metformin are mostly mild, transient gastrointestinal symptoms and are not worse in pregnancy.

GRADE CONSIDERATIONS

Justifications:
Two critical (associated) outcomes (preterm birth and gestational age) had high certainty.
One important outcome (gestational weight gain) had moderate certainty.

Subgroup considerations:
The studies did not focus on women with high risk of preterm delivery (previous late miscarriage, preterm delivery, smokers, cervical conization) – theoretically they may benefit more from metformin therapy, but it is not investigated.
Grouping according to pre-pregnancy weight may be beneficial to the analysis of gestational weight gain
Further, there is a need to examine whether metformin may assist in glycaemic control (alongside diet/lifestyle) among women with PCOS and an established GDM diagnosis (i.e. for treatment rather than for prevention).

Implementation considerations:
Potential side-effects of the drug should be considered.

Monitoring and evaluation considerations:
Long-term effects of metformin-exposure during pregnancy on the next generation's metabolic and neuropsychological health. Monitoring the implementation of the recommendation in clinical practice and evaluate the change in health outcomes.

Research priorities:
Understanding the mechanisms of metformin action in pregnancy
Timing, dosing, duration and subgroups that benefits most from metformin in pregnancy
To follow up the potential long-term the next generation health effects of metformin-exposure in utero

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Metformin may have positive effect, no effect or negative effect on the outcomes we review

Is a larger head circumference good or bad?

Is less weight gain in pregnancy good or bad?

A “no difference” for a drug vs placebo in pregnancy – would result in no treatment

Long-term safety is not evaluated and considered here

Do we have an indication that pre-pregnancy start for metformin is beneficial?

For 2 studies the initiation was prior pregnancy and one at week 2.

Do we have an indication of women “at risk” that should be prioritized for treatment?

Comment on when to stop metformin use during pregnancy.

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Still unclear on balance of effects.

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☒ Probably favours other options	☒ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

EBR: Health professionals should be aware that metformin use in pregnant women with PCOS reduces preterm delivery and gestational weight gain. (Moderate to high certainty)

EBR: Health professionals should not use metformin in pregnant women with PCOS to prevent gestational diabetes. (Low certainty)

EBR: Health professionals should be aware that there is inadequate evidence to support the use of metformin in pregnant women with PCOS to prevent:

- Hypertension in pregnancy or pre-eclampsia (Low certainty)
- Late miscarriage (12+1 to 21+6 gestational age) (Low certainty)
- Macrosomia or birthweight ≥ 4000 g (Moderate certainty)

Long-term safety evidence is not reviewed

- **VALUES**

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Preterm delivery/gestational age: no important uncertainty or variability

Miscarriage, birthweight, length, low birth weight, macrosomia: no important uncertainty or variability

Gestational weight gain, head circumference: probably no important uncertainty or variability

- **BALANCE OF EFFECTS**

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

As the other option is placebo - metformin should not be used if it has not more desirable effect than placebo

Probably certain subgroups (high risk of preterm delivery) would benefit.

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☒ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Recommend to not routine use metformin, and metformin is cheap.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

Prevention of preterm birth is associated with cost savings.

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Metformin is cheap and available.

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☒ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Recommendations are cautious but appropriate with evidence.

GUIDELINE DEVELOPMENT GROUP 5

Assessment and treatment of infertility

Clinical Questions	
Q 5.1.	In women with PCOS with infertility, what are the preconception risk factors associated with poor/negative fertility outcomes?
Q 5.2.	Should women with PCOS and infertility due to anovulation alone with normal semen analysis undergo tubal patency testing prior to starting ovulation induction with timed intercourse or IUI treatment?
Q 5.3.	In women with PCOS, are aromatase inhibitors effective for improving fertility outcomes?
Q 5.4.	In women with PCOS, is clomiphene citrate effective for improving fertility outcomes? In women with PCOS, is metformin effective for improving fertility outcomes? In women with PCOS and a BMI<30-32, what is the effectiveness of metformin compared to clomiphene citrate for improving fertility outcomes?
Q 5.5	In women with PCOS, are gonadotrophins effective for improving fertility outcomes?
Q 5.6	In women with PCOS, is ovarian surgery effective for improving fertility outcomes?
Q 5.7	In women with PCOS, is stimulated IVF/ICSI effective for improving fertility outcomes?
Q 5.7.1.	In women with PCOS undergoing IVF/ICSI treatment, is the GnRH antagonist protocol or GnRH agonist long protocol the most effective for improving fertility outcomes?
Q 5.7.2.	In women with PCOS undergoing GnRH antagonist IVF/ICSI treatment, is the use of hCG trigger or GnRH agonist trigger the most effective for improving fertility outcomes?
Q 5.7.3.	In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, does the choice of FSH effect fertility outcomes?
Q 5.7.4.	In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, is exogenous LH treatment during IVF/ICSI effective for improving fertility outcomes?

Q 5.7.5.	In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, is adjuvant metformin effective for improving fertility outcomes?
Q 5.7.6.	In women with PCOS, is In Vitro Maturation (IVM) effective for improving fertility outcomes?
Q 5.8.	In women with PCOS, is inositol alone or in combination with other therapies, effective for management of reproductive outcomes? (fertility outcomes only)
Q 5.9.	In women with PCOS, are anti-obesity pharmacological agents alone or in combination, effective for management of reproductive outcomes? (fertility outcomes only)
Appendix	GDG 5 Methodology Appendix (applicable to all GDG 5 questions, except Q 5.1, Q 5.2, Q 5.8 and Q 5.9)

5. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

First Author/ Year/ Country	Design	Population	Setting	PCOS criteria	Total randomized/ recruited	Total analysed	Patient Age (years)	Baseline characteristics mentioned	Intervention/ Treatment A	Intervention/ Treatment B
Abu-Fakher B, 2013 Syria	Prospective case-control study	Infertile PCOS patients	NR	Rotterdam criteria 2003, the association of at least two of the three criteria	PCOS 43 Control 20	PCOS 33 Control 20	PCOS 29.2 ± 5.2 Control 29.2 ± 6.2	BMI, sAMH, FF AMH,	IVF/ICSI	IVF/ICSI
Akpınar F, 2014 Turkey	Cohort study	PCOS patients that met the following criteria: BMI of 18.5-35 kg m-2; undergoing ovarian stimulation using the mid-luteal long GnRH agonist protocol or the flexible GnRH antagonist protocol; and age ≤35 years. Normal weight (BMI: 18.5-24.9 kg m-2 [group 1]) Overweight (BMI: 25-29.9kg m-2 [group 2]) Obese (BMI: 30-34.9 kg m-2 [group3])	NR	N/A	Normal weight (Group 1): 109 Overweight (Group 2): 84 Obese (Group 3): 79	Normal weight (Group 1): 109 Overweight (Group 2): 84 Obese (Group 3): 79	Normal weight (Group 1): 28.1±4.6 Overweight (Group 2): 29.0±3.9 Obese (Group 3): 29.2±4.2	Hormonal profile (FSH, LH, E2), Antral follicle count etc.	GnRH agonist	GnRH agonist
Al Safi WG, 2021 Iraq	Cohort study	Women with PCOS. Group 1 (Normal ratio): 1/2 LH/FSH ratio Group 2 (High ratio): 2/1 or 3/1 LH/FSH ratio	Fertility center	N/A	Normal ratio: 37 High ratio: 10	Normal ratio: 37 High ratio: 10	Normal ratio: 27.3 ± 3.6 High ratio: 29.9 ± 3.1	BMI, Age, Hormonal profile,	ICSI	ICSI
Al-Azemi M, 2004 Kuwait	Cohort study	Women with PCOS. Normal weight women (BMI 18–24) Overweight women (BMI 25–29) Obese women (BMI 30–34) Grossly obese women (BMI >=35)	Combined infertility clinic at Maternity Hospital	PCOS is defined as the detection of polycystic ovaries by US (enlarged ovaries with more than 10 cysts, 2–8 mm in diameter, scattered either around or through an echodense, thickened central stroma) plus presence of 1+ of clinical symptoms (oligo/amenorrhoea, obesity and hyperandrogenism [acne, hir- sutism]) or biochemical findings (high luteinising hormone [LH], hyperandrogenism)	270	270 Patients according to BMI: <18: 2 18-24: 62 25-29:100 30-34: 72 >=35: 34	<20: 4 (1.5) 20–29: 126 (46.7) 30–39: 125 (46.6) >40: 15 (5.6)	Ethnicity, weight, height, BMI	All patients underwent ovulation induction	
Aleyasian A, 2011 Iran	Cohort study	PCOS patients (based on Rotterdam criteria) who were candidates for assisted reproductive techniques. All patients were aged less than 35 years with normal prolactin and thyroid hormone levels and normal male spermogram.	Hospital	According to the Rotterdam criteria, we accepted the presence of two of the three following characteristics for inclusion in the study: 1) oligomenorrhea/amenorrhea, 2) clinical (hirsutism) or biochemical findings of hyperandrogenism, and 3) polycystic ovaries on transvaginal sonography	60	60 (N=48 non-pregnant and N=12 pregnant)	Mean +-SD = 29.25+-5.16	Age, BMI, infertility duration, serum levels (AMH, FSH, LH, E2, free testosterone, testerone, inhibin B, MIS)	Controlled ovarian hyperstimulation (COH) with gonadotropin/GnRH-agonist long protocol.	N/a
Arabzadeh S, 2010 Iran	Case-control	2 groups: women with and without PCOS Women with PCOS (N=26): infertile, 21 to 37 years of age and with body mass index (BMI) ranging between 17 kg/m2 and 32 kg/m2 Women without PCOS (N=42): infertile (due	IVF/ET clinic	According to the Rotterdam criteria, the diagnosis of PCOS was based on the association of at least two of the following three criteria: 1) ovulatory disturbance, mainly oligomenorrhea or amenorrhea; 2) hyperandrogenism, as	68	68	women with PCOS, 21 to 37 years women without, 24-42 years [no mean age reported]	BMI (kg/m^2): women with PCOS = 27 (17-32) women without = 27 (21-35)	IVF/ET treatment	N/a

		to sperm or tubal abnormalities, endometriosis or unexplained) normo-ovulatory women 24 to 42 years of age, both ovaries were present, menstrual cycle length was between 25 and 35 days, there were no current or past diseases affecting the ovaries or gonadotropin or sex steroid secretion, there were no clinical signs of hyperandrogenism, FSH levels were ≤10 mIU/mL on day 3 of the cycle, BMI ranged between 21 kg/m2 and 35 kg/m2		defined either by hirsutism, seborrhea, and/or testosterone > 0.7 ng/mL and/or androstenedione > 2.2 ng/mL, as measured on day 3 of the cycle; 3) more than 12 follicles in the 2- to 9-mm range in each ovary at US and/or ovarian volume higher than 10 mL.						
Bailey A, 2014	Cohort study	79 women younger than 40 years old who started a fresh, autologous IVF cycle with or without ICSI	IVF practice	2003 Rotterdam	79 women (101 cycles)	79 women (101 cycles)	Average age was similar across groups Lean group BMI 18.7-24.9 kg/m2 (N=51): 32.0 (3.5) Overweight group BMI 25-29.9 kg/m2 (N=19): 32.6 (2.9) Obese group BMI of ≥30 kg/m2 (N=31): 32.4 (3.2)	BMI, age	IVF cycle	N/A
Bakir VL, 2019	Retrospecti ve cohort study	230 women with PCOS	Hospital Gynecology outpatient clinic	Rotterdam Criteria,	230	230	Mean 26.7 years	BMI, total cholesterol, HDL, LDL, insulin resistane, impaired OGTT/DM	Nil intervention/ Treatment - was retrospective analysis of database	N/A
Berker,B	Cohort study	52 women, failed 3 x ovulatory cycles after ovulation induction with gonadotrophins	Not specified	Revised Rotterdam ESHRE/ASRM criteria	52 women	52 women, 94 follicular fluid samples	Homocysteine groups: Low, 29.4 ± 3.1, average 29.1 ± 3.7, high 30.1 ± 3.3	Homocysteine (Hcy) levels in follicular fluid	GnRH agonist / rFSH	N/A
Bousmpoul a A, 2019/ Greece	Case-control study	comprised women enrolled in the in vitro fertilization (IVF) program; specifically, 70 women (35 lean, BMI <25 kg/m2 and 35 overweight, BMI >25 kg/m2) with diagnosed PCOS		hyperandrogenism, menstrual irregularity, and polycystic ovary morphology, according to the Rotterdam consensus criteria	70	70		Age, BMI,		
Cakiroglu,T 2016	Case control study	292 total women, 146 with PCOS and 146 without PCOS (matched for age and BMI)	Assisted reproductive unit of Kocaeli University School of Medicine, Kocaeli, Turkey	ROtterdam (ESHRE/ASRM consensus, 2004)	292	292	Normal weight cases: 29.3 ± 3.5; Normal weight control: 29.5 ± 3.2, Obese cases: 30.4 ± 3.4; Obese controls: 30.7 ± 3.8	WCC, neutrophil count, inflammatory markers	IVF/ ICSI	NA
Catak Z, 2019, Turkey	case-control study	20 infertile women with PCOS and 20 control women diagnosed as poor ovarian responders stimulated with a GnRH	VF center, Firat University Hospital, Turkey	Rotterdam criteria	20 infertile women with PCOS and 20 control	20 infertile women with PCOS and 20 control	cases: 30.96±2.93; control: 35.6±2.88	BMI, Infertility duration; FSD days	NA	NA

Chen R, 2018 China	Cohort study	less than 35 years	Shanghai First Maternity and Infant Hospital	Rotterdam criteria	398	Normal weight= 260 Overweight/ Obese = 138	less than 35 years a	Age, BMI, Hormone kevels	Gonadotrophin	Gonadotrophin
Fedorcsak, 2001 Norway	Cohort study	Women with PCOS recieving ovarian stimulation for IVF or ICSI. Based on CIGMA test, 26 women were insulin resistant (CIGMA score>4) and 30 women had normal insulin sensitivity.	NR	The prescence of polycystic ovaries on vaginal ultrasound scan (at least 10 follicles between 2 and 8mm in diameter) and at lease 2 of the following criteria: Oligo/amenorrhoea, hirtuism or hyperandrogenism.	56	56	Non-insulin resistant (Median 31 yrs (range 25-28)) Insulin resistant (Median 30 yrs (range 23-28))	Hormone concentrations, age, BMI	IVF/ ICSI	IVF/ ICSI
Feng Y, 2022 China	Cohort study	Women aged 22–35 years, and undergoing IVF were recruited for this study. Of these, 32 had been diagnosed with PCOS and 32 were age- and BMI-matched controls	NR	Rotterdam criteria	64	64	22-35	NR	Gonadotropin releasing hormone antagonist protocol	Gonadotropin releasing hormone antagonist protocol
Gupta A, India	Descriptive study	pregnant women with polycystic ovary syndrome was carried out in a tertiary care hospital	hospital	Rotterdam's criteria	135	135	mean age was 26.8 year	BMI, age	NA	NA
Guido M, 2003 Italy	Cohort study	Women with PCOS, aged between 25 and 45 years, who underwent ovulation induction with recombinant FSH for timed intercourse	NR	Clinical finding of amenorrhea or oligomenorrhea and hirsutism, and presence of chronic anovulation; plasma androgen concentrations at the upper limits of or above the normal range (androstenedione 2.0–8.5 nmol/l, testosterone 0.6–2.0 nmol/l); the presence of ovaries that were bilaterally of normal volume or enlarged, with 10 cortical follicles (< 6 mm in diameter) and a hyperechoic stroma (ovarian stromal area/total ovarian area ratio of > 0.34) at the time of ultrasonography15. A normal LH/FSH ratio was not considered an exclusion criterion.	33	33	Younger PCOS patients (< 35 years old): 20 Older PCOS patients (>35 years old): 13	BMI, Hormonal parameters	Ovulation induction	
Hashimoto DM, 2003	comparative study	102 Brazilian women ageing between 18 and 32 years (x = 25.5, ± 3.9 yrs.) and 31 Austrian women also ranging in age between 18 to 32 years (x = 23.8, ± 4.7 yrs.) were enrolled in the present study	The study was carried out between 1999 and 2001 in two Departments of Gynecology in São Paulo Brazil (Hospital das Clinicas, Hospital Pérola Byington,) and	ultrasound plus one additional	133	133	5, ± 3.9 yrs and 8, ± 4.7 yrs	BMI	BMI(Weight)	NA
Hassani F, 2019, Iran	case-control	20 subjects were assigned to control (fertile women with male infertility history) group, 20 subjects with PCOS were insulin resistant	Royan Institute		60	60	age>36 years	BMI & age	rFSH	rFSH

		(IR) and 20 subjects with PCOS were insulin sensitive (IS)								
Ho VNA, 2018	retrospective study	women had to have PCOS diagnosed according to the Rotterdam criteria and be aged 18–42 years, and were undergoing IVM	IVF center in Ho Chi Minh City,	Rotterdam criteria	921	921	18–42 years	BMI & age	NA	NA
Huang Q, 2018	retroprective study	Women with PCOS, 20 to 44 years old, undergoing a long gonadotrophin releasing hormone receptor agonist (GnRH-a) protocol for COH	Hospital	Rotterdam criteria	516	516	22-44 years	ratio of serium estadiol to follicle number	GnRH-agonist protocol	
Hwang Yi, 2016	Retrospective cohort study	307 women with PCOS and 364 with tubal factor infertility	IVF database of Cheil General Hospital and Women's Healthcare Center, Dankook University College of Medicine	diagnosed according to the Rotterdam 2003 criteria	671	671	PCOS patients: 33.5 ± 2.7, Controls: 33.8 ± 2.7	Age	NA	NA
Inal HA, 2016, Turkey	prospective cross-sectional study	a total of 120 primary infertile women	Reproductive endocrinology department, Women's Health Research and Education Hospital		120	120	Non-PCOS - BMI <25 kg/m2: 30.30 ± 3.97/ PCOS - BMI <25 kg/m2: 29.40 ± 3.70/ Non-PCOS - BMI ≥25 kg/m2: 31.57 ± 4.04/ PCOS - BMI ≥25 kg/m2: 29.97 ± 3.66	BMI and age	IVF	IVF
Inal ZO, 2018	prospective sequential cross-sectional study	women with primary infertility	reproductive endocrinology department of Konya Research and Education Hospital.	Rotterdam criteria	160	160	27.63±4.10	BMI	IVF	IVF
Janati S, 2021 Iran	Cross sectional study	Women with PCOS, 20-45 years old	Hospital	NR	90	90 women, 740 oocyte samples	20-45 years	Age, BMI	ART	
Nikolai Jaschke	Retrospective cohort study	59 reproductive age women (21–43 years) who presented for in vitro fertilization (IVF) between 2014 and 2016	Not specified	Rotterdam criteria	Of the 59 women included in our study, 16 were stratifed to the PCOS group according to the Rotterdam criteria. The remaining 43 women were assigned to the control group.	59 women, 16 stratified to PCOS group according to Rotterdam criteria, 43 control group	21 - 43 years	Age, BMI	4 in the PCOS group (25%) with an agonist protocol. In the control group, 17 (40%) were treated with an agonist	12 women (75%) in the PCOS group were treated using an antagonist protocol and 26 in the control group (60%) with an

										antagonist -protocol
Jin Y, 2019	Case control study	Fifty-six infertile women with PCOS and 51 infertile women with tubal blockage (who served as controls) were recruited into this case-control pilot study	Referred to IVF department of nons-specified hospital	Rotterdam's Criteria	107	107	20-45 years of age	DEHP (Di(2-ethylhexyl) phthalate)	NA	NA
Kalra 2013 USA	Case control	Total of 44,286 IVF cycles from 2004–2006 Tubal factor infertility (controls) N=27,870 PCOS (cases) N=16,416	IVF clinic	Not reported	44286	44286	Control: 35.5 +- 4.3 (19.3–50.4) Case: 33.5 +- 4.4 (19.7–50.0) P <.001	Age, race, parity	IVF	Na
Kamardi S, 2021, Indonesia.	Retrospecti ve case–control	Data from 170 patients under the age of 38 years old and who had undergone ICSI were collected	Royal IVF Clinic, Bali Royal Hospital, Indonesia.	Rotterdam	170	170	under the age of 38 years	BMI(weight)	BMI(weight gain)	FSH (rFSH, Gonal F, Serono) based on age and follicle size and Ovulation stimulation
Kolibianaki s, 2003	Cohort study	110 patients were evaluated	Reproductive Medicine of the Dutch-Speaking Brussels Free University were included in the study.	ultrasound	110	110	mean age of patients was 30.6 ± 0.4 years	combinant FSH (rFSH) and gonadotrophin releasing hormone (GnRH) & BMI	Ovarian stimulation and type of ART	
Kudesia, 2018/US	retrospectiv e cohort	women who initiated their first autologous IVF cycle with conventional insemination or intracytoplasmic sperm injection	fertility treatment centers	ultrasound	51,198 cycles included	45,950 women reached oocyte retrieval	Underweight: 34.4+=4.47/ Normal: 35.34+- 4.52/ Overweight: 35.76 +- 4.59/ Obese: 35.63 +- 4.64	Age, BMI, basline hormone levels	IVF	IVF
Lai Q, 2018/ China	retrospectiv e study	77	Reproduction Center, Tongji Hospital, Wuhan, China	Rotterdam criteria	77	77		FSH and LH (IU/L)		
Li Y, 2018/ China	retrospectiv e study	PCOS women who accepted their first fresh IVF/ICSI cycles at the IVF center	IVF center of Sun Yat-sen Memorial Hospital, Sun Yat-sen University	Rotterdam diagnostic criteria	188	188			age, obesity	
Lin J, 2019/ China	retrospectiv e cohort study	Patients diagnosed as having PCOS according to the Rotterdam criteria who were aged ≥20 and < 35 years old who were undergoing their first FET cycles	Department of Assisted Reproduction of the Ninth People's Hospital of Shanghai JiaoTong University School of Medicine	Rotterdam criteria	1680	1680	aged ≥20 and < 35 years	BMI		

Lujan ME/2010/Canada	follow up study	Women had not used hormonal contraception, fertility medications, insulin sensitizers or antiepileptic drugs in the three months prior to enrollment		PCOS was defined by the 2003 international consensusguidelines	16	16	mean age of the women was 28.7±1.1(range, 18 – 35) years			
Luo L, 2016/ China	cohort study	40 pregnant women were included.	First Affiliated Hospital of Sun Yat-sen University	Rotterdam criteria	40	40	BMI			
Shari Mackens/ 2020/ Russia	retrospective cohort study	320	tertiary referral hospital	Rotterdam criteria	320	320	NA	Age, BMI, previously failed OS cycles (%), CLBR(%)	IVM	NA
Tahereh Madani, M.D./2010-2011/ Iran	prospective study	96	Department of Endocrinology and Female Infertility, Reproductive Biomedicine Research Center, Royan Institute for Reproductive Biomedicine, ACECR, Tehran, Iran	referred to Royan Research Center with history of infertility, irregular menstruation or hirsutism between 2005 to 2006.	96	First cycle there were 96, second cycle only 69 were willing to participate	between 18-37	Age, BMI	Flutamide tab 250 mg, started on day 3 till end of menstrual cycles Clomiphene Citrate 50mg was given to both groups, started on day 3 to day 7 of their menstrual cycles for two consecutive cycles.	Group B received placebo. Clomiphene Citrate 50 mg given to both groups, started on day 3 to day 7 of menstrual cycles for two consecutive cycles.
Nalini Mahajan/2019/India	prospective study	410	fertility center, Department of Reproductive Medicine, Mother and Child	Rotterdam criteria (2004) + ppl of indian origin	367	367	The mean age of patients in the PCOS, PCOM, and control group was 33.66 ± 3.56, 24.07 ± 1.91, and 30.74 ± 3.72 years, respectively	Age, BMI	306 went through controlled ovarian stimulation (OS) for ICSI	NR
Ahmad Mahran / 2013 / Egypt	prospective cohort observational study.	60	The study was conducted at the Fertility Unit, Derby, United Kingdom.	Age between 18 and 39 years, body mass index (BMI) of 35 kg/m2 or less, anovulatory infertility, and a diagnosis of PCOS based on Rotterdam	60	60	between 18 and 39 years	Age, BMI	Patients received CC as per standard protocol	NR
McCormick, 2008/ UK	longitudinal, anonymized research database	Women age 15– 44 years with a diagnosis of PCOS defined by the Read code classification	Clinical Practice Research Database (CPRD),	Read code classification & 10th revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10)	9068	9068	15– 44			

Mostinckx / 2019 / Belgium	retrospective observational study	1036	NR	Rotterdam criteria	1036	393	between 18 and 36 years	Age, BMI	20 weeks after IVM	COS
Muharam / 2022 / Indonesia	retrospective cohort study	238	fertility clinic	Rotterdam criteria	238	238	aged 24–41 years	Age, BMI	NR	NR
Müberra Namlı Kalem / 2016 / Turkey	cohort study	653	private IVF clinic	Rotterdam criteria	653	653	562 patients were under the age of 35 years and 91 patients were above the age of 35 years.	Age, BMI	NR	NR
Niu, 2017, China	case-control	90	Hospital	Rotterdam criteria	90	90	Control (N=30): 29.4 +-3.7 PCOS non-metabolic syndrome (MS): 30.2+-3.9 PCOS MS: 30.6+-3.5	Metabolic syndrome	IVF or ICSI	
Oberg / 2019 / Sweden	RCT	Overweight/obese women with PCOS	Hospital	Rotterdam	68	57 at 4-months and 47 at 12-months	Intervention (n=34): 31 +-5.1 Control / minimal intervention (n=34): 29.9 +-5.7	BMI	Behavioural modification intervention	Minimal interventio n
Palomba, 2012/ Italy	Retrospective cohort	PCOS diagnosed according to well-recognised diagnostic criteria	Academic Department of Obstetrics and Gynaecology of the University Magna Graecia of Catanzaro, Italy.		378	378	Metformin: 33 (8; 21–43)/ Control: 35 (9; 22–42)	BMI, Age, Hormonal profile	IVF	IVF

6. FINDINGS

Comparisons included:

- **Comparison 1:** Lean versus Overweight/ obese PCOS
- **Subgroups:** Sub-grouped by fertility treatment for most outcomes (where possible)
- **Comparison 2:** Younger versus older PCOS

COMPARISON 1: Lean vs Overweight/obese PCOS

▪ EVIDENCE SUMMARY:

A total of 20 studies reported on preconception BMI and/or obesity status as a risk factor or determinant of fertility outcomes in PCOS. Studies ranged from observational to randomised trial designs and included various fertility treatments including ovulation induction medications such as metformin or clomiphene citrate, gonadotrophins including GnRH or rFSH, as well as IVF. Most studies had moderate or low risk of bias and included large sample sizes with varied BMI cut-offs. For the purpose of this analysis, individuals with a BMI of 18.5 – 24.9 kg/m^2 and those classified with as lean or normal weight (as defined by individual studies) were classified as the lean/ normal weight group, whereas individuals with a BMI >25 kg/m^2 were classified as the overweight/ obese group (with no upper limit).

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Women with PCOS in the lean/ normal weight category for BMI (18.5 - 24.9 kg/m^2) had a higher pregnancy rate than those in the overweight/ obese category (≥25 kg/m^2), although this did not reach statistical significance when examining studies explicitly stating a clinical pregnancy rate as the outcome. These groups also had a higher live birth rate and ovulation rate per patient and per cycle and lower miscarriage rate per patient compared to the overweight/ obese BMI category group. Certainty in the evidence was very low to low for most outcomes, largely due to the observational nature of the studies, as well as being downgraded for risk of bias (many studies had moderate or high risk) and inconsistency (high and/or significant heterogeneity).

Outcome	Studies	N	Effect size [95% CI]	P	Favours	I²	Certainty

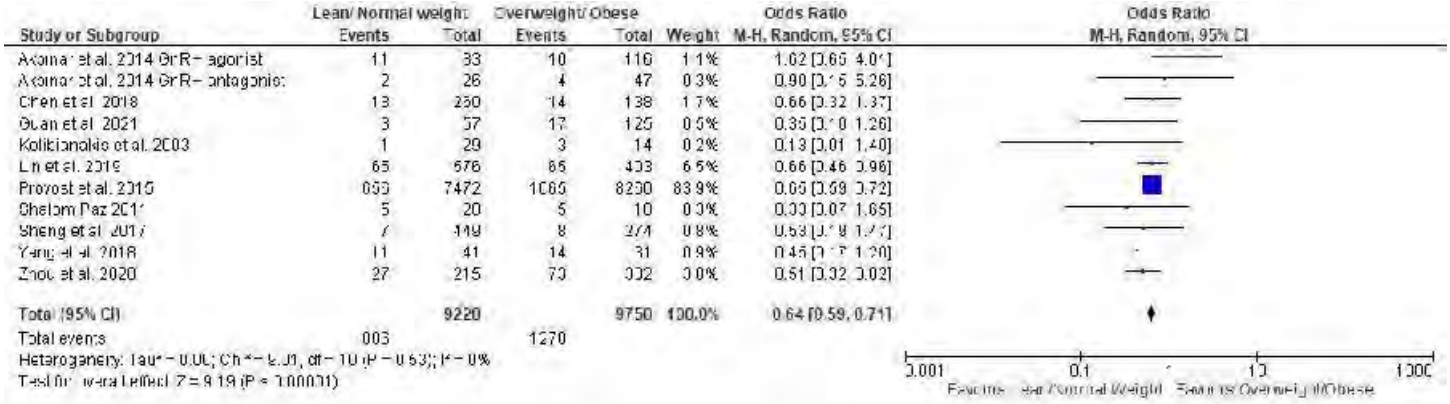
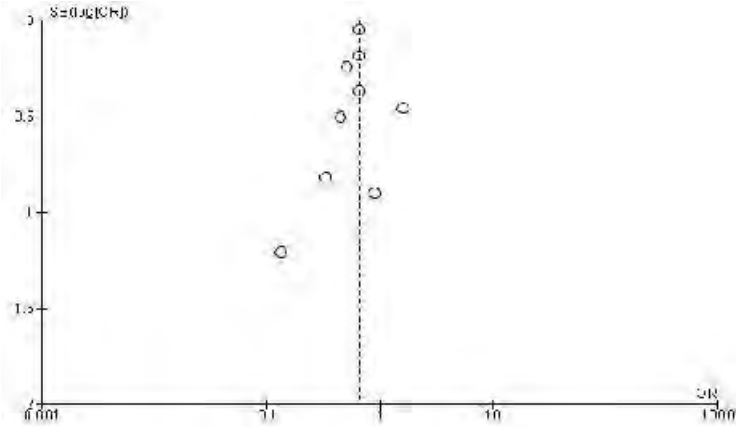
5.2. Forest plot for lean/ normal weight versus overweight/obese PCOS for miscarriage rate per patient

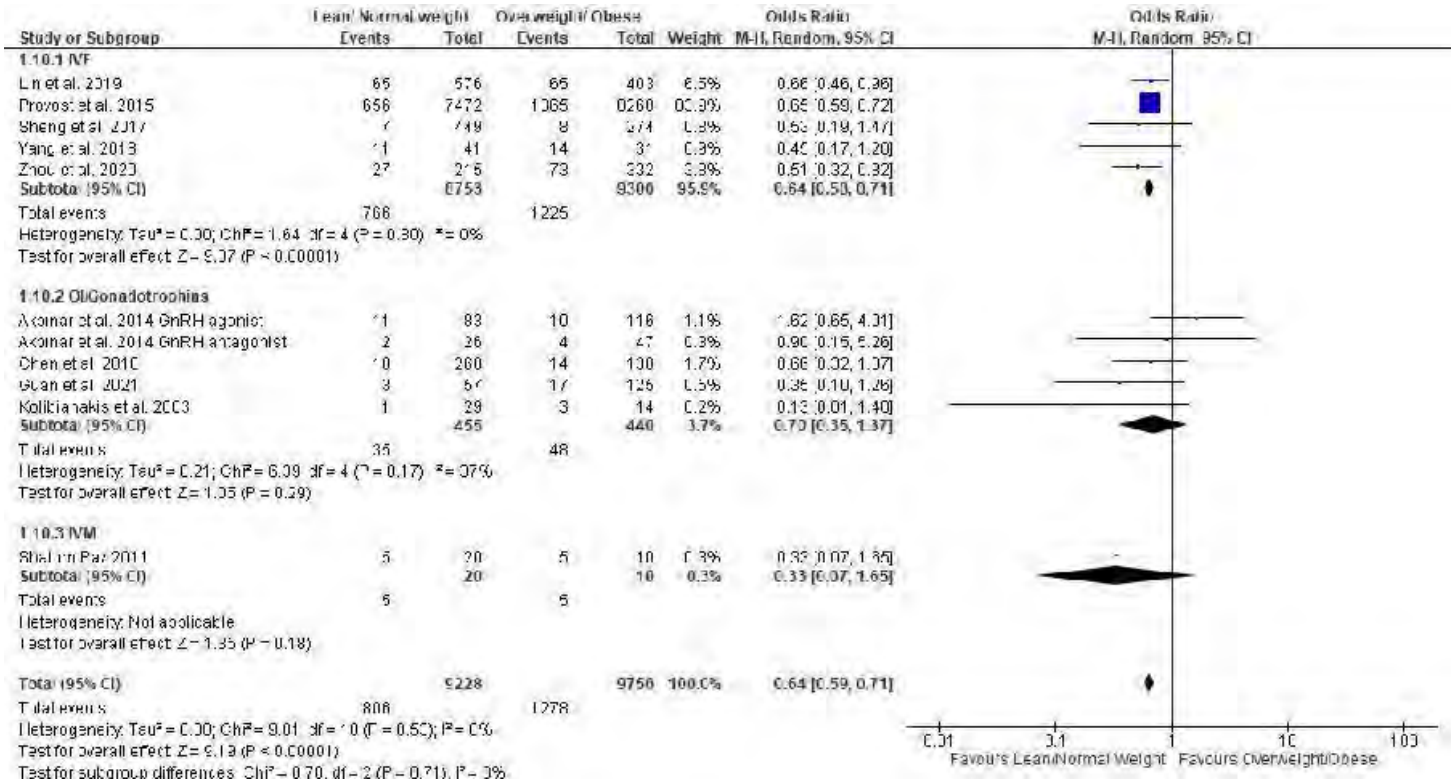


5.3. Funnel plot for assessment of publication bias



5.4. Subgroup analysis:

5.4.1. Forest plot for lean/ normal weight vs overweight/obese PCOS in miscarriage rate per patient, sub-grouped by fertility treatment



COMPARISON 2: Older versus Younger PCOS Age Groups

▪ EVIDENCE SUMMARY:

Few studies (n=6 identified) examined age in relation to fertility outcomes in PCOS. However, variations in analysis methods, age groupings and data reported meant it was not possible to pool these studies in meta-analysis for most outcomes. Three studies were in IVF treatment and two studies (the ones pooled in meta-analysis) were using gonadotrophin protocols. All five studies identified were of moderate to low risk of bias and were of observational design.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Data could only be pooled for two studies for the outcomes of clinical pregnancy rate and OHSS. Both these outcomes were not significantly different between women aged <35 years compared to women aged 35 years and over. Studies not pooled in the analysis also found no differences by age in most outcomes, however, Kalra et al. (2013) reported a decline in pregnancy rate in women with PCOS undergoing IVF aged between 40 and 45, reducing from 24.4% at age 40 to 13.3% at age 44. Live birth rates also decreased from 17.8% at age 40 to 6.7% at age 44. In contrast, miscarriage rates increased from 24.3% at age 40 to 50% at age 44 in the same cohort. Certainty of the evidence was low to very low due mainly to risk of bias (mostly moderate risk) and imprecision (small number of studies and/or small sample sizes).

Outcome	Studies	N	Effect size [95% CI]	P	Favours	I^2	Certainty
Clinical pregnancy rate per patient	2	686	2.41 [0.53, 10.98]	0.3	No difference	72% (p=0.06)	⊕◯◯◯ VERY LOW
OHSS per patient	2	686	0.96 [0.24, 3.84]	0.9	No difference	0% (NS)	⊕⊕◯◯ LOW
Ovulation rate per cycle	1	80	1.71 [0.36, 8.18]	0.5	No difference	NA	⊕◯◯◯ VERY LOW
Multiple pregnancy rate per patient	1	653	0.95 [0.52, 1.76]	0.9	No difference	NA	⊕⊕◯◯ LOW
Miscarriage rate per patient	2	1093	Not estimable	NA	No difference	NA	⊕◯◯◯ VERY LOW

Question 5.1.

In women with PCOS with infertility, what are the preconception risk factors associated with poor/negative fertility outcomes?

BACKGROUND

NARRATIVE REVIEW

Prevalence and problem

Polycystic ovary syndrome is a common heterogeneous endocrine disorder of uncertain aetiology, although genetics is indicated due to the increase in prevalence between first degree relatives and sisters and epigenetic impact from lifestyle and environmental exposure (1-3). PCOS has lifelong psychological and mental health implications and early diagnosis is crucial to optimise health. Women with PCOS suffer from greater body dissatisfaction and higher rates of eating disorders. They are also at increased risk of mood, anxiety, depression, and eating disorders which may affect libido and sexual relationships, impacting fertility (4-7).

Lifestyle factors especially obesity and being overweight exacerbate the condition; hence prevention of weight gain from adolescence is very important. The condition often results in several health complications, including menstrual dysfunction, infertility and metabolic syndrome disorders such as type 2 diabetes and cardiovascular disease. The endometrium of women with PCOS is further compromised by obesity and may improve with weight loss (8, 9).

The risk of infertility is increased in PCOS and pregnancy complications are higher including gestational diabetes. Preconception care is defined as “a set of interventions that aim to identify and modify biomedical, behavioural, and social risks to a woman's health or pregnancy outcome through prevention and management, emphasizing those factors that must be acted on before conception or early in pregnancy to have maximal impact”. As women with PCOS often require infertility treatment, both the requirement for and the opportunity for preconception care is increased. Preconception care should be considered in the context or routine recommendations and PCOS specific considerations.

Modifiable risk factors that may impact fertility: These include Body Mass Index <18 or >25, smoking status, alcohol consumption, pre-existing medical conditions such as diabetes and epilepsy, prescribed and recreational drug use, untreated sexually transmitted infections, nutritional status, supplementation requirements with folate, vitamin D, coeliac disease and dental health (10-15). These should be optimised as part of routine preconception care.

Pregnancy and fertility complications: Women with PCOS are at an increased risk of pregnancy complications including gestational diabetes, preterm birth, pre-eclampsia, miscarriage, longer time to conception and poor embryo development, reduced embryo implantation rates, increased risk of ovarian hyperstimulation syndrome (16) all exacerbated by obesity.

Mental health: Anxiety and depression coexist with PCOS, although it is unclear if this is a direct consequence of PCOS or due to associated psychological stressors such as obesity, hirsutism, body image issues and infertility (17). All women with PCOS should be screened for anxiety and depression. Body image and eating disorders should be considered and explored, irrespective of BMI (5, 7, 18). All can impact relationship health and sexual intimacy for fertility as well as impacting fertility treatment compliance or leading women to prematurely “drop out of treatment” due to the stress and demands of treatment (19). Mental health care supports treatment adherence, relationship health and quality of life.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Lean/ normal weight versus overweight/ obese PCOS	⊕◯◯◯ VERY LOW
Comparison 2. Younger versus older PCOS age groups	⊕◯◯◯ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Not relevant

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Women with PCOS should be counseled on the adverse impact of excess weight on clinical pregnancy, miscarriage and live birth rates following infertility treatment.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

RECOMMENDATION

CR: Consistent with routine preconception care, in women with PCOS planning pregnancy, weight, blood pressure, smoking, alcohol, diet and nutritional status, folate supplementation (higher dose in those with BMI >30), exercise, sleep and mental, emotional and sexual health should be considered and optimised to improve reproductive and pregnancy outcomes and overall health.

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

See also sections: Lifestyle; Assessment and Management of Emotional Wellbeing; and Cardiometabolic risk

PRACTICE POINT(S)

A reproductive life plan and age appropriate education on optimising reproductive health, is recommended in adolescents and women with PCOS, including including healthy lifestyle, prevention of excess weight gain, and optimising preconception risk factors.

- Healthcare professionals are encouraged to seek permission and if given, to assess weight and body mass index and initiate a dialogue on the importance of weight and lifestyle on women's health before pregnancy. This requires caution to avoid weight stigma and needs to consider the cultural, social and environmental determinants of health (see 3.6).

- Chronic conditions such as diabetes, high blood pressure, anxiety, depression and other mental health conditions, should be optimally managed and women should be counselled regarding related risks of adverse pregnancy outcomes.

GRADE CONSIDERATIONS

Justifications:

These recommendations are guided by WHO and FIGO and the evidence on weight associations (20).

Subgroup considerations:

Subgroups by infertility treatment in relation to the impact of weight, there were no significant differences between the groups.

Implementation considerations:

Optimise provider awareness and counselling skills on weight and health impacts in PCOS in relation to fertility.

Monitoring and evaluation considerations:

Preconception risk factors could be better identified and monitored in PCOS

PCOS status should be better captured and recorded in infertility and pregnancy to optimise monitoring and evaluation of preconception risk factor and infertility and pregnancy outcomes.

Research priorities:

Individual patient data meta-analysis of preconception risk factors in women with PCOS and impact on fertility outcomes.

Greater data on ethnic and geographical variations in PCOS reproductive outcomes and fertility treatment responses is needed.

The impact of age on fertility and fertility treatment outcomes in women with PCOS.
The cumulative weight gain over the reproductive life course and the impact of this on fertility and pregnancy outcomes.

The impact of underweight on fertility outcomes in women with PCOS.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Clearly recommended and beneficial in all women and even more so in high risk women with PCOS.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Undesirable impacts not anticipated.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Evidence certainty high in general population but lower in PCOS specifically. Stronger evidence for weight.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☒ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Impressed by the consistent evidence around the impact of weight and strongly felt that this needed to be considered.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Concerns about stigma and body image / eating disorders need to be considered.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Consider skills gaps

Evidence processing: The search and screening for this question was a separate process to the rest of Guideline Development Group 5 (which all underwent a single search/ screening). Studies were selected and appraised by 1 reviewer/s in consultation with the evidence team/ key contact using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by 1 reviewer. When a decision could not be made based on title and abstract alone, full text was retrieved. **No studies met inclusion criteria for this review.** Therefore, the available evidence has been reviewed narratively

Question 5.2.

Should women with PCOS and infertility due to anovulation alone with normal semen analysis undergo tubal patency testing prior to starting ovulation induction with timed intercourse or IUI treatment?

BACKGROUND

Prevalence and problem

One of the leading causes of female infertility is tubal pathology. It has been estimated that it affects around 30% of infertile women. The diagnostic assessment of infertile women often includes tubal testing by hysterosalpingography, ultrasound (Saline infusion sonohysterography, Hysterosalpingo-Contrast Sonography, [Hysterosalpingo-Foam Sonography]) or laparoscopy.

Clinical gap and need for guidance

PCOS is the most frequent cause of anovulation in infertile women. Ovulation induction is the most common treatment. There is little information about the prevalence of tubal pathology or for the need of intrauterine insemination with normal semen analysis in infertile women with PCOS.

Summary of key information

There is no evidence to support that tubal disease is more frequent in PCOS women (1). Therefore, it would be suitable to perform hysterosalpingography prior to IUI or timed intercourse in women with PCOS and the following clinical risk factors, independent of PCOS, consistent with usual infertility care.

Risk factors for Infertility associated with tubal pathology:

1) Women with PCOS and a history of previous abdominal septic surgery like peritonitis or any pelvic surgical procedure.

2) Women with PCOS with a history of Sexual Transmitted Infection or Pelvic Inflammatory Disease or have a positive serum test for sexually transmitted infection might be considered at risk of an etiologic factor that potentially disrupt fallopian tube function.
3) PCOS associated with endometriosis.

In large studies including a study with 1002 women with PCOS, 33 had tubal abnormalities (3%) with 97% having at least one patent fallopian tube or a normal uterine cavity (2) and other studies also show 3-5% abnormality (3).

In women with PCOS undergoing hysterosalpingography, in 185 women (85.2%) had bilateral tubal patency and 32 (14.7%) had unilateral patency. Seventeen patients underwent laparoscopy with six having both tubes patent and nine having one tube patent (4).

In a large cohort of women with PCOS (N= 619) with at least one patent fallopian tube confirmed by tubal patency test, who were then randomized to up to 5 cycles of letrozole or clomiphene citrate, there was no significant difference in clinical pregnancy rate between women who had tubal patency confirmed by HSG versus Saline infusion sonohysterography (OR 1.14, 95% CI 0.77, 1.67, P = 0.52) (4).
Finally, a multicentre, prospective, comparative study with a randomized design (N=1026), showed that hystero contrast sonography produces similar tubal pathology findings in a majority of infertile couples and, where they differ, a difference in findings does not lead to substantial difference in pregnancy outcome, while hystero contrast sonography is associated with significantly less pain (5). The authors suggested that [Hysterosalpingo-Foam Sonography can be preferred as first-choice tubal patency test during fertility work-up. In case of suspected tubal pathology or inconclusive results, further testing can be done (5).

Recommendations Framework

CONSENSUS RECOMMENDATION

CR: In women with PCOS and infertility due to anovulation alone with normal semen analysis, the risks, benefits, costs and timing and techniques of tubal patency testing in relation to the cost and complexity of the treatment, should be considered on an individual basis, depending on personal history and population prevalence, prior to starting ovulation induction with timed intercourse or IUI insemination.

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

CONSIDERATIONS

Justifications:

See background on broad evidence, no evidence found specifically for this PICO on evidence search

Subgroup considerations:

NA

Implementation considerations:

NA as recommendation is for discussion on risks vs benefits

Monitoring and evaluation considerations:

NA

Research priorities:

Define whether tubal patency test should be done during infertile work-up to identify the optimal timing and method of assessing tubal patency in women with PCOS and infertility due to anovulation alone with normal semen analysis, considering cost effectiveness and quality of life implications for the woman or the couple.

Equity:

NA

Acceptability

Likely acceptable as advice is for discussion on risk vs benefits

FEASIBILITY

NA

Question 5.3.

In women with PCOS, are aromatase inhibitors effective for improving fertility outcomes?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	In women with PCOS, are aromatase inhibitors effective for improving fertility outcomes?
Clinical leads (key contacts)	Rick Legro
Allocation ranking	Level 2- updated systematic review (with update of integrity check for all pre-2017 studies)

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women of any age, ethnicity and weight with PCOS diagnosed by Rotterdam, NIH or AIS and 1) at least one patent tube 2) normal sperm AND 3) have never been treated or been exposed to treatment for infertility (therapy naïve) OR 4) have been treated or exposed to treatment OR 5) have been treated or exposed to clomiphene citrate and ovulate but don't conceive (clomid failure) OR 6) have been treated or exposed to clomid and don't ovulate (clomid resistant). Also specifically identifying the 4 phenotypes where possible.	Any type, dose and frequency of aromatase inhibitor.	Placebo, no intervention, other infertility treatment interventions (ie. another type of aromatase inhibitor, metformin, clomiphene citrate, gonadotrophins, ovarian surgery) including aromatase inhibitors in combination with other infertility treatment intervention(s).	Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, single and multiple pregnancies, miscarriage rate, other adverse events, quality of life, cost effectiveness.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	None
Exclusion	Women without diagnosis of PCOS.	Placebo, no intervention or any intervention other than an aromatase inhibitor.	Any intervention other than those listed in the inclusion criteria.	None	Nonevidence based guidelines, non-systematic reviews, any study lower than a RCT.	None

2. SEARCH STRATEGY

The search and screening for all GDG 5 questions were done together. Details can be found in the GDG 5 Methodology Appendix, including for:

- Databases
- Search Dates
- Search String(s)
- PRISMA flowchart
- Full list of included studies
- Full list of excluded studies with reasons for exclusion

Evidence processing: The literature search and screening were performed together in one Endnote library and Covidence project for all non-IVF, IVF and IVM fertility treatments in PCOS. Studies were selected by one reviewer/s in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. The articles were screened by title and abstract by one reviewer. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy. In total, 102 unique studies met inclusion criteria across all non-IVF, IVF and IVF questions, of which 57 were included in the guideline update following the integrity check (refer to methodology appendix of guidelines for details).

Integrity Assessment: Of these eligible 102 studies, 14 studies met the inclusion criteria for this particular question (Q.5.3) on aromatase inhibitors, as detailed below.

3. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year, country	Population/ PCOS criteria/ Setting/ CC sensitivity	Study Design	Intervention N	Intervention description	Comparison N	Comparison description	Follow Up	Outcomes	Pooled in MA?	RoB
Amer 2017, UK	Women aged 18 – 39 years with BMI ≤ 35 kg/m2 and PCOS by Rotterdam, proven patency, CC sensitivity NR	Double blind RCT	79 randomised and analysed Age: 28.3 (4.4) BMI: 27.5 (23.4 - 32.2)	letrozole 2.5 mg/d for 5 days from day 2-4 doubled in the second cycle if no ovulation	80 randomised and analysed Age: 28.1 (4.2) BMI: 27.7 (23.0 - 31.0)	50 mg CC daily for 5 days from day 2-4, double in second cycle if no ovulation. CCR with max dose or no conception after 6 cycles were crossed-over to LET group after 6-week washout	NR	**Primary:** clinical pregnancy (by US gestational sac) rate per participant on primary treatment (before the cross-over). **Secondary:** ovulation, live birth, pregnancy by ovulating participant, pregnancy by strata, mono-ovulation, endometrial development (thickness and grades), pregnancy outcome and pregnancy complications. Other outcomes included pregnancy and live birth rates on secondary and overall (primary and secondary) treatments.	Yes	Low
Atay 2006, Turkey	Women with primary infertility and PCOS with no other known cause of infertility (criteria NR, CC sensitivity NR); history of oligo/amenorrhoea, ovaries with ≥10 cysts 2-10mm diameter + hyperechogenic stroma	RCT	51 randomised and analysed Age: 27.1 ± 0.9 BMI: 26.1 ± 1.9	2.5 mg letrozole daily for 5 days from day 3 of the menstrual cycle	55 randomised and analysed Age: 26.2 ± 1.1 BMI: 25.8 ± 1.8	100 mg CC daily for 5 days from day 3 of the menstrual cycle	Data suggests 1 treatment cycle for each patient	number of mature follicles, endometrial thickness (mm), day of hCG administration, ovulation rate, pregnancy rate, multiple pregnancies	Yes	High
Banerjee Ray, 2012, India	infertile women aged 20 - 35 with PCOS by Rotterdam; CC sensitivity NR; no CC for previous 2 months; Hospital	Comparative phase III open-label RCT	69 randomised and analysed (132 cycles) Age: 28 (19 - 35) BMI: 28.8 (23.2 - 34.6)	Letrozole 2.5mg day 3-7 of menstrual cycle	78 randomised and analysed (156 cycles) Age: 29 (20 - 35) BMI: 28.5 (24.2 - 33.6)	CC 100mg	NR	**Primary:** ovulation rate, average follicular diameter on day 16, number of mature follicles produced by cycle, mean estradiol level on the day of hCG administration, mean endometrial thickness, pregnancy rate **Secondary:** miscarriage rate, live birth rate	Yes	High

Bansal 2021, India	18–35 years with anovulatory infertility; PCOS by Rotterdam; Tertiary care teaching institute	RCT; not double-blinded	45 randomised, 41 analysed Age: 27.1±0.9 BMI: 26.1±1.91	LET, 2.5mg daily (5days)	45 randomised, 39 analysed Age: 26.2±1.1 BMI: 25.8±1.77	CC, 50 mg daily (5days)	3 cycles	**Primary**: ET. **Secondary**: Ovulation rate (free fluid in pouch of Douglas + collapsed follicle on transvaginal US and/or day 21 progesterone of ≥3 ng/mL), monofollicular development, pregnancy rate (detection of urinary hCG >7 days of missed period and/or detection of gestational sac by US), and time to pregnancy assessment.	Yes	High
Bayar 2006, Turkey	**Therapy naïve** women with anovulatory PCOS by Rotterdam; University outpatient clinic	RCT	40 randomised; 38 analysed Age: 32.2 ± 3.9 BMI: NR	2.5 mg/d letrozole, on days 3 to 7 of menstrual cycle	40 randomised; 36 analysed Age: 30.6 ± 4.0 BMI: NR	100 mg/d CC, administered on days 3 to 7 of the menstrual cycle	1-5 cycles	Ovulation rate by cycle, pregnancy rate by cycle, delivery rate by cycle, miscarriage rate, multiple pregnancy rate, endometrial thickness on the day of hCG (mm), N of follicles sized > 15 mm in diameter on the day of hCG, E2 level on the day of hCG (pg/mL), E2 per follicle sized > 15 mm in diameter on the day of hCG (pg/mL)	Yes	Low
Begum 2009, Bangladesh	CCR women with PCOS by Rotterdam who failed to ovulate by 100 mg of CC/day for 5 days in 2 consecutive cycles; private infertility care setting	Non-blinded RCT	32 Age: 25.5 ± 4.0 BMI: 22.7 ± 2.8	7.5 mg of letrozole daily for 5 days starting from day 3 of the cycle	32 Age: 26.1 ± 3.6 BMI: 23.6 ± 3.2	150 mg of CC daily for 5 days starting from day 3 of the cycle	NR	**Primary:** ovulation and pregnancy rate **Secondary:** follicular development by day 16 (mm), serum E2 on day of hCG (pg/mL), endometrial development by day 16 (mm), serum progesterone on day 21 (ng/mL), multiple pregnancies, OHSS cases.	Yes	Mod
Ganesh, 2009, India	Women with PCOS by Rotterdam who had previously failed to conceive or ovulate with CC and undergoing IUI; tertiary infertility care unit	Single blind RCT	**LET:** 372 analysed Age: 30.3 ± 4.9	**LET**: letrozole, 5 mg/day orally given for 5 days from cycle days 3 - 7	**CC + FSH:** 669 analysed Age: 30.4 ± 5.2 BMI: 24.8 ± 4.1	**CC + FSH:** clomiphene citrate, 100 mg/day orally given for 5 days from cycle days 3 - 7 + 75 or 100 IU rFSH during cycle days 3 and 8	NR	**Primary**: ovulation rate, cancellation rate, miscarriage rate and clinical pregnancy rate **Secondary**: OHSS rate and multiple pregnancy rate.	No	Mod*

			BMI: 24.5 ± 3.8		**FSH**: 346 analysed Age: 30.8 ± 4.6 BMI: 24.1 ± 3.4	**FSH**: rFSH 75IU/100IU from day 2 until the day of hCG administration				
Legro 2014, USA	Women with PCOS by Rotterdam; CC sensitivity NR	Multi-centre double blind RCT	374 (1352 cycles) Age: 29 ± 5 BMI: 35 ± 10	5 mg/day progestin for 10 days to induce bleed, then letrozole (2.5 mg daily) was given from cycle day 3 for 5 days. Maximum dose 7.5 mg/d of letrozole given for 5 days.	376 (1425 cycles) Age: 28 ± 4 BMI: 35 ± 9	5 mg/day progestin for 10 days to induce bleed, then CC (50 mg daily) was given from cycle day 3 for 5 days. Dose was increased in subsequent cycles for nonresponse or poor ovulatory response. Maximum dose of CC 150 mg/d given for 5 days.	Up to 5 cycles	Live birth, ovulation rate, clinical pregnancy rate, miscarriage rate, multiple pregnancy rate	Yes	Low
Liu, 2017, China	Infertile women aged 20-35, BMI≤35; normal patency; PCOS by Rotterdam; Hospital outpatient dept.; CC sensitivity mixed (some CCR)	RCT; blinding NR	**LET**: 67 randomised, 62 analysed; Age: 27.0 ± 3.0 BMI: 20.8 (19.1, 22.3) **LET + MET**: 67 randomised, 57analysed Age: 27.2 ± 3.3 BMI: 21.6 (19.2, 23.6)	**LET**: letrozole 5mg/d (5days) **LET + MET**: letrozole 5mg/d (5 days) + MET 1000–1500 mg/d	**CC**: 67 randomised, 63 analysed; Age: 26.8 ± 3.1 BMI: 21.1 (19.9, 22.8) **CC + MET**: 67 randomised, 58 analysed Age: 27.2 ± 2.8 BMI: 21.4 (19.8, 23.6)	**CC**: CC 50mg/d (5 days) **CC + MET**: CC, 50 mg daily (5days) + MET 1000–1500 mg/d	2 cycles	Ovulation rate, clinical pregnancy rate, and pregnancy outcome (abortion, premature delivery, and live birth)	Yes	High
Nazik 2012, Turkey	Infertile women with PCOS by Rotterdam; LET group CCR; CC group Treatment	Partly randomised trial	31 randomised and analysed (40 cycles)	Letrozole 2.5mg/day from day 3 -7	33 randomised and analysed (40 cycles)	All patients with oligomenorrhoea given 6 days of medroxyprogest-erone acetate to induce	NR	**Primary Outcomes:** ovulation rate and pregnancy rate **Secondary Outcomes:** ovarian hyperstimulation syndrome rate, miscarriage	Yes	High

	naïve; infertility polyclinic of University		Age: 25.6 ± 4.5 BMI: 24.7 ± 3.6		Age: 27.8 ± 6.2 BMI: 24.9 ± 4.8	withdrawal bleed, then CC 100mg/day from day 3-7		rate, multiple pregnancy rate, number of follicles on day of hCG (≥ 17 mm), E2 (pg/mL) on hCG day, endometrial thickness (mm), other side effects		
Pourghasem, 2019, Iran	Infertile women aged 15–38 years old; PCOS by Rotterdam; infertility clinic of University; Letrozole resistant (no ovulation at 7.5 mg letrozole)	RCT; not double-blind	**LET + folic acid**: 62 randomised, 50 analysed	Letrozole 7.5 mg per day from the third day of menstruation for 5 days; + folic acid 200 µg	**LET + MET + folic acid**: 62 randomised, 50 analysed; **LET + Inositol + folic acid:** 62 randomised, 50 analysed	**LET + MET + folic acid:** Letrozole 7.5 mg/d + Metformin 1500 mg/d + 200 µg folic acid **LET + Inositol + folic acid:** Letrozole 7.5 mg/d + Inositol 2g + 200 µg folic acid twice daily for 3 months.	3 cycles	Primary outcomes were ovarian function (presence or absence of a mature follicle ≥17 mm seen by transvaginal US) during 12–16 menstrual cycles; and clinical pregnancy (presence of gestational sac on US 5 weeks after HCG injection).	Yes	High
Roy 2012, India	Women aged 20 - 35 with infertility for > 1 year, normal fertility tests (patency, semen, hormone) BMI < 28, and anovulatory PCOS by Rotterdam; CC sensitivity **NR**; Tertiary care hospital	RCT	104 randomised; 98 analysed (294 cycles) Age: 26.1 ± 1.8 BMI: 25.8 ± 2.1	2.5 mg/d letrozole, increasing up to 5 mg/d, from Day 3-7 (5 days) after a 5-day course of 10 mg/ d medroxyprogesterone acetate to induce bleed	108 randomised; 106 analysed (318 cycles) Age: 26.5 ± 1.3 BMI: 25.4 ± 1.6	50 mg/d CC, increasing up to 100 mg/d, from Day 3-7 (5 days) after a 5-day course of 10 mg/ d medroxyprogesterone acetate to induce bleed	3 months	Mean number of follicles, endometrial thickness, ovulatory cycle rate, conception rate, pregnancy outcome, miscarriage rate, multiple pregnancies and OHSS rate	Yes	Low
Sohrabvand, 2006, Iran	**CCF** women (failed to become pregnant after 3 courses of 150 mg CC) with PCOS; Hospital infertility clinic	Single - blind RCT	30 randomised and analysed Age: 28.2 ± 3.1	metformin 500 mg x 3/d for 6 - 8 weeks. If pregnancy did not occur, 2.5 mg letrozole from cycle days 3 - 7 was given orally.	30 randomised and 29 analysed Age: 29.6 ± 3.5	metformin 500 mg x 3/d for 6 - 8 weeks. If pregnancy did not occur, 100 mg CC from cycle days 3 - 7 was given orally.	2 cycles	Endometrial thickness on day of hCG administration (cm), N of follicles > 18 mm in diameter, Mean total estradiol level on day of hCG administration (pM/L), mean estradiol level by mature follicle (pM/l), regular menses after metformin, adverse effects of metformin,	Yes	Mod*

			BMI: 30.0 ± 4.8		BMI: 30.2 ± 3.9			live birth rate, clinical pregnancy rate, miscarriage rate		
Zeinalzadeh 2010, Iran	Women with primary infertility, documented PCOS by ultrasound, oligomenorrhea, and an increased LH/ FSH ratio (>3), age < 35 years, < 5 years infertility and BMI between 19 and 26. CC sensitivity **NR**	RCT	50 randomised and analysed Age: 23.8±3.6 BMI: 19-26	5 mg/d letrozole within days 3-7 of menstrual cycle for 5 days	57 randomised and analysed Age: 23.1±3.6 BMI: 19-26	100 mg of CC daily within days 3-7 of menstrual cycle for 5 days	NR	Ovulation rate, pregnancy rate, number of follicles > 17mm, OHSS rate, multiple pregnancy rate, endometrial thickness.	Yes	High

CC, clomiphene citrate; CCR, clomiphene citrate resistant (to ovulate); CCF, clomiphene citrate failure (to become pregnant); LET, letrozole; MET, metformin; NR; not reported; OHSS, ovarian hyperstimulation syndrome; IUI, intrauterine insemination; hCG, human chorionic gonadotrophin; LH, luteinizing hormone; FSH, follicle stimulating hormone; MA, meta-analysis; RoB, risk of bias. All age data is in years and BMI is in kg/m^2. *Risk of bias assessment derived from reliable systematic review (e.g. Cochrane or previous review from the guideline evidence team).

4. FINDINGS

Comparisons Included:

- **Comparison 1.** Letrozole vs Clomiphene Citrate
- **Comparison 2.** Letrozole + Metformin vs Clomiphene Citrate + Metformin
- **Comparison 3.** Letrozole vs Letrozole + Metformin
- **Comparison 4.** Letrozole vs Clomiphene Citrate + rFSH vs continuous rFSH
- **Comparison 5.** Letrozole + Metformin vs Clomiphene Citrate
- **Comparison 6.** Letrozole vs Clomiphene Citrate + Metformin

COMPARISON 1. Letrozole vs Clomiphene Citrate

▪ EVIDENCE SUMMARY:

Eleven RCTs compared letrozole with clomiphene citrate, of which six had a high risk of bias (Atay, 2006; Nazik, 2012; Ray, 2012; Zeinalzadeh, 2010; Bansal, 2021; Liu, 2017), one had a moderate risk of bias (Begum, 2009), and four had a low risk of bias (Legro, 2014; Roy, 2012; Amer, 2017; Bayar, 2006). Studies were conducted in the UK, USA, Iran, India, Bangladesh and China.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

In meta-analysis, letrozole was superior to clomiphene citrate for ovulation rate (per patient and per cycle); pregnancy rate and clinical pregnancy rate per patient; and live birth rate per patient. Certainty in the evidence is high for live birth rate, and moderate for pregnancy rate, clinical pregnancy rate and ovulation rate, downgraded once for serious risk of bias since the majority of studies included had high to moderate risk of bias.

There were no differences between letrozole and clomiphene citrate for other outcomes including live birth rate per pregnancy, multiple pregnancy rate (per patient or pregnancy); and miscarriage rate (per patient or pregnancy). Certainty in these findings ranged from low to very low due to risk of bias, serious imprecision and serious inconsistency, except for multiple pregnancy rate per patient which was moderate due to 3 of the 5 studies having a high risk of bias. There was no evidence of statistical heterogeneity or publication bias for any of the outcomes.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	6	1449	1.78 [1.40, 2.26]	<0.00001	LET (live birth is higher with LET)	⊕⊕⊕⊕ HIGH
Live birth rate- per pregnancy	4	319	1.43 [0.62, 3.29]	0.4	None	⊕⊕◯◯ LOW
Clinical pregnancy rate- per patient†	8	1668	1.87 [1.50, 2.33]	<0.00001	LET (clinical pregnancy is higher with LET)	⊕⊕⊕◯ MODERATE
Pregnancy rate- per patient*	11	1870	1.83 [1.49, 2.26]	<0.00001	LET (pregnancy is higher with LET)	⊕⊕⊕◯ MODERATE
Ovulation Rate- per patient	8	1697	1.93 [1.35, 2.76]	0.0003	LET (ovulation per patient is higher with LET)	⊕⊕⊕◯ MODERATE
Ovulation Rate- per cycle	1	280	2.32 [1.41, 3.82]	0.0009	LET (ovulation per cycle is higher with LET)	⊕◯◯◯ VERY LOW
Multiple Pregnancy Rate- per patient	7	1394	1.20 [0.48, 2.99]	0.7	None	⊕◯◯◯ VERY LOW
Multiple pregnancy rate- per pregnancy	5	318	0.38 [0.14, 1.04]	0.06	None	⊕⊕◯◯ LOW
Miscarriage rate- per patient	8	1511	0.92 [0.44, 1.91]	0.8	None	⊕◯◯◯ VERY LOW
Miscarriage rate- per pregnancy	6	353	1.00 [0.60, 1.67]	0.9	None	⊕⊕◯◯ LOW

*includes biochemical (or undefined pregnancy rate) as reported in each study; †clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

OUTCOME 1.1. Live birth rate – per patient

OUTCOME: Live birth rate - per patient					**OUTCOME TYPE:** Dichotomous				
COMPARISON: Letrozole vs. Clomiphene Citrate									
Author, year	**Past OI Med Use**	**Unit of outcome (e.g. g, mg)**	**Method of measurement**	**N events in intervention/ exposure group (LET)**	**N total in intervention/ exposure group (LET)**	**N events in control / comparison group (CC)**	**N total in control/ comparison group (CC)**	**Are these values adjusted or crude?**	**If adjusted, what variables were in the model?**

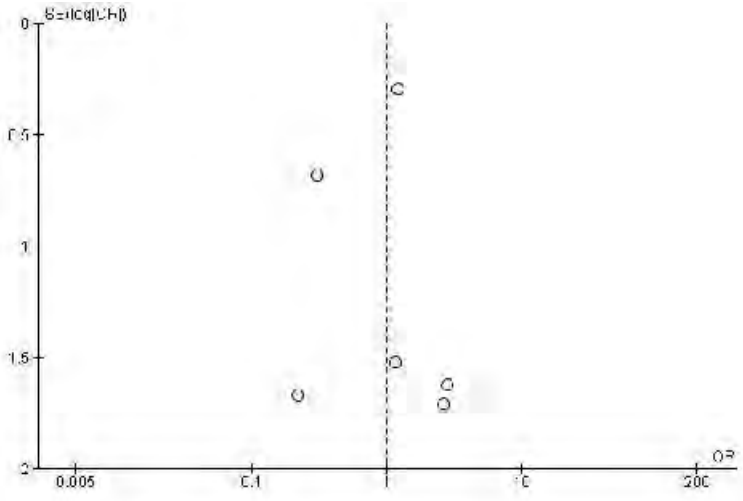
1.10.3. Funnel plot for assessment of publication bias



COMPARISON 2. Letrozole + Metformin vs Clomiphene Citrate + Metformin

▪ EVIDENCE SUMMARY:

Two studies compared letrozole + metformin with clomiphene citrate + metformin (Liu, et al. 2017; Sohrabvand, et al. 2006), with relevant outcomes including ovulation rate per cycle and pregnancy and miscarriage rate per patient. Liu et al. (2017) additionally assessed live birth rate per patient, whereas Sohrabvand et al. (2006) reported full term pregnancy per patient. Both studies were moderate (Sohrabvand, et al. 2006) or high (Liu, et al. 2017) risk of bias due to lack of blinding of participants and insufficient information around allocation concealment.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Meta-analysis of these two studies was performed for ovulation rate per cycle and pregnancy and miscarriage rate per patient, with results in the table below. Ovulation and pregnancy rates per patient were greater with letrozole + metformin compared with clomiphene citrate + metformin with odds ratios of 2.02 and 1.90, respectively. Miscarriage rates per patient did not differ between groups. Certainty of the evidence for these three outcomes was low, downgraded once due to high/ moderate risk of bias and once for serious imprecision (small n and wide confidence intervals).

The study by Liu et al. (2017) additionally assessed live birth rate per patient, showing no difference between letrozole + metformin versus clomiphene citrate + metformin groups. Sohrabvand et al. (2006) assessed full term pregnancy per patient and found that letrozole + metformin was more effective than clomiphene citrate + metformin for this outcome, with borderline statistical significance (10 versus 3 full term pregnancies per group, respectively, p=0.045).These results for both these outcomes are of very low certainty given that they are derived from only single studies with moderate to high risk of bias.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	1	115	1.30 [0.60, 2.81]	0.5	None	⊕○○○ VERY LOW
Clinical pregnancy rate- per patient†	2	174	1.90 [1.01, 3.58]	0.0486	**LET + MET** (clinical pregnancy is higher with LET + MET)	⊕⊕○○ LOW
Ovulation rate- per cycle	2	369 (cycles)	2.02 [1.24, 3.30]	0.005	**LET + MET** (ovulation per cycle is higher with LET + MET)	⊕⊕○○ LOW
Miscarriage rate- per patient	2	174	0.98 [0.12, 7.89]	0.9	None	⊕⊕○○ LOW
Full term pregnancy- per patient	1	59	4.74 [1.15, 19.55]	0.03	**LET + MET** (full term pregnancy is higher with LET + MET)	⊕○○○ VERY LOW

†clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

Sohrabvand 2006	CCF	Count	Investigator	10	29	3	30	Crude	NA

CCF, Clomiphene citrate failure

COMPARISON 3. Letrozole vs Letrozole + Metformin

▪ EVIDENCE SUMMARY:

Only two studies compared letrozole alone or combined with metformin. One of the studies performed in Iran (Pourghasem, et al. 2019) provided folic acid 200 µg daily (as a placebo) to both the letrozole and letrozole + metformin groups. Reported outcomes of relevance were clinical pregnancy rate per patient and live birth rate per patient. Both studies had a high risk of bias due to issues around lack of blinding and insufficient information about randomisation or allocation concealment. The study by Liu et al. (2017) was conducted in China and had a high dropout rate of 15% in the letrozole + metformin group, with 7.5% drop outs in the letrozole group.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Meta-analysis was only possible for the outcome of clinical pregnancy rate per person, with two studies pooled for this analysis (Liu, et al. 2017; Pourghasem, et al. 2019), showing no difference between letrozole alone or combined with metformin for this outcome. There is very low certainty in this result due to very serious risk of bias, with serious imprecision and serious indirectness.

For the outcomes of ovulation rate per cycle and live birth rate and miscarriage rate per patient, only one study was available. This study by Liu et al. (2017) was conducted in China in 119 women with PCOS (for this comparison) aged 20-35, with a BMI ≤35 kg/m^2 and showed no difference in live birth rate between letrozole alone versus letrozole + metformin (36.8% vs. 33.9%). Ovulation rate per cycle was higher in the letrozole + metformin group than letrozole alone, but this was not significant (89/118 cycles vs 93/130 cycles, $p > .05$). Similarly, miscarriage/ abortion rate per patient was slightly higher in the letrozole + metformin than in the letrozole group, but the difference was not statistically significant (21.1% vs 12.9%, $p > .05$). These results are of very low certainty given that they are derived from a single study with a high risk of bias.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	1	119	0.88 [0.41, 1.86]	0.7	None	⊕◯◯◯ VERY LOW
Clinical pregnancy rate- per patient	2	219	0.69 [0.40, 1.19]	0.2	None	⊕◯◯◯ VERY LOW
Ovulation rate per cycle	1	248	0.82 [0.46, 1.44]	0.5	None	⊕◯◯◯ VERY LOW
Miscarriage rate- per person	1	119	0.56 [0.21, 1.48]	0.2	None	⊕◯◯◯ VERY LOW

OUTCOME 3.4. Miscarriage rate – per patient

3.4.1. Individual Study Data Table

OUTCOME: Miscarriage rate – per person					**OUTCOME TYPE:** Dichotomous				
COMPARISON: Letrozole vs. Letrozole + Metformin									
Author, year	**Past OI Med Use**	**Unit of outcome (e.g. g, mg)**	**Method of measurement**	**N events intervention group (LET)**	**N total in intervention group (LET)**	**N events in control / comparison group (LET + MET)**	**N total in control/ comparison group (LET + MET)**	**Are these values adjusted or crude?**	**If adjusted, what variables were in the model?**
Liu 2017 (HRB)	Mixed	Count	Investigator	8	62	12	57	Crude	NA

Mixed, includes some clomiphene citrate resistant/failure and/or therapy naïve and/or not reported.

COMPARISON 4. Letrozole vs Clomiphene Citrate + rFSH (cycle days 3 to 8)

▪ EVIDENCE SUMMARY:

A single study (Ganesh, et al. 2009) in India compared letrozole with clomiphene citrate + gonadotropins (rFSH) in 1387 women with PCOS who had previously failed to conceive or ovulate with CC and were undergoing IUI. Outcomes assessed included clinical pregnancy, ovulation rate, and miscarriage rate per patient. The study was judged as having a moderate risk of bias due to the single-blind design.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Combined clomiphene citrate and FSH was less effective than letrozole in achieving clinical pregnancy or ovulation per patient in this study, with odds ratios of 0.55 and 0.35, respectively. There were no differences between clomiphene citrate + FSH compared with letrozole for miscarriage rates per patient. Certainty in these results is moderate given the narrow confidence intervals and large sample size, downgraded once due to risk of bias given its single-blind design.

OUTCOME 14.1 – 14.3: Clinical pregnancy rate-per patient; ovulation rate- per patient, miscarriage rate-per pregnancy

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Clinical pregnancy rate- per patient†	1	1041	1.82 [1.32, 2.52]	0.0003	**LET** (clinical pregnancy is lower with CC+ FSH)	⊕⊕⊕◯ Moderate
Ovulation rate - per patient	1	1041	2.90 [2.16, 3.89]	<0.00001	**LET** (ovulation rate is lower with CC + FSH)	⊕⊕⊕◯ Moderate
Miscarriage rate- per pregnancy	1	183	0.80 [0.36, 1.80]	0.6	None	⊕⊕⊕◯ Moderate

CCR/CCF, clomiphene citrate-resistant or failure

COMPARISON 5: Letrozole + Metformin versus Clomiphene Citrate

- **EVIDENCE SUMMARY:**

One study compared letrozole + metformin with clomiphene citrate (Liu, et al. 2017), with relevant outcomes including live birth, clinical pregnancy and miscarriage rate per patient, and ovulation rate per cycle. This study, by Liu et al. (2017) was conducted in China with 120 participants and had a high risk of bias due to lack of blinding of participants and insufficient information around allocation concealment.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Letrozole + metformin was more effective than metformin for clinical pregnancy rate and ovulation rate per cycle. There were no differences between metformin + letrozole versus clomiphene citrate for the outcomes of live birth or miscarriage rate per patient. Given that these results are from a single, relatively small, high-risk of bias study, certainty in the evidence is very low for all outcomes.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	1	120	2.04 [0.92, 4.55]	0.08	None	⊕◯◯◯ VERY LOW
Clinical pregnancy rate- per patient†	1	120	2.56 [1.22, 5.36]	0.01	**LET + MET** (clinical pregnancy is higher with LET + MET)	⊕◯◯◯ VERY LOW
Ovulation rate - per cycle	1	268	2.83 [1.67, 4.80]	0.0001	**LET + MET** (ovulation per cycle is higher with LET + MET)	⊕◯◯◯ VERY LOW
Miscarriage rate- per patient	1	120	2.13 [0.78, 5.87]	0.1	None	⊕◯◯◯ VERY LOW

GDG 5

Question 5.3.

In women with PCOS, are aromatase inhibitors effective for improving fertility outcomes?

BACKGROUND

Aromatase inhibitors are oral ovulation-inducing drugs that were first proposed as new ovulation-inducing agents in anovulatory women (with an inadequate response to clomiphene citrate) in 2001 (1). The most commonly used aromatase inhibitor in ovulation induction is letrozole (2). Anastrazole is likely less effective than letrozole, given its proven inferiority to clomiphene citrate in industry sponsored studies (3).

The enzyme aromatase is a member of the cytochrome P450 hemoprotein containing enzyme complex super family and catalyses the conversion of androgens to oestrogens, specifically the conversion of testosterone and androstenedione to oestradiol and estrone respectively in the ovary, and likely in other areas including adipose tissue and the hypothalamus. The exact mechanism of aromatase inhibition inducing ovulation is unknown. However, it is generally accepted that aromatase inhibitors inhibit oestrogen biosynthesis, thereby releasing the hypothalamus/pituitary axis from oestrogenic negative feedback and increasing the secretion of FSH by the pituitary (4). This is analogous to the proposed mechanism of clomiphene citrate as a selective oestrogen receptor modulator (SERM). As a result, the ovary receives increased FSH stimulation, allowing for greater follicular growth and development and development of an ovulatory follicle(s) from the antral follicle pool.

The main incentives for the proposal of aromatase inhibitors as ovulation induction agents were to improve pregnancy rates with first line treatments as well as avoid some of the adverse effects of clomiphene citrate including the effects on the endometrium and cervical mucus (5) and the increased risk of multiple pregnancy (6). Clomiphene citrate resistance, defined as failure to ovulation in response to ovulation induction is common and may affect over 25% of women with anovulation treated with clomiphene citrate (7) and clomiphene citrate failure, defined as failure to conceive after ovulation an even larger percentage of women (8). Although there have been data from smaller studies to suggest higher rates of monofollicular ovulation and a thicker endometrium in the luteal phase after ovulation induction with letrozole (6), larger trials to date have not confirmed these findings or the hope for a significantly lower multiple pregnancy rate (9).

Letrozole is typically administered on days 3–7 of the menstrual cycle at doses of 2.5–7.5 mg per day in 2.5mg increments (10). Adverse effects include gastrointestinal disturbances, asthenia, hot flushes, headache and back pain (11). While hot flushes are significantly less common with letrozole and clomiphene, fatigue and dizziness are more common (12). Letrozole has also been given concurrently with clomiphene citrate with one small study reporting improved ovulation versus letrozole alone (13). However, there are limited studies with combination therapy with an aromatase inhibitor.

The potential teratogenic effect of letrozole for infertility treatment was first raised at an American Society for Reproductive Medicine meeting in 2005 where an oral abstract presentation suggested that the use of letrozole for infertility treatment might be associated with a higher risk of congenital cardiac and bone malformations in newborns (14). These results were never confirmed in a peer-reviewed journal but led to a series of black box warnings in various countries to avoid use as an infertility agent. However multiple subsequent case series anomaly (15-19) as well as large multi-centre randomized clinical trials (12, 20) failed to note an increased congenital anomaly rate with letrozole nor significant differences between letrozole and clomiphene citrate with all prevalence of anomalies with letrozole or clomiphene citrate ***under*** 5% (the expected anomaly rate in this population is 5-8% (21). A recent meta-analysis and systematic review documented this low anomaly rate with letrozole and found it comparable with anomaly rates with pregnancies conceived from clomiphene, natural conception or other treatment agents (22).

A network meta-analysis performed in 2017 and updated in 2022 (23, 24) after retracted and ineligible studies were removed supported letrozole as the first line treatment for anovulatory infertility in PCOS. No first line oral therapy was associated with a difference in multiple pregnancy rate.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Letrozole vs Clomiphene citrate	⊕⊕⊕⊕ HIGH
Comparison 2. Letrozole + Metformin vs Clomiphene citrate + Metformin	⊕◯◯◯ VERY LOW
Comparison 3. Letrozole vs Letrozole + Metformin	⊕◯◯◯ VERY LOW
Comparison 4. Letrozole vs Clomiphene citrate + rFSH vs continuous rFSH	⊕⊕⊕◯ MODERATE
Comparison 5. Letrozole + Metformin vs Clomiphene citrate	⊕◯◯◯ VERY LOW
Comparison 6. Letrozole vs Clomiphene citrate + Metformin	⊕◯◯◯ VERY LOW

COMPARISONS (option versus other option)
COMPARISON 1. Letrozole vs Clomiphene citrate
COMPARISON 2. Letrozole + Metformin vs Clomiphene citrate + Metformin
COMPARISON 3. Letrozole vs Letrozole + Metformin
COMPARISON 4. Letrozole vs Clomiphene citrate + rFSH (cycle days 3 to 8) vs rFSH (cycle days 2 to trigger)
COMPARISON 5: Letrozole + Metformin versus Clomiphene citrate
COMPARISON 6: Letrozole versus Clomiphene citrate + Metformin

Recommendations Framework

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Letrozole should be the first line pharmacological treatment for ovulation induction in infertile anovulatory women with PCOS, with no other infertility factors.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

The use of letrozole is still off label in many countries.

Where it is not allowed, clinicians should use other ovulation induction agents.

Letrozole should not be given where there is any possibility of a pre-existing pregnancy, though there is no evidence for increased teratogenicity compared to other ovulation induction agents.

RESEARCH RECOMMENDATION

Further adequately powered, well designed, conducted and reported RCTs are needed to compare letrozole versus letrozole combined with metformin, in women with PCOS with anovulatory infertility (preferably therapy naive) and no other infertility factors for reproductive outcomes.

GRADE CONSIDERATIONS

Justifications:

This recommendation was based on the following totality of evidence:

1. International Evidence Based Guidelines 2022 updated evidence summaries on the clinical questions for Aromatase Inhibitors (AIs), metformin (MET) / clomiphene citrate (CC), gonadotrophins (Gns) and laparoscopic ovarian surgery (LOS), but especially the comparisons of:

- Letrozole Vs CC (favours Letrozole)
- CC Vs MET (favours CC)
- Gn’s Vs CC (favours Gn’s in terms of efficacy)

2. Cochrane review on Aromatase Inhibitors 2022 update (incorporated an integrity check list) (25) : especially the comparisons of

- Letrozole Vs CC (favours Letrozole)
- Letrozole V CC with other Ovulation Induction (OI) agents as adjuvants such as MET and Gn's (favours Letrozole)

3. Rui et al BMJ 2022 systematic review and network meta-analysis (incorporated an integrity check list): Letrozole 1st line OI agent (23, 24)

The justification for recommending letrozole as first line therapy is the replication of a similar magnitude of benefit vs clomiphene citrate in multiple studies with a cumulative large sample size (relative to other studies in PCOS or reproductive medicine). There is also a consistency about the benefit across all surrogate outcomes including improved ovulation and clinical pregnancy rates as well as the primary clinical outcome of live birth rates per patient. This is also supported by network meta-analysis comparing the main agents.

Subgroup considerations:

There are insufficient data to recommend whether patients who are drug naïve or clomiphene citrate resistant have varying pregnancy or live birth rates with letrozole therapy. There is evidence of an increased ovulation rate with letrozole in patients with clomiphene citrate resistance compared to those patients taking clomiphene.

Implementation considerations:

Letrozole is available widely as a generic drug and is used extensively for the treatment of breast cancer. The primary concern about implementation of letrozole as first line therapy for anovulatory infertility in women with PCOS are unwarranted concerns about increased teratogenicity based on one published abstract. Sharing the data from published studies and the meta-analysis with countries that have a black box warning may lead to a change of policy. Where it is forbidden, then clomiphene citrate should be the first line therapy.

Monitoring and evaluation considerations:

There should be ongoing monitoring of patients for adverse effects and infants for any teratogenicity in all studies conducted with aromatase inhibitors. These should be reported in any published papers.

Research priorities:

In descending order:

1. Establishing the ideal number of cycles of ovulation induction with letrozole before moving on to other treatments
2. Validation of prediction models to select first line ovulation induction agents and dose
3. Studying combination therapies of aromatase inhibitors with other inexpensive and widely available medications with different mechanisms of action such as metformin, inositol and clomiphene citrate would be helpful
4. Best therapies for drug naïve vs drug resistant/ drug failure patients is another research consideration.

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

EVIDENCE-BASED RECOMMENDATION(S)
Letrozole should be considered the first line pharmacological treatment for ovulation induction in infertile anovulatory women with polycystic ovary syndrome, with no other infertility factors.

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Clear definitive evidence for first line

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

While fatigue and dizziness and hot flashes differ between clomiphene citrate and letrozole, it is difficult to assess which side effect profile is more acceptable. Generally, dropout rates are higher in groups taking metformin compared to clomiphene citrate most likely due to GI side effects.

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☒ Moderate	☒ High

Moderate to high for the key comparisons that informed this recommendation

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Based on extensive evidence synthesis

- **VALUES**

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☒ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Good evidence, no uncertainty

- **BALANCE OF EFFECTS**

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Cost of drugs and monitoring comparable; higher efficiency of letrozole would result in savings.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

Cost effectiveness systematic review is done across PCOS. Please reference the overarching section on cost

Panel discussion:

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

Cost effectiveness systematic review is done across PCOS. Please reference the overarching section on cost.

Panel discussion:

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☒ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Are key stakeholders likely to find the recommendation acceptable, given the relative importance they attach to the desirable and undesirable consequences of implementing the recommendation; the timing of the benefits, harms and costs; and their moral values? This includes considering patients' values and preferences.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☒ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Limited ability to prescribe depending on regulatory approval

GDG 5

Question 5.4.

In women with PCOS, is clomiphene citrate effective for improving fertility outcomes? In women with PCOS, is metformin effective for improving fertility outcomes? In women with PCOS and a BMI<30-32, what is the effectiveness of metformin compared to clomiphene citrate for improving fertility outcomes?

1. STUDY SELECTION

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Q.5.4.1. Clomiphene Citrate						
Inclusion	Women of any age, ethnicity and weight with PCOS diagnosed by Rotterdam, NIH or AEPCOS and 1) at least one patent tube 2) normal sperm AND 3) have never been treated or been exposed to treatment for infertility (therapy naïve) OR 4) have been treated or exposed to treatment OR 5) have been treated or exposed to clomiphene citrate and ovulate but don't conceive (clomid failure) OR 6) have been treated or exposed to clomid and don't ovulate (clomid resistant). Subgroup by BMI. Also specifically identifying the 4 phenotypes where possible.	Any type, dose and frequency of clomiphene citrate.	Placebo, no intervention, other infertility treatment interventions (ie. aromatase inhibitor, metformin, gonadotrophins, ovarian surgery) including clomiphene cirate in combination with other infertility treatment intervention(s).	Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, single and multiple pregnancies, miscarriage rate, other adverse events, quality of life, cost effectiveness.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	2017-current, combined with studies from previous guideline
Exclusion	Women without diagnosis of PCOS.	Placebo, no intervention or any intervention other than clomiphene citrate.	Any intervention other than those listed in the inclusion criteria.	None	Non-evidence based guidelines, non-systematic reviews, any study lower than a RCT.	None
Q.5.4.2. & Q.5.4.3. Metformin						
Inclusion	Women of any age, ethnicity and weight with PCOS diagnosed by Rotterdam, NIH or AIS and 1) at least one patent tube 2) normal sperm AND 3) have never been treated or been exposed to treatment for infertility (therapy naïve) OR 4) have been treated or exposed to treatment OR 5) have been treated or exposed to clomiphene citrate and ovulate but don't conceive (clomid failure) OR 6) have been treated or exposed to clomid and don't ovulate (clomid resistant). Subgroup by BMI. Also specifically identifying the 4 phenotypes where possible.	At least 1000mg of any type of metformin at any frequency including slow release and standard release.	Placebo, no intervention, other infertility treatment interventions (ie. clomiphene citrate, aromatase inhibitors, gonadotrophin, ovarian surgery) including metformin in combination with other infertility treatment intervention(s).	Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, single and multiple pregnancies, miscarriage rate, other adverse events, quality of life, cost effectiveness.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	2017-current, combined with studies from previous guideline
Exclusion	Women without diagnosis of PCOS.	Placebo, no intervention or any intervention other than metformin.	Any type, dose and frequency of metformin alone.	None	Non-EB guidelines, non-systematic reviews, any study lower than a RCT.	None

2. SEARCH STRATEGY

The search and screening for all GDG 5 questions were done together. Details can be found in the GDG 5 Methodology Appendix, including for:

- Databases
- Search Dates
- Search String(s)
- PRISMA flowchart
- Full list of included studies

- Full list of excluded studies with reasons for exclusion

Evidence processing: The literature search and screening were performed together in one Endnote library and Covidence project for all non-IVF, IVF and IVM fertility treatments in PCOS. Studies were selected by one reviewer/s in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. The articles were screened by title and abstract by one reviewer. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy. In total, 102 unique studies met inclusion criteria across all non-IVF, IVF and IVF questions, of which 57 were included in the guideline update following the integrity check (refer to methodology appendix for details).

Integrity Assessment: Of these eligible 57 studies, 34 studies met the inclusion criteria for this particular set of questions (Q.5.4.1, Q.5.4.2, Q.5.4.3) on clomiphene citrate, metformin, and metformin in women with PCOS and BMI<30-32, as detailed below.

3. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year, country	Population/ PCOS criteria/ Setting/ CC sensitivity	Study Design	Intervention N, Age, BMI	Intervention Description	Comparison N, Age, BMI	Comparison description	Follow up	Outcomes	Poole d in MA?	RoB
Amer 2009, UK	Women with BMI ≤32 kg/m^2 anovulatory infertility ≥1 year associated with PCOS (PCOS diagnosed by; at least two of: clinical (oligo/ amenorrhoea and/or hyperandrogenaemia), biochemical [LH ≥ 10 IU/l, LH/FSH ratio ≥2, T >2.6 nmol/l or FAI >5] and/or polycystic ovaries on U/S; Reproductive Medicine Centre; CCR	RCT	LOD: 36 Age: 28.1 ± 4.3 BMI: 26.2 ± 3.9	Monopolar electrocautery probe was used to penetrate the ovarian capsule making four punctures per ovary at a power setting of 30 W applied for 5 s per puncture If the patient did not ovulate as evidenced by the low progesterone levels or lack of menstruation, CC would be started 6–8 weeks after surgery	CC: 36 Age: 29.1 ± 4.8 BMI: 26.1 ± 3.5	Incremental doses starting with a daily dose of 50 up to 150 mg on Days 2–6 of a menstrual period or after a progestogen withdrawal bleed using medroxy-progesterone acetate. Continued for 6 cycles and if still anovulatory after the maximum dose of CC or failed to conceive after six ovulatory cycles, surgery was offered.	Up to 12 months after surgery	Primary: cumulative pregnancy rate at 12 months Secondary: ovulation, miscarriage, multiple pregnancy and live birth rates Conception was diagnosed with a positive urinary pregnancy test taken 1 week after a missed period, then transvaginal ultrasound scan at 7 weeks of gestation	No	Mod – no blinding
Amer 2017, UK	Women aged 18 – 39 years with BMI ≤ 35 kg/m2 and PCOS by Rotterdam, proven patency, CC sensitivity NR	Double blind RCT	79 randomised and analysed Age: 28.3 (4.4) BMI: 27.5 (23.4 - 32.2)	letrozole 2.5 mg/d for 5 days from day 2-4 doubled in the second cycle if no ovulation	80 randomised and analysed Age: 28.1 (4.2) BMI: 27.7 (23.0 - 31.0)	50 mg CC daily for 5 days from day 2-4, double in second cycle if no ovulation. CCR with max dose or no conception after 6 cycles were crossed-over to LET group after 6-week washout	NR	Primary: clinical pregnancy (by US gestational sac) rate per participant on primary treatment (before the cross-over). Secondary: ovulation, live birth, pregnancy by ovulating participant, pregnancy by strata, mono-ovulation, endometrial development (thickness and grades), pregnancy outcome and pregnancy complications. Other outcomes included pregnancy and live birth rates on secondary and overall (primary and secondary) treatments.	Yes	Low
Atay 2006, Turkey	Women with primary infertility and PCOS with no other known cause of	RCT	51 randomised and analysed	2.5 mg letrozole daily for 5 days from	55 randomised and analysed	100 mg CC daily for 5 days from day 3 of the menstrual cycle	Data suggests 1	number of mature follicles, endometrial thickness (mm), day of	Yes	High

	infertility (criteria NR, CC sensitivity NR); history of oligo/amenorrhoea, ovaries with ≥10 cysts 2-10mm diameter + hyperechogenic stroma		Age: 27.1 ± 0.9 BMI: 26.1 ± 1.9	day 3 of the menstrual cycle	Age: 26.2 ± 1.1 BMI: 25.8 ± 1.8		treatment cycle for each patient	hCG administration, ovulation rate, pregnancy rate, multiple pregnancies		
Bansal 2021, India	18–35 years with anovulatory infertility; PCOS by Rotterdam; Tertiary care teaching institute	RCT; not double-blinded	45 randomised, 41 analysed Age: 27.1±0.9 BMI: 26.1±1.91	LET, 2.5mg daily (5days)	45 randomised, 39 analysed Age: 26.2±1.1 BMI: 25.8±1.77	CC, 50 mg daily (5days)	3 cycles	Primary: ET. Secondary: Ovulation rate (free fluid in pouch of Douglas + collapsed follicle on transvaginal US and/or day 21 progesterone of ≥3 ng/mL), monofollicular development, pregnancy rate (detection of urinary hCG >7 days of missed period and/or detection of gestational sac by US), and time to pregnancy assessment.	Yes	High
Bayar 2006, Turkey	Therapy naïve women with anovulatory PCOS by Rotterdam; University outpatient clinic	RCT	40 randomised; 38 analysed Age: 32.2 ± 3.9 BMI: NR	2.5 mg/d letrozole, on days 3 to 7 of menstrual cycle	40 randomised; 36 analysed Age: 30.6 ± 4.0 BMI: NR	100 mg/d CC, administered on days 3 to 7 of the menstrual cycle	1-5 cycles	Ovulation rate by cycle, pregnancy rate by cycle, delivery rate by cycle, miscarriage rate, multiple pregnancy rate, endometrial thickness on the day of hCG (mm), N of follicles sized > 15 mm in diameter on the day of hCG, E2 level on the day of hCG (pg/mL), E2 per follicle sized > 15 mm in diameter on the day of hCG (pg/mL)	Yes	Low
Begum 2009 Bangladesh	CCR women with PCOS by Rotterdam who failed to ovulate by 100 mg of CC/day for 5 days in 2 consecutive cycles; private infertility care setting	Non-blinded RCT	32 Age: 25.5 ± 4.0 BMI: 22.7 ± 2.8	7.5 mg of letrozole daily for 5 days starting from day 3 of the cycle	32 Age: 26.1 ± 3.6 BMI: 23.6 ± 3.2	150 mg of CC daily for 5 days starting from day 3 of the cycle	NR	Primary: ovulation and pregnancy rate Secondary: follicular development by day 16 (mm), serum E2 on day of hCG (pg/mL), endometrial development by day 16 (mm), serum progesterone on day 21 (ng/mL), multiple pregnancies, OHSS cases.	Yes	Mod
Begum 2013, Bangladesh	PCOS patients diagnosed with Rotterdam criteria; Outpatient department of a teaching hospital; CCR	RCT (3 groups)	MET + CC: 55 Age: 26.96±4.05 BMI: 27.71±3.61	MET + CC 500 mg metformin 3x daily (1500 mg) for 4 weeks then the same dose was continued for another 6 months along with scheduled CC 150	rFSH: 55 Age: 27.15±4.20 BMI: 28.98±3.19	75 IU rFSH every alternate day starting from D3 of the cycle (then daily if necessary after first monitoring on D12) till maturity of follicles or maximum 15 doses of rFSH.	6 cycles	Primary: Clinical pregnancy, live-birth rate Secondary: ovulation, spontaneous abortion, ectopic pregnancy, multiple pregnancies, congenital anomaly and other adverse perinatal or obstetric complications.	No	High Unblinded Missing details on randomisation, dropouts, blinding etc.

			MET + rFSH: 55 Age: 26.84±5.13 BMI: 28.36±4.54	mg daily for 5 days (D3–D7 of the cycle). MET + rFSH 500 mg metformin 3x daily (1500 mg) for 4 weeks, then same dose was continued for 6 months with 75 IU rFSH every alternate day from D3 of the cycle (then daily if needed after first monitoring on D12) till maturity of follicles or maximum 15 doses of rFSH.				Unclear on how pregnancy was tested: "Treatment was terminated:…(iv) after positive pregnancy test."		
De Leo 1999, Italy	Women with CCR/CCF and PCOS (chronic oligomenorrhoea or amenorrhoea and hyperandrogenemia); University department	RCT	10 Age: 28.0 ± 4.0 BMI: 27.7±3.1	Started with FSH (75 IU then increased to 5 ampoules/day) alone for two cycles and then for a month with metformin, then underwent a third cycle of combined metformin and FSH stimulation	10 Age: 29.5±2.9 BMI: 26.9±4.8	Metformin (1500 mg) for a month before undergoing ovarian stimulation with combined metformin and FSH for one cycle	2-4 cycles	Primary: number of FSH ampoules, days of treatment, E2 level on the day of hCG, number of follicles > 15mm, number of hyperstimulation, number of cycles with hCG withheld Secondary: Number of pregnancies (NR if clinical or biochemical)	No	High – unblinded, small
Fleming 2002, UK BMI ≥30 kg/m2	Obese PCOS (oligomenorrhoea < 8 cycles/year, exclusion of other endocrinopathy, US finding of PCO); age <35 years; infertility outpatient clinics; CC sensitivity NR	Double-blind RCT	N=45 Age: 28.6 ± 5.8 BMI: 34.2 ± 8.6	MET 850 mg 2/d	N=47 Age: 29.2 ± 5.6 BMI: 35.0 ± 8.2	Placebo	12-16 wks	Ovulation: by twice-weekly serum oestradiol. Where oestradiol > 300 pmol/L, LH and progesterone (> 8 nmol/L in ≥ 2 successive samples defined ovulation) were determined; Reproductive hormones, anthropometry, metabolic markers Others: ovarian US, biochemical pregnancy, adverse effects	Yes	Mod due to attrition*
Ganesh 2009, India	Women with PCOS by Rotterdam who had previously failed to conceive or ovulate with CC and undergoing IUI (CCR and	Single blind RCT	LET: 372 analysed Age: 30.3 ± 4.9	LET: letrozole, 5 mg/day orally given for 5 days from cycle days 3 - 7	CC + FSH: 669 analysed Age: 30.4 ± 5.2 BMI: 24.8 ± 4.1	CC + FSH: clomiphene citrate, 100 mg/day orally given for 5 days from cycle days 3 - 7 + 75	NR	Primary: ovulation rate, cancellation rate, miscarriage rate and clinical pregnancy rate Secondary: OHSS rate and multiple pregnancy rate.	Yes	Mod*

	CCF); tertiary infertility care unit		BMI: 24.5 ± 3.8		FSH: 346 analysed Age: 30.8 ± 4.6 BMI: 24.1 ± 3.4	or 100 IU rFSH during cycle days 3 and 8 FSH: rFSH 75IU/100IU from day 2 until the day of hCG administration				
George 2003, India	CCR women with PCOS based on oligomenorrhoea and hyperandrogenism, along with either biochemical abnormalities of a raised LH/FSH ratio or LH or ultrasound features of polycystic ovary; setting: Medical clinic at a medical school	RCT	MET: 30 Age: 25.1±3 BMI: 25.5 ± 3.7	MET: 1500 mg/day in three divided doses for 6 months	hMG: 30 Age: 26. ± 2.9 BMI: 24.6 ± 2.6	hMG: starting at 75 units 5 days after a spontaneous or induced cycle increased by increments of 75 units every 7±10 days	NR	Pregnancy rate (NR if clinical or biochemical)	No	Mod- unblinded (not possible); high drop outs
Ghanem 2012, Egypt Based on clinical registry entry: Egypt	PCOS women aged 18-38; Diagnosis of PCOS based on Rotterdam criteria; The women had not undergone a similar treatment protocol before; CCR	RCT	CC-HP uFSH: 87 Age: 24.8±4.7 BMI: 33.3±5.4 (CC-Clomiphene Citrate; HP: highly purified; uFSH: urinary FSH)	CC 100 mg daily doses for 5 days plus intramuscular (IM) injection of 37.5 IU/day HP uFSH from the 3rd to the 13th cycle day. Subsequent increments of uFSH by 37.5 IU/day were made according to response	HP uFSH: 87 Age: 24.7±4.3 BMI: 33.2±5.7	Highly purified (HP uFSH) only in the same daily doses and for the same duration. Subsequent increments of uFSH by 37.5 IU/day were made according to response	NR (? 1 cycle)	Primary: ovulation rate Secondary: clinical pregnancy rates, number of follicles, endometrial thickness, and gonadotropins consumption. Clinical pregnancy was defined by intrauterine gestational sac observed by an ultrasound scan 2 weeks after a positive pregnancy test in urine or blood	Yes	Mod- single blind
Hoeger 2004, USA	PCOS (oligomenorrhoea with < 6 menses/yr and hyperandrogenism), BMI > 25, normal TSH, prolactin and FSH concentrations; CC sensitivity NR; Academic medical centre	Double-blind RCT	MET: 9 Age: 29.5 ± 6.4 BMI: 37.1 ± 4.9 MET + L/S: 9 Age: 30.4 ± 5.4	MET 850 mg 2/d MET 850 mg 2/d + Lifestyle modification programme to reduce calorie intake by 500-1000 kcal/d	Placebo: 9 Age: 27.1 ± 4.5 BMI: 37.1 ± 4.6 Placebo + L/S: 11 Age: 27.1 ± 4.3 BMI: 40.0 ± 7.4	Placebo alone Lifestyle modification programme alone to reduce calorie intake by 500-1000 kcal/d	24 months	Ovulation; Anthropometric: weight, BMI, hirsutism Hormones: total testosterone, SHBG, FAI, AUC glucose, AUC insulin, fasting glucose, fasting insulin; Others: menstrual pattern; (pregnancy not an outcome of interest)	No	Mod*

			BMI: 41.7 ± 6.2							
Homburg 2012, Europe and South America	PCOS by Rotterdam; Therapy naïve	Multi-centre RCT	CC: Randomised: 143; Analysed/ received CC: 123 Age: 29.4±4 BMI: 25.7±6.0	The starting dose of CC was 50 mg/day (oral) for 5 days from Day 4 of a spontaneous or progestin-induced menstruation, rising by 50 mg/day up to 150 mg in subsequent cycles if ovulation was not achieved	FSH: Randomised: 159; Analysed/ received FSH:132 Age: 29.8±3.8 BMI: 25.1±5.2	Recombinant human FSH was given s.c. in a low-dose protocol starting with 50 IU on cycle day 4, with weekly increments of 25 IU as necessary to induce a follicular response	NR	Primary: clinical pregnancy rate	Yes	Mod
Johnson 2010, New Zealand BMI >32 and ≤ 32 kg/m^2	PCOS by Rotterdam; 14 to 20% of patients had past treatment with CC; excluding those with fertility treatment history using CC for >5 months.	Double-blind RCT	>32 BMI MET: 32 Age: 29.5±4.3 ≤32 BMI MET: 35 Age: 28.9±4.4	MET 500 mg 3/d (increasing dose over 2 weeks) CC 50 mg from day 2-6 (increasing up to 150 mg over 3 months if no evidence of ovulation)	>32 BMI Placebo (stand. care): 33 Age: 29.2±4.2 ≤32 BMI CC (stand. Care): 36 Age: 28.2±4.0 MET + CC: 35 Age: 29.2±4.7	Placebo MET+CC: MET as above + CC 50 mg from day 2-6 (increasing up to 150 mg over 3 months if no evidence of ovulation)	3 months or until pregnanc y	Primary outcomes were clinical pregnancy (intrauterine gestation sac) and live birth Secondary outcomes were ovulation, miscarriage, ectopic pregnancy or multiple pregnancy	Yes	Mod
Kar 2015, India	Treatment naïve Asian Indian women with PCOS by Rotterdam, gynaecology outpatient clinic	Double-blind RCT	CC: 32 Age: 25.8 ± 3.0 BMI: 26.5 ± 3.7	CC: 50-150 mg/d.	MET: 24 Age: 25.2 ± 3.47 BMI: 24.5 ± 5.0 CC + MET: 24 Age: 26.62 ± 3.54 BMI: 27.2 ± 3.7	MET: 1700 mg/d. CC + MET: CC 50-150 mg/d plus metformin 1700 mg/d	6 months, or until pregnant or until resistant to CC	Primary: live birth rate Secondary: ovulation rate, clinical pregnancy rate, early pregnancy loss rate	Yes	Mod*
Kocak 2002, Turkey	CC-resistant, primary infertile PCOS based on oligomenorrhea (<6 cycles in last year) + hirsutism, hyperandrogenism,or presence of multiple subcapsular follicles; Infertility clinic of a tertiary referral center	Double-blind RCT	MET + CC: 27 Age: 26.2 ± 3.7 BMI: 31.91± 5.38	MET: Metformin 850 mg, twice daily + CC (100 mg/day) on cycle days 3-7 of the second cycle	Placebo + CC: 28 Age: 27.1 ± 4.5 BMI: 30.8 ± 4.4	Placebo + CC (100 mg/day) on cycle days 3-7 of the second cycle	2 cycles	Insulin, T, DHEAS, FSH, LH, body mass index (BMI), waist-to-hip ratio, endometrial thickness, cervical score, ovulation, and clinical pregnancy rates (confirmed transvaginal US)	Yes	Mod (random-isation method unclear, no SS calc, 1 drop out); no BL diff

Kjotrod 2011, Denmark, Finland, Norway, Sweden BMI <28	Women PCOS by Rotterdam; Most had previously unsuccessful CC treatment (CCR/ CCF/ mixed); aged <38 years and with a BMI of <28 kg/m^2, who were scheduled to undergo a first or second cycle of IVF or ICSI; infertility treatment centres	Double-blind RCT	MET: 74 Age: 29.6 ± 3.4 BMI: 24.0± 2.7	MET: 2000 mg/day metformin	Placebo: 75 Age: 29.5 ± 3.8 BMI: 23.6±2.8	Placebo	≥ 12 weeks prior to and during long protocol IVF or ICSI and until the day of pregnanc y testing	The primary outcome measure was clinical pregnancy rate. Secondary outcome measures included spontaneous pregnancy rates during the pretreatment period, and the live birth rate	Yes	Mod
Legro 2007, USA BMI mixed, majority >30 kg/m^2	Women with PCOS (oligomenorrhoea < 8 menses/year), biochemical hyperandrogenism; normal uterine cavity, proven patency, normal semen; 40% therapy naïve	Multi-centre double-blind RCT	MET: 208 Age: 28.1 ± 4.0 BMI: 35.6 ± 8.5	MET: 2 extended-release metformin 500 mg	CC: 208 Age: 27.9 ± 4.0 BMI: 36.0 ± 8.9 MET + CC: 209 Age: 28.3 ± 4.0 BMI: 34.2 ± 8.4	CC: CC 50 mg + placebo on day 3-7 of cycle, increased by 50mg (or placebo tablet) for women with poor response to max 150mg (or 3 placebo tablets) Metformin + CC: metformin 500mg 2/d + 50 mg CC increased as above	up to 6 cycles or 30 weeks	Primary: Live birth rate. Secondary: rate of pregnancy loss, singleton birth and ovulation; clinical pregnancy rate	Yes	Low
Legro 2014, USA	Women with PCOS by Rotterdam; CC sensitivity NR	Multi-centre double blind RCT	LET: 374 (1352 cycles) Age: 29 ± 5 BMI: 35 ± 10	5 mg/day progestin for 10 days to induce bleed, then letrozole (2.5 mg daily) was given from cycle day 3 for 5 days. Maximum dose 7.5 mg/d of letrozole given for 5 days.	CC: 376 (1425 cycles) Age: 28 ± 4 BMI: 35 ± 9	5 mg/day progestin for 10 days to induce bleed, then CC (50 mg daily) was given from cycle day 3 for 5 days. Dose was increased in subsequent cycles for nonresponse or poor ovulatory response. Maximum dose of CC 150 mg/d given for 5 days.	Up to 5 cycles	Live birth, ovulation rate, clinical pregnancy rate, miscarriage rate, multiple pregnancy rate	Yes	Low
Liu, 2017, China	Infertile women aged 20-35, BMI≤35; normal patency; PCOS by Rotterdam; Hospital outpatient dept.;	RCT; blinding NR	LET: 67 randomised, 62 analysed;	LET: letrozole 5mg/d (5days)	CC: 67 randomised, 63 analysed; Age: 26.8 ± 3.1	CC: CC 50mg/d (5 days) CC + MET: CC, 50 mg daily (5days) +	2 cycles	Ovulation rate, clinical pregnancy rate, and pregnant outcome (abortion, premature delivery, and live birth)	Yes	High

BMI ≤35 kg/m^2	CC sensitivity mixed (some CCR)		Age: 27.0 ± 3.0 BMI: 20.8 (19.1, 22.3) LET + MET: 67 randomised, 57analysed Age: 27.2 ± 3.3 BMI: 21.6 (19.2, 23.6)	LET + MET: letrozole 5mg/d (5 days) + MET 1000–1500 mg/d	BMI: 21.1 (19.9, 22.8) CC + MET: 67 randomised, 58 analysed Age: 27.2 ± 2.8 BMI: 21.4 (19.8, 23.6)	MET 1000–1500 mg/d				
Lopez 2004, Spain	PCOS by Rotterdam; Therapy naïve; single centre.	RCT (crossover if unsuccessful)	CC= 38 (104 cycles) Age: 29 (23-38) Median (range) BMI: 22.3±1.9	CC daily dose of 50 mg for 5 days, from on day 5 after spontaneous or induced uterine bleeding, increased by 50mg from next cycle if ovulation not achieved until 150mg max.	FSH= 38 (91 cycles) Age: 30 (22-39) Median (range) BMI: 21.9±1.9	Recombinant FSH commencing at 75 IU daily on day 3 after spontaneous or induced menses with dose increments of 37.5 IU daily every 7 days if there was no evidence of ovarian response	Up to 3-6 cycles	Primary: cumulative pregnancy (before crossover) Secondary: cycle cancellation rate, ovulation rate per cycle, cumulative ovulation rate, clinical pregnancy rate per cycle, incidence of OHSS, cumulative live birth rate, and multiple birth rate	Partial	High
Morin-Papunen 2012, Finland BMI ≥27 or <27 kg/m^2	PCOS by Rotterdam with anovulatory infertility for at least 6 months and 3 months washout since the last infertility treatment (CC sensitivity not specified; likely mixed). Age range 18-39 years.	Multi-centre double-blind RCT	MET: 160 Age: 28.4 ± 3.9 BMI: 27.1 ± 6.3	MET: Metformin 500 mg 1/d for 1 week, then 1 extra tablet/d upto to 1.5 g in non-obese and 2 g/d in obese women; if no pregnancy= CC added after 3 months and AI or gonadotropins after 4-6 months/cycles	Placebo: 160 Age: 27.9 ± 4.1 BMI: 27.4 ± 6.2	Placebo	3-9 months or until 12 weeks pregnancy	Primary: Pregnancy (biochemical; positive pregnancy test) and live birth rate Other: miscarriage rate, pregnancy complications; Anthropometric: WHR, waist (cm), hirsutism score, BMI, ovarian volume	Yes	Low
Nazik 2012, Turkey	Infertile women with PCOS by Rotterdam; LET group CCR; CC group Treatment naïve; infertility polyclinic of University	Partly randomised trial	LET: 31 randomised and analysed (40 cycles) Age: 25.6 ± 4.5	Letrozole 2.5mg/day from day 3 -7	CC: 33 randomised and analysed (40 cycles) Age: 27.8 ± 6.2 BMI: 24.9 ± 4.8	All patients with oligomenorrhoea given 6 days of medroxyprogest-erone acetate to induce withdrawal bleed, then CC	NR	Primary Outcomes: ovulation rate and biochemical pregnancy rate Secondary Outcomes: ovarian hyperstimulation syndrome rate, miscarriage rate, multiple pregnancy rate, number of follicles on day of hCG (≥ 17 mm), E2 (pg/mL) on hCG	Yes	High

			BMI: 24.7 ± 3.6			100mg/day from day 3-7		day, endometrial thickness (mm), other side effects		
Ng 2001, Hong Kong	Chinese women with PCOS (irregular cycles of ≤ 21 days or ≥ 35 days and variation of > 4 days, anovulation with mid-luteal progesterone <16 nmol/L whilst taking CC 100 mg for 5 d over 3 cycles (CCR), exclusion of other endocrinopathy, PCO by US, age < 40, day 2 FSH < 10, bilateral patent tubes, normal semen; University obstetric dept.	Double-blind RCT	N=9 (9 cycles) Age: 30.4 ± 2.1 BMI: 25.5 ± 4.6	metformin 500 mg 3/d CC 100 mg for 5 d was given after 3 months if there was no ovulation	N= 9 (9 cycles) Age: 31.2 ± 2.6 BMI: 23.5 ± 4.4	Placebo CC 100 mg for 5 d was given after 3 months if there was no ovulation	3 months + extra cycle for those who do not ovulate	Ovulation: by serum progesterone (> 16 nmol/L) weekly Live births, clinical pregnancy confirmed by pelvic US Anthropometric: BMI Reproductive hormones: total testosterone, androstenedione, DHEA, SHBG, FSH, LH Metabolic markers: fasting glucose, fasting insulin, 120-min glucose levels after GTT, fasting leptin, HDL, LDL, triglycerides	Yes	Mod*
Pourghasem , 2019, Iran	Infertile women aged 15–38 years old; PCOS by Rotterdam; infertility clinic of University; Letrozole resistant (no ovulation at 7.5 mg letrozole)	RCT; not double-blind	LET + folic acid: 62 randomised, 50 analysed	Letrozole 7.5 mg per day from the third day of menstruation for 5 days; + folic acid 200 µg	LET + MET + folic acid: 62 randomised, 50 analysed; LET + Inositol + folic acid: 62 randomised, 50 analysed	LET + MET + folic acid: Letrozole 7.5 mg/d + Metformin 1500 mg/d + 200 µg folic acid LET + Inositol + folic acid: Letrozole 7.5 mg/d + Inositol 2g + 200 µg folic acid twice daily for 3 months.	3 cycles	Primary outcomes were ovarian function (presence or absence of a mature follicle ≥17 mm seen by transvaginal US) during 12–16 menstrual cycles; and clinical pregnancy (presence of gestational sac on US 5 weeks after HCG injection).	Yes	High
Qublan 2009, Jordan	CC-resistant women with PCOS by Rotterdam, undergoing IVF; tubal patency and normal sperm	Single-blinded RCT	MET: 34	850 mg of metformin 2/d + IVF Age: 34.6 ± 4.3 BMI: 32.2 (27–39)	Placebo: 32	Placebo + IVF Age: 33.8 ± 3.9 BMI: 31.9 (26–38)	1 month before IVF until day of pregnancy test. If pregnant, continued metformin for 12 wks.	Clinical pregnancy rates; implantation rates; hormones including FSH, LH, testosterone (T), androstenedione (A), 17-hydroxyprogesterone (17-OHP), oestradiol (E2) and dehydroepiandrosterone sulphate (DHEAS)	Yes	Mod
Roy 2012, India	Women aged 20 - 35 with infertility for > 1 year, normal fertility tests	RCT	LET: 104 randomised;	2.5 mg/d letrozole, increasing up to 5 mg/d, from Day 3-7	CC: 108 randomised; 106	50 mg/d CC, increasing up to 100 mg/d, from Day 3-7 (5	3 months	Mean number of follicles, endometrial thickness, ovulatory cycle rate, clinical pregnancy/	Yes	Low

	(patency, semen, hormone) BMI < 28, and anovulatory PCOS by Rotterdam; CC sensitivity NR; Tertiary care hospital		98 analysed (294 cycles) Age: 26.1 ± 1.8 BMI: 25.8 ± 2.1	(5 days) after a 5-day course of 10 mg/ d medroxyprogesterone acetate to induce bleed	analysed (318 cycles) Age: 26.5 ± 1.3 BMI: 25.4 ± 1.6	days) after a 5-day course of 10 mg/ d medroxyprogesterone acetate to induce bleed		conception rate, pregnancy outcome, miscarriage rate, multiple pregnancies and OHSS rate		
Sahin 2004, Turkey	Women with primary infertility and PCOS; PCO on USS (≥ 10 cysts 2-10 mm), oligomenorrhoea (> 35 d) or amenorrhoea (no period > 6 months), hyperandrogenism participants received no medication known to affect pituitary-ovarian function or carbohydrate metabolism for min 12 wks	RCT	CC: 10 Median (range) Age: 24.5 (19–28) BMI: 25.7 (23.1–35.7)	CC 100 mg daily for 5 d from day 5 of the cycle. Ovulation was triggered by administration of 10,000 IU hCG	MET + CC: 11 Median (range) Age: 27 (21–31) BMI: 30.4 (24.6–33.9)	Met + CC: Metformin 850 mg twice daily + CC 100 mg daily for 5 d from day 5 of the cycle. Ovulation was triggered by administration of 10,000 IU hCG, at which point metformin was terminated and repeated in the next cycle	3 months, pregnancy or maximum of 6 CC cycles	Clinical pregnancy (gestational sac on US and fetal heart motion), insulin resistance, ovarian androgen production, and clomiphene-induced ovulation		High* No blinding?-NR
Siebert 2009, South Africa	PCOS based on Rotterdam criteria; Couples with history of infertility at least 18 months; academic hospital; CC sensitivity status: NR	Unblinded RCT	MET + CC: 52 Age: BMI: 30.48 (26.55-34.05) Median (IQR)	metformin 850 mg twice daily, CC 50-150 mg day 4-8 for 4 cycles + lifestyle modification	CC: 55 Age: BMI: 30.71 (24.05–34.48) Median (IQR)	Starting dose of 50 mg day 4–8 and increase with increments of 50 mg to a maximum of 150 mg if no response was achieved	6 weeks before and throughout ovulation induction with CC	Primary: ovulation success NR pregnancy rates		High*
Sohrabvand 2006, Iran	CCF women (failed to become pregnant after 3 courses of 150 mg CC) with PCOS; Hospital infertility clinic	Single - blind RCT	30 randomised and analysed Age: 28.2 ± 3.1 BMI: 30.0 ± 4.8	MET + LET: 500 mg x 3/d for 6 - 8 weeks. If pregnancy did not occur, 2.5 mg letrozole from cycle days 3 - 7 was given orally.	30 randomised and 29 analysed Age: 29.6 ± 3.5 BMI: 30.2 ± 3.9	MET + CC: 500 mg x 3/d for 6 - 8 weeks. If pregnancy did not occur, 100 mg CC from cycle days 3 - 7 was given orally.	2 cycles	Endometrial thickness on day of hCG administration, N of follicles > 18 mm in diameter, Mean total estradiol level on day of hCG administration, mean estradiol level by mature follicle, regular menses after metformin, adverse effects of metformin, live births, clinical pregnancy rate, miscarriage	Yes	Mod*
Tang 2006b, UK BMI>30	Obese women with PCOS (PCO on USS > 10 cysts 2-8 mm diameter), oligomenorrhoea (cycle length > 35 d) or	Multi-centre RCT	MET: 69 Age: 29.7±3.7	Metformin (850 mg) twice daily + Dietary advice for 500kcal reduction	Placebo: 74 Age: 29.8±3.8 BMI: 38.9±9.5	Placebo + Dietary advice for 500kcal reduction	6 months	The primary outcome measures were: (i) change in menstrual cycle; (ii) change in anthropometric measurements; and (iii) changes in the endocrine parameters, insulin		Mod*

	amenorrhoea (no period in 6 months); Age 18-39 years; BMI > 30; normal semen; min 1 tubal patency; infertility clinics; Mixed but most therapy naïve due to BMI		BMI: 37.6±5.0					sensitivity and lipid profile. The main secondary outcome measure was pregnancy rate (assuming clinical since monthly US scans were used)

Yes	High

CC, clomiphene citrate; CCR, clomiphene citrate resistant (to ovulate); CCF, clomiphene citrate failure (to become pregnant); LET, letrozole; MET, metformin; NR; not reported; OHSS, ovarian hyperstimulation syndrome; IUI, intrauterine insemination; hCG, human chorionic gonadotrophin; LH, luteinizing hormone; FSH, follicle stimulating hormone; MA, meta-analysis; RoB, risk of bias. All age data is in years and BMI is in kg/m^2. *Risk of bias assessment derived from checklists/ summaries of previous systematic reviews (Morley et al. Cochrane Database Syst Rev. 2017 Nov; 2017(11): CD003053; and Franik et al. Cochrane Database Syst Rev. 2018; 2018(5): CD010287).

4. FINDINGS

Comparisons Included:

- **Comparison 1.** Metformin vs Placebo
- **Comparison 2.** Metformin vs Clomiphene Citrate
- **Comparison 3.** Metformin + Clomiphene Citrate vs Metformin
- **Comparison 4.** Metformin + Letrozole vs Letrozole
- **Comparison 5.** Metformin + Letrozole vs Metformin + Clomiphene Citrate
- **Comparison 6.** Metformin vs gonadotropins (hMG)
- **Comparison 7.** Metformin + gonadotropins vs gonadotropins

- **Comparison 8.** Clomiphene Citrate vs Metformin + Clomiphene Citrate
- **Comparison 9.** Clomiphene Citrate vs Letrozole
- **Comparison 10.** Clomiphene Citrate vs Metformin + Letrozole
- **Comparison 11.** Clomiphene Citrate + Metformin vs Letrozole
- **Comparison 12.** Clomiphene Citrate vs gonadotropins
- **Comparison 13.** Clomiphene Citrate + gonadotropins vs Clomiphene Citrate
- **Comparison 14.** Clomiphene Citrate + gonadotropins vs Letrozole
- **Comparison 15.** Clomiphene Citrate + gonadotropins vs Metformin
- **Comparison 16.** Clomiphene Citrate vs Laparoscopic ovarian drilling (LOD)

COMPARISON 1. Metformin versus Placebo

- **EVIDENCE SUMMARY:**

A total of seven studies compared metformin with placebo for fertility outcomes in PCOS. Studies were conducted in the UK, Europe (Norway, Finland, Sweden, Denmark), China, New Zealand and Jordan. Six of the studies had a moderate risk of bias and one had a low risk. Two studies were specifically in women with clomiphene citrate-resistant PCOS, and three had a mixed population (the remaining two did not report ovulation induction medication use in their populations).

- **META-ANALYSIS SUMMARY:**

All outcomes assessed were amenable to meta-analysis except for multiple pregnancy rate per patient which was only reported in a single study. Metformin was superior to placebo for improving live birth, clinical pregnancy and overall pregnancy rates, with ORs >1.8 and moderate certainty in the evidence for all. Downgrading was due to risk of bias since most of the studies (half or more) in these three analyses were of moderate risk of bias. No differences between metformin and placebo were identified for ovulation rate per patient, miscarriage rate or multiple pregnancy rates per patient or pregnancy. Evidence for these outcomes was of low certainty due to small sample sizes, wide confidence intervals and risk of bias.

Summary Table for meta-analysis results:

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate - per patient	4	552	1.84 [1.27, 2.66]	0.001	MET (live birth rate is higher with metformin)	⊕⊕⊕◯ MODERATE
Clinical pregnancy rate - per patient†	5	443	1.93 [1.19, 3.10]	0.007	MET (clinical pregnancy rate is higher with metformin)	⊕⊕⊕◯ MODERATE

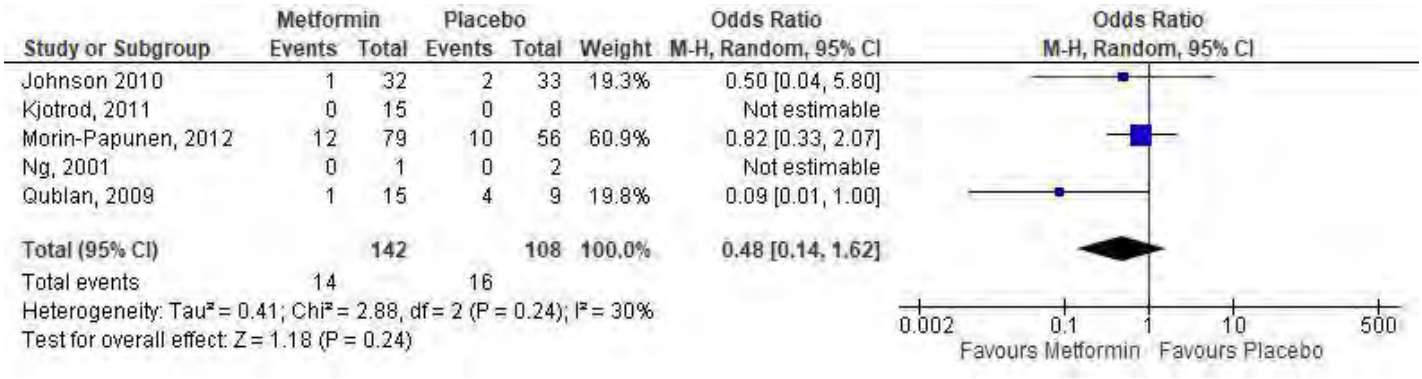
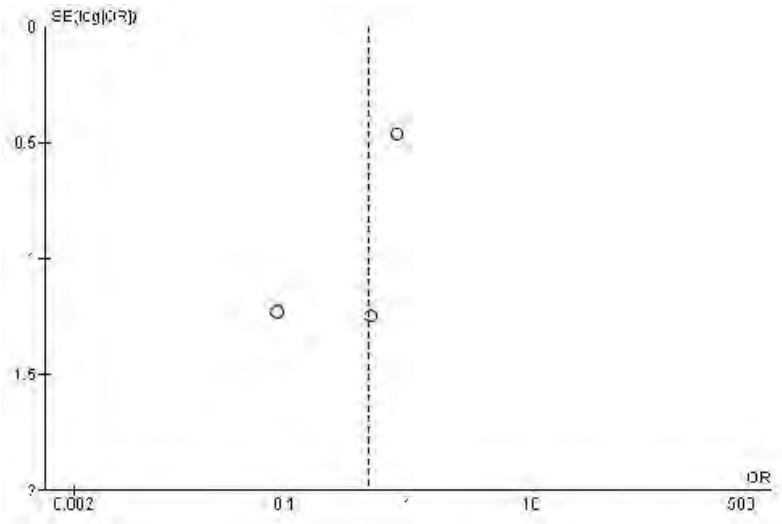
1.5.2. Forest Plot of all included RCTs comparing Metformin and Placebo for miscarriage rate- per pregnancy



1.5.3. Funnel Plot for Assessment of Publication Bias



COMPARISON 2. Metformin vs Clomiphene Citrate

- **EVIDENCE SUMMARY:**

Only three included studies compared metformin with clomiphene citrate, two of which included women with a BMI<30-32 kg/m^2 (Johnson et al. 2010; Kar et al. 2015), while the remaining study included women with a mean BMI ≥30-32 kg/m^2 (Legro et al. 2007). One of the studies (Johnson et al. 2010) had a moderate risk of bias and the other (Legro et al. 2007) had a low risk of bias. Both studies included participants with a mixed history of past ovulation induction medication use, with the study by Legro et al. 2007 being of a relatively large sample size (n>400). The third study by Kar et al. 2015 had a moderate risk of bias and included therapy naïve women with PCOS.

- **META-ANALYSIS SUMMARY:**

In meta-analysis, there were no differences between metformin and clomiphene citrate for live birth, clinical pregnancy, multiple pregnancy or ovulation rates per patient. In a single study, ovulation rate per cycle was significantly lower with metformin compared with clomiphene citrate (OR= 0.43) and miscarriage rate per patient was significantly higher with metformin in meta-analysis of three studies (OR= 2.44). In subgroup analysis by BMI, clomiphene citrate was more effective than metformin for achieving live birth rate and clinical pregnancy rates among women with a BMI ≥30-32 kg/m^2. This result was derived from a single study, however, and should be interpreted with caution. Certainty in the evidence was low for live birth, clinical pregnancy, and ovulation rate per cycle while the remaining outcomes were of moderate certainty (refer table below), with main reasons for downgrading the evidence including risk of bias and imprecision due to small sample sizes or single studies for some outcomes.

Summary Table for meta-analysis results:

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	3	544	0.61 [0.21, 1.73]	0.35	None	⊕⊕◯◯ LOW
Clinical pregnancy rate- per patient†	3	544	0.88 [0.24, 3.21]	0.8	None	⊕⊕◯◯ LOW
Ovulation Rate- per patient	1	56	1.30 [0.44, 3.82]	0.6	None	⊕⊕⊕◯ MODERATE
Ovulation Rate- per cycle	1	1961	0.43 [0.35, 0.51]	<0.00001	**CC** (ovulation per cycle is lower with metformin)	⊕⊕◯◯ LOW
Multiple pregnancy rate- per patient	1	71	1.03 [0.06, 17.13]	0.9	None	⊕⊕⊕◯ MODERATE
Miscarriage rate- per patient	3	181	2.44 [1.03, 5.82]	0.04	**CC** (miscarriage is higher with metformin)	⊕⊕⊕◯ MODERATE

†clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

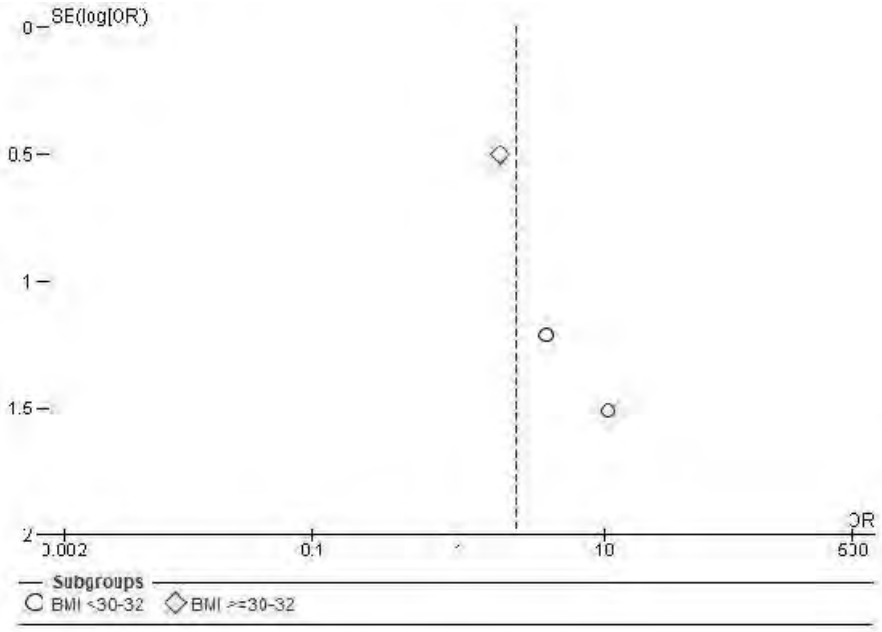
2.6.4.2. Funnel plot for assessment of publication bias: subgroup analysis: miscarriage rate - per patient



COMPARISON 3. Metformin + Clomiphene Citrate versus Metformin

- **EVIDENCE SUMMARY:**

Three studies examined metformin + clomiphene citrate compared with metformin alone in women with PCOS. Of these, one had a moderate risk of bias (Kar et al. 2015) in therapy naïve women with PCOS in India. The remaining two were moderate (Johnson et al. 2010) and low risk (Legro et al. 2007) studies in New Zealand and the US, respectively, with mixed ovulation induction medication use history.

- **META-ANALYSIS SUMMARY:**

In meta-analysis of the three RCTs, metformin combined with clomiphene citrate had a favourable effect on live birth rate and ovulation rate per patient, with odds ratios of 2.44 and 3.72, respectively. These outcomes were both of moderate certainty; live birth rate was downgraded for indirectness resulting from diverse populations since the studies included treatment naïve patients and those with clomiphene-citrate resistance or failure; and ovulation rate was downgraded due to being derived from a single study (despite its relatively large sample size, the result requires replication to increase certainty in the evidence). Subgroup analysis by BMI showed that the beneficial effect of metformin + clomiphene citrate on live birth rate was most pronounced in women with a BMI ≥30-32 kg/m^2, however only one study was included in this subgroup.

Summary Table for meta-analysis results:

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	3	535	2.44 [1.03, 5.76]	0.04	**MET + CC** (live birth is higher with MET + CC)	⊕⊕⊕◯ MODERATE
Clinical pregnancy rate- per patient†	3	535	2.11 [0.75, 5.93]	0.16	None	⊕⊕◯◯ LOW
Ovulation Rate- per patient	1	48	3.00 [0.77, 11.63]	0.11	None	⊕⊕◯◯ LOW
Ovulation Rate- per cycle	1	1983	3.72 [3.09, 4.49]	<0.00001	**MET + CC** (ovulation per cycle is higher with MET + CC)	⊕⊕⊕◯ MODERATE

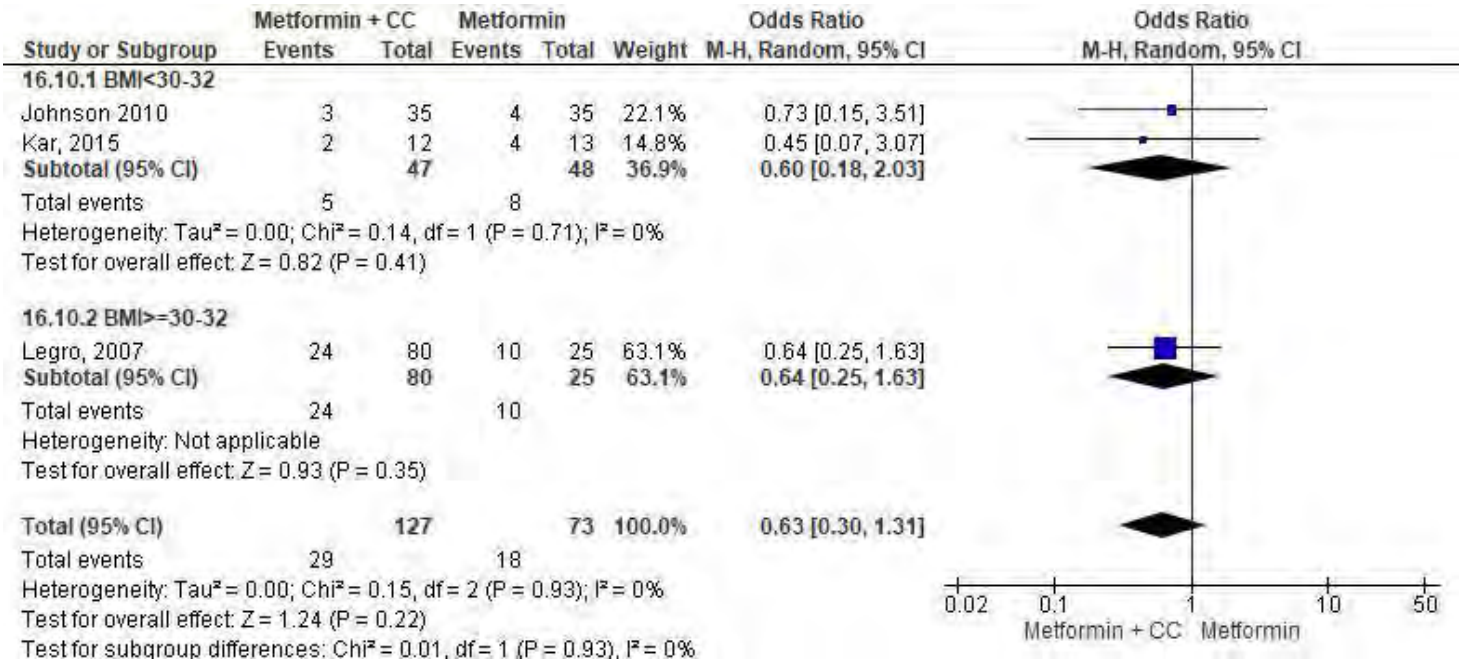
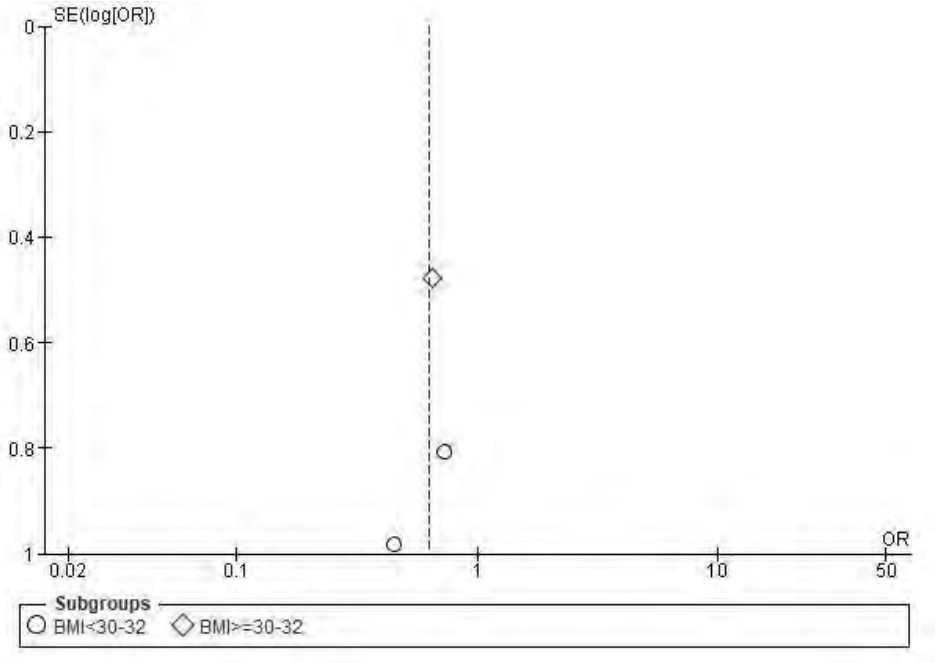
3.6.4. SUBGROUP ANALYSIS: miscarriage rate – per patient

3.6.4.1. Forest Plot of all included RCTs comparing Metformin + Clomiphene Citrate vs Metformin for miscarriage rate- per patient, sub-grouped by BMI



Note: The above can also be considered subgrouped by risk of bias since Johnson and Kar were moderate risk and Legro was low risk

3.6.4.2. Funnel plot for assessment of publication bias: subgroup analysis: miscarriage rate - per patient



COMPARISON 4. Metformin + Letrozole versus Letrozole

- **EVIDENCE SUMMARY:**

Only two studies compared metformin + letrozole with letrozole alone. One of the studies performed in Iran (Pourghasem, et al. 2019) in letrozole-resistant women (no ovulation at 7.5 mg letrozole), provided folic acid 200 µg daily (as a placebo) to both the letrozole + metformin and letrozole groups; whilst the other did not. The second study by Liu et al. (2017) was conducted in China in 119 women with PCOS (for this comparison) aged 20-35, with a BMI ≤35 kg/m^2. Reported outcomes of relevance were clinical pregnancy rate, live birth rate and miscarriage rate per patient and ovulation rate per cycle. Both studies had a high risk of bias due to issues around lack of blinding and insufficient information about randomisation or allocation concealment. The study by Liu et al. (2017) also had a high dropout rate of 15% in the letrozole + metformin group, with 7.5% drop outs in the letrozole group.

- **META-ANALYSIS SUMMARY:**

Meta-analysis was only possible for the outcome of clinical pregnancy rate per person, with two studies pooled for this analysis (Liu, et al. 2017; Pourghasem, et al. 2019), showing no difference between metformin + letrozole versus letrozole alone for this outcome. There is very low certainty in this result due to very serious risk of bias, with serious imprecision and serious indirectness. There were no differences in live birth rate between metformin + letrozole vs letrozole alone (33.9% vs 36.8%). Clinical pregnancy rate per patient (48.6% vs 40.2%) and ovulation rate per cycle (89/118 cycles vs 93/130 cycles) were higher in the letrozole + metformin group than letrozole alone, but these were not statistically significant. Similarly, miscarriage/ abortion rate per patient was slightly higher with metformin + letrozole than letrozole alone, but the difference was not statistically significant (21.1% vs 12.9%, p > .05). These results are of very low certainty given that they are derived from a single study with a high risk of bias.

Summary Table for meta-analysis results:

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P-value	Favours	Certainty
Live birth rate- per patient	1	119	1.14 [0.54, 2.42]	0.7	None	⊕◯◯◯ Very low
Clinical pregnancy rate- per patient†	2	219	1.44 [0.84, 2.49]	0.2	None	⊕◯◯◯ Very low
Ovulation Rate- per cycle	1	248	1.22 [0.69, 2.15]	0.5	None	⊕◯◯◯ Very low
Miscarriage rate- per patient	1	119	1.80 [0.68, 4.79]	0.2	None	⊕◯◯◯ Very low

†clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

COMPARISON 5. Metformin + Letrozole versus Metformin + Clomiphene Citrate

▪ EVIDENCE SUMMARY:

Two studies compared metformin + letrozole with metformin + clomiphene citrate (Liu, et al. 2017; Sohrabvand, et al. 2006), with relevant outcomes including ovulation rate per cycle and pregnancy and miscarriage rate per patient. Liu et al. (2017) additionally assessed live birth rate per patient, whereas Sohrabvand et al. (2006) reported full term pregnancy per patient. Both studies were moderate (Sohrabvand, et al. 2006) or high (Liu, et al. 2017) risk of bias due to lack of blinding of participants and insufficient information around allocation concealment.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Meta-analysis of these two studies was performed for ovulation rate per cycle and pregnancy and miscarriage rate per patient, with results in the table below. Clinical pregnancy and ovulation rates were greater with metformin + letrozole compared with metformin + clomiphene citrate with odds ratios of 1.90 and 2.02, respectively. Miscarriage rates per patient did not differ between groups. Certainty of the evidence for these three outcomes was low, downgraded once due to high/ moderate risk of bias and once for serious imprecision (small n and wide confidence intervals).

The study by Liu et al. (2017) additionally assessed live birth rate per patient, showing no difference between metformin + letrozole versus metformin + clomiphene citrate groups. Sohrabvand et al. (2006) assessed full term pregnancy per patient and found that metformin + letrozole was more effective than metformin + clomiphene citrate for this outcome (10 versus 3 full term pregnancies per group, respectively, p=0.03).The results for both these outcomes are of very low certainty given that they are derived from only single studies with moderate to high risk of bias.

Summary Table for meta-analysis results:

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	1	115	1.30 [0.60, 2.81]	0.5	None	⊕○○○ VERY LOW
Clinical pregnancy rate- per patient†	2	174	1.90 [1.01, 3.58]	0.0486	**MET + LET** (clinical pregnancy is higher with MET + LET)	⊕⊕○○ LOW
Ovulation rate- per cycle	2	369	2.02 [1.24, 3.30]	0.005	**MET + LET** (ovulation per cycle is higher with MET + LET)	⊕⊕○○ LOW
Miscarriage rate- per patient	2	174	0.98 [0.12, 7.89]	0.98	None	⊕⊕○○ LOW
Full term pregnancy- per patient	1	59	4.74 [1.15, 19.55]	0.03	**MET + LET** (full term pregnancy is higher with MET + CC)	⊕○○○ VERY LOW

†clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

COMPARISON 6. Metformin vs gonadotropins (hMG)

▪ EVIDENCE SUMMARY:

A single study by George et al. 2003 compared metformin with human menopausal gonadotropin (hMG) in 60 clomiphene citrate-resistant women with PCOS. Outcomes assessed included pregnancy rate per patient and ovulation rate per cycle. The study was judged as being of moderate risk of bias due to lack of blinding.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences between metformin versus hMG in pregnancy or ovulation rates. Certainty was ranked as low due to being reliant on a single small study of moderate risk of bias.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P-value	Favours	Certainty
Pregnancy rate- per patient*	1	60	0.66 [0.18, 2.36]	0.5	None	⊕⊕◯◯ LOW
Ovulation rate- per patient	1	60	1.31 [0.47, 3.65]	0.6	None	⊕⊕◯◯ LOW

COMPARISON 7. Metformin + gonadotropins (FSH) versus gonadotropins (FSH)

▪ EVIDENCE SUMMARY:

Three studies compared metformin combined with FSH versus FSH alone in women with PCOS. A study by De Leo (1999) in Italy was conducted in 20 women with PCOS and clomiphene failure or resistance (i.e. failed to ovulate or conceive after clomiphene citrate treatment up to a daily dose of 50 mg from cycle days 3–7 during at least three consecutive cycles). This study has a high risk of bias due to its small sample size and likely lack of power as well as lack of blinding and allocation concealment information.

The remaining two studies by Tasdemir et al. (2004) and Yarali (2002) were conducted in Turkey, also in women with clomiphene-citrate resistance and PCOS. One study (Tasdemir et al. 2004) was judged as being at high risk of bias due to lack of reporting on key elements such as blinding and randomisation, while Yarali et al. (2002) had a moderate risk of bias as it was likely underpowered (small sample size with no sample size calculation) but was reported to be double-blinded.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences between metformin + FSH versus FSH alone in pregnancy rate, ovulation rate, multiple pregnancy rate or miscarriage rate per patient. There was very low certainty for multiple pregnancy rate per patient due to the evidence being derived from a single, small study with a high risk of bias. For the remaining outcomes, the evidence was of low certainty, downgraded for risk of bias (all moderate or high risk studies) and for inconsistency (varied effect estimates, including different directions and wide CIs).

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P-value	Favours	Certainty
Pregnancy rate- per patient*	3	77	0.96 [0.18, 5.10]	0.9	None	⊕⊕◯◯ LOW
Ovulation rate- per patient	1	25	3.27 [0.31, 34.72]	0.3	None	⊕⊕◯◯ LOW
Multiple pregnancy rate -per patient	1	32	0.31 [0.01, 8.28]	0.5	None	⊕◯◯◯ VERY LOW
Miscarriage rate- per patient	1	25	4.89 [0.18, 132.83]	0.4	None	⊕⊕◯◯ LOW

*includes clinical, biochemical (or undefined pregnancy rate) as reported in each study

COMPARISON 8. Clomiphene Citrate versus Metformin + Clomiphene Citrate

▪ EVIDENCE SUMMARY:

Eight studies compared clomiphene citrate with metformin + clomiphene citrate, with several relevant outcomes. Studies were conducted across China, New Zealand, South Africa, Turkey, USA and India. One study had a low risk of bias, three moderate and four high risk. Two studies were specifically in women with clomiphene citrate-resistant, three had mixed populations and one was in therapy naïve PCOS (the remaining two did not report ovulation induction medication use in their populations).

▪ META-ANALYSIS SUMMARY:

Meta-analysis was possible for five outcomes as per the table below. Clomiphene citrate alone was less effective than the combination of clomiphene and metformin for clinical pregnancy rates and ovulations rates per patient and per cycle. In subgroup analysis by BMI, metformin + clomiphene citrate was more effective for clinical pregnancy rate in the BMI<30-32 kg/m^2 subgroup, and more effective for ovulation rate per patient in the BMI ≥30-32 kg/m^2 subgroup. Ovulation rate per cycle was better with metformin + clomiphene than clomiphene alone across both BMI subgroups. There were no significant differences in live birth rates, multiple pregnancy rates or miscarriage rates per patient or per pregnancy, including after subgrouping by BMI. There is low to moderate certainty in the evidence for these outcomes, which were downgraded due to risk of bias since most of the studies were of moderate to high risk of bias. Evidence was also downgraded for indirectness since some analyses included diverse populations with and without clomiphene citrate- resistance.

Summary Table for meta-analysis results:

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	5	687	0.73 [0.52, 1.03]	0.07	None	⊕⊕◯◯ LOW
Clinical pregnancy rate- per patient†	7	767	0.60 [0.44, 0.83]	0.002	**MET + CC** (clinical pregnancy is lower with CC)	⊕⊕◯◯ LOW

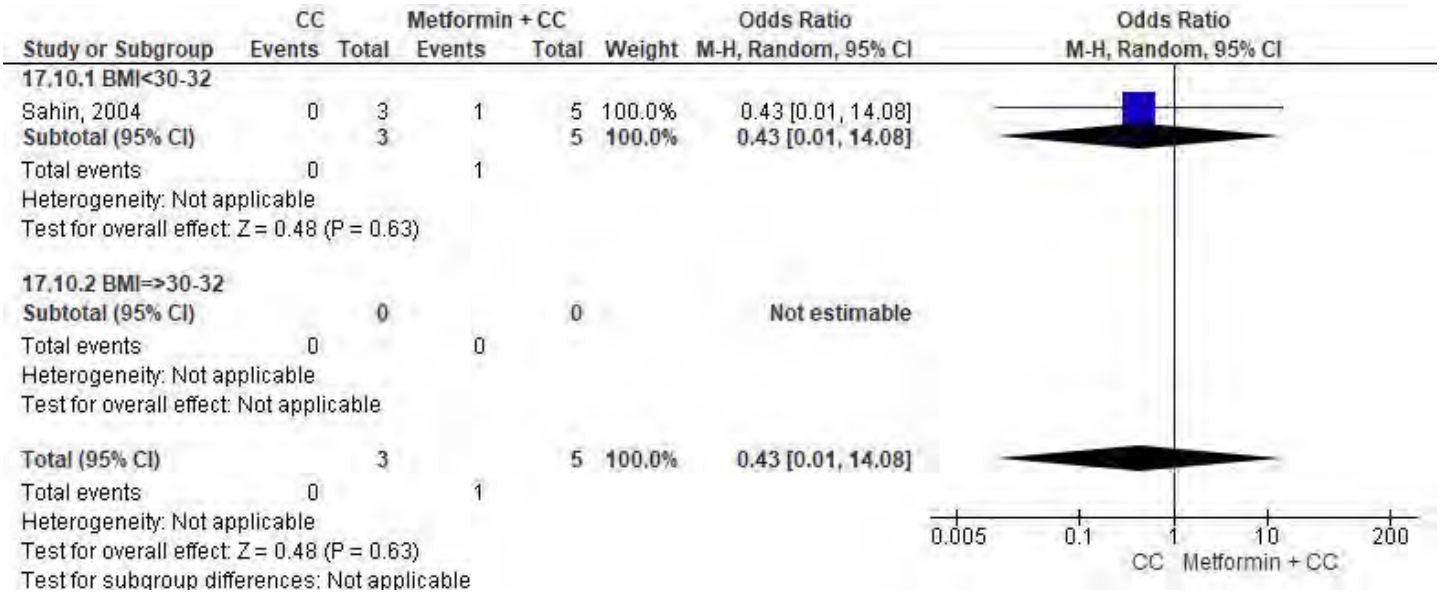
8.7.1. Individual Study Data Table

8.7.2. SUBGROUP ANALYSIS: Forest Plot of all included RCTs comparing Clomiphene Citrate vs Metformin + Clomiphene Citrate for miscarriage rate – per pregnancy, sub-grouped by BMI



COMPARISON 9. Clomiphene Citrate vs Letrozole

- **EVIDENCE SUMMARY:**

Eleven RCTs compared clomiphene citrate with letrozole, of which six had a high risk of bias (Atay, 2006; Nazik, 2012; Ray, 2012; Zeinalzadeh, 2010; Bansal, 2021; Liu, 2017), one had a moderate risk of bias (Begum, 2009), and four had a low risk of bias (Legro, 2014; Roy, 2012; Amer, 2017; Bayar, 2006). Studies were conducted in the UK, USA, Iran, India, Bangladesh and China.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

In meta-analysis, letrozole was superior to clomiphene citrate for ovulation rate per patient; pregnancy rate and clinical pregnancy rate per patient; and live birth rate per patient. Certainty in the evidence is high for live birth rate, and moderate for pregnancy rate, clinical pregnancy rate and ovulation rate, downgraded once for serious risk of bias since the majority of studies included had high to moderate risk of bias.

There were no differences between clomiphene citrate and letrozole for other outcomes including live birth rate per pregnancy, multiple pregnancy rate (per patient or pregnancy); and miscarriage rate (per patient or pregnancy). Certainty in these findings ranged from low to very low due to risk of bias, serious imprecision and serious inconsistency, except for multiple pregnancy rate per patient which was moderate due to 3 of the 5 studies having a high risk of bias. There was no evidence of statistical heterogeneity or publication bias for any of the outcomes.

Summary Table for meta-analysis results:

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	6	1449	0.56 [0.44, 0.71]	<0.00001	**LET** (live birth rate is lower with CC)	⊕⊕⊕⊕ HIGH
Live birth rate- per pregnancy	4	319	0.70 [0.30, 1.61]	0.4	None	⊕⊕◯◯ LOW
Clinical pregnancy rate- per patient†	8	1668	0.53 [0.43, 0.66]	<0.00001	**LET** (clinical pregnancy is lower with CC)	⊕⊕⊕◯ MODERATE
Pregnancy rate- per patient*	11	1870	0.55 [0.44, 0.67]	<0.00001	**LET** (pregnancy rate is lower with CC)	⊕⊕⊕◯ MODERATE
Ovulation Rate- per patient	8	1697	0.52 [0.36, 0.74]	0.0003	**LET** (ovulation per patient is lower with CC)	⊕⊕⊕◯ MODERATE
Ovulation Rate- per cycle	1	280	0.43 [0.26, 0.71]	0.0009	**LET** (ovulation per cycle is lower with CC)	⊕◯◯◯ VERY LOW
Multiple Pregnancy Rate- per patient	7	1394	0.83 [0.33, 2.08]	0.7	None	⊕◯◯◯ VERY LOW
Multiple pregnancy rate- per pregnancy	5	318	2.65 [0.96, 7.31]	0.06	None	⊕⊕◯◯ LOW
Miscarriage rate- per patient	8	1511	1.09 [0.52, 2.26]	0.8	None	⊕◯◯◯ VERY LOW
Miscarriage rate- per pregnancy	6	353	1.00 [0.60, 1.67]	0.9	None	⊕⊕◯◯ LOW

*includes biochemical (or undefined pregnancy rate) as reported in each study; †clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

COMPARISON 10: Clomiphene Citrate versus Metformin + Letrozole

▪ EVIDENCE SUMMARY:

One study compared clomiphene citrate with metformin + letrozole (Liu, et al. 2017), with relevant outcomes including live birth, clinical pregnancy and miscarriage rate per patient, and ovulation rate per cycle. This study, by Liu et al. (2017) was conducted in China with 120 participants and had a high risk of bias due to lack of blinding of participants and insufficient information around allocation concealment.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Clomiphene citrate alone was less effective than metformin + letrozole for clinical pregnancy rate and ovulation rate per cycle. There were no differences between clomiphene citrate and combine metformin + letrozole for the outcomes of live birth or miscarriage rate per patient. Given that these results are from a single, relatively small, high-risk of bias study, certainty in the evidence is very low for all outcomes.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	1	120	0.49 [0.22, 1.09]	0.08	None	⊕◯◯◯ Very low
Clinical pregnancy rate- per patient†	1	120	0.39 [0.19, 0.82]	0.01	**MET + LET** (clinical pregnancy is lower with CC)	⊕◯◯◯ Very low
Ovulation rate - per cycle	1	268	0.35 [0.21, 0.60]	0.0001	**MET + LET** (ovulation per cycle is lower with CC)	⊕◯◯◯ Very low
Miscarriage rate- per patient	1	120	0.47 [0.17, 1.29]	0.1	None	⊕◯◯◯ Very low

OUTCOME 10.1 – 10.4: Live birth rate- per patient, clinical pregnancy rate-per patient; ovulation rate- per cycle, miscarriage rate-per patient

COMPARISON 11: Clomiphene Citrate + Metformin versus Letrozole

▪ EVIDENCE SUMMARY:

One study compared clomiphene citrate combined with metformin versus letrozole (Liu, et al. 2017), with relevant outcomes including live birth, clinical pregnancy and miscarriage rate per patient, and ovulation rate per cycle. This study, by Liu et al. (2017) was conducted in China with 120 participants and had a high risk of bias due to lack of blinding of participants and insufficient information around allocation concealment.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences between clomiphene citrate + metformin compared with letrozole for any of the outcomes. Certainty in these results is very low due to being derived from a single, relatively small, high-risk of bias study.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	1	120	0.88 [0.41, 1.89]	0.7	None	⊕◯◯◯ Very low
Clinical pregnancy rate- per patient†	1	120	0.92 [0.45, 1.90]	0.8	None	⊕◯◯◯ Very low

Liu 2017 (HRB)	Mixed	Count	Investigator	7	58	8	62	Crude	NA

COMPARISON 12: Clomiphene Citrate versus gonadotropins (FSH)

▪ EVIDENCE SUMMARY:

Two studies compared clomiphene citrate versus gonadotropins (FSH) (Homburg et al. 2012 and Lopez et al. 2004), both in therapy naïve women with PCOS. Relevant outcomes included live birth rate, clinical pregnancy rate, ovulation rate, multiple pregnancy rate and miscarriage rate per patient, as well as ovulation rate per cycle. The studies were judged as moderate (Homburg et al. 2014) or high (Lopez et al. 2004) risk of bias.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences in ovulation rate, multiple pregnancy rate or miscarriage rate per patient; however, FSH was superior to clomiphene citrate for live birth rate and clinical pregnancy rate per patient, as well as ovulation rate per cycle. Evidence for these outcomes was moderate, with the exception of ovulation rate per cycle which was of very low quality due to being derived from a single small study with a high risk of bias.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate – per patient	2	331	0.58 [0.37, 0.91]	0.02	FSH (live birth rate is lower with CC)	⊕⊕⊕◯ MODERATE
Clinical pregnancy rate – per patient	2	331	0.54 [0.35, 0.85]	0.007	FSH (clinical pregnancy is lower with CC)	⊕⊕⊕◯ MODERATE

COMPARISON 13: Clomiphene Citrate + gonadotropins (FSH) versus gonadotropins (FSH)

▪ EVIDENCE SUMMARY:

Two studies compared clomiphene citrate + rFSH versus rFSH alone, one in India (Ganesh et al. 2009) and one in Egypt (Ghanem et al. 2012), with outcomes assessed including live birth rate, clinical pregnancy rate and ovulation rate per patient, and miscarriage rate per pregnancy. The study in India involved 1387 women with PCOS who had previously failed to conceive or ovulate with CC and were undergoing IUI. Three groups were included: Group A received letrozole, Group B received clomiphene citrate with two doses rFSH from cycle days 3-8 and Group C received continuous rFSH from day 2 onwards until hCG injection. The second study by Ghanem et al. (2012) included 174 women with clomiphene-citrate resistant PCOS, who received highly purified urinary FSH from days 3 to 13, with or without 100 mg of clomiphene citrate. Both studies were judged as having a moderate risk of bias due to their single-blind design.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences in any outcomes between clomiphene citrate + FSH versus urinary or recombinant FSH alone. Certainty in the evidence for these comparisons ranges from very low to moderate as shown below; downgraded for risk of bias (both studies moderate risk), as well as varied effect estimates (including differing directions of effect), and high statistical heterogeneity.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate -per patient	1	174	1.21 [0.60, 2.44]	0.6	None	⊕⊕◯◯ LOW
Clinical pregnancy rate- per patient†	2	1189	0.83 [0.61, 1.14]	0.3	None	⊕⊕◯◯ LOW
Ovulation rate - per patient	2	1189	0.79 [0.03, 21.36]	0.9	None	⊕◯◯◯ VERY LOW
Miscarriage rate- per pregnancy	1	158	1.18 [0.48, 2.86]	0.7	None	⊕⊕⊕◯ MODERATE

COMPARISON 14: Clomiphene Citrate + gonadotropins (FSH) versus letrozole

▪ EVIDENCE SUMMARY:

The same study in India compared clomiphene citrate + gonadotropins (rFSH) versus letrozole (Ganesh et al. 2009). Outcomes assessed included clinical pregnancy, ovulation rate, and miscarriage rate per patient. The study was judged as having a moderate risk of bias due to the single-blind design.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Combined clomiphene citrate and FSH was less effective than letrozole in achieving clinical pregnancy or ovulation per patient in this study, with odds ratios of 0.55 and 0.35, respectively. There were no differences between clomiphene citrate + FSH compared with letrozole for miscarriage rates per patient. Certainty in these results is moderate given the narrow confidence intervals and large sample size, downgraded once due to risk of bias given its single-blind design.

CCR/CCF, clomiphene citrate-resistant or failure

COMPARISON 15: Clomiphene Citrate + Metformin vs Gonadotropins (rFSH)

▪ EVIDENCE SUMMARY:

A single study in Bangladesh compared clomiphene citrate + metformin versus gonadotropins (rFSH) in clomiphene citrate-resistant women with PCOS (Begum et al. 2013). Outcomes assessed included clinical pregnancy and miscarriage rate per patient. The study was judged as having a high risk of bias due to being unblinded (presumably, as this was not described), and lack of information regarding randomisation and attrition.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Meta-analysis was not possible due to having a single eligible study with this comparison. Using this study alone, however, clinical pregnancy rate was higher with FSH compared to clomiphene citrate + Metformin, with an OR of 2.81 favouring FSH. Certainty in these results is very low given the reliance on a single study, with a high risk of bias and relatively small sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Clinical pregnancy rate- per patient†	1	110	2.81 [1.05, 7.52]	0.04	FSH (clinical pregnancy is higher with FSH)	⨁◯◯◯ VERY LOW
Miscarriage rate- per pregnancy	1	23	1.38 [0.12, 16.23]	0.8	None	⨁◯◯◯ VERY LOW

†clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

OUTCOME 15.1 – 15.2: Clinical pregnancy rate-per patient and miscarriage rate-per pregnancy

15.1.1 - 15.1.2. Individual Study Data Tables

OUTCOME: LISTED BELOW						OUTCOME TYPE: Dichotomous			
COMPARISON: Clomiphene Citrate + Metformin versus rFSH									
Author, year	Past OI Med Use	Unit of outcome (e.g. g, mg, µg)	Method of measurement	N events in intervention / exposure group (CC +MET)	N total in intervention / exposure group (CC +MET)	N events in control / comparison group (FSH)	N total in control/ comparison group (FSH)	Are these values adjusted or crude?	If adjusted, what variables were in the model?

Begum 2013 (HRB)	CCR	Count	Investigator	1	7	3	16	Crude	NA

CCR, clomiphene citrate-resistant

COMPARISON 16: Clomiphene Citrate versus LOD

▪ EVIDENCE SUMMARY:

A single UK-based study by Amer et al. (2009) examined the efficacy of clomiphene citrate versus LOD in 76 women with anovulatory PCOS and clomiphene citrate resistance. Women treated with clomiphene citrate unsuccessfully for 6 cycles were then also offered LOD. There was no blinding in this study; once randomised, the allocation was revealed to the investigators and patients. Hence, the study was judged as moderate risk of bias.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences between CC versus LOD in live birth rate or clinical pregnancy rate per patient or miscarriage rate per pregnancy. There was low certainty for all outcomes due to the evidence being derived from a single, small study (downgraded once for imprecision) with a moderate risk of bias (downgraded once for risk of bias).

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	1	65	1.54 [0.58, 4.10]	0.4	None	⊕⊕◯◯ LOW
Clinical pregnancy rate- per patient†	1	65	1.66 [0.59, 4.70]	0.3	None	⊕⊕◯◯ LOW
Miscarriage rate- per pregnancy	1	43	0.86 [0.11, 6.72]	0.9	None	⊕⊕◯◯ LOW

Question 5.4.

In women with PCOS, is clomiphene citrate effective for improving fertility outcomes? In women with PCOS, is metformin effective for improving fertility outcomes? In women with PCOS and a BMI<30-32, what is the effectiveness of metformin compared to clomiphene citrate for improving fertility outcomes?

BACKGROUND

Clomiphene citrate

Clomiphene citrate is a selective oestrogen receptor modulator with both oestrogenic and anti-oestrogenic properties (1). It was first approved for use in women with anovulation in 1967 and has been used as a first line ovulation induction agent for over 40 years (2). Acting as an anti-oestrogen, clomiphene citrate competitively inhibits the binding of oestradiol to its receptors in the hypothalamus and pituitary which in turn blocks the negative feedback effect of endogenous oestrogens including oestradiol. This release of the hypothalamus from negative inhibition results in an increased secretion of pulsatile gonadotrophin-releasing hormone secretion from the hypothalamus leading to an increase in FSH and luteinizing hormone production and secretion from the pituitary gland. This increase in FSH secretion stimulates follicular growth and oestradiol production with the aim of inducing a midcycle luteinizing hormone surge and ovulation (3).

Clomiphene citrate is usually given for 5 days, commencing on menstrual cycle day 2 to 5, starting with 50mg/day and increasing to a maximum of 150 mg/day. If ovulation cannot be achieved with clomiphene citrate administration at maximum doses, clomiphene citrate resistance is defined. If pregnancy cannot be achieved after six ovulatory cycles with clomiphene citrate, then the patient is described as having clomiphene citrate failure (4).

Studies with clomiphene citrate have shown an ovulation rate of 60–85% and a pregnancy rate of 30–50% after 6 ovulatory cycles. This apparent discrepancy between good ovulation rates and lower pregnancy rates has been partially attributed to the anti-oestrogenic effects of clomiphene citrate on the endometrium and cervical mucus. The rates of twin pregnancy and triplets with clomiphene citrate are 5–7% and 0.3%, respectively depending on the closeness of monitoring of the cycle. The incidence of ovarian hyperstimulation syndrome is less than 1% (5). A patient’s lifetime exposure to clomiphene citrate without pregnancy is often limited to 12 treatment cycles, as additional cycles have been alleged (without adequate evidence) to be at increased risk of borderline ovarian tumours (6). There is insufficient evidence to suspect clomiphene citrate in causing congenital abnormalities in children born from the treatment.

Metformin

Hyperinsulinaemia with insulin resistance is a prominent feature of PCOS (7) affecting approximately 65 to 80% of women with PCOS (8). This results in increased ovarian androgen biosynthesis *in vivo* and *in vitro* and decreased SHBG synthesis from the liver, leading to increased bioavailability of free androgens. This excess in local ovarian androgen production augmented by hyperinsulinaemia causes premature follicular atresia and anovulation (9).

This contribution to anovulation in PCOS has led to the introduction of insulin-sensitizing drugs in an attempt to restore ovulation and enhance pregnancy. Metformin has been the one studied most widely in PCOS and has the most reassuring safety profile (4). It is a biguanide which is used as an oral antihyperglycaemic agent in the treatment of DM2 (10). The first published report on the use of metformin as a treatment for PCOS was in 1994 and early studies examining the reproductive system effects of metformin in women with PCOS showed promising results.

Metformin is available in two formulations: immediate and extended-release. Therapeutic regimens of metformin administration in PCOS are not well standardized in clinical practice, and various protocols have been used in the studies available in literature with an extremely variable target dose of 1500 to 2550 mg per day having been proposed (11). Some studies have continued use of metformin into pregnancy while others have ceased its use once a positive pregnancy test has been achieved.

Metformin for fertility purposes has been used on its own or with other drugs such as clomiphene citrate, letrozole or gonadotrophins.

Methodological quality/risk of bias
Risk of bias for the included studies were rated as low to high risk of bias. Studies of moderate to high risk of bias should be interpreted with caution. The most common reasons for the ratings assigned include: unclear whether randomization had been performed appropriately; unclear whether allocation to the intervention group was concealed; unclear whether participants, investigators and outcome assessors were blinded to the intervention group; unclear if all participants were analysed in the groups to which they were randomly allocated; power calculations were not reported; lack of direct comparisons between the two groups; insufficient number of patients in the trials; unclear whether selective outcome reporting had occurred; and a lack of conflict of interest statements. These methodological issues are likely to have an impact on the direction of bias and reliability of the findings.

Research Integrity check was applied (see general Integrity guideline section).

Generalisability
Studies were conducted in university departments, outpatient clinics in hospitals and laboratories covering countries across Australia, Europe, South America, USA and Asia.

Comparisons

1. **Metformin vs. placebo**

Seven studies compared metformin with placebo for fertility outcomes in PCOS. Studies were conducted in the UK, Europe (Norway, Finland, Sweden, Denmark), China, New Zealand and Jordan. Five of the studies had a moderate risk of bias and two had a low risk. Two studies were specifically in women with clomiphene citrate-resistant PCOS, and three had a mixed population (the remaining two did not report ovulation induction medication use in their populations).

All outcomes assessed were amenable to meta-analysis except for multiple pregnancy rate per patient which was only reported in a single study. Metformin was superior to placebo for improving live birth, clinical pregnancy and overall pregnancy rates, with ORs >1.8 and moderate certainty in the evidence for all. Downgrading was due to risk of bias since most of the studies (half or more) in these three analyses were of moderate risk of bias. No differences between metformin and placebo were identified for ovulation rate per patient, miscarriage rate or multiple pregnancy rates per patient or pregnancy. Evidence for these outcomes was of low certainty due to small sample sizes, wide confidence intervals and risk of bias.

2. **Metformin vs. clomiphene citrate**

Only three included studies compared metformin with clomiphene citrate, two of which included women with a BMI<30-32 kg/m2 (12, 13), while the remaining study included women with a mean BMI ≥30-32 kg/m2 (14).

One of the studies (12) had a moderate risk of bias and the other (14) had a low risk of bias. Both studies included participants with a mixed history of past ovulation induction medication use, with the study by Legro et al. 2007 (14) being of a relatively large sample size (n>400). The third study (13) had a moderate risk of bias and included therapy naïve women with PCOS.

In meta-analysis, there were no differences between metformin and clomiphene citrate for live birth, clinical pregnancy, multiple pregnancy or ovulation rates per patient. In a single study, ovulation rate per cycle was significantly lower with metformin compared with clomiphene citrate (OR= 0.43) and miscarriage rate per patient was significantly higher with metformin in meta-analysis of three studies (OR= 2.44). In subgroup analysis by BMI, clomiphene citrate was more effective than metformin for achieving live birth rate and clinical pregnancy rates among women with a BMI ≥30-32 kg/m2. This result was derived from a single study, however, and should be interpreted with caution. Certainty in the evidence was low for live birth, clinical pregnancy, and ovulation rate per cycle while the remaining outcomes were of moderate certainty (refer table below), with main reasons for downgrading the evidence including risk of bias and imprecision due to small sample sizes or single studies for some outcomes.

3. Metformin and clomiphene citrate vs. metformin

Three studies examined metformin + clomiphene citrate compared with metformin alone in women with PCOS. Of these, one was moderate risk of bias (13) in therapy naïve women with PCOS in India. The remaining two were low risk studies (12, 14) in New Zealand and the US, with mixed ovulation induction medication use history.

In meta-analysis of the three RCTs, metformin combined with clomiphene citrate had a favourable effect on live birth rate and ovulation rate per patient, with odds ratios of 2.44 and 3.72, respectively. These outcomes were both of moderate certainty; live birth rate was downgraded for indirectness resulting from diverse populations since the studies included treatment naïve patients and those with clomiphene-citrate resistance or failure; and ovulation rate was downgraded due to being derived from a single study (despite its relatively large sample size, the result requires replication to increase certainty in the evidence). Subgroup analysis by BMI showed that the beneficial effect of metformin + clomiphene citrate on live birth rate was most pronounced in women with a BMI ≥30-32 kg/m2, however only one study was included in this subgroup.

4. Clomiphene citrate vs. metformin and clomiphene citrate

Eight studies compared clomiphene citrate with metformin + clomiphene citrate, with several relevant outcomes. Studies were conducted across China, New Zealand, South Africa, Turkey, USA and India. Two studies had low risk of bias, two moderate and four high risk. Two studies were specifically in women with clomiphene citrate-resistant, three had mixed populations and one was in therapy naïve PCOS (the remaining two did not report ovulation induction medication use in their populations).

Meta-analysis was performed for 5 possible outcomes. Clomiphene citrate alone was less effective than the combination of clomiphene citrate and metformin for clinical pregnancy rates and ovulations rates per patient and per cycle. In subgroup analysis by BMI, metformin + clomiphene citrate was more effective for clinical pregnancy rate in the BMI<30-32 kg/m2 subgroup, and more effective for ovulation rate per patient in the BMI ≥30-32 kg/m2 subgroup. Ovulation rate per cycle was better with metformin + clomiphene citrate than clomiphene citrate alone across both BMI subgroups. There were no significant differences in live birth rates, multiple pregnancy rates or miscarriage rates per patient or per pregnancy, including after subgrouping by BMI. There is low to moderate certainty in the evidence for these outcomes, which were downgraded due to risk of bias since most of the studies were of moderate to high risk of bias. Evidence was also downgraded for indirectness since some analyses included diverse populations with and without clomiphene citrate- resistance.

5. Clomiphene citrate vs. letrozole

Eleven RCTs compared clomiphene citrate with letrozole, of which six had a high risk of bias (15-20), one had a moderate risk of bias (21), and four had a low risk of bias (22-25). Studies were conducted in the UK, USA, Iran, India, Bangladesh and China.

In meta-analysis, letrozole was superior to clomiphene citrate for ovulation rate per patient; pregnancy rate and clinical pregnancy rate per patient; and live birth rate per patient. Certainty in the evidence is high for live birth rate, and moderate for pregnancy rate, clinical pregnancy rate and ovulation rate, downgraded once for serious risk of bias since the majority of studies included had high to moderate risk of bias.

There were no differences between clomiphene citrate and letrozole for other outcomes including live birth rate per pregnancy, multiple pregnancy rate (per patient or pregnancy); and miscarriage rate (per patient or pregnancy). Certainty in these findings ranged from low to very low due to risk of bias, serious imprecision and serious inconsistency, except for multiple pregnancy rate per patient which was moderate due to 3 of the 5 studies having a high risk of bias. There was no evidence of statistical heterogeneity or publication bias for any of the outcomes.

6. Clomiphene citrate and metformin vs letrozole

One study compared clomiphene citrate combined with metformin versus letrozole, (20) with relevant outcomes including live birth, clinical pregnancy and miscarriage rate per patient, and ovulation rate per cycle. This study, by Liu et al. (2017) (20) was conducted in China with 120 participants and had a high risk of bias due to lack of blinding of participants and insufficient information around allocation concealment. There were no differences between clomiphene citrate + metformin compared with letrozole for any of the outcomes. Certainty in these results is very low due to being derived from a single, relatively small, high-risk of bias study.

7. Metformin and letrozole vs. letrozole

Only two studies compared metformin + letrozole with letrozole alone. One of the studies performed in Iran (26) in letrozole-resistant women (no ovulation at 7.5 mg letrozole), provided folic acid 200 µg daily (as a placebo) to both the letrozole + metformin and letrozole groups; whilst the other did not. The second study by Liu et al. (2017) (20) was conducted in China in 119 women with PCOS (for this comparison) aged 20-35, with a BMI ≤35 kg/m2. Reported outcomes of relevance were clinical pregnancy rate, live birth rate and miscarriage rate per patient and ovulation rate per cycle. Both studies had a high risk of bias due to issues around lack of blinding and insufficient information about randomisation or allocation concealment. The study by Liu et al. (2017) (20) also had a high dropout rate of 15% in the letrozole + metformin group, with 7.5% drop outs in the letrozole group.

Meta-analysis was only possible for the outcome of clinical pregnancy rate per person, with two studies pooled for this analysis (20, 26) , showing no difference between metformin + letrozole versus letrozole alone for this outcome. There is very low certainty in this result due to very serious risk of bias, with serious imprecision and serious indirectness. There were no differences in live birth rate between metformin + letrozole vs letrozole alone (33.9% vs 36.8%). Clinical pregnancy rate per patient (48.6% vs 40.2%) and ovulation rate per cycle (89/118 cycles vs 93/130 cycles) were higher in the letrozole + metformin group than letrozole alone, but these were not statistically significant. Similarly, miscarriage/ abortion rate per patient was slightly higher with metformin + letrozole than letrozole alone, but the difference was not statistically significant (21.1% vs 12.9%, $p > .05$). These results are of very low certainty given that they are derived from a single study with a high risk of bias.

8. Metformin and letrozole vs. metformin and clomiphene citrate

Two studies compared metformin + letrozole with metformin + clomiphene citrate (20, 27) with relevant outcomes including ovulation rate per cycle and pregnancy and miscarriage rate per patient. Liu et al. (20) additionally assessed live birth rate per patient, whereas Sohrabvand et al. (27) reported full term pregnancy per patient. Both studies were moderate (27) or high (20) risk of bias due to lack of blinding of participants and insufficient information around allocation concealment.

Meta-analysis of these two studies was performed for ovulation rate per cycle and pregnancy and miscarriage rate per patient, with results in the table below. Clinical pregnancy and ovulation rates were greater with metformin + letrozole compared with metformin + clomiphene citrate with odds ratios of 1.90 and 2.02, respectively. Miscarriage rates per patient did not differ between groups.

Certainty of the evidence for these three outcomes was low, downgraded once due to high/ moderate risk of bias and once for serious imprecision (small n and wide confidence intervals). The study by Liu et al. (20) additionally assessed live birth rate per patient, showing no difference between metformin + letrozole versus metformin + clomiphene citrate groups. Sohrabvand et al. (27) assessed full term pregnancy per patient and found that metformin + letrozole was more effective than metformin + clomiphene citrate for this outcome (10 versus 3 full term pregnancies per group, respectively, p=0.03). The results for both these outcomes are of very low certainty given that they are derived from only single studies with moderate to high risk of bias.

9. Clomiphene citrate vs metformin and letrozole

One study compared clomiphene citrate with metformin + letrozole, (20) with relevant outcomes including live birth, clinical pregnancy and miscarriage rate per patient, and ovulation rate per cycle. This study, by Liu et al. (2017) (20) was conducted in China with 120 participants and had a high risk of bias due to lack of blinding of participants and insufficient information around allocation concealment.
Clomiphene citrate alone was less effective than metformin + letrozole for clinical pregnancy rate and ovulation rate per cycle. There were no differences between clomiphene citrate and combined metformin + letrozole for the outcomes of live birth or miscarriage rate per patient. Given that these results are from a single, relatively small, high-risk of bias study, certainty in the evidence is very low for all outcomes.

EVIDENCE-BASED RECOMMENDATIONS	
Metformin could be used alone, in women with PCOS with anovulatory infertility and no other infertility factors, to improve clinical pregnancy and live birth rates, whilst informing women should be informed that there are more effective ovulation agents.	Low
Clomiphene citrate could be used in preference to metformin in women with PCOS with anovulatory infertility and no other infertility factors, to improve ovulation, clinical pregnancy and live birth rates.	Low
Clomiphene citrate combined with metformin could be used rather than clomiphene citrate alone in women with PCOS with anovulatory infertility and no other infertility factors to improve ovulation and clinical pregnancy rates.	Low

Clomiphene citrate combined with metformin could be used rather than metformin alone in women with PCOS with anovulatory infertility and no other infertility factors to improve live birth rates.	Low
Letrozole should be used rather than clomiphene citrate in women with PCOS with anovulatory infertility and no other infertility factors to improve ovulation, clinical pregnancy, and live birth rates.	Low

PRACTICE POINTS
● Women should be counselled as to potential mild gastrointestinal side-effects of metformin ● Healthcare and resource burden including monitoring, travel and costs are lower with metformin ● Consideration of age and screening for other fertility factors needs to be discussed before prescribing metformin
The risk of multiple pregnancy is increased with clomiphene citrate use (alone or in combination with metformin) and therefore clomiphene cycles will require ultrasound monitoring.
Monitoring of combined cycles will need to be equivalent to clomiphene citrate alone
There is evidence of no harm in terms of foetal abnormality rates in women exposed to clomiphene compared with letrozole.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Metformin vs Placebo	⊕⊕◯◯ LOW
Comparison 2. Metformin vs Clomiphene citrate	⊕⊕◯◯ LOW

Comparison 4. Clomiphene citrate vs Metformin + Clomiphene citrate	⊕⊕◯◯ LOW
Comparison 5. Clomiphene citrate vs Letrozole	⊕◯◯◯ VERY LOW
Comparison 6. Clomiphene citrate + Metformin vs Letrozole	⊕◯◯◯ VERY LOW

Comparison 7. Metformin + Letrozole vs Letrozole	⊕◯◯◯ VERY LOW
Comparison 8. Metformin + Letrozole vs Metformin + Clomiphene citrate	⊕◯◯◯ VERY LOW
Comparison 9. Clomiphene citrate vs Metformin + Letrozole	⊕◯◯◯ VERY LOW

COMPARISONS (option versus other option)

1. Metformin vs placebo

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Metformin could be used alone, in women with PCOS with anovulatory infertility and no other infertility factors, to improve clinical pregnancy and live birth rates, whilst informing women that there are more effective ovulation agent.

LOW

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

- Women should be counselled as to potential mild gastrointestinal side-effects
- Healthcare and resource burden including monitoring, travel and costs are lower with metformin
- Consideration of age and screening for other fertility factors needs to be discussed before prescribing metformin

GRADE CONSIDERATIONS

Justifications:

Two critical criteria (live birth and clinical pregnancy rate) and one important criterion (pregnancy rate per patient) had moderate certainty

Subgroup considerations:

Implementation considerations:

Potential side-effects of the drug should be considered

Low cost, limited expertise and resource, monitoring limited and should be balanced in terms of efficacy versus health resource

Monitoring and evaluation considerations:

As there is no increase in multiple pregnancy rates, monitoring may not be required

Research priorities:

- Degree of side-effects and attempts to reduce these
- When the drug should be stopped if pregnant

A definitive trial to assess magnitude of efficacy on the critically important outcome of live birth is recommended

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Is cheap and seemingly effective with side-effects in up to 20% of patients which can be mitigated by advice and drug timing

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

GIT side-effects are potentially increased which may lead to cessation by the patient

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Limited numbers in trials to date

Moderate evidence for efficacy and low evidence for effects on multiple pregnancy

- **VALUES**

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Unlikely

-

- **BALANCE OF EFFECTS**

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

The ease of use and cost must be balanced by potential GIT effects. May be better with slow release tablets but efficacy of these are uncertain in terms of fertility outcomes

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☒ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Much cheaper than all other examined medical options

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

Despite this the widespread availability for other medical reasons suggests cheaper costs

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

Compared to other outcomes cost effectiveness would be expected but there are no published studies

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Widely available around the world and no monitoring required, lower cost burden and can be used in primary care

Need access to fertility factor screening if used in primary care

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Patients probably prefer oral drugs that are cheap, do not need monitoring and are easy to remember. Patient autonomy is maximised by regular oral use without intermittent health care centre attendance for results and investigations

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☒ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Yes, as the drug is freely available all over the world.

COMPARISONS (option versus other option)

2. Clomiphene citrate vs. metformin

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Clomiphene citrate could be used in preference to metformin in women with PCOS with anovulatory infertility and no other infertility factors, to improve ovulation, clinical pregnancy and live birth rates.

(Note: Low evidence rating as clinical pregnancy rate and multiple pregnancy rate had lower certainty than live birth rate)

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

The risk of multiple pregnancy is increased with clomiphene citrate use (alone or in combination with metformin) and therefore clomiphene cycles will require ultrasound monitoring.

GRADE CONSIDERATIONS

Justifications:

Clomiphene citrate vs. metformin all data:

There is evidence from high quality studies with low risk of bias for improvement of live birth rate

For clinical pregnancy rate overall, there were wide odds ratios but twice the chance of pregnancy with the combination suggesting the lower number of subjects contributes to non-significance.

Multiple pregnancy rate had an odds ratio of 1.00 indicating the same risk as clomiphene citrate alone

Ovulation rate per cycle was strongly associated with the combination with an odds ratio of 3.72 and confidence limits well away from 1.00.

Subgroup considerations:

Additional discussion BMI subgroups, apparent better success CC in BMI < 30kgm2 in Legro et al, (14, 22) yet evidence was inconclusive.

Recognition on the challenges of heterogeneous data, sensitivity analysis on high quality studies.

Implementation considerations: Monitoring and burden of clomiphene citrate is higher
Monitoring and evaluation considerations: Usual ultrasound monitoring of clomiphene citrate should apply
Research priorities: Impact by BMI subgroups

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Confidence around effects relies on 3 studies heavily dominated in numbers by one study (22) as the only high-quality study.

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

The addition of clomiphene citrate may increase side-effects but not documented

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Reduced by no difference in clinical pregnancy rate and multiple pregnancy rate where there are few studies

- **VALUES**

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☒ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Little to inform decisions in this area.

Women should be informed on the balance of risks and benefits compared to other agents

- **BALANCE OF EFFECTS**

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Monitoring adds costs

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

Systematic review on costs in PCOS – see HEA section

Panel discussion:

Monitoring adds costs

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

Systematic review on costs in PCOS – see HEA section

Panel discussion:

The drug is relatively inexpensive but monitoring costs are potentially greater for clomiphene citrate

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Complex considerations to be discussed based on shared decision making

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Depends on the health system and prescribing costs. Clomiphene citrate may be less accessible and needs more monitoring.

Practitioners may need more skill in monitoring and patients may need to attend for monitoring more often.

Complex considerations to be discussed based on shared decision making

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Dependent on the health care system in which this operates and access to monitoring

COMPARISONS (option versus other option)

3. Clomiphene citrate and metformin vs. clomiphene citrate alone

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Clomiphene citrate combined with metformin could be used rather than clomiphene citrate alone in women with PCOS with anovulatory infertility and no other infertility factors to improve ovulation and clinical pregnancy rates.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

GRADE CONSIDERATIONS

Justifications:

5 studies contributed to this outcome for clinical pregnancy was 0.60 rates and although numbers were small, the OR was 0.60 (CI 0.44-0.83).

This was minimal heterogeneity implying these results were generally applicable.

There were no significant subgroup differences

Subgroup considerations:

No subgroups

Implementation considerations:

If clomiphene citrate is being used, addition of metformin could improve ovulation and clinical pregnancy rates

Monitoring and evaluation considerations:

Standard monitoring of oral agents needed

Research priorities:

Definitive trial of live birth rates could be prioritised

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Small numbers but several studies contributed to this finding

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

The combination of Metformin and CC may have added side-effects

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

Research evidence:

No research evidence was identified

Panel discussion:

COMPARISONS (option versus other option)

4. Metformin and clomiphene citrate vs metformin alone

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Clomiphene citrate combined with metformin could be used rather than metformin alone in women with PCOS with anovulatory infertility and no other infertility factors to improve live birth rates

(Low as clinical pregnancy rate and multiple pregnancy rate had lower certainty than live birth rate)

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

Monitoring of combined cycles will need to be equivalent to clomiphene citrate alone.

GRADE CONSIDERATIONS

Justifications:

There is moderate evidence for improvement of live birth rate overall with nonsignificant effect on clinical pregnancy rate.

For clinical pregnancy rate there were wide odds ratios but twice the chance of pregnancy with the combination suggesting the lower number of subjects contributes to non-significance.

Multiple pregnancy rate had an odds ratio of 1.00 indicating the same risk as clomiphene citrate alone

Ovulation rate per cycle was strongly associated with the combination with an odds ratio of 3.72 and confidence limits well away from 1.00.

Subgroup considerations:

Previous unsuccessful use of medication led to higher results in the combined group while the numbers in therapy naïve groups was low.

Patients with a BMI >30-32 had a higher difference than those with a lower BMI where the difference was not obvious. The former group OR was 4.71 (2.56-8.65) compared with the latter 1.55 (0.73-3.29) although numbers were lower in this group.

Implementation considerations:

Two medications need to be dispensed with differing instructions for both (clomiphene citrate for 5 days, metformin continuous).

Monitoring and evaluation considerations:

Usual monitoring should apply.

Research priorities:

The impact of BMI needs more investigation as there is only one good quality study that examines this (14) .

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Confidence around effects relies on 3 studies heavily dominated in numbers by one study (22) .

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

The addition of clomiphene citrate may increase side-effects but not documented.

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Reduced by no difference in clinical pregnancy rate and multiple pregnancy rate where there are few studies

Studies on BMI and previous therapy dominated by one study

- **VALUES**

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☒ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Little to inform decisions in this area.

More monitoring and doctor interface may mean an intrusion in regular living.

- **BALANCE OF EFFECTS**

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

- Insufficient information to decide.

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

Cost effectiveness systematic review is done across PCOS. Please reference the overarching section on cost

Panel discussion:

Addition of a second drug and monitoring adds costs.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

Cost effectiveness systematic review is done across PCOS. Please reference the overarching section on cost.

Panel discussion:

Addition of a second drug and monitoring adds costs.

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

Cost effectiveness systematic review is done across PCOS. Please reference the overarching section on cost.

Panel discussion:

The extra drug is relatively inexpensive but monitoring costs are potentially greater by adding in clomiphene citrate.

- **EQUITY**

What would be the impact on health equity?

Judgement:

☒ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified.

Panel discussion:

Unable to tell.

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

Depends on the health system and prescribing costs. Clomiphene citrate may be less accessible and needs more monitoring.

- Practitioners may need more skill in monitoring and patients may need to attend for monitoring more often.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

Very dependent on the health care system in which this operates.

COMPARISONS (option versus other option)
5. Clomiphene citrate vs letrozole
EVIDENCE-BASED RECOMMENDATION(S)

EBR: Letrozole should be used rather than clomiphene citrate in women with PCOS with anovulatory infertility and no other infertility factors to improve ovulation, clinical pregnancy, and live birth rates.

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT

There is evidence of no harm in terms of foetal abnormality rates in women exposed to clomiphene citrate compared with letrozole.

GRADE CONSIDERATIONS

Justifications:

Evidence is high for live birth, moderate for pregnancy and low for multiple pregnancy. There are wide confidence limits for multiple pregnancy rates but strong evidence for the other parameters.

Subgroup considerations:

Numbers of patients in documented therapy naïve and previous medication patients are too low to make a recommendation on subgroup analysis for live birth rates. The majority of patients contributing to the overall result did not have any prior medication reported. This was also true for clinical pregnancy rates.

With regard to ovulation rates per cycle, only one study reported prior clomiphene-resistance and the majority did not report any prior medication use. The same was true for ovulation rate per cycle.

Implementation considerations:

Letrozole is used similarly to clomiphene citrate and needs the same monitoring regimen.

It should not prove any more difficult to use this agent compared with clomiphene

Monitoring and evaluation considerations:

The same monitoring regimen as for clomiphene citrate is required

Research priorities:

What is the impact of additional metformin?

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Evidence for livebirth rates being superior is high while clinical pregnancy rates are moderate.

There is no evidence for better or worse multiple pregnancy rates.

Last guideline:

Patients are significantly more likely both to ovulate and to have a live birth after use of letrozole compared to clomiphene, the previous first line agent. The likelihood of live birth is increased 40-60% with letrozole compared to clomiphene. Similarly, the failure to ovulate at all (letrozole resistance) is reduced 2-3 fold with letrozole versus clomiphene citrate (absolute chance ~10%).

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

No evidence is presented in either direction.

Last guideline:

Multiple pregnancy rate appears lower than clomiphene. Hot flushes, generally the least desired side effect of any anti-oestrogen, is less common with letrozole than clomiphene, but still present. Fatigue and dizziness are more common. While current data do not support the association of letrozole use with increased anomaly rates, anomalies still occur without a specific pattern to suggest a potential interaction or mechanism.

CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☒ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

A good number of high-quality studies and relatively tight confidence limits contribute to this conclusion.

Last guideline:

The body of evidence included here is of very low to moderate certainty with serious to very serious risk of bias, serious inconsistency, imprecision, indirectness, and publication bias.

- **VALUES**

  Is there important uncertainty about, or variability in, how much people value the main outcomes?

  Judgement:

☐ Important uncertainty or variability	☒ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Higher chance of pregnancy would lead to better valuation although no data available

Last guideline*:*

Generally, a live birth, as opposed to restoration of ovulation or a clinical pregnancy remains the desired infertility treatment outcome of both patient and clinician. Further research should focus on healthy perinatal outcomes of infant and mother, and eventual long-term development of the infant.

- **BALANCE OF EFFECTS**

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

No side-effects are presented but expected to be low

Last guideline:

The balance of benefits in terms of improved live births with letrozole and less hot flushes currently outweighs the adverse effects of relatively increased fatigue and dizziness, multiple pregnancy, and concerns about congenital anomalies (given limited evidence for these effects)

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☒ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

Cost effectiveness systematic review is done across PCOS. Please reference the overarching section on cost

Panel discussion:

Expected similar costs of the drug and monitoring

Last guideline

Proscription of prescribing by national agencies may limit use of letrozole is specific countries or regions. These may change with time. For instance, letrozole, previously proscribed in India, may now be used for ovulation induction. Because letrozole is a newer drug than clomiphene citrate and may enjoy ongoing patent protection in specific countries or regions, the associated increased expense of the drug may favour cheaper generic forms of clomiphene. However as patent exclusivity expires, the price of letrozole and clomiphene citrate may be comparable.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

Cost effectiveness systematic review is done across PCOS. Please reference the overarching section on cost.

Panel discussion:

Likely to be more cost-effective due to higher pregnancy and live birth rates.

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

Cost effectiveness systematic review is done across PCOS. Please reference the overarching section on cost.

Panel discussion:

Likely to be more cost-effective due to higher pregnancy and live birth rates.

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☒ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Last guideline:

There are currently no known disadvantaged group or different baseline conditions that may selectively favour use of any ovulation induction agent. Varies by availability in different countries. Willingness of HPs to prescribe.

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Health delivery personnel will favour the better clinical outcomes as will patients.

Better results for the same clinical intervention as clomiphene citrate incorporating similar monitoring will be acceptable for those who accept oral ovulation induction

Last guideline

Perception of the risks of letrozole, including multiple pregnancy or congenital anomalies, may lead to the choice of other treatment modalities with greater control over these outcomes.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Different attitudes by health authorities and staff to letrozole may delay implementation although there is no evidence of increased congenital abnormalities with this drug

Last guideline:

- The major barriers to implementation of the recommendation are regulatory agencies forbidding the off-label use of letrozole for ovulation induction and the perceptions of patients and clinicians to stick with established treatment options.

GDG 5

Question 5.5.

In women with PCOS, are gonadotrophins effective for improving fertility outcomes?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	**In women with PCOS, are gonadotrophins effective for improving fertility outcomes?**
Clinical leads (key contacts)	**Adam Balen**
Allocation ranking	**Level 2- updated systematic review (with update of integrity check for all studies)**

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women of any age, ethnicity and weight with PCOS diagnosed by Rotterdam, NIH or AIS and 1) at least one patent tube 2) normal sperm AND 3) have never been treated or been exposed to treatment for infertility (therapy naïve) OR 4) have been treated or exposed to treatment OR 5) have been treated or exposed to clomiphene citrate and ovulate but don't conceive (clomid failure) OR 6) have been treated or exposed to clomid and don't ovulate (clomid resistant). Also specifically identifying the 4 phenotypes where possible.	Any type, dose and frequency of gonadotrophins	Placebo, no intervention, other infertility treatment interventions (ie. aromatase inhibitor, metformin, clomiphene citrate, ovarian surgery) including gonadotrophins in combination with other infertility treatment intervention(s).	Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, single and multiple pregnancies, miscarriage rate, other adverse events, quality of life, cost effectiveness.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	None
Exclusion	Women without diagnosis of PCOS.	Placebo, no intervention or any intervention other than an gonadotrophins.	Any intervention other than those listed in the inclusion criteria.	None	Nonevidence based guidelines, non-systematic reviews, any study lower than a RCT.	None

2. SEARCH STRATEGY

The search and screening for all GDG 5 questions were done together. Details can be found in the GDG 5 Methodology Appendix, including for:

- Databases
- Search Dates
- Search String(s)
- PRISMA flowchart
- Full list of included studies
- Full list of excluded studies with reasons for exclusion

Evidence processing: The literature search and screening were performed together in one Endnote library and Covidence project for all non-IVF, IVF and IVM fertility treatments in PCOS. Studies were selected by one reviewer/s in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. The articles were screened by title and abstract by one reviewer. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy. In total, 102 unique studies met inclusion criteria across all non-IVF, IVF and IVF questions, of which 57 were included in the guideline update following the integrity check (refer to methodology appendix for details).

Of these eligible 102 studies, 12 studies met the inclusion criteria for this particular question (Q.5.5) on gonadotrophins, as detailed below.

Table of Included Studies

3. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year, country	Population/ PCOS criteria/ Setting/ CC sensitivity	Study Design	Intervention N	Intervention description	Comparison N	Comparison description	Follow Up	Outcomes	Pooled in MA?	RoB
Baryam 2004 The Netherlands	Chronic anovulation (World Health Organization type II) and polycystic ovaries, diagnosed by transvaginal Ultrasonography, 29 Dutch hospitals; **CCR**	RCT	**Laparoscopic surgery**: 83 Age: 28.5±3.7 BMI: 27.9±6.3	**Laparoscopic electrocautery of the ovaries.** If ovulated, no further treatment. Each ovary was randomly punctured 5-10 times, depending on its size using 15mm long 0.9mm diameter needle. If anovulation persisted, 50mg clomiphene citrate (CC) increased to max 150mg.	**FSH**: 85 Age: 28.7±4.1 BMI: 27.3±8.8	10 mg medroxy-progesterone for 10 days, followed by daily 75 IU **rFSH**. If the diameter of the follicles remained < 10 mm, the dose was increased by half an ampoule (37.5 IU) on each of cycle days 16 and 23.	12 months	Pregnancy, miscarriages, multiple pregnancies, premature deliveries Unclear on how pregnancy was tested: " The primary end point was ongoing pregnancy within 12 months, defined as a viable pregnancy of at least 12 weeks."	Yes	High – drop outs in controls and non-blinded
Begum 2013, Bangladesh	PCOS patients diagnosed with Rotterdam criteria; Outpatient department of a teaching hospital; **CCR**	RCT (3 groups)	**MET + CC**: 55 Age: 26.96±4.05 BMI: 27.71±3.61 **MET + rFSH**: 55 Age: 26.84±5.13 BMI: 28.36±4.54	**MET + CC** 500 mg metformin 3x daily (1500 mg) for 4 weeks then the same dose was continued for another 6 months along with scheduled CC 150 mg daily for 5 days (D3–D7 of the cycle). **MET + rFSH** 500 mg metformin 3x daily (1500 mg) for 4 weeks, then same dose was continued for 6 months with 75 IU rFSH every alternate day from D3 of the cycle (then daily if needed after first monitoring on D12) till maturity of follicles or maximum 15 doses of rFSH.	**rFSH**: 55 Age: 27.15±4.20 BMI: 28.98±3.19	75 IU **rFSH** every alternate day starting from D3 of the cycle (then daily if necessary after first monitoring on D12) till maturity of follicles or maximum 15 doses of rFSH.	6 cycles	Primary: Clinical pregnancy, live-birth rate Secondary: ovulation, spontaneous abortion, ectopic pregnancy, multiple pregnancies, congenital anomaly and other adverse perinatal or obstetric complications. Unclear on how pregnancy was tested: "Treatment was terminated:…(iv) after positive pregnancy test."	No	High Unblinded Missing details on randomisation, dropouts, blinding etc.
De Leo 1999, Italy	Women with **CCR/CCF** and PCOS (chronic oligomenorrhoea or amenorrhoea and	RCT	10 Age: 28.0 ± 4.0	Started with FSH (75 IU then increased to 5 ampoules/day) alone for two cycles and then for a month with metformin, then	10 Age: 29.5±2.9	Metformin (1500 mg) for a month before undergoing ovarian stimulation with combined metformin and FSH for one cycle	2-4 cycles	Primary: number of FSH ampoules, days of treatment, E2 level on the day of hCG, number of follicles > 15mm, number of hyperstimulation, number of cycles with hCG withheld	Yes	High

	hyperandrogenemia); University department		BMI: 27.7±3.1	underwent a third cycle of combined metformin and FSH stimulation	BMI: 26.9±4.8			Secondary: Number of pregnancies (NR if clinical or biochemical)		
Farquhar 2002 New Zealand	PCOS diagnosed based on criteria by Adams et al. (1985)[redacted]; publicly funded and private tertiary level fertility clinics; all patients had infertility and treatment before; **CCR**	RCT (N per group dissimilar due to unblocked randomization)	**Laparoscopic ovarian diathermy**: 29 Age: 29.6±4.7 BMI: 28.3±3.9	**Laparoscopic ovarian diathermy:** A monopolar electrocautery needle of 1 cm in length was used to drill 10 holes in each ovary. The diathermy was done with cutting power at 30 units and was continued for 10 seconds	**Urinary or recombinant FSH** (3 cycles): 21 Age: 29.6±4.2 BMI: 27.8±4.8	**Urinary or rFSH**: 75 IU/day (one ampoule) was given for 2 weeks, adjusted accordingly depending on the serum E2	6 months (for surgery) 3 cycles (FSH)	Ovulation rates, pregnancy outcomes, birth after 20 weeks of gestation Pregnancy detection: serum β-hCG of >50 IU/l and foetal heart activity on ultrasound scan	Yes	High – small and non-blinded
Ganesh 2009, India	Women with PCOS by Rotterdam who had previously failed to conceive or ovulate with CC and undergoing IUI (**CCR and CCF**); tertiary infertility care unit	Single blind RCT	**LET:** 372 analysed Age: 30.3 ± 4.9 BMI: 24.5 ± 3.8	**LET**: letrozole, 5 mg/day orally given for 5 days from cycle days 3 - 7	**CC + FSH:** 669 analysed Age: 30.4 ± 5.2 BMI: 24.8 ± 4.1 **FSH**: 346 analysed Age: 30.8 ± 4.6 BMI: 24.1 ± 3.4	**CC + FSH:** clomiphene citrate, 100 mg/day orally given for 5 days from cycle days 3 - 7 + 75 or 100 IU rFSH during cycle days 3 and 8 **FSH**: rFSH 75IU/100IU from day 2 until the day of hCG administration	NR	**Primary**: ovulation rate, cancellation rate, miscarriage rate and clinical pregnancy rate **Secondary**: OHSS rate and multiple pregnancy rate. Clinical pregnancy: defined as the presence of a gestational sac with cardiac activity as detected by transvaginal ultrasound at 7 weeks of gestation	Yes	Mod*
George 2003 India	Diagnosis of PCOS based on oligomenorrhoea and hyperandrogenism + biochemical abnormalities of a raised LH/FSH ratio or LH or ultrasound features of polycystic ovary; Medical clinical at a medical school; **CCR** patients	RCT	**MET**: 30 Age: 25.1±3 BMI: 25.5 ± 3.7	**MET**: 1500 mg/day in three divided doses for 6 months	**hMG**: 30 Age: 26. ± 2.9 BMI: 24.6 ± 2.6	**hMG**: starting at 75 units 5 days after a spontaneous or induced cycle increased by increments of 75 units every 7±10 days	NR	Pregnancy rate How conception was ascertained is not reported	No	Mod – high drop-out rate, small n, blinding not possible
Ghanem 2012, Egypt	PCOS women aged 18-38; Diagnosis of PCOS based on Rotterdam criteria; The women	RCT	**CC-HP uFSH**: 87	**CC** 100 mg daily doses for 5 days plus intramuscular (IM) injection	**HP uFSH**: 87 Age:	Highly purified (**HP uFSH**) only in the same daily doses and for the	NR	Primary: ovulation rate	Yes	Mod-single blind

Based on clinical registry entry: Egypt	had not undergone a similar treatment protocol before; **CCR**		Age: 24.8±4.7 BMI: 33.3±5.4	of 37.5 IU/day highly purified (HP) urinary FSH (uFSH) from the 3rd to the 13th cycle day. Subsequent increments of uFSH by 37.5 IU/day were made according to response	24.7±4.3 BMI: 33.2±5.7	same duration. Subsequent increments of uFSH by 37.5 IU/day were made according to response	(? 1 cycle)	Secondary: clinical pregnancy rates, number of follicles, endometrial thickness, and gonadotropins consumption. Clinical pregnancy was defined by intrauterine gestational sac observed by an ultrasound scan 2 weeks after a positive pregnancy test in urine or blood		
Homburg 2012, Europe and South America	PCOS by Rotterdam; **Therapy naïve**	Multi-centre RCT	**CC**: Assigned: 143 Received CC= 123 Age: 29.4±4 BMI: 25.7±6.0	Starting dose of **CC** was 50 mg/day (oral) for 5 days from Day 4 of a spontaneous or progestin-induced menstruation, rising by 50 mg/day up to 150 mg in subsequent cycles if ovulation was not achieved	**FSH**=Assigned 159 Received FSH=132 Age:29.8±3.8 BMI: 25.1±5.2	**rFSH** was given s.c. in a low-dose protocol starting with 50 IU on cycle day 4, with weekly increments of 25 IU as necessary to induce a follicular response	NR	**Primary**: clinical pregnancy rate (as a pregnancy diagnosed by ultrasonographic visualization of one or more gestational sacs with at least one foetus at 6–7 weeks gestation)	Yes	Mod
Lopez 2004, Spain	PCOS by Rotterdam; single centre; **Therapy naïve;**	RCT Cross-over (if un-successful)	**CC**= 38 (104 cycles) Age: 29 (23-38) Median (range) BMI: 22.3±1.9	**CC** daily dose of 50 mg for 5 days, starting on day 5 following spontaneous or induced uterine bleeding, increased by 50mg from next cycle if ovulation not achieved until 150mg max.	**FSH**= 38 (91 cycles) Age: 30 (22-39) Median (range) BMI: 21.9±1.9	**rFSH** commencing at 75 IU daily on day 3 following spontaneous or induced menses with dose increments of 37.5 IU daily every 7 days if there was no evidence of ovarian response	Up to 3-6 cycles	**Primary**: cumulative pregnancy (before crossover) **Secondary**: cycle cancellation rate, ovulation rate per cycle, cumulative ovulation rate, clinical pregnancy rate per cycle, incidence of OHSS, cumulative live birth rate, and multiple birth rate Pregnancy was initially diagnosed by increasing serum concentrations of β-HCG after missed menses	Yes	High Blindiing NR, underpowered
Tasdemir 2003 Turkey	PCOS diagnosed based on oligomenorrhea (<6 periods in a year), hyperandrogenism (hirsutism, acne, increased free and total testosterone, androstenedione, DHEASO4, and FAI), and FSH/LH level >2; hospital IVF centre; **CCR**	RCT	**MET+FSH**: 16 Age: 31.8±2.7 BMI: 28.5±3.5	**MET+FSH** 850mg metformin twice daily for 8 weeks in advance followed by rFSH 75IU given first 7 days (1 ampoule/day) adjusted based on ultrasonography findings of follicle development	**FSH**: 16 Age: 30.6±3.2 BMI: 29.0±2.1	**FSH** rFSH 75IU given first 7 days (1 ampoule/day) adjusted based on ultrasonography findings of follicle development	NR ≥8 weeks	Total gonadotropin dosage, duration of gonadotropin therapy, estradiol level on HCG-day, number of follicles with ≥16 mm diameter, number of cases with hyperstimulation development, number of cancelled cycles, endometrial thickness on HCG-day, pregnancy outcome (NR if clinical or biochemical), multiple pregnancy rate.	Yes	High-small n and unblinded
Yadav 2017 India	Chronic anovulation and polycystic ovaries diagnosed by transvaginal ultrasonography-Any standard criteria not reported. Hospital-based setting; **CCR**	RCT	**rFSH**: 44 Age: 26.23±2.9 BMI: 24.94±2.8	**rFSH** subcutaneous injection of 37.5/75 IU/daily started on cycle day 3-If the diameter of the follicle remained <10 mm, dose was increased by half an ampoule (37.5 IU)	**LOD**: 45 Age: 26.11±2.7 BMI: 25.0±2.35	**LOD:** An insulated monopolar needle was introduced at 90° angle to the ovarian cortex and 4-5 puncture sites were created. Those who failed to ovulate on LOD	12 months	Primary: ongoing pregnancy within 12 months (defined: a viable pregnancy of at least 12 weeks) Secondary: ovulation, miscarriage, ectopic pregnancy, multiple pregnancies, and live birth	Yes	High – lacking critical info

				on days 16 and 23. If no follicle development was seen on day 30, the cycle was terminated because of poor response.		spontaneously at 8 wk, were then added with CC for 1 cycle followed by gonadotrophin.		Pregnancy was ascertained based on positive urine pregnancy test		
Yarali 2002 Turkey	Peripubertal onset of oligo-amenorrhoea, elevated serum testosterone levels (>80 ng/dl; conversion factor=0.03467; >2.4 nmol/l) and U/S evidence of polycystic ovaries (PCO); setting NR; **CCR**	RCT Double blind	**MET + FSH**: 16 Age: 29.7±5.6 BMI: 28.6±4.0	**Metformin**, 850 mg, 2 times daily for 6 weeks + FSH (later) starting with 75 IU for 14 days and increased as required based on ovarian response	**Placebo + FSH**: 16 Age: 28.4±5.1 BMI:29.6±4.8	**Placebo** for 6 weeks + FSH (later) starting with 75 IU for 14 days and increased as required based on ovarian response	NR (≥ 6 weeks)	Duration of stimulation, total dose, number of vials used, follicle development, ovulation, pregnancy per cycle "A serum pregnancy test was performed 13-15 days after administration of HCG."	Yes	Mod – small and lacking info on blinding

CC, clomiphene citrate; CCR, clomiphene citrate resistant (to ovulate); CCF, clomiphene citrate failure (to become pregnant); LET, letrozole; MET, metformin; NR; not reported; OHSS, ovarian hyperstimulation syndrome; IUI, intrauterine insemination; hCG, human chorionic gonadotrophin; LH, luteinizing hormone; FSH, follicle stimulating hormone; MA, meta-analysis; RoB, risk of bias. All age data is in years and BMI is in kg/m^2. *Risk of bias assessment derived from reliable systematic review (e.g. Cochrane or previous review from the guideline evidence team). ⧖Ref: Adams J, et al. *Lancet* 1985;1375–9.

4. FINDINGS

Comparisons Included:

- **Comparison 1.** FSH vs CC
- **Comparison 2.** FSH + CC vs FSH
- **Comparison 3.** FSH + CC vs LET
- **Comparison 4.** FSH vs LOD
- **Comparison 5.** FSH + Metformin vs FSH +/- Placebo
- **Comparison 6.** FSH vs Clomiphene Citrate + Metformin
- **Comparison 7.** hMG vs Metformin

COMPARISON 1: Gonadotropins (FSH) versus Clomiphene Citrate

▪ EVIDENCE SUMMARY:

Two studies compared gonadotropins (FSH) versus clomiphene citrate (Homburg et al. 2012 and Lopez et al. 2004), both in therapy naïve women with PCOS. Relevant outcomes included live birth rate, clinical pregnancy rate, ovulation rate, multiple pregnancy rate and miscarriage rate per patient, as well as ovulation rate per cycle. The studies were judged as moderate (Homburg et al. 2014) or high (Lopez et al. 2004) risk of bias.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences ovulation rate, multiple pregnancy rate or miscarriage rate per patient; however, FSH was superior to clomiphene citrate for live birth rate, clinical pregnancy rate per patient and ovulation rate per cycle. Evidence for these outcomes was moderate, with the exception of ovulation rate per patient and per cycle which was of very low quality due to being derived from a single small study with a high risk of bias.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate – per patient	2	331	1.74 [1.10, 2.74]	0.02	**FSH** (live birth rate is higher with FSH)	⊕⊕⊕◯ MODERATE
Clinical pregnancy rate – per patient†	2	331	1.84 [1.18, 2.87]	0.007	**FSH** (clinical pregnancy is higher with FSH)	⊕⊕⊕◯ MODERATE
Ovulation rate – per patient	1	76	3.11 [0.76, 12.79]	0.1	None	⊕◯◯◯ VERY LOW
Ovulation rate – per cycle	1	195	2.49 [1.36, 4.55]	0.003	**FSH** (ovulation per cycle is higher with FSH)	⊕◯◯◯ VERY LOW
Multiple pregnancy rate – per pregnancy	2	155	2.41 [0.36, 16.10]	0.4	None	⊕⊕◯◯ LOW
Miscarriage rate- per pregnancy	2	155	0.97 [0.36, 2.60]	0.9	None	⊕⊕⊕◯ MODERATE

† clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity.

OUTCOME 1.1. Live birth rate– per patient

1.1.1. Individual Study Data Tables

COMPARISON 2: Gonadotropins (FSH) + clomiphene citrate versus gonadotropins (FSH)

▪ EVIDENCE SUMMARY:

Two studies compared rFSH alone versus clomiphene citrate + rFSH, one in India (Ganesh et al. 2009) and one in Egypt (Ghanem et al. 2012), with outcomes assessed including live birth rate, clinical pregnancy rate and ovulation rate per patient, and miscarriage rate per pregnancy. The study in India involved 1387 women with PCOS who had previously failed to conceive or ovulate with CC and were undergoing IUI. Three groups were included: Group A received letrozole, Group B received clomiphene citrate with two doses rFSH from cycle days 3-8 and Group C received continuous rFSH from day 2 onwards until hCG injection. The second study by Ghanem et al. (2012) included 174 women with clomiphene-citrate resistant PCOS, who received highly purified urinary FSH from days 3 to 13, with or without 100 mg of clomiphene citrate. Both studies were judged as having a moderate risk of bias due to their single-blind design.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences in any outcomes between FSH + clomiphene citrate versus urinary or recombinant FSH alone. Certainty in the evidence for these comparisons ranges from very low to moderate as shown below; downgraded for risk of bias (both studies moderate risk), as well as varied effect estimates (including differing directions of effect), and high statistical heterogeneity.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	1	174	1.21 [0.60, 2.44]	0.6	None	⊕○○○ LOW
Clinical pregnancy rate- per patient†	2	1189	0.83 [0.61, 1.14]	0.3	None	⊕⊕○○ LOW
Ovulation rate - per patient	2	1189	0.79 [0.03, 21.36]	0.9	None	⊕⊕○○ VERY LOW
Miscarriage rate- per pregnancy	1	158	1.18 [0.48, 2.86]	0.7	None	⊕⊕⊕○ MODERATE

† clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

COMPARISON 3: Gonadotrophins (FSH) + Clomiphene Citrate versus Letrozole

▪ EVIDENCE SUMMARY:

The same study by Ganesh et al. (2009) compared gonadotrophins (rFSH) + clomiphene citrate versus letrozole. Outcomes assessed included clinical pregnancy, ovulation rate, and miscarriage rate per patient. The study was judged as having a moderate risk of bias due to the single-blind design.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Combined FSH and clomiphene citrate were less effective than letrozole in achieving clinical pregnancy or ovulation per patient in this study, with odds ratios of 0.55 and 0.35, respectively. There were no differences between FSH + clomiphene citrate compared with letrozole for miscarriage rates per patient. Certainty in these results is moderate given the narrow confidence intervals and large sample size, downgraded once due to risk of bias given its single-blind design.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Clinical pregnancy rate- per patient†	1	1041	0.55 [0.40, 0.76]	0.0003	**LET** (clinical pregnancy is lower with CC+ FSH)	⊕⊕⊕◯ MODERATE

COMPARISON 4: FSH vs LOD

- **EVIDENCE SUMMARY:**

Three studies (Baryam et al. 2004; Farquhar et al. 2002; Yadav et al. 2017) compared FSH with laparoscopic ovarian drilling (LOD), conducted in the Netherlands, New Zealand and India. All three studies were in women with clomiphene-citrate resistant PCOS and all were judged as having a high risk of bias due to lack of blinding (or insufficient information to ascertain blinding), as well as small sample sizes and high dropout rates.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

FSH was superior to LOD for live birth rates; however, FSH also resulted in a much higher rate of multiple pregnancies, with an OR of 5.10. While certainty in the evidence for live birth rates per patient was moderate (downgraded once due to risk of bias), certainty in the evidence for all other outcomes was low or very low due to risk of bias, varied effect estimates and varied and/or wide CIs. Given that all studies for this comparison had a high risk of bias, findings should be interpreted with caution.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	3	307	2.21 [1.32, 3.71	0.003	**FSH** (live birth rate is higher with FSH)	⊕⊕◯◯ MODERATE

COMPARISON 5: FSH + Metformin versus FSH (+/- Placebo)

▪ EVIDENCE SUMMARY:

Three studies compared FSH + metformin versus FSH alone in women with PCOS. A study by De Leo et al. (1999) in Italy, examined 20 women with PCOS and clomiphene failure or resistance (i.e. failed to ovulate or conceive after clomiphene citrate treatment up to a daily dose of 50 mg from cycle days 3–7 during at least three consecutive cycles). This study has a high risk of bias due to its small sample size and likely lack of power as well as lack of blinding and allocation concealment information.

The remaining two studies by Tasdemir et al. (2004) and Yarali (2002) were conducted in Turkey, also in women with clomiphene-citrate resistance and PCOS. One study (Tasdemir et al. 2004) was judged as being at high risk of bias due to lack of reporting on key elements such as blinding and randomisation, while Yarali et al. (2002) had a moderate risk of bias as it was likely underpowered (small sample size with no sample size calculation) but was reported to be double-blinded.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences between FSH + metformin versus FSH in pregnancy rate, ovulation rate, multiple pregnancy rate or miscarriage rate per patient. There was very low certainty for multiple pregnancy rate per patient due to the evidence being derived from a single, small study with a high risk of bias. For the remaining outcomes, the evidence was of low certainty, downgraded for risk of bias (all moderate or high risk studies) and for inconsistency (varied effect estimates, including different directions and wide CIs).

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Pregnancy rate- per patient*	3	77	0.96 [0.18, 5.10]	0.9	None	⊕⊕◯◯ LOW
Ovulation rate- per patient	1	25	3.27 [0.31, 34.72]	0.3	None	⊕⊕◯◯ LOW
Multiple pregnancy rate -per patient	1	32	0.31 [0.01, 8.28]	0.5	None	⊕◯◯◯ VERY LOW
Miscarriage rate- per patient	1	25	4.89 [0.18, 132.83]	0.4	None	⊕⊕◯◯ LOW

COMPARISON 6: FSH vs Clomiphene Citrate + Metformin

▪ EVIDENCE SUMMARY:

A single study in Bangladesh compared gonadotropins (rFSH) versus clomiphene citrate + metformin in clomiphene citrate-resistant women with PCOS (Begum et al. 2013). Outcomes assessed included clinical pregnancy and miscarriage rate per patient. The study was judged as having a high risk of bias due to being unblinded (presumably, as this was not described), and lack of information regarding randomisation and attrition.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Meta-analysis was not possible due to having a single eligible study with this comparison. Using this study alone, however, clinical pregnancy rate was higher with FSH compared to clomiphene citrate + metformin, with an OR of 2.81 favouring FSH. Certainty in these results is very low given the reliance on a single study, with a high risk of bias and relatively small sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Clinical pregnancy rate- per patient†	1	110	2.81 [1.05, 7.52]	0.04	**FSH** (clinical pregnancy is higher with FSH)	⊕○○○ VERY LOW
Miscarriage rate- per pregnancy	1	23	1.38 [0.12, 16.23]	0.8	None	⊕○○○ VERY LOW

† clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

COMPARISON 7. Gonadotropins (hMG) versus Metformin

- **EVIDENCE SUMMARY:**

A single study by George et al. 2003 compared human menopausal gonadotropin (hMG) with metformin 60 clomiphene citrate-resistant women with PCOS. Outcomes assessed included pregnancy rate per patient and ovulation rate per cycle. The study was judged as being of moderate risk of bias due to lack of blinding.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

There were no differences between hMG and metformin in pregnancy or ovulation rates.
Certainty was ranked as low due to being reliant on a single small study of moderate risk of bias.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P-value	Favours	Certainty
Pregnancy rate- per patient*	1	60	1.52 [0.42, 5.47]	0.5	None	⊕⊕◯◯ LOW
Ovulation rate- per patient	1	60	0.76 [0.27, 2.12]	0.6	None	⊕⊕◯◯ LOW

*includes clinical, biochemical (or undefined pregnancy rate) as reported in each study

Question 5.5.

In women with PCOS, are gonadotrophins effective for improving fertility outcomes?

BACKGROUND

Gonadotrophin therapy is usually second- or third-line therapy for women with PCOS and may be indicated for women with anovulatory PCOS who have been treated with anti-estrogens (clomiphene citrate, CC) or aromatase inhibitors (letrozole, LET) if they have failed to ovulate or if they have a response that is likely to reduce their chance of conception (e.g., with CC the persistent hypersecretion of LH, or an antiestrogenic effect on the endometrium). In order to prevent overstimulation and multiple pregnancy, the traditional standard step-up regimens, when 75–150i.u. were increased by 75i.u. every 3–5 days (1) have been replaced by either low-dose step-up regimens (2, 3) or step-down regimens (4). The low-dose step-up regimen employs a starting dose of 50-75 i.u., which is only increased after 14 days if there is no response and then by only 25-37.5 i.u. every 7 days. Treatment cycles using this approach can be quite long – up to 28–35 days – but the risk of multiple follicular growth is lower than with conventional step-up regimens. With the step-down protocol, follicular recruitment is achieved using 150 i.u. daily for 3 or 4 days before decreasing the dose to 50–75 i.u. to maintain follicular development. In all the above-mentioned ovulation induction regimens, gonadotrophins are used alone, without a background of pituitary desensitization, which does not confer any advantage.

Gonadotrophin preparations are derived from either purified menopausal urine (hMG) or recombinantly-derived (recFSH). There appears to be no difference in efficacy between the different preparations in the context of anovulatory PCOS (5). All gonadotrophin preparations are significantly more expensive than oral agents (CC and LET) and require parenteral administration and close monitoring with regular ultrasound scan.

It can be extremely difficult to predict the response to stimulation of a woman with polycystic ovaries and achieve the development of a single dominant follicle in order to reduce the risks of multiple pregnancy and ovarian hyperstimulation syndrome (OHSS). Treatment with gonadotrophins should be commenced within the first 3 days of a natural or induced menstrual bleed, when a pelvic USS indicates that the endometrium is thin (less than 5mm) and that there are no ovarian cysts. It is essential to carefully monitor follicular development by ultrasound scan (USS). Ovulation is usually triggered with a single injection of human chorionic gonadotrophin (hCG) 5000 units (s.c.), when at least one follicle of at least 17 mm in its largest diameter has developed. To reduce the risks of multiple pregnancy, hCG should not be administered if a total of two or more follicles larger than 14 mm in diameter have developed. In overstimulated cycles hCG is withheld, the patient counselled about risks and advised to refrain from unprotected intercourse.

If conception has failed to occur after six ovulatory cycles in a woman younger than 35 years or after 12 ovulatory cycles in women older than 35, then it can be assumed that anovulation is unlikely to be the cause of the couple's infertility. The couple should have been comprehensively investigated by this stage with a test of tubal patency and sperm function tests. If no other explanation has been found for their infertility assisted conception (usually IVF) is now indicated.

Comparisons:

1. Gonadotrophins (FSH) vs. Clomiphene Citrate (CC)

Two RCTs were identified by the search to address this comparison. One RCT was low quality with high risk of bias (6) compared recombinant FSH with CC in women with PCOS who were therapy naïve and found that there was no difference between the two interventions for all fertility outcomes. The second was a multi-centre RCT with moderate risk of bias (7) comparing CC with low dose gonadotrophins, as the first line therapy for ovulation induction in anovulatory women with PCOS who were also therapy naïve. They reported with per protocol analysis that the clinical pregnancy rate was significantly higher in the gonadotrophin treated group. Furthermore, the chance of pregnancy was almost double in the first treatment cycle when compared to clomiphene citrate.

Meta-analysis of the two studies has demonstrated no differences ovulation rate, multiple pregnancy rate or miscarriage rate per patient; however, FSH was superior to clomiphene citrate for live birth rate OR 1.74 [95% CI 1.10, 2.74], clinical pregnancy rate per patient OR 1.84 [95% 1.18, 2.87] and ovulation rate per cycle OR 3.11 [95% CI 0.76, 12.79]. Evidence for these outcomes was moderate, with the exception of ovulation rate per patient and per cycle which was of very low quality due to being derived from a single small study with a high risk of bias. There was no difference in risk of multiple pregnancy or miscarriage.

2. **Gonadotrophins (FSH) + clomiphene citrate vs. gonadotrophins (FSH)**

Two studies compared rFSH alone with clomiphene citrate + rFSH (8) and one in Egypt (9), and a meta-analysis has shown no differences in any outcomes with very low to moderate certainty.

3. Gonadotrophins (FSH) vs. Laparoscopic Ovarian Diathermy/Drilling (LOD)

Three studies (10-12) compared FSH with laparoscopic ovarian diathermy/drilling (LOD), all in women who were CC resistant. Meta-analysis shows that FSH was superior to LOD for live birth rates OR 2.21 [95% CI 1.32, 3.71] (moderate certainty) it also resulted in a much higher rate of multiple pregnancy OR 5.10 [95% CI 1.39, 18.68], with no difference in the other outcomes.

4. Gonadotrophins (FSH) vs Clomiphene citrate + Metformin

.

A single study compared gonadotrophins (rFSH) with clomiphene citrate + metformin in clomiphene citrate-resistant women with PCOS. (13) Clinical pregnancy rate was higher with FSH compared with clomiphene citrate + Metformin (OR 2.81 [95% CI 1.05, 7.52]) with very low certainty.

5. Gonadotrophins (hMG) vs. Metformin

A single study (14) compared human menopausal gonadotrophin (hMG) with metformin in clomiphene citrate-resistant women. There was no difference in pregnancy or ovulation rates with low certainty.

Comparison 5. hMG vs. Metformin	⊕⊕◯◯ LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

1. Gonadotrophins (FSH) versus Clomiphene Citrate (CC)
2. FSH + CC vs. FSH
3. FSH vs. Laparoscopic ovarian surgery (LOS)
4. FSH vs. CC + Metformin
5. hMG vs. Metformin

EVIDENCE-BASED RECOMMENDATION(S)

This first recommendation was included in the last set of recommendations and was not updated here, given that gonadotrophin preparations stimulate ovulation yet are significantly more expensive than oral agents (CC and LET) and require parenteral administration and close monitoring with regular ultrasound scan.

EBR 1: Gonadotrophins alone could be considered rather than clomiphene citrate in therapy naïve women with PCOS with anovulatory infertility and no other infertility factors to improve ovulation, clinical pregnancy and live birth rates.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

EBR 2: Gonadotrophins alone could be used over gonadotrophins combined with clomiphene citrate in women with PCOS who are anovulatory and infertile with clomiphene citrate resistance or failure, and no other infertility factors.

-

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☒ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

EBR 3: Either gonadotrophins or Laparoscopic Ovarian Surgery (LOS) could be used in women with PCOS who are anovulatory and infertile, with clomiphene citrate-resistance with no other infertility factors, following counselling on higher live birth rate and higher multiple pregnancy rates with gonadotrophins.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☒ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

EBR 4: Gonadotrophins could be considered rather than the combination of clomiphene citrate and metformin in women with PCOS who are anovulatory and infertile, with clomiphene citrate-resistance and no other infertility factors.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

EBR 5: Gonadotrophins could be second line pharmacological therapy for women with PCOS who are anovulatory and infertile, with no other infertility factors and who have failed first line oral ovulation induction.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

Where gonadotrophins are to be prescribed, the following should be considered:

- Cost of the ovulation induction intervention
- Expertise required for the use of the intervention for ovulation induction.
- The degree of intensive ultrasound monitoring that is required.
- A low dose step up gonadotrophin protocol should be used to optimize the chance of monofollicular development.
- Implications of potential multiple pregnancy.

There appears to be no difference in the clinical efficacy of the available gonadotrophin preparations.

When using gonadotrophins, best clinical practice is to avoid multiple pregnancy. Considerations here include cancelling cycles when there is more than a total of two follicles greater than 14mm in diameter and advise avoiding unprotected intercourse.

Live birth rate, clinical pregnancy rate per patient and ovulation rate per cycle are higher with gonadotrophins than with clomiphene citrate.

A low dose step up gonadotrophin protocol should be used to optimise the chance of monofollicular growth and minimize multiple pregnancy.

Cycle monitoring and drug costs coupled with multiple injection will influence choice in gonadotrophin use.

GRADE CONSIDERATIONS

Justifications:

Gonadotrophin therapy is an effective treatment for anovulatory women with PCOS and no other fertility factors, but requires adequate resource (trained medical/nursing personnel and ultrasound machinery). All gonadotrophin preparations are significantly more expensive than oral agents (CC and LET) and require parenteral administration and close monitoring with regular ultrasound scans. They generally require increased travel for regular appointments.

Subgroup considerations:

The subjects studied were heterogeneous, with respect to baseline characteristics and prognostic factors (e.g. age, BMI, ethnicity and numerous other confounding factors that have not been described). Some were treatment naïve and some clomiphene-resistant and in some studies, it is unclear.

Implementation considerations:

Key considerations include cost of medication, training of staff, parenteral administration and clinic visits for scans and risk of multiple pregnancy.

Monitoring and evaluation considerations:

Indicators that should be monitored:

- Singleton live birth rates
- Multiple pregnancy rates
- Routine safety monitoring for long term risks including pregnancy outcomes, congenital anomalies, childhood development
- Quality of life
- Cost effectiveness

Research priorities:

Compare letrozole versus gonadotrophins in women with anovulatory PCOS who are therapy naïve in terms of clinical and cost effectiveness and quality of life.

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

---

1. **Evidence-based recommendation (EBR 1):**

Gonadotrophins alone could be considered rather than clomiphene citrate in therapy naïve women with PCOS with anovulatory infertility and no other infertility factors to improve ovulation, clinical pregnancy and live birth rates.

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- Gonadotrophin therapy provides better per cycle and cumulative pregnancy and livebirth rates compared with the use of oral anti-oestrogens in anovulatory women with PCOS

There is no evidence of teratogenicity.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- Daily injections
- The need for intensive monitoring with ultrasound, including travel times to clinic
- The potential risk of multiple pregnancy
- Increased cost of medication compared with oral agents in treatment naïve patients

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	Low	☒ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Direct quote from 2018:

The body of evidence included here is of very low to moderate certainty with serious to very serious risk of bias, serious inconsistency, very serious to serious imprecision, and serious indirectness; with no publication bias.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified.

Panel discussion:

The prime outcome is livebirth and main risk multiple pregnancy.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Desirable effects outweigh undesirable effects.

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

- Clinical and nursing skill to assess appropriate starting dose and monitor treatment
- Ultrasound skills
- Ultrasound equipment
- Drug costs
- Travelling cost to clinic

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified.

Panel discussion:

No (or possibly limited) evidence on cost-effectiveness.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified.

Panel discussion:

No (or possibly limited) evidence on cost-effectiveness.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified.

Panel discussion:

Regional contact/health systems and resources will influence.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

Are key stakeholders likely to find the recommendation acceptable, given the relative importance they attach to the desirable and undesirable consequences of implementing the recommendation; the timing of the benefits, harms and costs; and their moral values? This includes considering patients values and preferences.

Stakeholders are likely to accept the balance of benefits over harms and costs.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

- Regional contact/health systems and resources will influence.
- The need for:
- Clinical and nursing skill to assess appropriate starting dose and monitor treatment
- Ultrasound skills
- Ultrasound equipment

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

---

2. Evidence-based recommendation (EBR 2):

Gonadotrophins use combined with clomiphene citrate is not recommended over gonadotrophins alone in women with PCOS who are anovulatory and infertile with clomiphene citrate resistance or failure, and no other infertility factors.

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☒ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- Gonadotrophin therapy provides better per cycle and cumulative pregnancy and livebirth rates compared with the use of oral anti-oestrogens in anovulatory women with PCOS
- There is no evidence of teratogenicity

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- Daily injections
- The need for intensive monitoring with ultrasound, including travel times to clinic
- The potential risk of multiple pregnancy

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Direct quote from 2018:

The body of evidence included here is of very low to moderate certainty with serious to very serious risk of bias, serious inconsistency, very serious to serious imprecision, and serious indirectness; with no publication bias.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☒ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

The prime outcome is livebirth and main risk multiple pregnancy.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☒ Probably favours other options	☐ Favours other options

Panel discussion:

Desirable effects outweigh undesirable effects

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

- Clinical and nursing skill to assess appropriate starting dose and monitor treatment
- Ultrasound skills
- Ultrasound equipment
- Drug costs
- Travelling cost to clinic

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified.

Panel discussion:

No (or possibly limited) evidence on cost-effectiveness.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☒ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified.

Panel discussion:

No (or possibly limited) evidence on cost-effectiveness.

● EQUITY

What would be the impact on health equity?

Judgement:

☒ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified.

Panel discussion:

Regional contact/health systems and resources will influence.

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☒ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Are key stakeholders likely to find the recommendation acceptable, given the relative importance they attach to the desirable and undesirable consequences of implementing the recommendation; the timing of the benefits, harms and costs; and their moral values? This includes considering patients values and preferences.

Stakeholders are likely to accept the balance of benefits over harms and costs.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☒ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

- Regional contact/health systems and resources will influence.
- The need for:
- Clinical and nursing skill to assess appropriate starting dose and monitor treatment
- Ultrasound skills
- Ultrasound equipment

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

3. Evidence-based recommendation (EBR 3):

Either gonadotrophins or Laparoscopic Ovarian Surgery (LOS) could be used in women with PCOS who are anovulatory and infertile, with clomiphene citrate-resistance with no other infertility factors, following counselling on higher live birth rate and higher multiple pregnancy rates with gonadotrophins.

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- Gonadotrophin therapy provides better livebirth rates compared with the use of LOD in anovulatory women with PCOS.
- There is no evidence of teratogenicity.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- Daily injections
- The need for intensive monitoring with ultrasound, including travel times to clinic
- The potential risk of multiple pregnancy
- Increased cost of medication
- Risk of surgery

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☒ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified.

Panel discussion:

The prime outcome is livebirth and main risk multiple pregnancy.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Desirable effects outweigh undesirable effects

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified.

Panel discussion:

- Clinical and nursing skill to assess appropriate starting dose and monitor treatment
- Ultrasound skills
- Ultrasound equipment
- Drug costs
- Travelling cost to clinic
- Risk of surgery

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified - there has been a cost effectiveness analysis in the Netherlands (15).

Panel discussion:

No (or possibly limited) evidence on cost-effectiveness.

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

No (or possibly limited) evidence on cost-effectiveness.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified.

Panel discussion:

Regional contact/health systems and resources will influence.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

Are key stakeholders likely to find the recommendation acceptable, given the relative importance they attach to the desirable and undesirable consequences of implementing the recommendation; the timing of the benefits, harms and costs; and their moral values? This includes considering patients values and preferences.

Stakeholders are likely to accept the balance of benefits over harms and costs.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

- Regional contact/health systems and resources will influence.
- The need for:
- Clinical and nursing skill to assess appropriate starting dose and monitor treatment
- Ultrasound skills
- Ultrasound equipment
- Surgical skills and equipment

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

---

4. Evidence-based recommendation (EBR 4):

Gonadotrophins could be considered rather than the combination of clomiphene citrate and metformin in women with PCOS who are anovulatory and infertile, with clomiphene citrate resistance or failure, and no other infertility factors.

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- Daily injections
- The need for intensive monitoring with ultrasound, including travel times to clinic
- The potential risk of multiple pregnancy

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☒ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

The prime outcome is livebirth and main risk multiple pregnancy.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Desirable effects outweigh undesirable effects.

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified.

Panel discussion:

- Clinical and nursing skill to assess appropriate starting dose and monitor treatment
- Ultrasound skills
- Ultrasound equipment
- Drug costs
- Travelling cost to clinic

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified.

Panel discussion:

No (or possibly limited) evidence on cost-effectiveness.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified.

Panel discussion:

No (or possibly limited) evidence on cost-effectiveness.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified.

Panel discussion:

Regional contact/health systems and resources will influence.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

Are key stakeholders likely to find the recommendation acceptable, given the relative importance they attach to the desirable and undesirable consequences of implementing the recommendation; the timing of the benefits, harms and costs; and their moral values? This includes considering patients values and preferences.

Stakeholders are likely to accept the balance of benefits over harms and costs.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Regional contact/health systems and resources will influence.

The need for:

Clinical and nursing skill to assess appropriate starting dose and monitor treatment

Ultrasound skills

Ultrasound equipment.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

5. Evidence based recommendation (EBR 5):
Gonadotrophins could be second line pharmacological therapy for women with PCOS who are anovulatory and infertile, with no other infertility factors and who have failed first line oral ovulation induction.

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- Single intervention that leads to the preferred outcome (singleton birth) in a significant proportion of women in the target group in a sustained way (but not permanent).
- No need for ongoing cycle monitoring (because of mono-ovulation).
- Normal risk of multiple pregnancy.

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- LOD requires an invasive surgical intervention.
- Small risk it could lead to reduced ovarian reserve or loss of ovarian function.
- Adhesion formation.

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- The body of evidence included here remains of very low to moderate certainty with very serious risk of bias and imprecision, and serious risk of inconsistency, imprecision and indirectness; with no publication bias.

- **VALUES**

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified.

Panel discussion:

People are likely to value this determination.

- **BALANCE OF EFFECTS**

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Balance of effects is positive toward recommendations.

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☒ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified.

Panel discussion:

- Access to a day surgery centre with endoscopic equipment.

Access to skilled surgeons.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

Refer to overarching Cost effectiveness analysis.

Panel discussion:

No evidence for resource requirements.

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

Refer to overarching Cost effectiveness analysis.

Panel discussion:

- Single costly procedure but without need for further medications and monitoring and high probability of singleton pregnancies.

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified.

Panel discussion:

In certain healthcare systems access to surgery may be restricted or unaffordable

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

- Other than local health care resources, no potential barriers identified to interfere with feasibility.

GDG 5

Question 5.6.

In women with PCOS, is ovarian surgery effective for improving fertility outcomes?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	**In women with PCOS, is ovarian surgery effective for improving fertility outcomes?**
Clinical leads (key contacts)	**Luk Rombauts**
Allocation ranking	**Level 2- updated systematic review (with update of integrity check for all studies)**

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women of any age, ethnicity and weight with PCOS diagnosed by Rotterdam, NIH or AIS and 1) at least one patent tube 2) normal sperm AND 3) have never been treated or been exposed to treatment for infertility (therapy naïve) OR 4) have been treated or exposed to treatment OR 5) have been treated or exposed to clomiphene citrate and ovulate but don't conceive (clomid failure) OR 6) have been treated or exposed to clomid and don't ovulate (clomid resistant). Also specifically identifying the 4 phenotypes where possible.	Any type of ovarian surgery alone, including: laser or diathermy laparoscopy, laparotomy, transvaginal hydrolaparoscopy. Unilateral or bilateral	Placebo, no intervention, other infertility treatment interventions including metformin, clomiphene citrate, aromatase inhibitors, gonadotrophin, or ovarian surgery in combination with other infertility treatment intervention(s). Compare uni v bi	Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, single and multiple pregnancies, miscarriage rate, other adverse events, quality of life, cost effectiveness.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	None
Exclusion	Women without diagnosis of PCOS.	Placebo, no intervention or any intervention other than a type of ovarian surgery	Any intervention other than those listed in the inclusion criteria.	None	Non-evidence based guidelines, non-systematic reviews, any study lower than a RCT.	None

2. SEARCH STRATEGY

The search and screening for all GDG 5 questions were done together. Details can be found in the GDG 5 Methodology Appendix, including for:

- Databases
- Search Dates
- Search String(s)
- PRISMA flowchart
- Full list of included studies
- Full list of excluded studies with reasons for exclusion

Evidence processing: The literature search and screening were performed together in one Endnote library and Covidence project for all non-IVF, IVF and IVM fertility treatments in PCOS. Studies were selected by one reviewer/s in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. The articles were screened by title and abstract by one reviewer. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy. In total, 102 unique studies met inclusion criteria across all non-IVF, IVF and IVF questions, of which 57 were included in the guideline update following the integrity check (refer to methodology appendix for details).

Integrity Assessment: Of these eligible 102 studies, 6 studies met the inclusion criteria for this particular question (Q.5.6) on ovarian surgery, as detailed below.

Table of Included Studies
Amer SA, Li TC, Metwally M, Emarh M, Ledger WL. Randomized controlled trial comparing laparoscopic ovarian diathermy with clomiphene citrate as a first-line method of ovulation induction in women with polycystic ovary syndrome. Hum Reprod. 2009 Jan;24(1):219-25. doi: 10.1093/humrep/den325. Epub 2008 Sep 14.
Baryam N, van Wely M, Kaaijk EM, Bossuyt PM, van der Veen F. Using an electrocautery strategy or recombinant follicle stimulating hormone to induce ovulation in polycystic ovary syndrome: randomised controlled trial. BMJ. 2004 Jan 24;328(7433):192. doi: 10.1136/bmj.328.7433.192.
Farquhar CM, Williamson K, Gudex G, Johnson NP, Garland J, Sadler L. A randomized controlled trial of laparoscopic ovarian diathermy versus gonadotropin therapy for women with clomiphene citrate-resistant polycystic ovary syndrome. Fertil Steril. 2002 Aug;78(2):404-11. doi: 10.1016/s0015-0282(02)03225-9.
Roy KK, Baruah J, Moda N, Kumar S. Evaluation of unilateral versus bilateral ovarian drilling in clomiphene citrate resistant cases of polycystic ovarian syndrome. Arch Gynecol Obstet. 2009 Oct;280(4):573-8. doi: 10.1007/s00404-009-0961-z. Epub 2009 Feb 13. PMID: 19214545.

Yadav P, Singh S, Singh R, Jain M, Awasthi S, Raj P. To study the effect on fertility outcome by gonadotropins vs laparoscopic ovarian drilling in clomiphene-resistant cases of polycystic ovarian syndrome. Journal of SAFOG 2017; 9(4): 336-340.

3. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year, country	Population/ PCOS criteria/ Setting/ CC sensitivity	Study Design	Intervention N	Intervention description	Comparison N	Comparison description	Follow Up	Outcomes	Pooled in MA?	RoB
Amer 2009 UK	Women with BMI ≤32 kg/m² anovulatory infertility ≥1 year associated with PCOS (PCOS diagnosed by; at least two of: clinical (oligo/ amenorrhoea and/or hyperandrogenaemia), biochemical [LH ≥ 10 IU/l, LH/FSH ratio ≥2, T >2.6 nmol/l or FAI >5] and/or polycystic ovaries on U/S; Reproductive Medicine Centre; **CCR**	RCT	**LOD: 36** Age: 28.1 ± 4.3 BMI: 26.2 ± 3.9	Monopolar electrocautery probe was used to penetrate the ovarian capsule making four punctures per ovary at a power setting of 30 W applied for 5 s per puncture If the patient did not ovulate as evidenced by the low progesterone levels or lack of menstruation, CC would be started 6–8 weeks after surgery	**CC: 36** Age: 29.1 ± 4.8 BMI: 26.1 ± 3.5	Incremental doses starting with a daily dose of 50 up to 150 mg on Days 2–6 of a menstrual period or after a progestogen withdrawal bleed using medroxy-progesterone acetate. Continued for 6 cycles and if still anovulatory after the maximum dose of CC or failed to conceive after six ovulatory cycles, surgery was offered.	Up to 12 months after surgery	Primary: cumulative pregnancy rate at 12 months Secondary: ovulation, miscarriage, multiple pregnancy and live birth rates Conception was diagnosed with a positive urinary pregnancy test taken 1 week after a missed period, then transvaginal ultrasound scan at 7 weeks of gestation	No	Mod – no blinding
Baryam 2004 The Netherlands	Chronic anovulation (World Health Organization type II) and polycystic ovaries, diagnosed by transvaginal Ultrasonography, 29 Dutch hospitals; **CCR**	RCT	**Laparoscopic surgery**: 83 Age: 28.5±3.7 BMI: 27.9±6.3	**Laparoscopic electrocautery of the ovaries.** If ovulated, no further treatment. Each ovary was randomly punctured 5-10 times, depending on its size using 15mm long 0.9mm diameter needle. If anovulation persisted, 50mg clomiphene citrate (CC) increased to max 150mg.	**FSH**: 85 Age: 28.7±4.1 BMI: 27.3±8.8	10 mg medroxy-progesterone for 10 days, followed by daily 75 IU **rFSH**. If the diameter of the follicles remained < 10 mm, the dose was increased by half an ampoule (37.5 IU) on each of cycle days 16 and 23.	12 months	Pregnancy, miscarriages, multiple pregnancies, premature deliveries Clinical pregnancy: The primary end point was ongoing pregnancy within 12 months, defined as a viable pregnancy of at least 12 weeks.	Yes	High – high drop outs in controls and non-blinded
Farquhar 2002 New Zealand	PCOS diagnosed based on criteria by Adams et al. (1985)✶; publicly funded and private tertiary level fertility clinics; all patients had infertility and treatment before; **CCR**	RCT (N per group dissimilar due to unblocked random-ization)	**Laparoscopic ovarian diathermy**: 29 Age: 29.6±4.7 BMI: 28.3±3.9	**Laparoscopic ovarian diathermy:** A monopolar electrocautery needle of 1 cm in length was used to drill 10 holes in each ovary. The diathermy was done with cutting power at 30 units and was continued for 10 seconds	**Urinary or recombinant FSH** (3 cycles): 21 Age: 29.6±4.2 BMI: 27.8±4.8	**Urinary or rFSH**: 75 IU/day (one ampoule) was given for 2 weeks, adjusted accordingly depending on the serum E2	6 months (for surgery) 3 cycles (FSH)	Ovulation rates, pregnancy outcomes, birth after 20 weeks of gestation Pregnancy detection: serum β-hCG of >50 IU/l and foetal heart activity on ultrasound scan	Yes	High – small and non-blinded
Roy 2009 India	PCOS patients based on Rotterdam criteria; No other infertility factor; National centre; **CCR**	RCT	Unipolar diathermy: 22 Age: 28.2±1.7	Unilateral ovarian drilling A unipolar diathermy drilling needle was used to penetrate the ovarian capsule at right angle to a standard depth of 8 mm at points with 60 W cutting current to make 5	Bipolar diathermy: 22 Age: 28.8±2.9	Bilateral ovarian drilling. A unipolar diathermy drilling needle was used to penetrate the ovarian capsule at right angle to a standard depth of 8 mm at points with 60 W cutting current	1 year	Clinical and biochemical response, ovulation rate and pregnancy rate How pregnancy was ascertained not reported		High- no randomisation or concealment details, no blinding

			BMI ≤30: 63.6%	punctures in the ovary; If no ovulation within 3 months, the patients were started on CC 50 mg daily for 5 days increasing up to maximum of 150 mg daily for 5 days for maximum of 6 cycles.	BMI ≤30: 5 4.5%	to make 5 punctures each in both ovaries If no ovulation within 3 months, the patients were started on CC 50 mg daily for 5 days increasing up to maximum of 150 mg daily for 5 days for maximum of 6 cycles.				
Sharma 2006 India	Criteria used to identify PCOS women - National Institute of Health Consensus Conference on PCOS-no citation available; setting: a national centre; **CCR**	RCT	Unipolar electocautery: 10 Age: 27.3 BMI: 26.68	Unipolar electocautery Carried out with unipolar diathermy needle at power settings of 30–40 watts (average number of punctures 14.8)	Bipolar electocautery: 10 Age: 25.5 BMI: 24.13	Bipolar electocautery bipolar diathermy needle at power settings of 40–50 watts (average number of punctures 14.9)	1 and 3 months at onset of period, up to conception, if ovulation and conception had not occurred by 3 months	pregnancy rate, changes in luteinizing hormone (LH), follicle-stimulating hormone (FSH), testosterone levels, and alteration of glucose tolerance and insulin levels How pregnancy was ascertained not reported	Yes	High- no randomisation or concealment details, no blinding, small n
Yadav 2017 India	Chronic anovulation and polycystic ovaries diagnosed by transvaginal ultrasonography-Any standard criteria not reported. Hospital-based setting; **CCR**	RCT	**rFSH**: 44 Age: 26.23±2.9 BMI: 24.94±2.8	**rFSH** subcutaneous injection of 37.5/75 IU/daily started on cycle day 3-If the diameter of the follicle remained <10 mm, dose was increased by half an ampoule (37.5 IU) on days 16 and 23. If no follicle development was seen on day 30, the cycle was terminated because of poor response.	**LOD**: 45 Age: 26.11±2.7 BMI: 25.0±2.35	**LOD:** An insulated monopolar needle was introduced at 90° angle to the ovarian cortex and 4-5 puncture sites were created. Those who failed to ovulate on LOD spontaneously at 8 wk, were then added with CC for 1 cycle followed by gonadotrophin.	12 months	Primary: Pregnancy was ascertained based on positive urine pregnancy test but defined as a viable pregnancy of at least 12 weeks Secondary: ovulation, miscarriage, ectopic pregnancy, multiple pregnancies, and live birth	Yes	High – lacking critical info

CC, clomiphene citrate; CCR, clomiphene citrate resistant (to ovulate); CCF, clomiphene citrate failure (to become pregnant); LET, letrozole; MET, metformin; NR; not reported; OHSS, ovarian hyperstimulation syndrome; IUI, intrauterine insemination; hCG, human chorionic gonadotrophin; LH, luteinizing hormone; FSH, follicle stimulating hormone; MA, meta-analysis; RoB, risk of bias. All age data is in years and BMI is in kg/m^2. *Risk of bias assessment derived from reliable systematic review (e.g. Cochrane or previous review from the guideline evidence team). ⧖Ref: Adams J, et al. *Lancet* 1985;1375–9.

4. FINDINGS

Comparisons Included:

- **Comparison 1.** LOD vs gonadotrophins (FSH)
- **Comparison 2.** LOD vs CC
- **Comparison 3.** Unilateral LOD vs Bilateral LOD

COMPARISON 1: LOD versus Gonadotrophins (FSH)

▪ EVIDENCE SUMMARY:

Three studies (Baryam et al. 2004; Farquhar et al. 2002; Yadav et al. 2017) compared laparoscopic ovarian drilling (LOD) with FSH, conducted in the Netherlands, New Zealand and India. All three studies were in women with clomiphene-citrate resistant PCOS and all were judged as having a high risk of bias due to lack of blinding (or insufficient information to ascertain blinding), as well as small sample sizes and high dropout rates.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

FSH was superior to LOD for live birth rates; however, FSH also resulted in a higher rate of multiple pregnancies per patient, with an OR of 0.20 favouring LOD (i.e. 80% lower odds with LOD). While certainty in the evidence for live birth rates per patient was moderate (downgraded once due to risk of bias), certainty in the evidence for all other outcomes was low or very low due to risk of bias, varied effect estimates and varied and/or wide CIs. Given that all studies for this comparison had a high risk of bias, findings should be interpreted with caution.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	3	307	0.45 [0.27, 0.76]	0.003	**FSH** (live birth rate is higher with FSH)	⊕⊕◯◯ MODERATE
Clinical pregnancy rate- per patient†	3	307	0.44 [0.16, 1.23]	0.1	None	⊕⊕◯◯ LOW
Ovulation rate - per patient	1	50	0.66 [0.21, 2.07]	0.5	None	⊕◯◯◯ VERY LOW
Multiple pregnancy rate – per patient	3	307	0.20 [0.05, 0.72]	0.01	**LOD** (multiple pregnancy rate is higher with FSH)	⊕⊕◯◯ LOW
Miscarriage rate- per patient	3	307	0.73 [0.32, 1.66]	0.5	None	⊕⊕◯◯ LOW

† clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity.

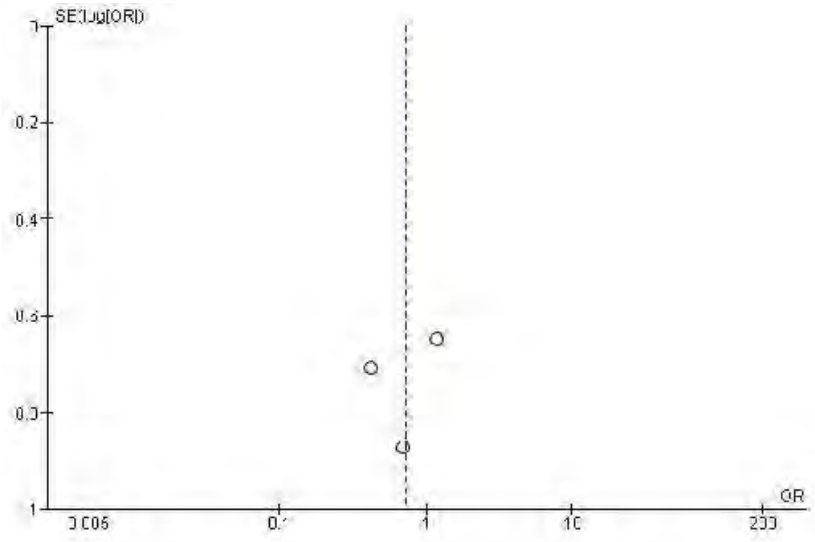
1.5.3. Funnel plot for assessment of publication bias



COMPARISON 2: LOD versus Clomiphene Citrate

- **EVIDENCE SUMMARY:**

A single UK-based study by Amer et al. (2009) examined the efficacy of LOD compared with clomiphene citrate in 76 women with anovulatory PCOS and clomiphene citrate resistance. Women treated with clomiphene citrate unsuccessfully for 6 cycles were then also offered LOD. There was no blinding in this study; once randomised, the allocation was revealed to the investigators and patients. Hence, the study was judged as moderate risk of bias.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

There were no differences between LOD versus CC in live birth rate or clinical pregnancy rate per patient or miscarriage rate per pregnancy. There was low certainty for all outcomes due to the evidence being derived from a single, small study (downgraded once for imprecision) with a moderate risk of bias (downgraded once for risk of bias).

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	1	65	0.65 [0.24, 1.72]	0.4	None	⊕⊕◯◯ LOW
Clinical pregnancy rate- per patient†	1	65	0.60 [0.21, 1.70]	0.3	None	⊕⊕◯◯ LOW
Miscarriage rate- per pregnancy	1	43	1.17 [0.15, 9.14]	0.9	None	⊕⊕◯◯ LOW

CCR, Clomiphene citrate-resistant.

COMPARISON 3: Unilateral LOD vs Bilateral LOD

- **EVIDENCE SUMMARY:**

Two studies in India examined unilateral versus bilateral LOD in women with PCOS and clomiphene citrate resistance (Roy et al. 2009; Sharma et al. 2006). Both studies were judged as high risk of bias due to lacking information on blinding and allocation concealment and having small sample sizes.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

There were no differences between bilateral versus unilateral LOD for any of the assessed outcomes, including live birth rate, pregnancy rate, ovulation rate and multiple pregnancy rate per patient or miscarriage rate per patient or per pregnancy. Certainty in the evidence was low for live birth rate, but very low for the remaining outcomes due to risk of bias (high for all), imprecision (being derived from a single small study) or inconsistency (having varied effect estimates or wide CIs).

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate- per patient	2	64	0.60 [0.22, 1.66]	0.3	None	⊕⊕◯◯ LOW

Question 5.6.

In women with PCOS, is ovarian surgery effective for improving fertility outcomes?

BACKGROUND

In 1935 Stein and Leventhal were the first to describe an association between the presence of polycystic ovaries, oligo/anovulation and hirsutism, later known as PCOS (1). The observation that women with PCOS resumed regular ovulations following ovarian biopsies led to the belief that the condition was primarily ovarian in origin. This also resulted in the development of a surgical treatment for the condition involving a wedge resection of both ovaries via laparotomy (2). A 15-25 year follow-up of nearly 150 women after ovarian wedge resection shows that regular menstrual patterns lasting up to 25 years after surgery were restored in 88% of patients with a cumulative pregnancy/live birth rate of 78% (3).

No alternative treatment was available until the arrival of hormonal preparations such as clomiphene citrate and gonadotrophins. Ovarian wedge resection was then soon abandoned because of the relative cost of the surgical treatment and the risk of post-operative adhesions.

It was not until the introduction of minimally invasive techniques that surgical approaches were revisited. The laparoscopic ovarian drilling procedure was first described by Gjønæss in 1984 (4). Minor variations of the technique have been reported (electrocautery, laser vaporization, multiple ovarian biopsies and others) but all are characterised by an altered endocrine profile following surgery. Some studies have also examined the relative effectiveness of unilateral versus bilateral laparoscopic ovarian drilling. It remains poorly understood, however, which mechanisms bring about the hormonal changes and the resumption of ovulation.

The main reason laparoscopic ovarian surgery has found support for the treatment of women with CCR PCOS is the fact that the endoscopic approach is thought 1) to cause fewer adhesions, 2) to be more cost-effective as an outpatient-procedure and 3) to restore regular mono-ovulations, albeit for a limited time in the majority of cases. In contrast, ovulation induction with gonadotrophins is expensive, requires regular monitoring and often results in the development of multiple mature follicles with a potential risk of multiple pregnancies and ovarian hyperstimulation syndrome. It is important to establish the effectiveness of laparoscopic ovarian surgery, particularly in comparison to other treatments, in infertile women with PCOS in light of the potential risks.

This review focuses on the clinical effectiveness of laparoscopic ovarian surgery compared to non-surgical treatments for PCOS. It also compares the clinical effectiveness of unilateral versus bilateral laparoscopic ovarian surgery.
For the purpose of this review, laparoscopic ovarian drilling (LOD), sometimes also referred to as laparoscopic ovarian diathermy or laparoscopic ovarian surgery (LOS) is a keyhole surgical procedure in which a diathermy instrument (usually a monopolar needle) is used to puncture the ovarian cortex followed by the delivery an electrical current to the ovarian stroma.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Laparoscopic Ovarian Surgery (LOS) vs gonadotrophins (FSH)	⊕⊕◯◯ LOW
Comparison 2. LOS vs Clomiphene citrate	⊕⊕◯◯ LOW
Comparison 3. Unilateral LOS vs Bilateral LOS	⊕◯◯◯ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Comparison 1. LOS vs gonadotrophins (FSH)

Comparison 2. LOS vs Clomiphene citrate

Comparison 3. Unilateral LOS vs Bilateral LOS

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Laparoscopic ovarian surgery could be second line therapy for women with PCOS who are anovulatory and infertile, with clomiphene citrate resistance and no other infertility factors

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

When using laparoscopic ovarian surgery, the following should be considered:

- Cost of either intervention for ovulation induction
- Expertise required for the safe use of either intervention for ovulation induction
- Both intra-operative and post-operative risks should be considered which are higher in women who are above healthy weight

GRADE CONSIDERATIONS

Justifications:

- FSH was superior to LOD for live birth rates; however, FSH also resulted in a higher rate of multiple pregnancies per patient, with an OR of 0.20 favouring LOD (i.e. 80% lower odds with LOD). While certainty in the evidence for live birth rates per patient was moderate (downgraded once due to risk of bias), certainty in the evidence for all other outcomes was low or very low due to risk of bias, varied effect estimates and varied and/or wide CIs. Given that all studies for this comparison had a high risk of bias, findings should be interpreted with caution.
- A single UK-based study by Amer et al. (2009) (5) examined the efficacy of LOD compared with clomiphene citrate in 76 women with anovulatory PCOS and clomiphene citrate resistance. Women treated with clomiphene citrate unsuccessfully for 6 cycles were then also offered LOD. There was no blinding in this study; once randomised, the allocation was revealed to the investigators and patients. Hence, the study was judged as moderate risk of bias.
- Two studies in India examined unilateral versus bilateral LOD in women with PCOS and clomiphene citrate resistance (6, 7) . Both studies were judged as high risk of bias due to lacking information on blinding and allocation concealment and having small sample sizes.

Subgroup considerations

N/A

Implementation considerations:

- Adequate surgical skill training of surgeons and facilities. Access to effective first line ovulation induction treatments prior to LOS.

Monitoring and evaluation considerations:

Standard monitoring for long term outcomes

Research priorities:

Further research is required to understand how LOS restores ovulatory function.

Further adequately powered, well designed, conducted and reported RCTs are required to compare LOS with other ovulation induction agents in women with PCOS.

Further research is required in identifying profiles of women with PCOS who may respond to LOS.

Further research is required to determine the minimal effective intervention of LOS (i.e. how many drillings, at which energy level and modality and unilateral or bilateral)

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

- Single intervention that leads to the preferred outcome (singleton birth) in a significant proportion of women in the target group in a sustained way (but not permanent).
- No need for ongoing cycle monitoring (because of mono-ovulation).
- Normal risk of multiple pregnancy.

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

The body of evidence included here remains of very low to moderate certainty with very serious risk of bias and imprecision, and serious risk of inconsistency, imprecision and indirectness; with no publication bias.

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☒ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified.

Panel discussion:

- Access to a day surgery centre with endoscopic equipment.
  Access to skilled surgeons.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

Refer to overarching Cost effectiveness analysis.

Panel discussion:

No evidence for resource requirements.

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

Refer to overarching Cost effectiveness analysis.

Panel discussion:

Single costly procedure but without need for further medications and monitoring and high probability of singleton pregnancies.

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified.

Panel discussion:

In certain healthcare systems access to surgery may be restricted or unaffordable.

- ## FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

Other than local health care resources, no potential barriers identified to interfere with feasibility.

Question 5.7.

In women with PCOS, is stimulated IVF/ICSI effective for improving fertility outcomes?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	In women with PCOS, is stimulated IVF/ICSI effective for improving fertility outcomes?
Clinical leads (key contacts)	Edgar Mocanu
Allocation ranking	Level 2- updated systematic review (with update of integrity check for all pre-2017 studies)

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women of any age, ethnicity and weight with PCOS diagnosed by Rotterdam, NIH or AEPCOS AND with or without co-existing infertility factors (other than anovulation) Also specifically identifying the 4 phenotypes where possible.	IVF/ICSI treatment using the following (controlled) ovarian (hyper) stimulation protocols: □ GnRH antagonist protocol □ GnRH agonist long protocol	Placebo, no intervention, other infertility treatment interventions (ie. aromatase inhibitor, metformin, clomiphene citrate, gonadotrophins, ovarian surgery) including IUI or IVM	Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, amount of gonadotrophins used, duration of ovarian stimulation, maximum serum estradiol level (or serum estradiol level on the day of trigger), number of oocytes collected, single and multiple pregnancies, miscarriage rate, OHSS rate, other adverse events, quality of life, cost effectiveness.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	None
Exclusion	Women without diagnosis of PCOS.	Placebo, no intervention or any intervention other than IVF.	Any intervention other than those listed in the inclusion criteria.	None	Non-evidence based guidelines, nonsystematic reviews, any study lower than a RCT.	None

2. SEARCH STRATEGY

The search and screening for all GDG 5 questions were done together. Details can be found in the GDG 5 Methodology Appendix, including for:

- Databases
- Search Dates
- Search String(s)
- PRISMA flowchart
- Full list of included studies
- Full list of excluded studies with reasons for exclusion

Evidence processing: The literature search and screening were performed together in one Endnote library and Covidence project for all non-IVF, IVF and IVM fertility treatments in PCOS. Studies were selected by one reviewer/s in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. The articles were screened by title and abstract by one reviewer. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy. In total, 102 unique studies met inclusion criteria across all non-IVF, IVF and IVF questions, of which 57 were included in the guideline update following the integrity check (refer to methodology appendix for details).

Of these eligible 102 studies, **1 study met the inclusion criteria for this particular question** (Q.5.7) on stimulated IVF/ICSI, as detailed below.

Table of Included Studies

All age data is in years and BMI is in kg/m^2. *Risk of bias assessment derived from reliable systematic review (e.g. Cochrane or previous review from the guideline evidence team).

4. FINDINGS

Comparisons Included:

- **Comparison 1.** IVF vs IVM

COMPARISON 1. IVF vs. IVM

▪ EVIDENCE SUMMARY:

A single study by Zheng et al. (2022) compared standard IVF with stimulated IVM in infertile women aged 20–38 years with PCOS and infertility scheduled for their first IVF attempt at an academic infertility centre. Relevant outcomes included live birth rate per patient and per pregnancy, clinical pregnancy rate per patient, and miscarriage rate per pregnancy. This study had a low risk of bias, with high-quality methodology despite being unblinded due to the nature of the intervention/s.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Pooled meta-analysis was not possible due to having a single study. However, in comparing the differences between groups, IVF resulted in higher rates of live births per patient and clinical pregnancy rates per patient compared with IVM. There were no differences in live birth rates or miscarriage rates per pregnancy. Certainty in the evidence is moderate for all outcomes, downgraded once due to being derived from a single study with a modest sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P-value	Favours	Certainty
Live birth rate per patient	1	351	3.57 [2.25, 5.67]	<0.00001	**IVF** (live birth per patient is higher with IVF)	⊕⊕⊕◯ MODERATE
Live birth rate per pregnancy	1	351	1.55 [0.75, 3.19]	0.2	None	⊕⊕⊕◯ MODERATE
Clinical pregnancy rate- per patient†	1	170	3.91 [2.51, 6.09]	<0.00001	**IVF** (clinical pregnancy is higher with IVF)	⊕⊕⊕◯ MODERATE
Miscarriage rate- per pregnancy	1	170	0.53 [0.26, 1.07]	0.08	None	⊕⊕⊕◯ MODERATE

†clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

Question 5.7.

In women with PCOS, is stimulated IVF/ICSI effective for improving fertility outcomes?

BACKGROUND:

Prevalence and problem

The prevalence of polycystic ovarian syndrome (PCOS), a heterogenic condition is high at 20% (1). The diagnosis can be a challenging one, the most accepted criteria for the diagnosis of PCOS being published in 2004 by the Rotterdam Consensus Group (2). Women desiring a pregnancy and presenting with PCOS and anovulation receive ovulation induction therapy: first line with antioestrogens and second line therapy with gonadotrophins. This low intervention therapeutic step has its challenges: side effects of and resistance to antioestrogen therapy, poor compliance, need for ultrasound monitoring, multiple pregnancy and OHSS, the last two occurring mainly with gonadotrophin use. Assisted Reproductive Technology (ART) therapies like IVF and ICSI are offered to patients after investigation of infertility and usually when other therapies have failed. While IVF is offered where the semen quality is within normal parameters, ICSI is usually reserved for situations where a male factor is present. In the PCOS context, women that do not achieve pregnancy after ovulation induction therapy are advised to proceed with IVF/ ICSI. The challenges of performing IVF for PCOS patients are significant namely, over-response to stimulation, high oestradiol levels, accelerated endometrial maturation and the need for a “freeze all” intervention due to the risk of OHSS, particularly if the long, GnRH analogue protocol, is used. One alternative to full IVF is in vitro maturation (IVM) of oocytes followed by in vitro fertilisation using intracytoplasmic sperm injection (ICSI). The IVM protocol, particularly in the circumstances where no gonadotrophins are used, eliminates the risk of OHSS, reduces patient burden and offers a potential treatment alternative prior to stimulated IVF/ICSI.

Clinical practice gap: need for guidance

Among reproductive age females, PCOS is the most common cause of anovulatory infertility (3). For PCOS patients presenting with infertility, reported as high as 40% in some studies, (4) ovulation induction is the first line therapy. While ovulation rates are satisfactory, long-term cumulative pregnancy rates are below 50%. Gonadotrophin stimulation, as second line therapy, is used when no response to first line therapy is present and has risks similar to IVF. Alternative therapies like IVF offer, in one cycle of treatment pregnancy rates that can reach 50%, particularly in women younger than 37 years old. A recent publication (5) offers a potentially viable alternative between ovulation induction and stimulated IVF, namely unstimulated IVM and ICSI. The clinical practice questions are if women with anovulatory PCOS should pursue IVF/ICSI sooner rather than after failed ovulation induction, if IVF is effective in improving outcomes when compared to pre-IVF interventions and if unstimulated IVM with ICSI outcomes are comparable to stimulated IVF/ICSI? There are no randomised trials comparing pre-IVF therapies with IVF in anovulatory PCOS women. The ability to advise such patients as to what is the preferred choice of intervention is very limited. Although patient relevant aspects like quality of life has been extensively studied in the general population with infertility issues and in PCOS (6, 7), few comparative studies of PCOS versus other infertile populations exist. The work that exists suggests patients with PCOS and Infertility are more distressed in emotional, social and mind/body life domains than patients with unexplained infertility. Support for fertility problems is readily available through online resources (e.g., peer support groups, mobile applications) and through clinics which patients find useful and may help some patients cope during treatment (8-10).

There is a single RCT comparing live birth rates after unstimulated IVM (ICSI) treatments with stimulated IVF/ ICSI treatments after freeze all and embryo transfers in frozen cycles.

Summary of key information

There are no randomised controlled trails comparing stimulated IVF/ ICSI therapy with alternative therapies like aromatase inhibitors, metformin, clomiphene citrate, gonadotrophins, ovarian surgery, IUI or no intervention, in women diagnosed with PCOS. The risks associated with gonadotrophin use in this group of patients are better controlled in an IVF or in an unstimulated IVM (ICSI) treatment. In stimulated IVF/ ICSI the exclusive use of a GnRH antagonist protocol (11) coupled with a GnRH agonist trigger significantly lowers the major risk of OHSS and elective single embryo transfer policies significantly reduce the risk of multiple pregnancy. There is a single RCT (5) comparing live birth rates after unstimulated IVM (ICSI) treatments with stimulated IVF/ ICSI treatments after freeze all and embryo transfers in frozen cycles.
Control of multiple pregnancy rates is not possible outside the unstimulated IVM (ICSI) or stimulated IVF/ ICSI therapy. Access related to cost of therapy remains a major limiting factor for stimulated IVF compared to unstimulated IVM (ICSI) and all non-IVF related therapies.

The patient and societal benefits of pre-IVF therapies compared with unstimulated IVM (ICSI) and stimulated IVF/ ICSI treatments in anovulatory PCOS women require systematic analysis in randomised controlled studies. Outcomes as time to conception, cost of therapy, quality of life, risk of OHSS, multiple pregnancy, miscarriage and cumulative livebirth rates should be investigated (6, 7).

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. IVF versus IVM	⊕⊕⊕◯ MODERATE

Evidence to Recommendations Framework

COMPARISONS (option versus other option)
● Standard stimulated in vitro fertilization (IVF) [option] vs. unstimulated in vitro maturation of oocytes and ICSI [other option]
CONSENSUS RECOMMENDATION(S)

CR: In the absence of an absolute indication for IVF / intracytoplasmic sperm injection (ICSI), IVF could be offered in women with PCOS and anovulatory infertility, if first- or second-line ovulation induction therapies have failed.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☒ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

1. In women with anovulatory PCOS, the use of IVF is effective and when elective single embryo transfer is used multiple pregnancies can be minimised.
2. Women with PCOS undergoing IVF/ICSI treatment should be counselled prior to starting treatment about the increased risk of ovarian hyperstimulation syndrome (OHSS) and options to reduce the risk should be offered.

GRADE CONSIDERATIONS

Justifications:

Stimulated IVF (option) when compared with IVM+ IVF (other option) results in a significantly higher:

Life birth rate per patient – MODERATE

Clinical pregnancy rate per patient – MODERATE

The following outcomes are similar in stimulated IVF (option) when compared with IVM+ IVF (other option)

Life birth rate per pregnancy - MODERATE

Miscarriage per pregnancy - MODERATE

Subgroup considerations:

None

Implementation considerations:

While IVM is no longer considered experimental, potential limitations in offering IVM are the costs of implementation and the expertise related to both the surgical procedure and the laboratory consumables and processes.

Monitoring and evaluation considerations:

If IVM+ICSI is to be implemented, services should consider:

1. Identification of an ideal cohort of patients (high risk of OHHS (AMH), affordability, access (distance)
2. Monitoring and benchmarking laboratory parameters (oocytes maturation, blastocyst and embryo utilisation rates)

Research priorities:

Exploring benefits of stimulated IUI vs IVF in PCOS

Comparing IVM-ICSI to Stimulated-ICSI only

Comparing cumulative outcomes after the use of all embryos from a performed cycle in IVM.

Exploring the optimal day of freezing and embryo transfers for efficacy in IVM

Long term follow-up of children.

GDG 5

Question 5.7.1

In women with PCOS undergoing IVF/ICSI treatment, is the GnRH antagonist protocol or GnRH agonist long protocol the most effective for improving fertility outcomes?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	**In women with PCOS undergoing IVF/ICSI treatment, is the GnRH antagonist protocol or GnRH agonist long protocol the most effective for improving fertility outcomes?**
Clinical leads (key contacts)	**Roger Hart**
Allocation ranking	**Level 2- updated systematic review (with update of integrity check for all studies)**

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women of any age, ethnicity and weight with PCOS diagnosed by Rotterdam, NIH or AEPCOS AND with or without co-existing infertility factors (other than anovulation) Also specifically identifying the 4 phenotypes where possible.	"IVF/ICSI treatment with GnRH antagonist protocol"	IVF/ICSI treatment with GnRH agonist long protocol	Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, amount of gonadotrophins used, duration of ovarian stimulation, maximum serum estradiol level (or serum estradiol level on the day of trigger), number of oocytes collected, single and multiple pregnancies, miscarriage rate, OHSS rate, other adverse events, quality of life, cost effectiveness.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	None
Exclusion	Women without diagnosis of PCOS.				Non-evidence based guidelines, non-systematic reviews, any study lower than a RCT.	None

2. SEARCH STRATEGY

The search and screening for all GDG 5 questions were done together. Details can be found in the GDG 5 Methodology Appendix, including for:

- Databases
- Search Dates
- Search String(s)
- PRISMA flowchart
- Full list of included studies
- Full list of excluded studies with reasons for exclusion

Evidence processing: The literature search and screening were performed together in one Endnote library and Covidence project for all non-IVF, IVF and IVM fertility treatments in PCOS. Studies were

selected by one reviewer/s in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. The articles were screened by title and abstract by one reviewer. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy. In total, 102 unique studies met inclusion criteria across all non-IVF, IVF and IVF questions, of which 57 were included in the guideline update following the integrity check (refer to methodology appendix for details).

Of these eligible 102 studies, **7 studies met the inclusion criteria for this particular question** (Q.5.7.1) on GnRH antagonist protocol versus agonist long protocols, as detailed below.

3. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year, country	Population/ PCOS criteria/ Setting/ CC sensitivity	Study Design	Intervention N	Intervention description	Comparison N	Comparison description	Follow Up	Outcomes	Pooled in MA?	RoB
Ashrafi 2005 Iran	Patients <35 years old with oligomenorrhea, hyperandrogenism, LH/FSH>2.5 and ultrasonographic features of PCOS (Adams criteria); medical institute; CC status: **NR**	RCT	GnRH agonist n=30 Age (years) GnRH agonist 28.3 ± 4 BMI (kg/m2) GnRH agonist 30.45 ± 6.09	Standard long GnRH analogue protocol 21 day of cycle GnRH agonist Suprefact 500µg/day When pituitary suppression was achieved, Buserline was reduced to 200µg/day and gonadotrophin (Pregonal) 150IU/day was started	GnRH antagonist n=30 Age (years) GnRH antagonist 29.2 ± 4.6 BMI (kg/m2) GnRH antagonist 27.97 ± 6.71	HMG (150 IU/day) was started from third day of cycle. Then GnRH antagonist (0.25mg) was administered from 6th day after HMG initiation (LH≤5 IU/ml) to the day of HCG injection	1 cycle	Duration of treatment, Duration of HMG stimulation, Serum LH and E2, follicle development, risk of OHSS, number of embryos, fertilisation 10 to 12 days after embryonic transfer**, βHCG was tested**.		High
Bahceci 2005 Turkey	PCOD patients admitted to hospital to undergo ART; PCOS defined as defined as primary infertility, oligomenorrhea, clinical hyperandrogenism (hirsutism Ferriman-Galway score >7), reversed FSH /LH ratio and polycystic appearance of ovaries on ultrasound; a tertiary hospital; CC sensitivity: **NR**	RCT	GnRH agonist n=73 (Cetrorelix) Age (years) 29.43 ± 4.3 BMI 26.03 ± 4.2	Pituitary desensitization with daily LA, 0.5mg, on day 14 of the cycle. Daily administration of gonadotropins, 2 or 3 ampules was initiated on the 3rd day of the anteceding menstrual period. All patients received OC for 21 days from the preceding menstrual period	GnRH antagonist n=75 (Leuprolide) Age (years) 30.06 ± 4.8 BMI 26.1 ± 3.8	Gonadotropins were administered in 2-3 ampoules on the 3rd day of the antecedent bleeding after OC usage. After 4 days, the starting regimen was adjusted based on the individual response. Cetrorelix 0.25 mg/d sc was starte when the leading follicle reached 14 mm All patients received OC for 21 days from the preceding menstrual period	? 1 cycle	Primary outcomes NR Stimulation duration Ampoules consumed E2 level on hCG day (pg/ml) Number of retrieved oocytes Fertilization rate Number of pregnancies Pregnancy rate Multiple pregnancy rate **Clinical pregnancy** was confirmed by ultrasonography.		High
Engmann 2007 US	Patients under 40 years of age with polycystic ovarian syndrome, polycystic ovarian morphology, or previous high response undergoing IVF; diagnosis based on Rotterdam criteria; University-based tertiary fertility centre CC sensitivity: NR	RCT	GnRH antagonist n=34 Age (yrs) 32.0 ± 3.7 BMI (kg/m2) 28.3 ± 7.1	Pre-treatment with OCPs for 21 days. If the ovaries were quiescent on ultrasound, COH was commenced on day 2 of withdrawal bleeding, and was achieved using a step-down protocol of recombinant FSH in a starting dose of 112–225 IU Both groups received luteal phase and early pregnancy supplementation with IM progesterone	GnRH agonist n=32 Age (yrs) 33.1 ± 3.6 BMI (kg/m2) 30.7 ± 6.4	Pre-treatment with OCP for 25 days overlapping with 1 mg leuprolide acetate commencing on day 21 of the OCP. Ganirelix acetate was commenced once the leading follicle was R14 mm and continued every morning until and including the day of trigger. Both groups received luteal phase and early pregnancy supplementation with IM progesterone	1 cycle	Primary: incidence of OHSS, Secondary: implantation rate. Others: number of oocytes retrieved, proportion of mature oocytes retrieved, fertilization rate, midluteal phase mean ovarian volume (MOV), clinical and ongoing pregnancy rates, and luteal phase serum E2 and P levels. **Clinical pregnancy**: "…until a negative pregnancy test or a viable fetus was documented by transvaginal sonography."		Mod

Haydardedeoglu 2012 Turkey	PCOS patients in the first IVF/ICSI cycles; diagnosis by Rotterdam criteria; University Department; CC sensitivity: NR	RCT	GnRH agonist n=150 Age 27.70±3.59 BMI 24.97 ± 4.36	GnRH agonist long protocol (Leuprolide acetate) 1 mg/d from day 21 of the preceding menstruation (last 3 tablets of OCP). If there were no cysts ≥2 cm and the E2 was <50 pg/ml, gonadotropin stimulation with 150 IU of gonadotropins rFSH was performed. All patients received oral contraceptive pills (OCPs) for 21 days	GnRH antagonist n=150 Age 27.57±3.54 BMI 25.74 ± 4.37	150 IU rFSH was initiated on day 3 of menstruation after discontinuation of OCPs, then GnRH antagonist protocol (Ganirelix) 0.25 mg/d was initiated on day 6 of gonadotropin stimulation, until day of hCG. All patients received oral contraceptive pills (OCPs) for 21 days	NR	Primary: Ongoing pregnancy rates (defined as a pregnancy proceeding beyond 12 weeks of gestation) Secondary: E2 and progesterone levels on the day of hCG administration, duration of rFSH stimulation, total dose of rFSH administered, cost of COH, cycle cancellation rate, number of metaphase II oocytes, fertilization rates, cryopreservation rates, hospitalized OHSS rates. Hospitalized OHSS was diagnosed when the hematocrit level rose > 45 % and abdominal discomfort, and/or progressive oliguria and/or respiratory difficulties were found together with moderate ascites and/or thrombocytosis, and leucocytosis. **Clinical pregnancy** was detected by identifying an embryo with cardiac activity using transvaginal ultrasound		High
Kurzawa 2008 Poland	Non-obese PCOS patients were considered eligible if they were scheduled for controlled ovarian stimulation and intracytoplasmic sperm injection (ICSI); diagnosis of PCOS by Rotterdam criteria; University department; CC sensitivity: NR	RCT	Agonist protocol n=37 Age (years) 30.36 ± 3.40 BMI 22.3 ± 1.6	During OCP use on day 16-18 of the preceding cycle, GnRH agonist (Triptorelin) was given, then rFSH 150 IU/d* after confirmation of pituitary desensitization, continued until β-hCG trigger (10000 IU when 3 follicles reached mean diameter ≥17mm)	Antagonist protocol n=33 Age (years) 31.33 ± 3.91 BMI 23.1 ± 1.3	rFSH 150 IU/d* from 2nd day of cycle. GnRH antagonist (Cetrorelix) 0.25mg when at least 2 follicles reached 14mm in diameter (average 4 injections per day), then 10000 IU hCG administered when dominant follicle reached diameter ≥18mm	NR	Primary endpoints: Embryological: •Matured oocytes (M2) rate, defined as proportion of metaphase II to total number of retrieved oocytes •Fertilization rate, defined as proportion of two pronuclei oocytes to number of injected oocytes •Quality of zygotes on the first day of culture •Quality of embryos on the third day of culture Secondary endpoints: Clinical: •Delivery per attempt, defined as a live birth after 32 weeks of gestation •**Clinical pregnancy** per attempt, defined as an ongoing pregnancy at 12 weeks of gestation •Implantation rate; defined as gestational sacs per number of transferred embryos •Multiple pregnancy per viable pregnancy •Miscarriage per intrauterine pregnancy, defined as a miscarriage of an ongoing pregnancy after 12 weeks of gestation •Occurrence of severe OHSS •Number of days of gonadotropin treatment •Gonadotropin consumption		Low

								•Correlation between serum LH level and IVF outcome **Ultrasound Pregnancy** was checked by pregnancy test in serum 14 days after ET and confirmed by vaginal ultrasound scan at 12 weeks of gestation.		
Lainas 2007 Greece	Patients were diagnosed based on oligoovulation/ anovulation (Ehrmann et al., 2006) and polycystic ovaries; single IVF clinic CC sensitivity: NR	RCT	GnRH agonist n=52 Age: 30.5 (16) BMI: 23.6 (18.9) Median (IQR)	GnRH agonist (Triptorelin) 0.1mg/d, commenced 3 days before discontinuation of OCP. rFSH* 150 IU/d when desensitization achieved (GnRH agonist reduced to 0.05mg/d that day), continued until β-hCG trigger (10000 IU when 3 follicles reached mean diameter ≥17mm) *dose adjusted after day 5 of stimulation	GnRH antagonist n=26 Age: 32.0 (14) BMI: 23.2 (20.9) Median (IQR)	rFSH* daily (Puregon) + GnRH antagonist protocol (Ganirelix) 0.25mg/d from day 2 of menses, until and including day of β-hCG trigger (10000 IU when 3 follicles reached mean diameter ≥17mm)	1 cycle	Primary outcome measure: E2 levels on Day 5 of stimulation, Secondary outcome measures: Follicular development, LH and progesterone levels **Clinical pregnancy** was determined by sac with foetal heart at 7 weeks and ongoing pregnancy rates by sac with foetal heart at 12 weeks		Mod
Lainas 2010 Greece	Patients could enter the study only once after being diagnosed as PCOS [presence of oligoovulation/anovulation (Ehrmann et al., 2006) and polycystic ovaries]; single centre; CC sensitivity: NR	RCT	GnRH agonist long protocol n=110 Age: 32 (29-35) BMI: 23.2 (20.9-25.8) Media (IQR)	GnRH agonist long protocol (Triptorelin) 0.1 mg, commenced 3 days before the discontinuation of the OCP. Once desensitization was achieved (~10-15 days after Triptorelin commenced), 150 IU/d* rFSH (Puregon) was commenced (GnRH agonist was decreased on that day to 0.05 mg/d and continued until and including the day of hCG trigger)* *5000 IU hCG when three follicles reached a mean diameter of ≥17 mm	GnRH antagonist protocol n=110 Age: 31 (28-35) BMI: 24.6 (20.9-29.3) Median (IQR)	rFSH from Day 2 of cycle that followed discontinuation of the OCP, then GnRH antagonist (Ganirelix) commenced at 0.25mg/d when at least one of the following criteria were fulfilled: (i) the presence of at least one follicle measuring >14 mm; (ii) (ii) serum E2 levels >600 pg/ml; (iii) (iii) serum LH levels>10 IU/l. Both continued until and including the day of hCG trigger*	1 cycle	The primary outcome measure: •ongoing **clinical pregnancy rate** per patient randomized (defined as the presence of gestational sac with fetal heart beat detection at 12 weeks and at 6–7 weeks of gestation, respectively). Secondary outcome measures: •incidence of OHSS; duration of rFSH stimulation; total dose of rFSH, E2 and progesterone concentration on the day of hCG administration; cycle cancellation rate; number of cumulus-oocyte complexes (COCs) retrieved, number of metaphase II oocytes and fertilization rates.		Mod

NR; not reported; OHSS, ovarian hyperstimulation syndrome; IUI, intrauterine insemination; MA, meta-analysis; RoB, risk of bias. All age data is in years and BMI is in kg/m^2.

4. FINDINGS

Comparisons Included:

- **Comparison 1.** GnRH antagonist protocol vs GnRH agonist long protocol

COMPARISON 1: Gonadotrophin-releasing hormone (GnRH) antagonist protocol versus GnRH agonist long protocol

▪ EVIDENCE SUMMARY:

Seven studies compared gonadotropin-releasing hormone antagonist protocol with the GnRH agonist long protocol in women with PCOS undergoing IVF. Relevant outcomes included clinical pregnancy rate, OHSS rate, multiple pregnancy rate, miscarriage rate and cancellation rate per patient, as well as miscarriage rate per pregnancy, number of oocytes collected, amount of gonadotropins used, duration of ovulation stimulation and serum E2 concentration on the day of trigger. Most studies were judged as moderate risk of bias (Bahceci et al. 2005; Engmann et al. 2008; Lainas et al. 2007 and 2010) while two had a high risk of bias (Ashrafi et al. 2005; Haydardedeoglu et al. 2012) and only one study by Kurzawa et al. (2008) had a low risk.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences in any of the measured outcomes between the GnRH antagonist protocol compared with the GnRH agonist long protocol, with the exception of days of ovarian stimulation, which were lower with the GnRH antagonist protocol with a mean difference of -3.07 days. Certainty for most outcomes was low to moderate, mainly due to risk of bias and some inconsistencies in effect estimates or CIs; however, certainty was very low for days of ovarian stimulation due to serious risk of bias and very serious inconsistency (high heterogeneity and wide variation in effect estimates and CIs).

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Clinical pregnancy rate- per patient†	6	827	0.89 [0.65, 1.23]	0.5	None	⊕⊕⊕◯ MODERATE
OHSS rate- per patient	7	903	0.50 [0.23, 1.10]	0.09	None	⊕⊕◯◯ LOW
Multiple pregnancy rate- per patient	3	470	1.04 [0.62, 1.76]	0.9	None	⊕⊕⊕◯ MODERATE
Miscarriage rate- per patient	7	874	0.92 [0.55, 1.52]	0.7	None	⊕⊕◯◯ LOW
Miscarriage rate- per pregnancy	5	321	0.80 [0.41, 1.56]	0.5	None	⊕⊕◯◯ LOW
Cancellation rate - per patient	4	727	1.10 [0.41, 2.96]	0.9	None	⊕⊕⊕◯ MODERATE
Number of oocytes collected	6	604	0.44 [-1.67, 2.56]	0.7	None	⊕⊕◯◯ LOW
Amount of gonadotropins used (IU)	3	488	-77.68 [-205.96, 50.61]	0.2	None	⊕⊕◯◯ LOW
Duration of ovarian stimulation (days)	7	903	-3.07 [-4.68, -1.46]	0.0002	**GnRH antagonist** (lower with GnRH antagonist)	⊕◯◯◯ VERY LOW
Serum E2 on day of trigger (pg/ml)	4	535	-34.61 [-354.92, 285.71]	0.8	None	⊕⊕◯◯ LOW

† clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity.

Question 5.7.1

In women with PCOS undergoing IVF/ICSI treatment, is the GnRH antagonist protocol or GnRH agonist long protocol the most effective for improving fertility outcomes?

BACKGROUND:

Women with PCOS are particularly vulnerable to a significant complication of IVF/ICSI treatment, whereby they have a florid response to stimulation with gonadotrophins (as they have multiple follicles within the ovary), and this can be associated with fluid extravasation from the vascular system- a condition called ovarian hyperstimulation syndrome (OHSS) (1). A woman with this condition experiences; abdominal distension (due to the development of ascites) which causes significant discomfort, and she will also experience shortness of breath, nausea and constipation. Consequently, fertility doctors should endeavour to avoid undertaking IVF treatment for women with PCOS, unless it is absolutely essential, or consider in-vitro maturation of oocytes, to completely avoid the risk of OHSS (2). Hence, approaches to minimise the risk of OHSS are important to consider for a patient with PCOS undertaking an IVF cycle (3, 4). One of the proposed methods to reduce the risk of OHSS is to use a GnRH antagonist (as opposed to an agonist) to suppress pituitary LH secretion to prevent an endogenous LH surge and precipitate ovulation, as it believed the pituitary suppression leads to a lower serum oestradiol concentration (5-7). A high serum oestradiol concentration is one of the potential warning signs of incipient OHSS. Although not the subject of this review the use of an GnRH antagonist enables the final trigger injection for oocyte maturation, prior to oocyte retrieval, to be a GnRH agonist, triggering an endogenous LH surge, which has a shorter half-life than the traditional hCG trigger reducing the duration of the OHSS symptoms (4). Hence in a patient at risk of OHSS, where all embryos generated will be frozen and no fresh embryo transfer performed to let incipient OHSS settle (4), the use of an GnRH agonist trigger after down-regulation with a GnRH antagonist offers an approach to reduce the duration of the OHSS symptoms. Further, if the GnRH antagonist approach offered a favourable risk of OHSS compared to the traditional ‘long-down regulation’ with a GnRH agonist, this would further endorse this approach.

Understandably the most important endpoint for any woman embarking on fertility treatment is the live-birth rate from her IVF cycle. Paradoxically, despite this being an apparently obvious endpoint, it is increasingly difficult to provide easily interpretable data. The main reason for this is confusion is that for many young women with PCOS, the IVF cycle commenced may be a planned ‘freeze-all’- to minimise the risk and duration of OHSS, and to completely avoid the discomfort of ‘secondary’ OHSS which occurs when a woman conceives, and the hCG now continues to stimulate follicular development, perpetuating the OHSS. Hence the live-birth rate from that cycle is zero; however, particularly if she is young with PCOS, she will generally generate many oocytes and indeed, ultimately, may have her entire family resulting from that single oocyte retrieval. Hence, IVF specialists may quote cumulative pregnancy rates per cycle commenced to a patient, generating significant confusion for the patient interpreting the data. Consequently, an outcome of live-birth rate should be interpreted with a degree of caution; perhaps a more useful endpoint is the cumulative pregnancy rate per cycle started, and the IVF cycle cancellation rate. Women with PCOS have multiple follicles, and hence many oocytes will be collected, and multiple embryos generated, and there potentially could be a difference between the two groups for these endpoints, and hence ultimately to a potential difference in the rate of miscarriage.

Additional endpoints that may be of interest are the duration of stimulation, as potentially a patient may have to self-inject for fewer days with one preparation in comparison to the other,

and further there may be cost benefits to the patient and health care providers if one treatment regime was cheaper than another if they were equally efficacious on clinical grounds.

GRADE EVIDENCE CERTAINTY

Evidence to Recommendations Framework

COMPARISON (option versus other option)
GnRH antagonist versus agonist
RESEARCH RECOMMENDATION
Adequately powered, well designed, conducted and reported RCTs are required to compare the effectiveness of GnRH antagonist protocol versus GnRH long protocol to improve reproductive outcomes.
PRACTICE POINT(S)
GnRH antagonist protocol cannot be recommended over GnRH agonist long protocol for women with PCOS undergoing IVF/ICSI to improve clinical pregnancy or live birth rate. The use of an antagonist protocol for women with PCOS undergoing IVF/ICSI is recommended as it enables the use of an agonist trigger, with the freezing of all embryos generated if required, without compromising the cumulative live birth rate, to reduce the risk of significant ovarian hyperstimulation syndrome.

Question 5.7.2

In women with PCOS undergoing GnRH antagonist IVF/ICSI treatment, is the use of hCG trigger or GnRH agonist trigger the most effective for improving fertility outcomes?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	In women with PCOS undergoing GnRH antagonist IVF/ICSI treatment, is the use of hCG trigger or GnRH agonist trigger the most effective for improving fertility outcomes?
Clinical leads (key contacts)	Lan Vuong
Allocation ranking	Systematic review Level 2 (updated)

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women of any age, ethnicity and weight with PCOS diagnosed by Rotterdam, NIH or AEPCOS AND with or without coexisting infertility factors (other than anovulation). Also specifically identifying the 4 phenotypes where possible.	IVF/ICSI treatment with GnRH antagonist protocol and use of hCG trigger to induce final oocyte maturation. Note: It is important to clarify doses of HCG in GnRH antagonist trigger ovulation. HCG alone in traditional doses to trigger ovulation it is at risk of ovarian hyperstimulation.	IVF/ICSI treatment with GnRH antagonist protocol and use of GnRH agonist trigger to induce final oocyte maturation.	Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, amount of gonadotrophins used, duration of ovarian stimulation, maximum serum estradiol level (or serum estradiol level on the day of trigger), number of oocytes collected, single and multiple pregnancies, miscarriage rate, OHSS rate, other adverse events, quality of life, cost effectiveness.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	
Exclusion	Women without diagnosis of PCOS.	Placebo, no intervention or any intervention other than IVF.	Any intervention other than those listed in the inclusion criteria.	None	Non-evidence based guidelines, nonsystematic reviews, any study lower than a RCT.	

2. SEARCH STRATEGY

The search and screening for all GDG 5 questions were done together. Details can be found in the GDG 5 Methodology Appendix, including for:

- Databases
- Search Dates
- Search String(s)
- PRISMA flowchart
- Full list of included studies
- Full list of excluded studies with reasons for exclusion

Evidence processing: The literature search and screening were performed together in one Endnote library and Covidence project for all non-IVF, IVF and IVM fertility treatments in PCOS. Studies were selected by one reviewer/s in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. The articles were screened by title and abstract by one reviewer. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with

discussion to resolve any discrepancy. In total, 102 unique studies met inclusion criteria across all non-IVF, IVF and IVM questions, of which 57 were included in the guideline update following the integrity check (refer to methodology appendix for details).

3. FINDINGS

Of the eligible 57 studies (after integrity assessment) across all non-IVF, IVF and IVM, **none met the inclusion criteria for this particular question (Q 5.7.2) on hCG or GnRH trigger**. Therefore, the available evidence has been reviewed narratively.

See PART 2 for this question.

GDG 5

Question 5.7.2

In women with PCOS undergoing GnRH antagonist IVF/ICSI treatment, is the use of hCG trigger or GnRH agonist trigger the most effective for improving fertility outcomes?

BACKGROUND

Gonadotrophin releasing hormone agonists (GnRHa) are highly effective in inducing an LH surge, with levels comparable to those observed during the spontaneous surge during normal menstrual cycles so that it has been exploited clinically in women at risk of ovarian hyperstimulation syndrome (OHSS) such as PCOS women. GnRH-a trigger has become the trigger mode of choice in women at risk of OHSS because several previous trials showed a complete elimination of OHSS as well as reproductive outcomes similar to those seen with hCG trigger (1). Although a GnRHa induced LH surge is capable of inducing oocyte maturation, it is significantly shorter than that observed during a natural cycle, leading to a compromised corpus luteal function (2).

Evidence for defective luteal function included the observation that GnRHa cycles have a shorter luteal phase and that the luteal steroid profile is reduced in both non-supplemented and supplemented in-vitro fertilisation (IVF) cycles, as compared to an hCG trigger (3). The clinical impact of this defective corpus luteal function after a GnRHa trigger, is that when combined with standard luteal phase support, pregnancy rates are lower and miscarriage rates higher in fresh embryo transfer (4, 5). Segmentation of the cycle and freezing of all embryos is an appropriate alternative to avoid OHSS in women at risk of OHSS and is increasingly used in most IVF centers (6).

No studies identified	

Recommendations Framework

CONSENSUS RECOMMENDATION(S)

CR: Triggering final oocyte maturation with a GnRH agonist and freezing all suitable embryos is recommended, in an IVF/ICSI cycle with a GnRH antagonist protocol, where a fresh embryo transfer is not intended or where there is an increased risk of Ovarian Hyperstimulation Syndrome.

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	X Strong recommendation for the option

PRACTICE POINT

See PP Q.5.7.1

CONSIDERATIONS

Justifications:

The choice to trigger final oocyte maturation with GnRH-agonist instead of hCG is important in prevention of OHSS as hCG alone induces oocyte maturation but is associated with OHSS. GnRH- agonist triggers are associated with lower pregnancy rates, primarily in fresh embryo transfers, which can be overcome in frozen cycles.

Subgroup considerations:

- Different regimes for luteal support in GnRH agonist trigger and fresh transfers.

Implementation considerations:

- Cost-effectiveness of GnRH agonist triggering + Freeze-all

Monitoring and evaluation considerations:

Cost-effectiveness of the strategies.

Research priorities:

Additional trials should ascertain whether the combination of GnRHa trigger and the intensive luteal steroid support package in the OHSS high-risk patient is associated with better clinical outcomes than the use of GnRHa trigger and subsequent frozen embryo transfer.

Equity:

May be less due to the cost issue related to GnRH agonist triggering and Freeze-all.

Acceptability

Yes.

FEASIBILITY

Only feasible in centres having good freezing program.

Question 5.7.3

In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, does the choice of FSH effect fertility outcomes?

BACKGROUND:

Different preparations of FSH exist. FSH can be extracted from human urine (uFSH) or it can be synthesised by animal cell lines using recombinant DNA techniques (rFSH) (1). rFSH preparations are manufactured using both animal and human cell lines and can also be distinguished by their originator or biosimilar status.

Urinary FSH preparations have varying levels of LH activity and other impurities. The LH activity in urinary gonadotrophin preparations is known to stimulate androgen production in theca cells and it plays an important role in completing maturation of the follicle. However, it is assumed that less than 1% of follicular LH receptors needs to be occupied in order to elicit maximal steroidogenesis (2) and it is therefore possible that enough endogenous LH is present during controlled ovarian stimulation to promote androgen synthesis and oocyte maturation without the need for extra LH activity in FSH preparations.

The perceived clinical benefits of the different FSH preparations are the subject of ongoing debate (3), with evidence pointing at a lower risk of OHSS with human menopausal gonadotrophin (hMG) in a general population (4). All types of preparations remain commonly used.

Comparison	**GRADE for critical outcomes**
No studies identified	

Recommendations Framework

CONSENSUS RECOMMENDATION

CR: Either urinary or recombinant FSH could be used in women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, with insufficient evidence to recommend a particular type of FSH preparation.

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☒ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

CONSIDERATIONS

Justifications:

Of the eligible 57 studies (after integrity assessment) across all non-IVF, IVF and IVM, none met the inclusion criteria for this particular question (Q 5.09d.) on choice of FSH. Therefore, the available evidence has been reviewed narratively.

Subgroup considerations:

N/A

Implementation considerations:

Availability, convenience and cost considerations may be an important factor in the decision.

Monitoring and evaluation considerations:

N/A

Research priorities

High quality studies are required comparing different types of FSH preparations in women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI using GnRH antagonist or GnRH agonist long protocol on live birth rate per cycles started, cumulative live birth rate from one egg retrieval, OHSS and cost effectiveness.

Equity:

Evidence was not sought to address this criterion.

Acceptability:

There are no foreseeable concerns stakeholders might have with the recommendation of no preference.

Feasibility:

Yes. No option was favoured.

title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy. In total, 102 unique studies met inclusion criteria across all non-IVF, IVF and IVM questions, of which 57 were included in the guideline update following the integrity check (refer to methodology appendix for details).

3. FINDINGS

Of the eligible 57 studies (after integrity assessment) across all non-IVF, IVF and IVM, **none met the inclusion criteria for this particular question (Q 5.7.4.) on exogenous LH treatment**. Therefore, the available evidence has been reviewed narratively below and in PART 2 for this question.

▪ CLINICAL NEED FOR THE QUESTION

Options have been explored to reduce OHSS risk in IVF/ICSI in PCOS. The chronic low dose step-up protocol with exogenous FSH in securing single (fewer) dominant follicle selection is an alternative method to avoid multi-follicular development. During late follicular development, LH is essential to achieve adequate ovarian steroidogenesis and develop the subsequent capacity of the follicle to ovulate and luteinize. Increased LH secretion or elevated LH/FSH ratio in PCOS may influence fertility, with inhibition of oocyte maturation, deleterious effects on granulosa cell steroidogenesis and endometrial receptivity and with potential increased early pregnancy loss. The lack of clarity around the role of exogenous LH in the setting of IVF/ICSI prompted this clinical question.

▪ NARRATIVE SUMMARY

Obesity adversely impacts on ovulation and on responses to ovulation induction in PCOS. In PCOS, granulosa cells respond to LH at a relatively earlier follicular stage and are significantly more responsive than for ovulatory women with PCOS or women without PCOS. Granulosa cell differentiation may be prematurely advanced. Controlled ovarian stimulation for multiple follicular development in ART can be performed in a variety of ways to increase efficacy and reduce risks.

Systematic reviews and meta-analysis have demonstrated that there is no significant difference between different ovarian stimulation protocols (hMG, purified FSH, recombinant FSH) regarding the fertility outcomes. Therefore, clinical gonadotropin choice depends on the availability of the product, the convenience of its use, and the associated costs. Individualised gonadotrophin dose selection using markers of ovarian reserve for women undergoing IVF/ICSI. There is no clear evidence that co-administration of rLH to recombinant follicle-stimulating hormone (rFSH) in GnRHa down-regulated women resulted in more live births or fewer cases of OHSS than COH with rFSH alone Nevertheless, pooled clinical and ongoing pregnancy estimates suggested a beneficial effect of co-treatment with rLH.

There may be little or no difference in live birth, incidence of multiple pregnancy, clinical pregnancy rate, or miscarriage rate between urinary-derived gonadotrophins and recombinant follicle stimulating hormone in women with polycystic ovary syndrome. It is uncertain whether human menopausal gonadotropin or highly purified human menopausal gonadotrophin improves or lowers live birth, incidence of multiple pregnancy, clinical pregnancy rate, or miscarriage rate when compared with urinary follicle stimulating hormone. No current study investigates efficacy of exogenous LH supplement for fertility outcomes in PCOS during IVF/ICSI. Careful monitoring of follicular development during ovarian stimulation is critical.

The systematic review by Datta et al., (2021) reviewed RCTs comparing a mild (<150 IU daily dose) versus conventional stimulation in terms of clinical outcomes and cost-effectiveness in patients described as poor, normal and non-polycystic ovary syndrome (PCOS) hyper-responders to IVF. The review found that live birth rates (LBRs) per randomisation were similar following use of MD-IVF in poor (relative risk (RR) 0.91 (CI 0.68, 1.22)), normal (RR 0.88 (CI 0.69, 1.12)) and hyper-responders (RR 0.98 (CI 0.79, 1.22)) when compared to CD-IVF. Risk of ovarian hyperstimulation syndrome was significantly less with MD-IVF than CD-IVF in both normal (RR 0.22 (CI 0.10, 0.50)) and hyper-responders (RR 0.47 (CI 0.31, 0.72)). The CCRs were comparable in poor (RR 1.33 (CI 0.96, 1.85)) and hyper-responders (RR 1.31 (CI 0.98, 1.77)) but increased with MD-IVF among normal responders (RR 2.08 (CI 1.38, 3.14)). Although fewer oocytes were retrieved and fewer embryos created with MD-IVF, the proportion of high-grade embryos was similar in all three population types. Compared to CD-IVF, MD-IVF was associated with less gonadotrophin use and lower cost.

This updated review provides reassurance on using MD-IVF not only for the LBR per cycle but also for the cumulative LBR, with moderate QoE. With risks identified with 'freeze-all' strategies, it may be time to recommend mild-dose ovarian stimulation for IVF for all categories of women i.e. hyper, poor and normal responders to IVF.

A Cochrane review by Farquhar et al., 2018 compared recombinant versus urinary gonadotrophin for ovarian stimulation in ART cycles. It appears that all available gonadotrophins were equally effective and safe. Review authors stated that the choice of one or the other product would depend upon the availability of the product, the convenience of its use, and the associated costs, and that any specific differences were likely to be too small to justify further research (moderate- to high-quality evidence) (van Wely 2011).

Individualised gonadotrophin dose selection using markers of ovarian reserve for women undergoing IVF/ICSI: a decreased dose of FSH in predicted high responders appeared to reduce the likelihood of moderate or severe OHSS (low-quality evidence). Furthermore, ovarian reserve test (ORT) algorithms reduced the incidence of OHSS compared to standard dosing of 150 IU, probably by facilitating dose reductions among women with a predicted high response (moderate-quality evidence) (Lensen 2018)

Recombinant luteinising hormone (rLH) for controlled ovarian hyperstimulation (COH) in assisted reproductive cycles: there is no clear evidence that co-administration of rLH to recombinant follicle-stimulating hormone (rFSH) in GnRHa down-regulated women resulted in more live births or fewer cases of OHSS than COH with rFSH alone (very low- or low quality evidence). Nevertheless, pooled clinical and ongoing pregnancy estimates suggested a beneficial effect of co-treatment with rLH (moderate-quality evidence) (Mochtar 2017)

(Mochtar 2017) found no clear evidence of a difference between recombinant luteinising hormone (rLH) combined with recombinant follicle-stimulating hormone (rFSH) and rFSH alone in rates of live birth (very low-quality evidence) or OHSS (low-quality evidence), but evidence suggested that use of rLH combined with rFSHmay lead tomore clinical pregnancies than use of rFSH alone (moderate-quality evidence). Results show little or no difference between groups in rates of miscarriage (moderate-quality evidence). The review authors concluded that the evidence was insufficient to encourage or discourage stimulation regimens that include rLH combined with rFSH in IVF/ICSI cycles.

Wang et al., 2017 compared the effectiveness of alternative first line treatment options for women with WHO group II anovulation wishing to conceive and concluded that in women with WHO group II anovulation, letrozole and the combination of clomiphene and metformin are superior to clomiphene alone in terms of ovulation and pregnancy. Compared with clomiphene alone, letrozole is the only treatment showing a significantly higher rate of live birth.

Weiss et al., 2109 in a systematic review, compared the effectiveness and safety of gonadotrophins as a second-line treatment for ovulation induction in women with clomiphene citrate-resistant polycystic ovary syndrome (PCOS), and women who do not ovulate or conceive after clomiphene citrate and noted there may be little or no difference in the birth rate between rFSH and urinary-derived gonadotrophins (RR 1.21, 95% confidence interval (CI) 0.83 to 1.78; five trials, N = 505; IO = 9%; low-quality evidence). This suggests that for the observed average live birth per woman who used urinary-derived FSH of 16%, the chance of live birth with rFSH is between 13% and 28%. There may also be little or no difference between groups in incidence of multiple pregnancy (RR 0.86, 95% CI 0.46 to 1.61; eight trials, N = 1368; IO = 0%; low-quality evidence), clinical pregnancy rate (RR 1.05, 95% CI 0.88 to 1.27; eight trials, N = 1330; IO = 0; low-quality evidence), or miscarriage rate (RR 1.20, 95% CI 0.71 to 2.04; seven trials, N = 970; IO = 0; low-quality evidence). We are uncertain whether rFSH reduces the incidence of OHSS (RR 1.48, 95% CI 0.82 to 2.65, ten trials, n=1565, IO = 0%, very low-quality evidence).

When compared to uFSH, t is not clear whether HMG or HP-HMG improves live birth rate (RR 1.28, 95% CI 0.65 to 2.52; three trials, N= 138; IO = 0%; very low quality evidence), or reduces multiple pregnancy rate (RR 2.13, 95% CI 0.51 to 8.91; four trials, N = 161; IO = 0%; very low quality evidence). It is also uncertain whether HMG or HP-HMG improves clinical pregnancy rate (RR 1.31, 95% CI 0.66 to 2.59; three trials, N = 102; IO = 0; very low quality evidence), reduces miscarriage rate (RR 0.33, 95% CI 0.06 to 1.97; two trials, N = 98; IO = 0%; very low quality evidence), or reduces the incidence of OHSS (RR 7.07, 95% CI 0.42 to 117.81; two trials, N = 53; very low quality evidence) when compared to uFSH..

There may be little or no difference in live birth, incidence of multiple pregnancy, clinical pregnancy rate, or miscarriage rate between urinary-derived gonadotrophins and recombinant follicle stimulating hormone in women with polycystic ovary syndrome. For human menopausal gonadotropin or highly purified human menopausal gonadotrophin versus urinary follicle stimulating hormone , it is not clear whether one or the other improves or lowers live birth, incidence of multiple pregnancy, clinical pregnancy rate, or miscarriage rate. Whether any of the interventions reduce the incidence of ovarian hyperstimulation syndrome is unclear.

We suggest weighing costs and convenience in the decision to use one or the other gonadotrophin. In women with clomiphene citrate failure, gonadotrophins resulted in more live births than continued clomiphene citrate without increasing multiple pregnancies.

Question 5.7.4

In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, is exogenous LH treatment during IVF/ICSI effective for improving fertility outcomes?

BACKGROUND:

Folliculogenesis and oocyte maturation are complex processes that require the action of both LH and FSH (1). However, systematic reviews and meta-analysis have demonstrated that there is no significant difference between different ovarian stimulation protocols (hMG, purified FSH, recombinant FSH) regarding fertility outcomes (2-4). It has been suggested that the benefits of LH supplementation may occur in subpopulations characterized by LH insufficiency, including hypo–responders and advanced age women (5).

PCOS is the most common cause of anovulatory infertility. Increased LH secretion or elevated LH/FSH ratio in women with PCOS has been suggested to be involved in the pathogenesis of decreased fertility. The proposed mechanisms include inhibition of oocyte maturation leading to premature oocyte maturation as well as its deleterious effects on granulosa cell steroidogenesis and endometrial receptivity and with potential increased early pregnancy loss.

Ovulation stimulation protocols for PCOS patients need to benefit effectiveness and safety. Ovarian stimulation for IVF/ICSI in patients with PCOS is characterized by a risk of multiple follicular development leading to a high incidence of OHSS and multiple pregnancies. Reducing the incidence of OHSS is an important goal in PCOS treatment.

Options have been explored to reduce OHSS risk in IVF/ICSI in PCOS. In women predicted hyper-responder who undergo IVF/ICSI, individualised selection of gonadotrophin doses is found to reduce the likelihood of moderate or severe OHSS, while increasing the likelihood of cycle cancellations. The impact of gonadotrophin choice (with or without LH preparation) on the incidence of OHSS remains uncertain.

Some studies indicated that HP-hMG treatment of potential high responders (non-PCOS), was associated with a lower median number of retrieved oocytes, significantly lower incidence of high response, fewer interventions for OHSS, and increased live birth rate compared with rFSH in GnRH agonist or antagonist protocols (6-8).

The lack of clarity around the role of exogenous LH in the setting of IVF/ICSI prompted this clinical question.

Recommendations Framework

CONSENSUS RECOMMENDATION(S)

CR: Exogenous recombinant luteinising hormone treatment should not be routinely used in combination with follicle stimulating hormone therapy in women with PCOS undergoing controlled ovarian hyperstimulation for IVF / ICSI.

☐ Strong recommendation against the option	☒ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

CONSIDERATIONS
Justifications: There is no anticipated effect or benefit to add exogenous LH supplement in women with PCOS undergoing ovarian stimulation for IVF /ICSI. There is insufficient evidence to determine the benefits of using or not using exogenous LH.
Subgroup considerations: No studies were available for any subgroup analysis.
Implementation considerations: Not applicable.
Monitoring and evaluation considerations: Implementation not recommended.
Research priorities: The dose of exogenous LH in addition to FSH appropriate for follicular development should be further investigated. Identify whether there is benefit in terms of improving live birth rate or reducing OHSS, and which groups will benefit from exogenous LH addition to FSH in IVF +/- ICSI.
Equity: No research evidence was identified. There are currently no known advantaged group or different baseline conditions that may selectively favour use of LH agent.
Acceptability Not applicable.
FEASIBILITY Not applicable.

Author, year, country	Population/ PCOS criteria/ Setting/ CC sensitivity	Study Design	Intervention N	Intervention description	Comparison N	Comparison description	Follow Up	Outcomes	Pooled in MA?	RoB
Doldi 2006 Italy	PCOS patients, diagnosis align with Rotterdam CC sensitivity NR	RCT	[MET + rFSH + GnRH] N=20 Age: NR BMI: NR	Pre-treated with MET 1.5g/day for 2 months and then stimulated with rFSH 150 IU/day starting on day 3 of menstrual cycle. GnRH antagonist, cetrorelix acetate 0.25 mg/day started at follicle maturity	[rFSH + GnRH] Age: NR BMI: NR	No pre-treatment with metformin and same management with rFSH and GnRH antagonist	2 months + 1 cycle	The number and quality of oocytes, fertilization rate, number of embryos and cases of OHSS How pregnancy was assessed **not reported**	Yes	High
Fedorcsak 2003 Norway	Infertile PCOS women with insulin resistance and about to receive ovarian stimulation and IVF or intracytoplasmic sperm injection Age (years) Median (range) 31 (23-35) BMI (kg/m2) 31.5 (27.1-40.7) Median (range) CC sensitivity NR	RCT **Cross Over** *(only pre-cross over data was used)*	MET + rFSH + GnRH n=9 Age: NR BMI: NR	500mg Metformin t.i.d (3-week pre-treatment and 1 cycle co-administration with IVF protocol*, until hCG injection)	rFSH + GnRH n=8 Age: NR BMI: NR	rFSH + GnRH No co-treatment, IVF protocol* * Long protocol GnRH-agonist suppression + rFSH (150IU starting dose, step-up protocol) + hCG (10,000IU in presence of at least 2 dominant follicles >18mm)	Two consecutive cycles	• Primary outcomes a) **clinical pregnancy** rate per woman b) incidence of OHSS • Secondary outcomes: a) total dose of FSH (IU) given during stimulation b) number of collected oocytes c) number of days of gonadotrophin d) fertilisation rate e) number of embryos transferred f) miscarriage rate g) incidence of adverse side effects Pregnancy was detected on day 14 after follicle puncture with plasma β-hCG >20 IU	Yes	High
Jacob 2016 UK	PCOS women recruited from IVF clinic waiting list between October 2009 and June 2014; diagnosis align with Rotterdam CC sensitivity: NR	RCT	MET + rFSH + GnRH n=77 Age: 29.9 ± 4.4 BMI: 25.3 ± 3.4	Metformin in the range 100-150 IU started 7 days prior to the patient's anticipated menstruation, daily rFSH from day 2 and GnRH antagonist 250 µg added on day 6	Placebo + rFSH + GnRH n=76 Age: 29.6 ± 3.9 BMI: 25.0 ± 3.3	Placebo + rFSH + GnRH See intervention for rFSH and GnRH	? 1 cycle	Primary: Severe OHSS within 6 weeks of completing an IVF cycle Secondary: ovarian stimulation characteristics, embryological measures (including fertilisation rate and good quality Day 3 embryos) and cycle outcome including **clinical pregnancy** rate (CPR) and live birth rate (LBR). Pregnancy was detected on day 14 by serum hCG>2 IU/l and confirmed by foetal heart on scan to be considered a clinical pregnancy	Yes	Low
Onalan 2005 Turkey	PCOS patients aged <40 years and having PCOS without concomitant causes of infertility and those undergoing first IVF/ICSI attempts; Diagnosis align with Rotterdam criteria; IVF clinic;	RCT	MET n=53 Age (y), mean ± SD: 29.3 ± 3.9	Metformin 850mg, 2-3 times daily according to BMI (8- week pre-treatment and throughout ICSI*, until a positive pregnancy test).	Placebo n=55 Age (y), mean ± SD: 29.76 ± 5.3	Placebo 2-3 times daily according to BMI (8- week pre-treatment and throughout ICSI*, until a positive pregnancy test). *long protocol GnRH-agonist suppression +	8 weeks + 1 cycle?	• Primary outcomes: a) **clinical pregnancy** rate per woman b) incidence of OHSS • Secondary outcomes: a) number of days of gonadotrophins b) number of ampoules of gonadotrophins c) number of follicles (> 16 mm)	Yes	High

	CC sensitivity: NR		BMI (kg/m2): 25 (19.41)		BMI (kg/m2): 23.5 (19-34)	rFSH (150-300IU starting dose, stepdown protocol) + hCG (10000IU, in presence of at least 3 dominant follicles >18mm and E2 levels <5500 pg/ml)		d) number of mature oocytes e) fertilisation rate f) number of embryos transferred g) pregnancy rate per woman h) miscarriage rate i) serum E2 levels j) glucose/insulin rate		
Kjotrod 2004 Norway	Infertile PCOS patients (of 60% had undergone a laparoscopy); diagnosis aligns with Rotterdam criteria; IVF clinic at a university hospital CC sensitivity: **NR**	RCT	MET n=35 Age (years) (n=31; started IVF) mean 28.9 (95% CO 27.6-30.2) BMI <28 (kg/m2) (n=14; started IVF) mean 29.0 (95% CI 27.3-30.7) BMI ≥28 (kg/m2) (n=17; started IVF) mean 28.9 (95% CI 26.7-31.0)	Metformin 500mg b.d (for at least 16 weeks until the day of hCG)* * long protocol GnRH-agonist + rFSH (100IU daily in normal weight women or 150 IU in obese women) + hCG (5000IU in presence of E² levels <10nmol/l)	Placebo n=34 Age n (years) (n=32 started IVF) mean 30.2 (95% CI 29.0-31.5) BMI <28 (kg/m2) (n=13; started IVF) mean 30.7 (95% CI 28.7-32.7) BMI ≥28 (kg/m2) (n=19; started IVF) mean 29.9 (95% CI 28.1-31.8)	Placebo b.d (for at least 16 weeks until the day of hCG)* * long protocol GnRH-agonist + rFSH (100IU daily in normal weight women or 150 IU in obese women) + hCG (5000IU in presence of E² levels <10nmol/l)	16 weeks of metformin Pre-treatment + 1 cycle	Primary: total number of days of FSH stimulation; serum oestradiol on the day of HCG injection Secondary: number of oocytes, total gonadotrophin dose used, fertilization rates, embryo quality, pregnancy rates, **clinical pregnancy rate** (defined as a verified intrauterine gestational sac by ultrasound performed in week 7) live birth rates	Yes	Low
Kjotrod 2011 Norway, Denmark, Finland, and Sweden	Women diagnosed with PCOS, aged <38 years and with a BMI of <28 kg/m2. Multicentre study mainly from Norway; Diagnosis aligns with Rotterdam criteria. The majority of patients had previously received unsuccessful clomiphene citrate (CC) treatment (n = 59 in each treatment group). **Mixed CCR**	RCT	MET Age (years) Mean (SD) 29.6 (3.4) BMI, kg/m2 Mean (SD) 24.0 (2.7) number of previous cycles of CC mean (SD) 3.7 (1.8)	500mg Metformin q.i.d (≥12 weeks pre-treatment and throughout IVF/ICSI*, until pregnancy test). * long protocol GnRH-agonist suppression + rFSH (112.5IU starting dose, step-down protocol) + rhCG (250 µg) or hCG (5000 or 10000IU) in presence of at least 1 dominant follicle >17mm	Placebo Age (years) Mean (SD) 29.5 (3.8) BMI, kg/m2 Mean (SD) 23.6 (2.8) number of previous cycles of CC mean (SD) 3.5 (1.9)	Placebo q.i.d (≥12 weeks pre-treatment and throughout IVF/ICSI*, until pregnancy test). * long protocol GnRH-agonist suppression + rFSH (112.5IU starting dose, step-down protocol) + rhCG (250 µg) or hCG (5000 or 10000IU) in presence of at least 1 dominant follicle >17mm	12 weeks + IVF cycle If pregnant, up to a year	Primary: clinical pregnancy rate; Secondary: biochemical pregnancy and live birth rate – these were not reported for SP population. Safety variables included the incidence of adverse events (AEs) and OHSS. Pregnancy was detected initially by a serum pregnancy test performed on Days 13–15 after embryo transfer and women with a positive test underwent an ultrasound in week 7 of pregnancy	Yes	Mod

Qublan 2009 Jordan	PCOS patients undergoing IVF treatment; PCOS diagnosis based on Rotterdam criteria; setting hospital; CC sensitivity: CCR	RCT Single blind	MET n=34 Age (years) Mean (SD) 34.6+4.3 BMI 32.2 (27–39)	Metformin 850 mg b.d. commencing 1 month before IVF Long GnRH agonist protocol starting on day 21 of the menstrual cycle starting at 150 IU	Placebo n=32 Age (years) Mean (SD) 33.8+3.9 BMI 31.9 (26–38)	Placebo Long GnRH agonist protocol starting on day 21 of the menstrual cycle starting at 150 IU	1 month before a cycle	**Clinical pregnancy rates**; implantation rates; hormones including FSH, LH, testosterone (T), androstenedione (A), 17-hydroxyprogesterone (17-OHP), oestradiol (E2) and dehydroepiandrosterone sulphate (DHEAS) Pregnancy detected with serum β-hCG at 2 weeks and confirmed by ultrasound scan at 6 weeks.	Yes	Mod
Tang 2006 UK	PCOS patients, if BMI above 30 kg/m2 advised to reduce weight using lifestyle Modification; single fertility unit; diagnosis align with Rotterdam criteria CCR- not reported	RCT double blind	MET Age (years) Mean (SD) 31.3 (4.0) BMI (kg/m2) Mean (SD) 27.9 (5.6)	850mg Metformin b.d (from the 1st day of down-regulation* until oocyte retrieval) *long protocol GnRH-agonist suppression + rFSH (100IU starting dose, low-dose stepdown protocol) + hCG (10000IU in presence of at least 3 dominant follicle >17mm)	Placebo Age (years) Mean (SD) 31.1 (4.0) BMI (kg/m2) Mean (SD) 26.9 (4.8)	Placebo b.d (from the 1st day of downregulation* until oocyte retrieval) *long protocol GnRH-agonist suppression + rFSH (100IU starting dose, low-dose stepdown protocol) + hCG (10000IU in presence of at least 3 dominant follicle >17mm)	1 cycle	• Primary outcome: a) fertilisation rate • Secondary outcomes: a) number of days of gonadotrophins b) total dose of FSH given during stimulation c) number of follicles (> 14 mm) d) number of oocytes e) number of embryos transferred f) implantation rate g) pregnancy rate per woman h) **clinical pregnancy rate** per woman i) pregnancy rate per transfer j) clinical pregnancy rate per transfer k) live birth rate l) incidence of OHSS that required hospitalisation m) side effects n) fasting insulin o) fasting glucose p) SHBG q) free androgen index r) testosterone	Yes	High

CC, clomiphene citrate; CCR, clomiphene citrate resistant (to ovulate); CCF, clomiphene citrate failure (to become pregnant); LET, letrozole; MET, metformin; NR; not reported; OHSS, ovarian hyperstimulation syndrome; IUI, intrauterine insemination; hCG, human chorionic gonadotrophin; LH, luteinizing hormone; FSH, follicle stimulating hormone; MA, meta-analysis; RoB, risk of bias. All age data is in years and BMI is in kg/m^2. *Risk of bias assessment derived from reliable systematic review (e.g. Cochrane or previous review from the guideline evidence team).

4. FINDINGS

Comparisons Included:

- **Comparison 1.** Metformin versus placebo or no treatment (with IVF/ ICSI)

COMPARISON 1: Metformin versus Placebo or No Treatment

- **EVIDENCE SUMMARY:**

Eight studies were identified for this clinical question, all of which compared adjuvant metformin to placebo or no treatment in women with PCOS undergoing IVF/ICSI using either a GnRH agonist protocol (Qublan et al. 2009, Kjotrod et al. 2004; Kjotrod et al. 2011; Onalan et al. 2005; Tang et al. 2006 and Fedorcsak et al. 2003) or a GnRH antagonist protocol (Doldi et al. 2006; Jacob et al. 2006). Only one study by Fedorcsak et al. (2003) compared adjuvant metformin with no treatment, while the remaining seven studies were placebo-controlled. The study by Fedorcsak et al. (2003) was also a cross-over trial, but only data from the pre-cross-over phase was used in this analysis. Two studies had a low risk of bias (Jacob et al. 2006 and Kjotrod et al. 2004) two were moderate (Qublan et al. 2009 and Kjotrod et al. 2011) while the remaining four studies had a high risk of bias Doldi et al. 2006; Onalan et al. 2005; Tang et al. 2006 and Fedorcsak et al. 2003).

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

There were no differences in any of the measured outcomes, except for side effects which were higher with adjuvant metformin compared with placebo. Certainty of the evidence was moderate to low for most outcomes, largely downgraded for risk of bias and inconsistency (heterogeneity, varying estimates and CIs). Only multiple pregnancy rate had a high certainty of evidence, while E2 on the day of hCG trigger had very low certainty due to serious risk of bias, inconsistency and imprecision (a very wide CI in the pooled estimate).

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty
Live birth rate – per patient	5	553	1.09 [0.48, 2.47]	0.8	None	⊕⊕◯◯ LOW
Clinical pregnancy rate* – per patient	7	667	1.26 [0.68, 2.32]	0.5	None	⊕⊕◯◯ LOW
OHSS rate -per patient	7	690	0.56 [0.30, 1.06]	0.07	None	⊕⊕⊕◯ MODERATE
Multiple pregnancy rate – per pregnancy	3	121	0.77 [0.27, 2.21]	0.6	None	⊕⊕⊕⊕ HIGH
Miscarriage rate- per patient	7	667	0.76 [0.43, 1.33]	0.3	None	⊕⊕◯◯ LOW
Miscarriage rate- per pregnancy	7	266	0.59 [0.23, 1.52]	0.3	None	⊕⊕◯◯ LOW
Side effects rate – per patient	5	584	4.87 [2.60, 9.13]	<0.00001	**Placebo** (side effects are higher with metformin)	⊕⊕◯◯ LOW
Mean dose of gonadotrophins (IU) used- per patient	7	593	0.33 [-117.38, 118.05]	1.0	None	⊕⊕◯◯ LOW
Mean days of gonadotrophins- per patient	7	593	0.12 [-0.24, 0.49]	0.5	None	⊕⊕⊕◯ MODERATE
Number of oocytes retrieved- per patient	6	432	0.02 [-1.25, 1.28]	0.2	None	⊕⊕◯◯ LOW
E2 on day of hCG trigger (pg/ml)	2	106	-520.62 [-1332.27, 291.04]	0.2	None	⊕◯◯◯ VERY LOW

*refers to clinical pregnancy, determined by ultrasound confirmation of gestational sac/ fetal heart activity

Question 5.7.5

In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, is adjuvant metformin effective for improving fertility outcomes?

BACKGROUND:

IVF/ICSI treatment in women with PCOS is usually recommended either as a third-line treatment (after failed first- or second- line therapies including letrozole, clomiphene citrate, gonadotrophin or LOD ovulation induction) or in the presence of other infertility factors such as tubal damage, severe endometriosis or male factor infertility (1). IVF/ICSI treatment in women with PCOS poses a number of clinical challenges, in particular that of an increased risk of moderate to severe Ovarian Hyperstimulation Syndrome (OHSS) (2).

The aetiological hypotheses of PCOS are continually developing with the understanding and incorporation of the evolving evidence of the syndrome, which appears to be both multifactorial and polygenic and includes hypothalamic-pituitary-ovarian and adrenal axis contributions, ovarian thecal cell steroidogenesis dysfunction, and insulin resistance with compensatory hyperinsulinemia (3). Based on the association between insulin resistance and anovulation in both lean and obese PCOS women, insulin-sensitising drugs, such as metformin, have been added as a promising therapy to restore ovulation and enhance pregnancy in PCOS (4).

Metformin is a biguanide which reduces hepatic glucose production by reducing hepatic gluconeogenesis, improves insulin sensitivity by increasing insulin mediated glucose uptake by skeletal muscle / liver / adipose tissue, reduces intestinal absorption of glucose, reduces lipogenesis and increases fatty acid oxidation in skeletal muscle / liver / adipose tissue, and reduces ovarian androgen production both directly by a reduction in CYP17 enzyme activity and indirectly via a reduction in hyperinsulinemia. It is estimated that 10-15% of its efficacy in type 2 diabetes is due to peripheral improvement in insulin sensitivity, primarily in skeletal muscle. Thus, metformin is not primarily an insulin-sensitizing drug, although it is often labelled as such in the treatment of women with PCOS (5-7).

There is a good physiological rationale for believing that suppression of insulin levels, through the use of insulin sensitising agents such as metformin, may be useful in women with PCOS who are undergoing in vitro fertilisation (IVF) with or without intracytoplasmic sperm injection (ICSI). Suppression of insulin levels might ameliorate the adverse effects of ovarian stimulation and improve treatment outcomes in IVF/ICSI. It has also been suggested that metformin may reduce serum oestradiol levels during ovarian stimulation and it has also been hypothesized that metformin may reduce the production of vascular endothelial growth factor (VEGF), both of which are important factors involved in the pathophysiology of OHSS (8). Therefore, it is important to determine the effectiveness and safety of metformin as a co-treatment in achieving pregnancy or live birth and reducing OHSS in women with PCOS undergoing IVF or ICSI treatment.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Metformin versus placebo or no treatment	⊕⊕◯◯ LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Metformin + IVF/ICSI (option) versus placebo or no treatment + IVF/ICSI (other option) (GnRH agonist long protocol)

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Adjunct metformin therapy could be used before and/or during FSH ovarian stimulation in women with PCOS undergoing IVF/ICSI treatment with GnRH agonist long protocol, to reduce the risk of developing Ovarian Hyperstimulation Syndrome and miscarriage.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

Practice Points

Good practice in PCOS and IVF is the use of an antagonist protocol as it gives the flexibility of using an agonist trigger, freeze all strategy to reduce the risk of ovarian hyperstimulation syndrome (OHSS). However, if using a GnRH agonist long protocol, then metformin could be considered.

If using metformin, the following could be considered:

- Commence metformin at the start of GnRH agonist treatment
- Gradually titrate metformin up to a dose of between 1000mg to 2500mg daily in order to minimise side effects
- Stopping metformin therapy at the time of the pregnancy test or period, unless the metformin therapy is otherwise indicated

GRADE CONSIDERATIONS

Justifications:

For GnRH agonist protocol: Adjuvant metformin may reduce the risk of OHSS rate per patient and miscarriage rate per pregnancy but may also increase the incidence of gastrointestinal side-effects

Subgroup considerations:

None

Implementation considerations:

Potential barriers (of limited impairment of implementation) to implementation of the recommendations relate to the availability of drug metformin and costs of the drugs which may vary depending on many factors including, but not limited to, the health care setting (IVF/ICSI funded, partly funded, or not funded) and socioeconomic status of the patient.

Monitoring and evaluation considerations:

It would be difficult to monitor and measure the success of implementing these recommendations as there are many individualized strategies to reduce the incidence of OHSS.

Research priorities:

Further adequately powered, well designed, conducted & reported RCTs are needed to assess the benefits and harms of adjunct metformin treatment before and/or during IVF/ICSI treatment in women with PCOS.

Further adequately powered, well designed, conducted & reported RCTs are needed to assess the benefits and harms of adjunct metformin treatment before and/or during IVF/ICSI treatment with GnRH antagonist protocol in women with PCOS.

Further adequately powered, well designed, conducted & reported RCTs are needed to determine the appropriate time to both start and cease metformin with regard to pregnancy rate, live birth rate and infant outcomes.

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Summary of evidence for GnRH agonist protocol: There was no difference in all outcomes except

- a **reduction in E2 level on day of hCG trigger, OHSS rate per patient, miscarriage rate per pregnancy favouring metformin.**
- an increase in side-effects rate per patient if taking metformin.

With respect to the no difference in outcomes:

- The meta-analyses **did not exclude that metformin is superior to placebo/no Rx for clinical pregnancy rate per patient** as the 95% CI excluded an important reduction in clinical pregnancy rate per patient with metformin.
- There was equivalence (due to narrow 95% CI's excluding an important difference between metformin and placebo / no treatment) for duration of ovarian stimulation, number of eggs retrieved.
- There was uncertainty (inconclusive result due to wide 95% CI's) for live-birth rate per patient, amount of gonadotrophins used, multiple pregnancy rate per pregnancy, miscarriage rate per patient.

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Summary of evidence for GnRH agonist protocol: There was no difference in all outcomes except

- a reduction in E2 level on day of hCG trigger, OHSS rate per patient, miscarriage rate per pregnancy favouring metformin.
- **an increase in mild side-effects rate per patient if taking metformin**

With respect to the no difference in outcomes:

- the meta-analyses did not exclude that metformin is superior to placebo/no Rx for clinical pregnancy rate per patient as the 95% CI excluded an important reduction in clinical pregnancy rate per patient with metformin.
- there was equivalence (due to narrow 95% CI's excluding an important difference between metformin and placebo / no treatment) for duration of ovarian stimulation, number of eggs retrieved.
- there was uncertainty (inconclusive result due to wide 95% CI's) for live-birth rate per patient, amount of gonadotrophins used, multiple pregnancy rate per pregnancy, miscarriage rate per patient.

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

The **overall certainty of the evidence** is determined by the critical (as opposed to important) outcome with the lowest certainty (quality) of the evidence.

- **VALUES**

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified.

Panel discussion:

Patients (and clinicians) would generally strongly value (with probably no important uncertainty in or variability in) an

- a reduced risk for developing OHSS (with its associated morbidity and rarely mortality) .
- a reduced miscarriage rate per pregnancy

Patients (and clinicians) would generally mild to moderately value (with probably no important uncertainty in or variability in)

not having an increased incidence of side-effects.

- **BALANCE OF EFFECTS**

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Summary of evidence for GnRH agonist protocol: There was no difference in all outcomes except

- a **reduction in E2 level on day of hCG trigger, OHSS rate per patient, miscarriage rate per pregnancy favouring metformin.**
- **an increase in mild side-effects rate per patient if taking metformin.**

With respect to the no difference in outcomes:

- the meta-analyses **did not exclude that metformin is superior to placebo/no Rx for clinical pregnancy rate per patient** as the 95% CI excluded an important reduction in clinical pregnancy rate per patient with metformin.
- there was equivalence (due to narrow 95% CI's excluding an important difference between metformin and placebo / no treatment) for duration of ovarian stimulation, number of eggs retrieved.
- there was uncertainty (inconclusive result due to wide 95% CI's) for live-birth rate per patient, amount of gonadotrophins used, multiple pregnancy rate per pregnancy, miscarriage rate per patient.

For metformin, the balance of desirable effects in terms of a **reduction in E2 level on day of hCG trigger, OHSS rate per patient, & miscarriage rate per pregnancy** currently outweighs the undesirable effects of an **increase in mild side-effects rate per patient.**

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☒ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified.

Panel discussion:

Cost of oral metformin therapy small for up to 4 months.

Cost of managing OHSS moderate to large depending on severity and whether or not outpatient management or hospitalization required.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified.

Panel discussion:

There is no certainty of evidence for this.

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified.

Panel discussion:

Costs of oral metformin therapy are small for up to 4 months.

Costs of managing OHSS are moderate to large depending on severity and whether or not it involves outpatient management or hospitalization.

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☒ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified.

Panel discussion:

Limited impact.

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

Patients (and clinicians) probably likely to find the intervention (metformin) acceptable. However, some patients (and clinicians) may not find delaying IVF treatment for up to 4 months (if adjunct metformin treatment is started at such a time) acceptable despite the potential benefit of a reduction in the risk of developing OHSS.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☒ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

Probably feasible to sustain the option recommended and probably no important potential barriers to implementation of the recommendation (apart from patients unable to tolerate oral metformin due to side-effects which affect approximately 5% of patients).

Question 5.7.6

In women with PCOS, is In Vitro Maturation (IVM) effective for improving fertility outcomes?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	In women with PCOS, is In Vitro Maturation (IVM) effective for improving fertility outcomes?
Clinical leads (key contacts)	Dr Ho Manh Tuong Reproductive endocrinologist My Duc Hospital, HOPE Research Centre, Vietnam tuongho.ivfmd@gmail.com Prof Roger Hart Reproductive endocrinologist The University of Western Australia, Australia roger.hart@uwa.edu.au
Allocation ranking	Systematic review Level 1- New systematic review (with integrity check for all studies)

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women of any age, ethnicity and weight with PCOS diagnosed by Rotterdam, NIH or AEPCOS AND with or without coexisting infertility factors (other than anovulation). Also specifically identifying the 4 phenotypes where possible.	IVM treatment using no or minimal ovarian stimulation	Placebo, no intervention, other infertility treatment interventions (ie. aromatase inhibitor, metformin, clomiphene citrate, gonadotrophins, ovarian surgery) including IUI or IVF.	Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, amount of gonadotrophins used, duration of ovarian stimulation, maximum serum oestradiol level (or serum oestradiol level on the day of trigger), number of oocytes collected, single and multiple pregnancies, miscarriage rate, OHSS rate, other adverse events, quality of life, cost effectiveness. Number and/or percentage of metaphase II (mature) oocytes.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	English language. No date limit
Exclusion	Women without diagnosis of PCOS.	Placebo, no intervention or any intervention other than IVM.	Any intervention other than those listed in the inclusion criteria.	None	Non-evidence Based guidelines, non-systematic reviews, any study lower than a RCT.	

2. SEARCH STRATEGY

The search and screening for all GDG 5 questions were done together. Details can be found in the GDG 5 Methodology Appendix, including for:

- Databases
- Search Dates
- Search String(s)
- PRISMA flowchart
- Full list of included studies
- Full list of excluded studies with reasons for exclusion

Evidence processing: The literature search and screening were performed together in one Endnote library and Covidence project for all non-IVF, IVF and IVM fertility treatments in PCOS. Studies were selected by one reviewer/s in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. The articles were screened by title and abstract by one reviewer. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy. In total, 102 unique studies met inclusion criteria across all non-IVF, IVF and IVM questions, of which 57 were included in the guideline update following the integrity check (refer to methodology appendix for details).

Of these eligible 102 studies (57 after integrity assessment), **1 study met the inclusion criteria for this particular question** (Q.5.7.6.) on IVM, as detailed below.

Table of Included Studies

Zheng X, Guo W, Zeng L, Zheng D, Yang S, Xu Y, Wang L, Wang R, Mol BW, Li R, Qiao J. In vitro maturation without gonadotropins versus in vitro fertilization with hyperstimulation in women with polycystic ovary syndrome: a non-inferiority randomized controlled trial. Hum Reprod. 2022 Jan 28;37(2):242-253. doi: 10.1093/humrep/deab243. PMID: 34849920; PMCID: PMC9115328.

3. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year, country	Population/ PCOS criteria/ Setting/ CC sensitivity	Study Design	Intervention N	Intervention description	Comparison N	Comparison description	Follow Up	Outcomes	Pooled in MA?	RoB
Zheng 2022 China	Infertile women aged 20–38 years with PCOS and infertility scheduled for their first IVF attempt / academic infertility centre; **CC sensitivity NR**	RCT	IVF: 176	Unstimulated IVM	IVM: 175	Standard IVF with a flexible GnRH antagonist protocol (n=176)	1 cycle	Primary: ongoing pregnancy (leading to live birth, defined as a baby born live at ≥ 22 weeks of gestation within 6months of the first oocyte retrieval cycle after randomization) Secondary: implantation, **clinical pregnancy**, and time to ongoing pregnancy leading to live birth. Initial pregnancy diagnosis: positive pregnancy test (not specified). Confirmed by: gestational sac	No	Low

CC, clomiphene citrate; NR; not reported; MA, meta-analysis; RoB, risk of bias.

4. FINDINGS

Comparisons Included:

- **Comparison 1.** In vitro maturation (IVM) vs. standard in vitro fertilization (IVF)

COMPARISON 1. IVM vs. IVF

▪ EVIDENCE SUMMARY:

A single study by Zheng et al. (2022) compared IVM with standard IVF in infertile women aged 20–38 years with PCOS and infertility scheduled for their first IVF attempt at an academic infertility centre. Relevant outcomes included live birth rate per patient and per pregnancy, clinical pregnancy rate per patient, and miscarriage rate per pregnancy. This study had a low risk of bias, with high-quality methodology despite being unblinded due to the nature of the intervention/s.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Pooled meta-analysis was not possible due to having a single study. However, in comparing the differences between groups, IVM had a lower rate of live births and clinical pregnancies per patient compared with IVF. There were no differences in live birth rates or miscarriage rates per pregnancy. Certainty in the evidence is moderate for all outcomes, downgraded once for imprecision due to being derived from a single study with a modest sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P-value	Favours	Certainty
Live birth rate per patient	1	351	0.28 [0.18, 0.45]	<0.00001	**IVF** (live birth per patient is lower with IVM)	⊕⊕⊕◯ MODERATE
Live birth rate per pregnancy	1	351	0.64 [0.31, 1.33]	0.2	None	⊕⊕⊕◯ MODERATE
Clinical pregnancy rate- per patient†	1	170	0.26 [0.16, 0.40]]	<0.00001	**IVF** (clinical pregnancy is lower with IVM)	⊕⊕⊕◯ MODERATE
Miscarriage rate- per pregnancy	1	170	1.88 [0.93, 3.79]	0.08	None	⊕⊕⊕◯ MODERATE

†clinical pregnancy rate is confirmed by ultrasound detection of gestational sac/ fetal heart activity

Question 5.7.6

In women with PCOS, is In Vitro Maturation (IVM) effective for improving fertility outcomes?

BACKGROUND:

Where IVF is indicated in PCOS women, OHSS risks are increased with gonadotropin stimulation. IVM of oocytes limits or omits ovarian stimulation prior to oocyte retrieval, with maturation of oocytes post retrieval, avoiding OHSS risk (1). The definition of an IVM cycle requires clarification (2), the term IVM treatment should include only the maturation of immature cumulus oocyte complexes from antral follicles, with or without HMG/FSH priming, but without hCG/GnRH trigger before oocyte retrieval.

Recently, there have been RCTs published relating to the efficacy of IVM versus IVF/ICSI in PCOS women.

Zheng et al., conducted (3) a large RCT (n=351), that compared IVM (without FSH priming) vs. conventional IVF/ICSI for PCOS women. The results showed that IVM procedure without additional gonadotropin resulted in a lower ongoing pregnancy (leading to live birth) within 6 months after randomization compared to standard IVF treatment (22.3% vs. 50.6%, p<0.001). Moderate-severe OHSS did not occur in the IVM group, while in the IVF group, ten women (5.7%) had moderate OHSS and one woman (0.6%) had severe OHSS.

Vuong et al., in 2020 (4) conducted a large RCT (N=546), IVM (with FSH priming) vs. conventional IVF/ICSI for high AFC women, in which majority of patients are PCOS women (more than 70%). The results showed that live birth rate per single transfer did not differ significantly between the IVM and IVF/ICSI groups, 35.2% vs. 43.2%, RR 0.81 (95% CI:0.66 - 1). There was no statistically significant difference in live birth rate after first transfer between the IVM and IVF/ICSI groups in patients with PCOS (35.7% vs. 41.1%; P=0.27). Cumulative ongoing pregnancy rates at 12 months after randomization were 44.0% in the IVM group and 62.6% in the IVF/ICSI group (absolute risk difference –18.7%; 95% CI –27.3%, –10.1%). Ovarian hyperstimulation syndrome did not occur in the IVM group, versus two cases in the IVF/ICSI group.

IVM could provide a comparable live birth rate per single transfer to conventional IVF for PCOS women, but a significantly lower cumulative live birth rate per started cycle. IVM could completely avoid OHSS in both studies (3, 4).

One small RCT, (N=36) (5), showed that FSH priming before oocyte retrieval might improve the maturational potential of the oocytes and the implantation rate of the cleaved embryos. Another small RCT, N=80 (6), showed that two-step IVM improved maturation and clinical pregnancy rates versus one-step standard IVM in PCOS women.

A RCT, that consisted of 40 participants (7) compared fresh embryo transfer versus freeze-only after IVM in women with high antral follicle count, in which, majority of patients are PCOS women. The live birth rate was significantly higher in the freeze-only than that in the fresh ET group (60% versus 20%; p = 0.02). The finding suggested that the effectiveness of IVM could be improved considerably by using a freeze-only strategy followed by frozen ET in subsequent cycles. Additional data from the author demonstrates that all women met PCOS criteria.
Observational data also suggests that fresh embryo transfers are inferior to frozen embryo transfers.
A recent study (8) followed-up of babies born to women who participated in a randomized controlled trial comparing IVM and IVF, in which developmental assessments were performed on 231 children over 24 months of follow-up. The study is still ongoing and once the final results are available, the evidence base for this question will be updated.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Comparison 1. IVM versus stimulated IVF	⊕⊕⊕◯ MODERATE
Comparison 2. Frozen embryo transfer versus Fresh embryo transfer after IVM	⊕◯◯◯ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

In vitro maturation (IVM) of oocytes versus standard stimulated in vitro fertilization (IVF).

EVIDENCE-BASED RECOMMENDATION(S)

EBR: The use of IVM and ICSI could be considered in women with PCOS, as an alternative to a stimulated IVF / ICSI cycle, where an embryo is frozen and replaced in a subsequent embryo transfer cycle, acknowledging there is no risk of Ovarian Hyperstimulation Syndrome, but a lower cumulative live birth rate.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☒ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

CONSENSUS RECOMMENDATION(S)

CR: The use of IVM and ICSI could be considered prior to stimulated IVF/ ICSI cycles acknowledging both benefits and limitations.

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☒ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

1. IVM should only be considered in services with sufficient expertise, and advocacy is needed for regional centres of expertise.
2. IVM could be offered as an option in women with prior severe Ovarian Hyperstimulation Syndrome and where the risk of severe Ovarian Hyperstimulation Syndrome is deemed unacceptably high, provided expertise in the IVM technique exists.
3. Evidence suggests that IVM and ICSI is less effective than standard IVF/ICSI in terms of clinical pregnancy per patient and live birth rate per patient.

GRADE CONSIDERATIONS

Justifications:

IVM when compared with stimulated IVF in PCOS women, results in a significantly lower cumulative live birth rate per cycle and IVM completely avoids OHSS

Subgroup considerations:

None

Implementation considerations:

While IVM is no longer considered experimental, potential limitations in offering IVM are the costs of implementation and the expertise related to both the surgical procedure and the laboratory consumables and processes.

Monitoring and evaluation considerations:

If IVM is to be implemented, services should consider:

Identification of an ideal cohort of patients
IVM expertise
Monitoring and benchmarking laboratory parameters (oocytes maturation, blastocyst and embryo utilisation rates)

Research priorities:

The optimal IVM protocol for PCOS women.

Long term health of offspring with IVM

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

Panel discussion:

IVM is a treatment option that could be considered for PCOS patient prior to stimulated IVF/ICSI, where available.

Safer, simpler, less costly with reasonable fertility outcomes.

- **UNDESIRABLE EFFECTS**

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

The cumulative live birth rates are lower after IVM.

- **CERTAINTY OF THE EVIDENCE**

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☒ Moderate	☐ High

Research evidence:

Panel discussion:

- **VALUES**

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☒ No important uncertainty or variability

Research evidence:

Panel discussion:

Availability of IVM technique, facility and expertise

- **BALANCE OF EFFECTS**

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

Panel discussion:

IVM might have lower cost compared to stimulated IVF.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No evidence.

Panel discussion:

- **EQUITY**

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Varies according to geographical location.

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified.

Panel discussion:

Are key stakeholders likely to find the recommendation acceptable, given the relative importance they attach to the desirable and undesirable consequences of implementing the recommendation; the timing of the benefits, harms and costs; and their moral values? This includes considering patients values and preferences.

Both patients and services could consider the IVM option if available, for safety, simplicity, less cost and reasonable result.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

Panel discussion:

Varies according to facility and expertise.

GDG 5

Question 5.8.

In women with PCOS, is inositol alone or in combination with other therapies, effective for management of reproductive outcomes? (fertility outcomes only)

BACKGROUND:

Women with PCOS are commonly treated with insulin sensitizing agents due to insulin resistance and hyperinsulinemia, common features of the syndrome both in obese and non-obese women. Due to gastrointestinal side effects related to metformin and more serious adverse effects related to glitazones other medical options are needed in treating insulin resistance in women with PCOS. Inositol (myo-inositol and di-chiro inositol) is a nutritional supplement that acts as a second messenger and has been shown to play a role in insulin signalling transduction. Previous studies have suggested improvement of insulin resistance and hormonal profile in women with PCOS during inositol treatment (1, 2). Furthermore, some data also suggests inositol may be effective in decreasing risk for gestational diabetes (3).

Please see the background section on Q 4.7 for more details.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Di-chiro inositol (DCI) vs. Placebo - single trial	⊕⊕◯◯ LOW
Comparison 2. Myo-inositol (MI) + FA vs. Folic Acid (FA)	⊕◯◯◯ VERY LOW
Comparison 3. MI vs. Metformin	⊕⊕◯◯ LOW
Comparison 4. MI + DCI (higher dose) vs. MI + DCI (lower dose)	⊕◯◯◯ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)
Comparison 1: DCI vs placebo, Comparison 2: MI+FA vs FA Comparison 3: MI vs. Metformin Comparison 4: MI + DCI (higher dose) vs. MI + DCI (lower dose)
EVIDENCE-BASED RECOMMENDATION(S)

EBR: Inositol in any form alone, or in combination with other therapies, should be considered experimental therapy in women with PCOS, with benefits and risks currently too uncertain to recommend the use of these agents as fertility therapies.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

There is limited evidence with uncertain results, on the effect of inositol on ovulation, clinical pregnancy and live birth rates.

Side effects and safety are not fully documented for inositol

Women need to be aware that these agents have limited regulation with variable dose, quality, consistency and combination with other agents.

Women's personal goals and preferences should be considered when discussing complimentary therapies

GRADE CONSIDERATIONS

Justifications:

Most studies having a high to moderate risk of bias are small and heterogeneous with wide confidence intervals and evidence is uncertain.

Subgroup considerations:

Implementation considerations:

Monitoring and evaluation considerations:

Research priorities:
The effect, optimal formulations and dose of inositol on ovulation and critically important outcomes of clinical pregnancy and live birth needs to be established in large high quality trials.

The side effects and safety of inositol needs to be determined through large randomised trials,

GDG 5

Question 5.9.

In women with PCOS, are anti-obesity pharmacological agents alone or in combination, effective for management of reproductive outcomes? (fertility outcomes only)

BACKGROUND:

Obesity is a significant concern for many affected adolescents and women with PCOS. Whilst lifestyle change has a key role in the management of obesity, the role of anti-obesity pharmacological agents in achieving weight loss and potential associated health benefits is increasingly recognised with recent guidelines (1,2), and systematic reviews (3) in the area. However, the role of these agents in PCOS and in reproductive-aged women remains unclear.

Semaglutide, liraglutide, phentermine/topiramate, naltrexone/bupropion and orlistat are approved anti-obesity medications in adults, each of which has been compared to placebo in randomised controlled trials. These medications are increasingly being used in adults for assistance with weight loss. However, there is limited available data in women with PCOS. Consensus recommendation has been made by GDG to manage obesity independent of PCOS with these medications.

COMPARISONS (option versus other option)
Anti-obesity versus placebo Anti-obesity versus lifestyle
CONSENSUS RECOMMENDATION
We recommend using anti-obesity agents in PCOS for reproductive outcomes only in research settings to establish the efficacy and safety.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☒ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

1. SEARCH AND SELECTION CRITERIA

Table 1.1. Search details	
Search strategy source: ***2018 PCOS Guideline Technical Report***	
Evidence source	**Date of search**
Medline (Ovid)	01/01/2017 until 08/07/2022
PsychInfo (Ovid)	01/01/2017 until 08/07/2022
EMBASE (Ovid)	01/01/2017 until 10/07/2022
All EBM (Ovid)	01/01/2017 until 10/07/2022
CINAHL	01/01/2017 until 10/07/2022
Any subsequent updates - enter database and date: Not applicable	

Table 1.2. Questions addressed by this search:	
Q 5.3	In women with PCOS, are aromatase inhibitors effective for improving fertility outcomes?
Q 5.4	In women with PCOS, is clomiphene citrate effective for improving fertility outcomes? In women with PCOS, is metformin effective for improving fertility outcomes? In women with PCOS and a BMI<30-32, what is the effectiveness of metformin compared to clomiphene citrate for improving fertility outcomes?
Q 5.5	In women with PCOS, are gonadotrophins effective for improving fertility outcomes?
Q 5.6	In women with PCOS, is ovarian surgery effective for improving fertility outcomes?
Q 5.7	In women with PCOS, is stimulated IVF/ICSI effective for improving fertility outcomes?
Q 5.7.1	In women with PCOS undergoing IVF/ICSI treatment, is the GnRH antagonist protocol or GnRH agonist long protocol the most effective for improving fertility outcomes?
Q 5.7.2	In women with PCOS undergoing GnRH antagonist IVF/ICSI treatment, is the use of hCG trigger or GnRH agonist trigger the most effective for improving fertility outcomes?
Q 5.7.3	In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, does the choice of FSH affect fertility outcomes?
Q 5.7.4	In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, is exogenous LH treatment during IVF/ICSI effective for improving fertility outcomes?
Q 5.7.5	In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, is adjuvant metformin effective for improving fertility outcomes?
Q 5.7.6	In women with PCOS, is In Vitro Maturation (IVM) effective for improving fertility outcomes?

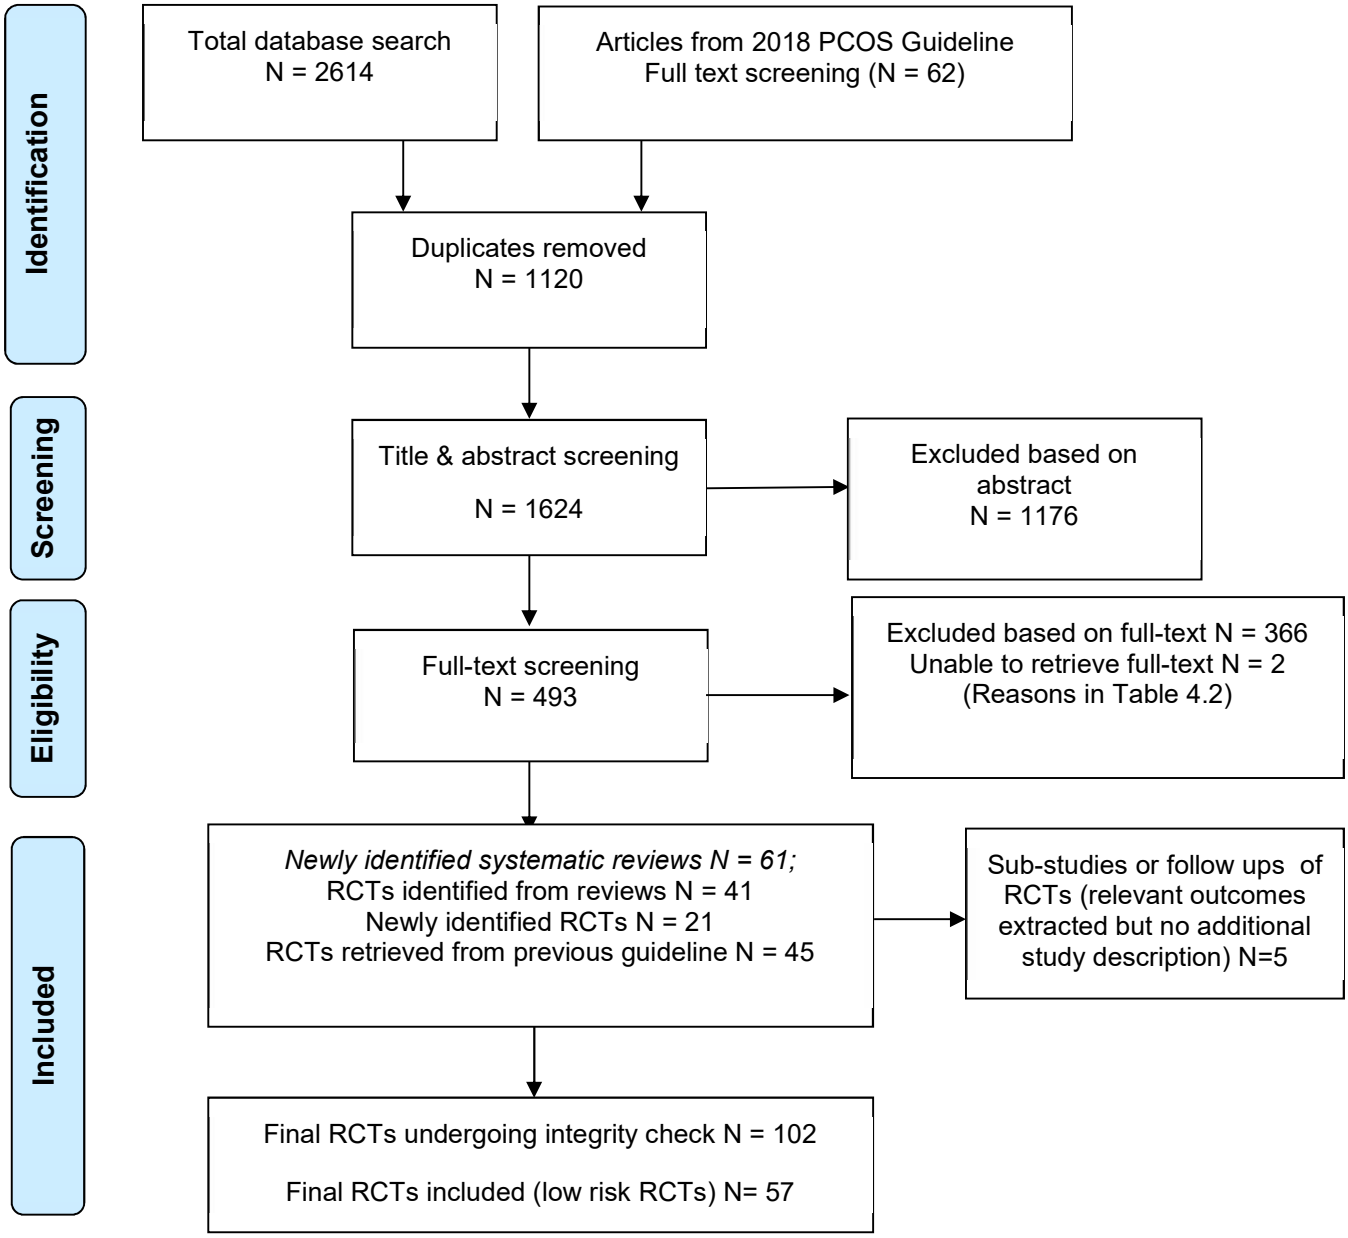
Evidence processing: Literature search and screening were performed together in one Endnote library and Covidence project for all non-IVF, IVF and IVM fertility treatments in PCOS. Studies were screened and selected by title and abstract by one reviewer in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. When a decision could not be made based on title and abstract alone, full text was retrieved. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy.

In total, 107 studies met inclusion criteria for evidence review for all non-IVF fertility, IVF and IVM treatment in PCOS. Of these, five were sub-studies or follow-ups of published RCTs. Hence, a total of 102 unique studies were included across all of GDG 5.

Of the 102 eligible studies, 57 were included in the guideline update following the integrity check (refer to the methodology appendix of the guidelines for details).

2. SEARCH RESULTS - PRISMA flowchart for search of all non-IVF, IVF and IVM randomised controlled trials in PCOS



3. STUDY INCLUSION

NB: Categories are not weighted equally; some studies may be ranked as Awaiting Classification or Not Included due to more critical concerns, despite achieving a low score on the checklist. Final decisions are made by the integrity committee on the basis of a majority vote.

Studies classified as 'Awaiting Classification' are where author(s) have responded indicating an intention to clarify the concerns raised. Studies classified as 'Not included' are those where the author(s) did not respond to emails requesting clarifications for concerns raised.

Table 4.2. Integrity assessment for the inositol search results (Q 5.8.), conducted using the TRACT checklist (Mol, et al. 2023)

QUALITY APPRAISALS – GDG 5

Study ID	*Amer 2017*
Study Citation	*Amer SA, Smith J, Mahran A, Fox P, Fakis A. Double-blind randomized controlled trial of letrozole versus clomiphene citrate in subfertile women with polycystic ovarian syndrome. Hum Reprod. 2017 Aug 1;32(8):1631-1638. doi: 10.1093/humrep/dex227. PMID: 28854590; PMCID: PMC5850470.*
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Age (y):* *letrozole: 28.3 (4.4) vs CC: 28.1 (4.2)* *BMI (kg/mO):* *letrozole: 27.5 (23.4 - 32.2) vs CC: 27.7 (23.0 - 31.0)* *"Eligible participants were women aged 18–39 years with BMI ≤35 kg/m2, anovulatory infertility, and a diagnosis of PCOS based on Rotterdam consensus (two of three criteria: oligo-/anovulation, hyperandrogenaemia and sonographic appearance of polycystic ovaries)"*
PCOS diagnostic criteria	*Rotterdam*
Presence of infertility	*Duration (y):* *1.5 (1.0 - 2.0) for both groups*
Presence of other condition/s	*"After the crossover, 45 women with CC-resistance/failure were allocated to letrozole and 31 with letrozole-resistance/failure were allocated to CC"*
Medication History	*"We excluded patients who have received OI within 6 months and those with uncontrolled thyroid disease or hyperprolactinaemia."*
N per group	*N=159 women randomised* *n= 79 (CC)* *n=80 (letrozole)*
Setting	*Fertility Unit, Teaching Hospital (single centre)*
Intervention	*letrozole was prescribed (by the senior investigator, SA) orally daily for 5 days starting on Days 2 – 4 of a menstrual period or a progestogen-induced bleed (medroxy-progesterone acetate 10 mg twice daily for 5 days).* *The starting dose was 1 tablet/day (letrozole 2.5 mg) and if ovulation was not achieved, the dose would be doubled in the second cycle.*

Comparison	*CC was prescribed daily for 5 days starting on days 2 – 4 of a menstrual period or a progestogen-induced bleed (medroxy-progesterone acetate 10mg twice daily for 5 days). The starting dose was 1 tablet/day (50 mg) and if ovulation was not achieved, the dose would be doubled in the second cycle.* *Participants who failed to ovulate on the maximum dose (2 tablets) or to conceive after 6 ovulatory cycles were crossed over to the other drug (after a 6-week wash-out period) following the same procedures as with the first drug.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*clinical pregnancy (diagnosed by ultrasonographic visualisation of a gestational sac) rate per participant on primary treatment (before the cross-over).* *secondary outcomes included ovulation, live birth, pregnancy by ovulating participant, pregnancy by strata, mono-ovulation, endometrial development (thickness and grades), pregnancy outcome and pregnancy complications. Other outcomes included pregnancy and live birth rates on secondary and overall (primary and secondary) treatments.*	
Follow up Duration	*Six ovulatory cycles* *6-week break until crossover* *Duration of follow-up after crossover not reported*	
Summary Result/s	*"Amongst the 159 participants included in the intention-to-treat analysis, four women conceived before treatment and six were lost-to-follow-up. The remaining 149 participants (74 on CC and 75 on letrozole) completed at least the first treatment. Women receiving letrozole achieved a significantly (P = 0.022; absolute difference [95% confidence interval] 18% [3–33%]) higher pregnancy rate (61.%) than those on CC (43%). The median number of treatment cycles received until pregnancy was significantly (log rank P = 0.038) smaller with letrozole (4[3–5] cycles) compared to CC (6[4–7] cycles). LB rates were not statistically (P = 0.089) different between the two groups, although there was a trend towards higher rates on letrozole (48.8%) compared to CC (35.4%). After the crossover, pregnancy and LB rates on letrozole (n = 45; 28.9 and 24.4%, respectively) were not statistically (P = 0.539 and P = 0.601) different from CC (n = 31; 22.6 and 19.4%)."*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"Would letrozole as a primary ovulation induction agent generate better pregnancy rates than clomiphene citrate (CC) in subfertile women with anovulatory polycystic ovarian syndrome (PCOS)?"*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	

Inclusion criteria		Yes	*"eligible participants were women aged 18 – 39 years with BMI e 35 kg/m2, anovulatory infertility, and a diagnosis of PCOS based on Rotterdam consensus (two of three criteria: oligo-/anovulation, hyperandrogaenemia and sonographic appearance of polycystic ovaries) (Rotterdam ESHRE/ASRM-sponsored PCOS consensus workshop group, 2004). Diagnosis of oligo-/anovulation was based on a menstrual pattern of oligo-/amenorrhoea (cycle > 35 days) and/or a low mid-luteal serum progesterone concentration. Hyperandrogenaemia was diagnosed either clinically (acne/hirsutism) or biochemically (testosterone f 2.5 nmol/l or free androgen index [FAI] f 5). Ultrasound criteria included f 12 follicles (2 – 9 mm) and/or an ovarian volume of > 10 ml (Jonard et al., 2003). All participants had proven patency of at least one fallopian tube and normal semen analysis of their male partners (WHO, 1999)."*
Exclusion criteria		Yes	*"We excluded patients who have received OI within 6 months and those with uncontrolled thyroid disease or hyperprolactinaemia. Patients with marked hyperandrogaenemia were screened for adult onset congenital adrenal hyperplasia (by measuring serum 17- g -hydroxyl-progesterone concentration) and Cushing syndrome (by measuring urinary free cortisol)."*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*"An independent pharmacist randomly allocated participants to letrozole or CC, in 1:1 ratio according to a randomisation list created by the trial statistician using NQuery Advisor v6.0 software. Randomization was stratified by patients' BMI (non-obese < 30 kg/m2 and obese 30 – 35 kg/m2) using mixed block sizes."*
	Was allocation to intervention group concealed?	Yes	*"An independent pharmacist randomly allocated participants to letrozole or CC, in 1:1 ratio."*
PERFORMANC	**Were patients blind to intervention group?**	Yes	*"Investigators, patients, outcome assessors and the statistician were blinded to the allocation of participants."*

	Were investigators and care providers blind to intervention group?	Yes	*"Investigators, patients, outcome assessors and the statistician were blinded to the allocation of participants."*
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes	*"Investigators, patients, outcome assessors and the statistician were blinded to the allocation of participants."*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*"3 women in the CC group discontinued treatment due to failing to attend; also 3 women discontinued treatment in the letrozole arm (1 due to social reasons, 1 failed to attend, 1 withdrew consent)."*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*all women randomised were also analysed in the ITT analysis.* *""Intention-to-treat (ITT) analysis included all randomised subjects, regardless of whether or not they received the study drug. Per protocol (PP) analysis included all randomised subjects who received the study drug and were not lost to follow-up. Participants who were lost to follow-up were assumed neither to be pregnant nor to have given LB in the ITT analysis."*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	*All expected outcomes reported*

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*“Baseline demographic, clinical and endocrine characteristics of the two trial groups were similar (Table I).”*
	If confounding was present, was it controlled for?	No	*No confounding was observed*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	*Sponsored by the University of Nottingham.* *“The authors have no conflicts of interest.”*
	Was the study sufficiently powered to detect any differences between the groups?	Partial	*“…"to detect a clinically significant difference of 20% between the previously reported pregnancy rate of CC (˜35%) and letrozole with a two-sided 5% significance level and power of 80%, a sample size of 212 participants (106 per arm) was required (Dickey and Holtkamp, 1996;Kousta et al., 1997; Imani et al., 2002)."* *“Although, the difference was statistically significant, the power of the study was only 65%. Based on these data, the sample size was recalculated as 75 participants per arm to achieve 80% power with a two-sided 5% significance level. We aimed to recruit 160 participants to allow for 5% drop-outs.”*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Low	

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	

Study ID	***Atay 2006***
Study Citation	Atay, V., Cam, C., Muhcu, M., Cam, M., & Karateke, A. (2006). Comparison of letrozole and clomiphene citrate in women with polycystic ovaries undergoing ovarian stimulation. *Journal of international medical research*, *34*(1), 73-76.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Group 1 (CC) (n=55)* *Age (years) 26.2 ± 1.1* *BMI (kg / m^2) 25.8 ± 1.7* *Group 2 (Letrozole) (n=51)* *Age (years) 27.1 ± 0.9* *BMI (kg / m^2) 26.1 ± 1.91*
PCOS diagnostic criteria	Not reported. Apparently, all women had a prior diagnosis of PCOS
Presence of infertility	*All women had no known cause of infertility* *Group 1 (CC) (n=55)* *Mean fertility period (years) 2.4 ± 0.9* *Group 2 (Letrozole) (n=51)* *Mean fertility period (years) 2.2 ± 0.7*
Presence of other condition/s	*history of oligo- or amenorrhoea*
Medication History	*Not reported*
N per group	*N=106* *Letrozole (n=51)* *CC (n=55)*
Setting	*Probably a research/training hospital in Istanbul, Turkey*
Intervention	2.5 mg letrozole daily for 5 days beginning on day 3 of the menstrual cycle* * Data suggest each patient had one treatment cycle
Comparison	100 mg CC daily for 5 days beginning on day 3 of the menstrual cycle*

	* Data suggest each patient had one treatment cycle	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Follicular development (*transvaginal ultrasound from day 10 onwards) *Pregnancy (*diagnosed using □-hCG levels obtained 2 weeks after timed intercourse, and ultrasound was performed 2 –4 weeks after a positive pregnancy test to confirm clinical pregnancy by the presence of cardiac activity.)	
Follow up Duration	Follow-up time not reported.	
Summary Result/s	*The number of mature follicles was significantly lower, but endometrial thickness and ovulation and pregnancy rates were significantly higher in the letrozole group than in the CC group.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"*In this prospective, randomized study, the effect on ovulation induction of a standard dose of letrozole was compared with CC treatment in women with PCOs in order to investigate the role of letrozole as a first-line treatment."
Does the study have specified inclusion/exclusion criteria?	Partial	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Partial	
Inclusion criteria	Partial	*"*Women with primary infertility and PCOs with no other known cause of infertility were enrolled into the study. All patients had a history of oligo- or amenorrhoea and ovaries with at least 10 subcapsular cysts 2 – 10 mm in diameter and hyperechogenic stroma."
Exclusion criteria	No	."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Not reported	
SELECTION BIAS **Was allocation to intervention group concealed?**	Not reported	

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	Not reported	*The number randomised had been analysed and therefore likely not dropped off*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*Only BMI, Fertility period and age have been reported and similar at baseline*
	If confounding was present, was it controlled for?	Not applicable	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes	The study intended to just compare the effect on ovulation induction of a standard dose of letrozole with CC treatment in women with PCOs
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		High	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	***Banerjee Ray 2012***
Study Citation	Comparison of efficacy of letrozole and clomiphene citrate in ovulation induction in Indian women with polycystic ovarian syndrome. Ray P, Ray A, Chakraborti PS. Archives Gynecology and Obstetrics (2012) 285:873–877
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Infertile 18-35 year old Indian women • Age: CC=29 Median, 20-35 Range; letrozole=28 Median, 19-35 Range • BMI: CC=28.5 Median, 24.2-33.6 Range; letrozole=28.8 Median, 23.2-34.6 Range
PCOS diagnostic criteria	Rotterdam 2003 “The major criteria for the diagnosis of PCOS were oligo- and/or anovulation, clinical or biochemical signs of hyperandrogenism and polycystic ovaries, which is in accordance with the revised 2003 Rotterdam Criteria for the diagnosis of PCOS”
Presence of infertility	Duration of infertility in years (mean) 2.4 (CC) 2.2 (Letrozole)
Presence of other condition/s	*Not reported* patients with a history of liver and kidney failure, cardiovascular diseases, diabetes or patients who consumed metformin or drugs effecting insulin secretion or clomiphene citrate in the previous 2 month were not included in the study
Medication History	*Not reported*
N per group	N=147 Randomised: 69 in letrozole group, 78 in clomiphene citrate group Analysed: 147
Setting	Obstetrics and gynaecology hospital, India. Recruitment: Jan 2008 to Dec 2009 = 2 years
Intervention	Letrozole 2.5mg day 3-7 of menstrual cycle
Comparison	Clomiphene citrate 100mg
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Rate of ovulation (day 21 serum “progesterone >10ng/ml considered ovulatory”), average follicular diameter on day 16, number of mature follicles per cycle, oestradiol on day of hCG administration (≥100pg/ml satisfactory), endometrial thickness (>8mm), pregnancy rate. To evaluate physiological maturity, serum estradiol (E2) level was measured when the follicle was assumed to be anatomically mature.

		Follicular diameter/rupture was measured using ultrasonography	
Follow up Duration		*Unclear* "Overall, 288 ovarian cycles were studied in 147 patients (132 cycles in 69 patients in the letrozole group and 156 cycles in 78 patients in clomiphene group). Doesn't say how many cycles women received treatment for.	
Summary Result/s		"The pertinent results of the study are as follows: on the day of hCG injection, mean E2 level was significantly higher in the clomphene citrate group (817 ± 286.70 pg/ml) in comparison with letrozole group (444.03 ± 85.42 pg/ml). Mean endometrial development was 8.72 ± 1.41 mm in the letrozole and 8.78 ± 1.16 mm in the clomiphene group (P = 0.004)."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	*"*The objective of this study was to compare the efficacy of letrozole versus clomiphene citrate as an ovulation induction drug in polycystic ovarian syndrome (PCOS) patients of Indian origin."
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	*Infertile PCOS patients*
Exclusion criteria		Yes	Hyperprolactinaemia, thyroid disorder, male factor, tubal factor infertility (endometriosis, PID) Liver and kidney failure, cardiovascular disease, diabetes Consumption of metformin, drugs with effects on insulin secretion, clomiphene citrate in 2 months before study
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Not reported	*"*The patients were randomly assigned to receive either letrozole (2.5 mg) or clomiphene citrate (100 mg) from day 3 to day 7 of menstrual cycle."
	Was allocation to intervention group concealed?	No	*"*A comparative, prospective, phase III, open labelled trial Study….."
PER FOR	**Were patients blind to intervention group?**	No	*"*A comparative, prospective, phase III, open labelled trial Study….."

	Were investigators and care providers blind to intervention group?	No	*"*A comparative, prospective, phase III, open labelled trial Study….."
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	*"*A comparative, prospective, phase III, open labelled trial Study….." No details given. In the acknowledgments, they thank the Department of Radiology "for their assistance in serial folliculometry". Unclear whether they were blind or independent, but the outcomes measured are fairly objective.
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Not reported	*No information available*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*0%*	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*Not relevant. No drop-outs*
REP ORT	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Not reported	
	If confounding was present, was it controlled for?	Not reported	

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	"Conflict of interest The authors hereby declare that they have not received any financial support for this studyand there is no conflict of interest."
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	*Not much statistical information* "Statistical analysis, Chi square test and student's t test were performed using SPSS version 15. A P value of\0.05 was considered statistically significant."
	If statistical analysis was undertaken, was this appropriate?	Yes	Table 2 provides summary of outcome results with simple statistical analysis The study intended to just compare the two interventions
COMMENTS		Unclear how many cycles treatment was given for and unclear length of follow up. Less data in terms of baseline and outcomes compared with other, similar papers. No documentation of side effects or cost analysis.	
What is the overall risk of bias?		High	*High* No details of randomisation technique. Some lack of clarity as documented information
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	*Bansal 2020*
Study Citation	*Bansal S, Goyal M, Sharma C, Shekhar S. Letrozole versus clomiphene citrate for ovulation induction in anovulatory women with polycystic ovarian syndrome: A randomized controlled trial. Int J Gynaecol Obstet. 2021 Mar;152(3):345-350. doi: 10.1002/ijgo.13375. Epub 2020 Oct 14. PMID: 32920843.*
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*infertile women with PCOS* *Age (years)* *LET: 27.0.9±3.56* *CC: 26.0±3.97* *BMI (kg/m2)* *LET: 23.90±3.57* *CC: 23.10±3.64*

PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Duration of infertility (years)* *LET: 3.9±2.3* *CC: 3.4±2.3*
Presence of other condition/s	*NR*
Medication History	*Those who had received ovulation induction in the previous 6 months were excluded*
N per group	*N=90* *Letrozole n=45* *Clomiphene citrate n=45*
Setting	*Tertiary care teaching institute*
Intervention	*Letrozole:* *Given as 2.5 mg once daily for 5 days (from day 2 to 6) after spontaneous or progesterone-induced bleeding and increased by 2.5 mg every cycle up to a maximum of 7.5 mg in each subsequent cycle if ovulation did not occur.* *When size of dominant follicle reached more than 18 mm, human chorionic gonadotropin (hCG) 5000 IU was given as a trigger intramuscularly for ovulation.*
Comparison	*Clomiphene citrate:* *Given as 50 mg once daily for 5 days in a similar fashion and increased by 50 mg every cycle up to a maximum of 150 mg in each subsequent cycle if ovulation did not occur.* *When size of dominant follicle reached more than 18 mm, human chorionic gonadotropin (hCG) 5000 IU was given as a trigger intramuscularly for ovulation.*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary: endometrial thickness (ET)* *Secondary: ovulation rate, monofollicular development, pregnancy rate, and time to pregnancy assessment.* *Pregnancy defined by detection of urinary hCG after 7 days of missed period and or detection of gestational sac by ultrasound. Ovulation defined as the presence of free fluid in the pouch of Douglas and collapsed follicle on transvaginal ultrasound and/or day 21 serum progesterone value of at least 3 ng/mL.*
Follow up Duration	*Maximum of three cycles*
Summary Result/s	*“Mean endometrial thicknesses were 9.86 ± 2.32 mm and 9.39 ± 2.06 mm with letrozole and CC, respectively (P=0.751). Cumulative ovulation rates were 86.7% and 85.2% with letrozole and CC, respectively (P=0.751). Pregnancy was achieved in 42.2% of*

	women in the letrozole group and 20.0% of women in the CC group (P=0.04). *Monofollicular development was seen in 68.4% of ovulatory cycles in the letrozole group compared with 44.8% in the CC group (P=0.000). Mean time to achieve pregnancy was significantly shorter (log rank P=0.042) with letrozole (9.65 weeks) than with CC (11.07 weeks).”*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	“To compare the efficacy of letrozole and clomiphene citrate (CC) for ovulation induction in infertile women with polycystic ovarian syndrome (PCOS).” *“Hence, we conducted this randomized controlled trial to compare the therapeutic efficacy of letrozole and CC among Indian women presenting with anovulatory infertility due to PCOS using the recommended incremental dosing of both drugs with clearly stated study end points.”*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	*“Eligible participants were women aged 18–35 years with anovulatory infertility due to PCOS diagnosed by Rotterdam criteria,16 which entails finding any two of the following* *(1) ovarian dysfunction, (2) androgen excess identified either by raised modified Ferryman-Gallwey score or raised serum testosterone, and (3) polycystic ovarian morphology on ultrasound.”*
Exclusion criteria	Yes	*“Additional workup included partner’s semen analysis, premenstrual endometrial biopsy, and tubal patency test. Women with an abnormality in any of the above tests were excluded from the study. Those with thyroid disorders and prolactin excess, with a major medical illness, and those who had received ovulation induction in the previous 6 months were also excluded.”*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*"Random sequence was generated online and was kept in sequentially numbered, opaque, sealed envelopes."*
	Was allocation to intervention group concealed?	Yes	*"Random sequence was generated online and was kept in sequentially numbered, opaque, sealed envelopes."*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	No	*"Another limitation of the index study is absence of blinding of the participants. However, this is unlikely to have affected the results as most of the outcomes studied are highly objective in nature."*
	Were investigators and care providers blind to intervention group?	Partial	*Patients not blinded, therefore most probably the care providers weren't* *If the investigator was the outcome assessor, he was blinded. Otherwise, not.*
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes	*"This was a single center, double arm, assessor masked, randomized controlled trial."* *"The senior consultant who performed transvaginal ultrasound for outcome assessment and the statistician were blinded to treatment allocation."*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*"In total, 205 women were approached for enrollment; 90 were randomized and 80 completed the study. A total of 213 cycles of ovulation induction were carried out in 90 women, out of which 98 cycles were in the letrozole group and 115 cycles were in the CC group"* *4 (8.8%) dropped out in intervention (LET)* *6 (13.3) dropped out in control (CC)*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*"Analysis was based upon intention-to-treat (ITT) as well as per protocol, and results of both analyses are presented."* *"Participants who were lost to follow up were assumed neither to have ovulated nor to have conceived in the ITT analysis."*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"Baseline characteristics of both groups were comparable"*
	If confounding was present, was it controlled for?	No	*No confounding identified*
IER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	*"The authors have no conflicts of interest."*

	Was the study sufficiently powered to detect any differences between the groups?	Yes	*"Sample size calculation was based on the difference between the mean ET with CC and and that with letrozole on the day of hCG administration.17 A sample size of 90 (45 in each arm) was targeted to be able to detect a difference of 15% in ET between two groups, with 80% power and α (type 1 error) set at 0.05."*
	If statistical analysis was undertaken, was this appropriate?	Yes	*"Student's t test was used to analyze normally distributed data and Mann-Whitney U test was used for non-normally distributed data. For categorical variables, χ2 test was used at a two-sided significance level of 0.05 for testing the differences between two groups. The lengths of time (weeks) from commencing ovulation induction to pregnancy were compared using a Kaplan-Meier plot and significance used a log rank test."*
COMMENTS			
What is the overall risk of bias?		High	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*Some of the outcomes (e.g. pregnancy rate) may be low risk due to the objective nature of assessment.*	

Study ID	*Bayar 2006*
Study Citation	Bayar, U., S. Kiran, et al. (2006). "Use of an aromatase inhibitor in patients with polycystic ovary syndrome: a prospective randomized trial." Fertility and sterility 86(5): 1447-51.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Anovulatory, infertile patients with PCOS who were therapy naïve. "In this study, we compared letrozole with CC as a first-line therapeutic agent for ovulation induction in patients with PCOS. In conclusion, in this study, we showed that letrozole is as effective as CC in PCOS patients who previously have not been treated with other ovulation-induction agents" Mean age: letrozole = 32.2 ± 3.9 CC = 30.6 ± 4.09, p=0.09 BMI not reported but women with a BMI > 25 were excluded.

PCOS diagnostic criteria	PCOS patients diagnosed by using the Rotterdam criteria.
Presence of infertility	Duration of infertility (years) Letrozole: 5 (1–10) CC: 3 (1–11) *Median (range)*
Presence of other condition/s	*Tubal, peritoneal, and uterine causes of infertility were excluded by hysterosalpingography, laparoscopy, or transvaginal ultrasonography (LOGIQ 7 Scanner, GE Medical Systems, Milwaukee, WI).*
Medication History	*Not reported*
N per group	Eligible and randomised – 80 Letrozole – 40, 2 lost to follow up (5%) CC - 40, 4 lost to follow up (10%)
Setting	Outpatient clinics of the Infertility and Reproductive Medicine Unit of the Zonguldak Karaelmas University Hospital (Zonguldak, Turkey) during the study period of 2004 through 2005.
Intervention	2.5 mg/d letrozole, administered on days 3 to 7 of the menstrual cycle. Treatment duration: was for a range of between 1 to 5 treatment cycles.
Comparison	100 mg/d CC, administered on days 3 to 7 of the menstrual cycle. Treatment duration: was for a range of between 1 to 5 treatment cycles.
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Ovulation rate per cycle, pregnancy rate per cycle and delivery rate per cycle. Primary outcomes were not specified, however other outcomes that are not relevant to this evidence review include: endometrial thickness (mm), number and size of follicles and E2.
Follow up Duration	Follow-up time not reported.
Summary Result/s	"Ovulation occurred in 65.7% (65/99) of letrozole cycles and in 74.7% (71/95) of CC cycles. The median (minimum-maximum) number of follicles sized >15 mm in diameter on the day of hCG administration were 1 (0-4) and 1 (0-5) in the letrozole and CC groups, respectively. On the day of hCG administration, median serum E(2) concentrations in the letrozole and CC groups were statistically significantly different: 189 pg/mL (18-1,581 pg/mL) and 386 pg/mL (27-6,190 pg/mL), respectively. The median serum E(2) concentrations per follicle sized >15 mm in diameter on the day of hCG also statistically significantly differed between the letrozole and CC groups: 160 pg/mL (18-808 pg/mL) and 281 pg/mL (27-2,615 pg/mL), respectively. The median endometrial thickness on the day of hCG did not significantly differ between the CC and letrozole groups; it was 8 mm. Pregnancy was achieved in nine cycles (9.1%) of the letrozole group and in seven cycles (7.4%) of the CC group, which also was not a statistically significant difference."
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?		Yes	*"*In this study, we aimed to investigate the role of letrozole as a first-line ovulation-induction agent and to compare the clinical parameters with those of CC in PCOS patients."
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	PCOS patients diagnosed by using the Rotterdam criteria.
Exclusion criteria		Yes	"Tubal, peritoneal, and uterine causes of infertility were excluded by hysterosalpingography, laparoscopy, or transvaginal ultrasonography (LOGIQ 7 Scanner, GE Medical Systems, Milwaukee, WI). Specific endocrine abnormalities (Cushing's disease, hypothyroidism, hyperthyroidism, congenital adrenal hyperplasia, and prolactinoma), male-factor infertility, and women with a body mass index of >25 kg/m2 were excluded from the study."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*In this prospective double-blind study, each patient's treatment was determined by simple randomization, performed by a computer.*
	Was allocation to intervention group concealed?	Yes	*Allocation concealment was achieved by using central consultation for treatment of eligible patients.*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	*Double-blind study.*
	Were investigators and care providers blind to intervention group?	Yes	*Double-blind study.*

	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	5% treatment 10% control/ comparison	*Intervention group: 2/40* *Comparison group: 4/40*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	No	*No ITT analysis*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"The two groups were comparable regarding the baseline characteristics, including female age, basal FSH level, and duration of infertility (Table 1)."*

	If confounding was present, was it controlled for?	Not reported	*NA*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	*Sample-size determination was based on the difference between the median number of follicles sized _15 mm and E2 concentration on hCG day.* *"A sample size of 60 patients (30 patients in each group) was targeted to be able to detect a difference of at least one follicle or of 200 pmol/L between the two groups, with _ (type I error) set at 0.05 and 80% power."*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Low	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

- Begum 2009

Study ID	***Begum 2009***
Study Citation	Begum, M. R., J. Ferdous, et al. (2009). "Comparison of efficacy of aromatase inhibitor and clomiphene citrate in induction of ovulation in polycystic ovarian syndrome." Fertility & Sterility 92(3): 853-7.
Study Country	Bangladesh
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants	Anovulatory patients with PCOS who failed to ovulate when taking 100 mg/day clomiphene citrate in previous cycles (and therefore are clomiphene citrate – resistant women with PCOS) Mean age: letrozole = 25.47 ± 3.98 CC = 26.09 ± 3.62, p=0.38 Mean BMI: letrozole = 22.72 ± 2.77 CC = 23.63 ± 3.23, p=0.12	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	*Duration of infertility (y)* *Letrozole 2.66 ± 1.11* *CC 2.58 ± 1.10* *Mean ± SD*	
Presence of other condition/s	*Not reported*	
Medication History	*Not reported*	
N per group	*64*	
Setting	Private infertility care setting between August 2004 and December 2005. Country: Bangladesh.	
Intervention	Letrozole group - 7.5 mg of letrozole daily for 5 days starting from day 3 of the cycle.	
Comparison	CC group - 150 mg of CC daily for 5 days starting from day 3 of the cycle.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	The main outcome measure was rate of ovulation rate per patient and pregnancy rate per patient. “Two consecutive cycles were observed to declare ovulation failure. Six ovulatory cycles were observed for pregnancy.” *Follicular monitoring was done by transvaginal ultrasonography (TVS)* *“A level of R100 pg/mL of serum E2 was considered satisfactory”*	
Follow up Duration	2-6 cycles? *“Two consecutive cycles were observed to declare ovulation failure. Six ovulatory cycles were observed for pregnancy.”*	
Summary Result/s	*“Twenty (62.5%) patients from the letrozole group and 12 (37.50%) patients from the CC group ovulated during the observation period. Mean serum E2 level was 817.75 pg/mL and 448.03 pg/mL in the CC and letrozole groups, respectively, on the day of hCG administration. The mean endometrial thickness on the day of hCG administration was 9.03 mm and 10.37 mm in the CC and letrozole groups, respectively. The mean D21 serum P was 13.09 ng/mL and 19.09 ng/mL in the CC and letrozole groups, respectively. Thirteen patients from the letrozole group (40.63%) and six patients from the CC group (18.75%) became pregnant.”*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	“the purpose of our study is to compare the efficacy of 7.5 mg of letrozole with that of 150 mg of CC in patients with PCOS who did not respond to 100 mg of CC.”

Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	"Anovulatory patients with PCOS, who failed to ovulate when taking 100 mg/day CC for 5 days in two consecutive cycles. Polycystic ovary syndrome was diagnosed by the Rotterdam criteria (19). Those patients who did not develop follicles of optimum size (>17 mm) by day 16 of the cycle were recruited for this study."
Exclusion criteria		Yes	."Patients who had hyperprolactinemia, thyroid disorder, male factor infertility, known or suspicious tubal factor infertility (endometriosis and pelvic inflammatory disease), and unexplained infertility were excluded from the study."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Not enough information	*Patients were divided by lottery.*
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% Not reported	*Apparently no drop-outs*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"Characteristics of age, duration of infertility, and basal hormone levels (Table 1) were similar in both groups of patients."*
	If confounding was present, was it controlled for?	Not reported	*N/A*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		Moderate	*Few criteria fulfilled or the conclusions of the study are likely or very likely to be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*

Study Citation	*Ganesh A, Goswami SK, Chattopadhyay R, Chaudhury K, Chakravarty B. Comparison of letrozole with continuous gonadotropins and clomiphene-gonadotropin combination for ovulation induction in 1387 PCOS women after clomiphene citrate failure: a randomized prospective clinical trial. J Assist Reprod Genet. 2009 Jan;26(1):19-24. doi: 10.1007/s10815-008-9284-4. Epub 2009 Jan 7. PMID: 19127427; PMCID: PMC2649330.*
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS, diagnosed by the Rotterdam criteria, who had previously failed to conceive or ovulate with CC treatment and undergoing IUI* *Mean Age (years)* *Group A: 30.25 ± 4.90* *Group B: 30.38 ± 5.18*

	Group C: 30.82 ± 4.56 *Mean BMI (kg/m2)* *Group A: 24.49 ± 3.83* *Group B: 24.75 ± 4.05* *Group C: 24.08 ± 3.43*
PCOS diagnostic criteria	*Rotterdam criteria*
Presence of infertility	*Only duration of marriage given*
Presence of other condition/s	*CC resistant* *(Patients who failed to ovulate or conceive despite 6 cycles of CC using 100 mg/day or showed poor endometrial development (endometrial thickness <0.7 cm on the day of hCG administration))*
Medication History	*NR*
N per group	*Group A; Letrozole (n=372)* *Group B; Clomiphene Citrate and rFSH (n=669)* *Group C: rFSH (n=346)*
Setting	*Tertiary infertility care unit, Institute of Reproductive Medicine, Kolkata, India*
Intervention	*Group A; Letrozole; 2.5 mg twice daily, starting from day 3 of the menstrual cycle for 5 days* *Group B: CC with two doses rFSH* *Clomiphene Citrate 100 mg daily from day 3 to day 7 of the menstrual cycle and two ampoules of rFSH subcutaneously (75 IU), one on day 3 and the other on day 8*
Comparison	*Group C: continuous rFSH* *continuously administered one ampoule (75 IU/100 IU rFSH daily) from day 2 onwards until the day of hCG administration, gonadotrophin dose subsequently adjusted based on the follicular response*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary outcome measures: ovulation rate, cancellation rate, miscarriage rate and pregnancy rate* *Clinical pregnancy was defined as the presence of a gestational sac with cardiac activity as detected by transvaginal ultrasound at 7 weeks of gestation* *LH & FAH: immunoassay*
Follow up Duration	
Summary Result/s	*“Group A, B and C had an ovulation rate of 79.30%, 56.95% and 89.89% and cycle cancellation rate of 20.70%, 43.05% and 10.11%, respectively. Pregnancy rates in Group A, B and C were 23.39%, 14.35% and 17.92%,*

	while the miscarriage rates were 13.80%, 16.67% and 14.52%, respectively"	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	*Yes*	*"The purpose of this study is to compare the efficacy of letrozole with that of rFSH and clomiphene citrate(CC)/rFSH for ovarian stimulation in IUI cycles."*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	*Yes*	*PCOS* *normal TSH and prolactin levels* *Normozoospermic male partners as per WHO guidelines* *AT least one patent tube*
Exclusion criteria	*Yes*	*Patients with pre-existing ovarian cyst on day 3* *Previous history of ovarian drilling*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*"The method of simple randomization was used and the allocation was done using sealed envelopes where the person allocating was blinded to the type of protocol received by the patients"*
	Was allocation to intervention group concealed?	Yes	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	*Not reported*	*Only the allocating person appeared blind*
	Were investigators and care providers blind to intervention group?	Not reported	*"Randomized, prospective, single-blinded clinical trial."*

	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	*Not reported*	
	Were all outcomes measured in a standard, valid and reliable way?	*Yes*	
	Were outcomes assessed objectively and independently?	*Yes*	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*Not reported*	*Apparently no drop outs? Not much information on patients who were treated with alternative protocols in the text*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	*Yes*	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	*Yes*	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	*Yes*	

	If confounding was present, was it controlled for?	NA	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	*Not reported*	*Only financial statement is available* *"*One of the authors, Dr. Ashalatha Ganesh sincerely acknowledges the Council of Scientific and Industrial Research (CSIR) for providing financial support."
	Was the study sufficiently powered to detect any differences between the groups?	*Not reported*	
	If statistical analysis was undertaken, was this appropriate?	*Yes*	*"Multiple comparison using one-way ANOVA and z-Test were performed, wherever appropriate, between the three groups A, B and C. Data are expressed as mean ± SD. Significance of the test was performed at the 5% level (P < 0.05)."*
COMMENTS			
What is the overall risk of bias?		*Moderate*	*Only the allocating person was blinded (not clear whether the treating clinicians and assessors were blinded-perhaps yes but not explicitly reported), no-dropouts is a concern but may be due to using alternative protocols which the information is not clearly available. This is a big study, but power calculation is not reported.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	***Legro 2014***
Study Citation	Legro, R. S., R. G. Brzyski, et al. (2014). "Letrozole versus clomiphene for infertility in the polycystic ovary syndrome." New England Journal of Medicine 371(2): 119-129.
Study Country	US
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Infertile women 18 to 40 years of age with PCOS Age (yr): CC = 28.8±4.0; letrozole = 28.9±4.5 BMI: CC = 35.1±9.0; letrozole = 35.2±9.5
PCOS diagnostic criteria	modified Rotterdam criteria "…all participating women had ovulatory dysfunction combined with hyperandrogenism (on the basis of hirsutism or an elevated testosterone level), polycystic ovaries (defined by an increased number of small antral follicles [≥12 follicles that were <10 mm in diameter] or an increased individual ovarian volume [>10 cm3] in ≥1 ovary), or both."
Presence of infertility	Fertility history Duration of time attempting to conceive — months 42.5±37.6 (CC) 40.9±38.0 (Letrozole) Previous live birth — no. (%) 73 (19.4) (CC) 75 (20.1) (Letrozole)
Presence of other condition/s	Patients had no major medical disorders
Medication History	*Not reported*
N per group	3457 prescreened 1002 screened 750 randomized CC: 376; letrozole: 374 158 withdrawn CC: 85; letrozole: 73 750 analysed ITT
Setting	Academic Health Centers throughout the United States
Intervention	After spontaneous menses or withdrawal bleeding induced by progestin administration (medroxyprogesterone acetate [Provera], 5 mg per day for 10 days), ***clomiphene citrate (50 mg daily)*** was administered, beginning on cycle day 3 for 5 days and for up to five menstrual cycles. The dose was increased in subsequent cycles in cases of nonresponse (progesterone level during the midluteal phase, <3 ng per milliliter) or a poor ovulatory response (progesterone levels indicative of ovulation but with values clustering just above the cutoff point [see the Supplementary Appendix]), noted in 2% of 2777 treatment cycles.

	The maximum daily dose of clomiphene was 150 mg (three pills) given for 5 days. Investigators had the option to induce menstrual bleeding with medroxyprogesterone acetate after an anovulatory cycle; this option was exercised in 309 of 1255 anovulatory cycles (24.6%). Couples were instructed to have regular intercourse two to three times a week, and the women kept an intercourse diary. Ovulation predictor kits were not used.
Comparison	After spontaneous menses or withdrawal bleeding induced by progestin administration (medroxyprogesterone acetate [Provera], 5 mg per day for 10 days), ***letrozole (2.5 mg daily)*** was administered, beginning on cycle day 3 for 5 days and for up to five menstrual cycles. The maximum daily dose of letrozole was 7.5 mg (three pills) given for 5 days. Investigators had the option to induce menstrual bleeding with medroxyprogesterone acetate after an anovulatory cycle; this option was exercised in 309 of 1255 anovulatory cycles (24.6%). Couples were instructed to have regular intercourse two to three times a week, and the women kept an intercourse diary. Ovulation predictor kits were not used.
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcome: live birth; Secondary outcomes: ovulation, pregnancy loss, singleton birth, and congenital anomalies. Serious adverse events were defined as events that were fatal or immediately life-threatening, that were severely or permanently disabling, or that required or prolonged inpatient hospitalization; overdoses (intentional or accidental); congenital anomalies; pregnancy loss after 12 weeks of gestation; and any event deemed to be serious by the site principal investigator.
Follow up Duration	*Ongoing* *"Participants who conceived were followed until a viable intrauterine pregnancy was observed (fetal heart motion visualized on ultrasonography) and were then referred for prenatal care. Outcomes were tracked through review of maternal* *and infant medical records."* *An ongoing registry follows infants to 3 years of age for developmental delays*
Summary Result/s	*"Women who received letrozole had more cumulative live births than those who received clomiphene (103 of 374 [27.5%] vs. 72 of 376 [19.1%], P = 0.007; rate ratio for live birth, 1.44; 95% confidence interval, 1.10 to 1.87) without significant differences in overall congenital anomalies, though there were four major congenital anomalies in the letrozole group versus one in the clomiphene group (P = 0.65).*

	The cumulative ovulation rate was higher with letrozole than with clomiphene (834 of 1352 treatment cycles [61.7%] vs. 688 of 1425 treatment cycles [48.3%], P<0.001). There were no significant between-group differences in pregnancy loss (49 of 154 pregnancies in the letrozole group [31.8%] and 30 of 103 pregnancies in the clomiphene group [29.1%]) or twin pregnancy (3.4% and 7.4%, respectively). Clomiphene was associated with a higher incidence of hot flushes, and letrozole was associated with higher incidences of fatigue and dizziness."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"We designed a double-blind, multicenter, randomized trial to test the hypothesis that letrozole would be superior to clomiphene as an infertility treatment and would have a similar safety profile"*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	Infertile women 18 to 40 years of age with the polycystic ovary syndrome who had no major medical disorders and who were not taking confounding medications (primarily sex steroids, other infertility drugs, and insulin sensitizers, as described in the study protocol), their male partners, and their neonates participated in the study.9 We used modified Rotterdam criteria1 to diagnose the polycystic ovary syndrome. Additional eligibility criteria were at least one patent fallopian tube and a normal uterine cavity, as determined by sonohysterography (on the basis of the presence of free fluid in the pelvis), hysterosalpingography, a combined hysteroscopy and laparoscopy, or evidence of an intrauterine pregnancy within the previous 3 years; a male partner with a sperm concentration of at least 14 million per milliliter, according to World Health Organization cutoff points,11 with documented motility in at least one ejaculate during the previous year; and a commitment on the part of the women and their partners to have regular intercourse during the study with the intent of pregnancy.

Exclusion criteria		Yes	Described in detail in protocol and baseline paper.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	Women were randomly assigned in a 1:1 ratio in permuted blocks of two, four or six. Stratified randomization with permuted blocking within each stratum was generated by the data coordination centre (DCC) statistician. The only stratification variable will be by site.
	Was allocation to intervention group concealed?	Yes	Once patient consent is received, the patient is entered into secure online system where the patient is randomised and the site is provided with a patient identifier and a study kit number. According to allocated kit number, the site coordinator dispenses the intervention.
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	The purchased study drugs were overencapsulated to look the same, tested, and packaged by a commercial supply company (Almac Clinical Services). The two drugs were given for the same duration and with the same stepwise increase in dose.
	Were investigators and care providers blind to intervention group?	Yes	The randomization scheme (including block size) will not be disclosed to the investigators or staff, including the Protocol Lead Investigator. Unless otherwise specified, treatment group data will be presented in a blinded fashion within Data safety monitoring board (DSMB) reports.
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	All reported laboratory values were determined by a central laboratory (Ligand Core Laboratory, University of Virginia) and all data entry and analysis was done by DCC but no mention of whether outcome assessors were blinded.
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	22.6% CC 19.5% letrozole	CC: 85/376; letrozole 73/374 Reasons for drop out were described in detail.
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*ITT*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	
	If confounding was present, was it controlled for?	Partial	*BMI*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes	*"*Dr. Legro reports receiving consulting fees from Ferring Pharmaceuticals, AstraZeneca, and Euroscreen. Dr. Diamond reports receiving consulting fees from EMD Serono and serving on the board of directors of and owning stock in Advanced Reproductive Care. Dr. Santoro reports receiving grant support from Bayer and holding stock options in MenoGeniX. No other potential conflict of interest relevant to this article was reported." Disclosure forms provided by the authors are available with the full text of this article at NEJM.org." *The interventions used in this study are made by Teva Pharmaceuticals USA and Novartis.*

	Was the study sufficiently powered to detect any differences between the groups?	Partial	"The study was designed to have 81% power to detect an absolute difference of 10 percentage points in cumulative live-birth proportions between treatment groups…We calculated that the analysis would require a sample of 300 patients per treatment group, which we increased to 375 to allow for a dropout rate of 20%." However drop out rate was a little bit more than 20% in the CC group and had less than 300 participants.
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Low	*Most of the criteria have been fulfilled or where criteria have not been fulfilled it is very unlikely the conclusions of the study would be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*

Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Age (years)* *group A (CC) 26.8 ± 3.1;* *group B (CC + met) 27.2 ± 2.8;* *group C (letrozole) 27.0 ± 3.0;* *group D (letrozole + met) 27.2 ± 3.3* *BMI (kg/m^2)* *group A (CC) 21.1 (19.9, 22.8);* *Group B (CC + met) 21.4 (19.8, 23.6);* *group C (letrozole) 20.8 (19.1, 22.3);* *group D (letrozole + met) 21.6 (19.2, 23.6)*

PCOS diagnostic criteria	Rotterdam	
Presence of infertility	*Duration of infertility (years):* *group A (CC) 1 (0, 2);* *group B (CC + met) 1 (0, 3);* *group C (let) 1 (0, 2);* *group D (let + met) 1 (0, 3)*	
Presence of other condition/s	*NR*	
Medication History	*NR*	
N per group	*N=238*	
Setting	*Tertiary hospital*	
Intervention	*Group A: the oral administration of CC was started in the group CC or CC + met from day 3 to day 5 of the menstrual cycle at a daily dose of 50 mg for 5 days; and the daily dose gradually increased to 100 mg or 150 mg at maximum in the next cycle if the undeveloped follicle (< 16 mm) was present in the previous cycle.* *Group B: The oral administration of letrozole started in the group letrozole or letrozole + met from day 3 to day 5 of the menstrual cycle at a daily dose of 5 mg for 5 days.*	
Comparison	*Additional met (1000 – 1500 mg/d) was orally administered to participants in the groups CC + met and letrozole + met.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Ovulation rate, pregnancy rate, live birth rate, miscarriage rate, premature delivery, OHSS, multiple pregnancy rate*	
Follow up Duration	*Three continuous cycles*	
Summary Result/s	*"The ovulation rate was significantly higher in the group LE than the group CC; however, no significant difference was noted between the groups LE and CC, CC, and CC + MET, or LE and LE + MET in the pregnancy rate, abortion rate, and live birth rate. No birth defect was found in the total of 63 newborns. CC regimen was still recommended to be the first-line therapy of ovulation induction for PCOS."*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"To explore the optimal ovulation-induction therapy for PCOS patients, a perspective randomized controlled trial was conducted in the current study with PCOS patients who desired childbearing, to compare the therapeutic effect of CC, LE, and those in combination with MET."*

Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	*"PCOS patients attending the outpatient department of the hospital between April 2012 and March 2014, who had a desire for childbearing and fulfilled the Rotterdam diagnostic criteria as well, were recruited for this study. The inclusion criteria for this study were as follows: (1) patency of at least one side of the fallopian tube and (2) normal spouse's sperm."*
Exclusion criteria		Yes	*"The exclusion criteria were as follows: (1) patients with gynaecologic tumours or genital tract malformations, (2) patients with severe systemic disease or acute and chronic urogenital tract infections, (3) patients with other endocrine diseases such as thyroid disease and adrenal disease, (4) body mass index (BMI)>30, and (5) age over 35 years or below 20 years."*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*Randomisation with computer-generated blocks*
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	*Probably not*
	Were investigators and care providers blind to intervention group?	Not reported	*Probably not*

	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	*Probably not*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*28 women left the study; 13 in the CC groups, 15 in the LE groups; 5 in the CC + met and 7 in the LE + met group left the study due to complications; 3 participants were excluded (no reasons reported), the rest were lost to follow-up*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Not reported	*Unknown if all 268 or only 240 were analysed* *28 of 268 women leN the study (> 10%)*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	*All outcomes expected were reported*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"No significant difference was noted among the four groups regarding to the baseline data of clinical manifestations, serum sex hormone levels, and serum insulin levels."*

	If confounding was present, was it controlled for?	No	*No confounding reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	*The study was self-supported by West China Women's and Children's Hospital S.C.U* *"The authors report no conflicts of interest."*
	Was the study sufficiently powered to detect any differences between the groups?	Partial	*The number required was not reported. However, the method used to derive a number is explicitly reported. Perhaps the authors missed to report this clearly even though they have actually done this. If so, this should be assessed as "Yes".* *"Ovulation rate as the main indictor, the sample size was calculated by introducing maximal and minimal ovulation rate retrieved in literatures into the formula (Figure 1) [8,11,12]. SPSS 21.0 software (IBM Inc., Armonk, NY) was used to create a random figure, and the participants were numbered and randomly divided into group CC, CCþMET, LE, and LEþMET according to the order of inclusion."* *"Figure 1. The formula of sample size calculation. The value of μ_a is 2.5758, value of μ_b is 1.2816, P1 (.604) is maximal ovulation rate, P_2 (.902) is minimal ovulation rate."*
	If statistical analysis was undertaken, was this appropriate?	Yes	*"The measurement data that fulfilled the normal distribution were presented as mean ± standard deviation (SD), and analysed by t-test and analysis of variance (ANOVA). The data that did not fulfill the normal distribution were presented as median (interquartile range) and analyzed by the rank sum test. The count data comparison was conducted by v2 test or Fisher exact test. p<.05 was considered as statistically significant."*
COMMENTS			
What is the overall risk of bias?		High	*Few or no criteria have been fulfilled and therefore likely to effect conclusion*

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No*

Study ID	***Nazik 2012***
Study Citation	Nazik, H., & Kumtepe, Y. (2012). Comparison of efficacy of letrozole and clomiphene citrate in ovulation induction for women with polycystic ovarian syndrome. *HealthMED*, *6*(3), 879-83.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Group 1 (n=33) (CC)* *Age (years)* 27.80±6.18 *BMI (kg/m²)* 25.90±4.80 *Group 2 (n=31) (Letrozole)* *Age (years)* 25.55±4.45 *BMI (kg/m²)* 24.66±3.57
PCOS diagnostic criteria	"The diagnosis of PCOS was based on the 2003 Rotterdam criteria"
Presence of infertility	*3 arm study (only 2 arms used here). Group 3 letrozole 150mg/day of CC during successive cycles, added non-randomly was not discussed here.* *Group 1 (n=33) (CC)* *Duration of infertility (years)* 4.40±3.58 *Group 2 (n=31) (Letrozole)* *Duration of infertility (years* 3.40±3.04 "No male factor was detected in the two normal spermiograms conducted fortnightly."
Presence of other condition/s	*Not reported*
Medication History	Withdrawal bleeding was achieved using oral 10-mg medroxyprogesteron acetate for 6 days before stimulation for patients with oligomenore. 100 mg/day oral CC
N per group	(N=98, 120 cycles) Patients were divided into three groups. Patients receiving ovulation induction for the first time randomly established to the first two groups: Group 1: 100 mg/day clomiphene citrate (n=33, 40 cycles) Group 2: 2.5 mg/day letrozole (n=31, 40 cycles)

	The 3rd group consisted of patients who failed to ovulate after taking 50, 100, and 150 mg/day of CC treatment during successive cycles and therefore added non-randomly. Group 3: 2.5 mg/day of letrozole (n=34, 40 cycles) *[will not be included here]*	
Setting	Infertility Polyclinic of Atatürk University Medical Faculty (Erzurum, Turkey) between December 2005 and March 2007.	
Intervention	Letrozole 2.5mg/day (Femara, Novartis Pharma AG, Basel, Switzerland) to groups 2 and 3 from day 3 -7	
Comparison	All patients with oligomenorrhoea given 6 days of PO medroxyprogesterone acetate to achieve a withdrawal bleed. Clomiphene citrate 100mg/day (Gonaphene, Organon, Ilaclari AS, Turkey) to group 1 from day 3 to 7.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Number of mature follicles, rate of ovulation (Follicles were measured with transvaginal ultrasound) pregnancy rate (serum hCG concentration) *miscarriage rate* multiple pregnancy adverse effects	
Follow up Duration	*Approximately 1 cycle*	
Summary Result/s	"There were no significant differences between the 1st and 2nd groups with respect to number of mature follicles (1.02±0.83 vs. 0.83±0.68), and in group 1 and 2 the number of mature follicles were significantly greater than group 3 (0.4±0.25). There were no significant differences between the 1st and 2nd groups with respect ovulation rate (72.5% vs. 70%), and in both groups ovulation rate were greater than group 3 (37.5%). The pregnancy rate was 20% in group 1 and 17.5% in group 2 without significant differences, while pregnancy was not detected in group 3."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	To compare the efficacy of letrozole and clomiphene citrate in ovulation induction for women with polycystic ovarian syndrome (PCOS).
Does the study have specified inclusion/exclusion criteria?	Partial	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Partial	Patients with PCOS applied to the Infertility Polyclinic of Atatürk University Medical Faculty

Exclusion criteria		Yes	." Patients who had ovarian or adnexial surgery, hypothyroidism, hyperprolactinemia, bilateral tubal occlusion diagnosed with hysterosalphingography and unexplained infertility were excluded from the study" Patients with follicles greater than 10 mm was excluded the study after the day 3 hormonal profile and transvaginal ultrasound
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*Computer random list*
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	No evidence of blinding in this study
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	*Pertaining to groups 1 and 2 only. Group 3 is not considered for the PCOS evidence*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	"Follicles were measured with USG daily or every other day until the diameter of the follicle reached ≥17 mm."
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% treatment 0% control/ comparison	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*Apparently not drop-outs*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Partial	*"*The patients in group 2 were found to be significantly younger and have shorter duration of infertility the other two groups although the patients had been grouped randomly (Table 1). However, the BMI, the hormone values on 3rd day of menstruation were similar. This illustrates that the patients are homogeneously distributed among the three groups."
	If confounding was present, was it controlled for?	Yes	*"*CC-resistant patients who failed to ovulate when taking 50, 100, and 150 mg/day of CC during successive cycles, added non-randomly to the category of group three (34 patients, 40 cycles)."
ER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	Not reported	No sample size calculation in paper. Likely Underpowered "The main outcome measures were the rate of ovulation and pregnancy. Statistical analysis was accomplished on a personal computer by using statistical program for social sciences version 12.0 (SPSS 12.0, demo, SPSS Inc. Chicago, Illinois). Normality of variables was analyzed and normally distributed variables in three groups were compared with One-Way ANOVA test. For post-hoc comparison Bonferroni test was used. Proportions were analyzed using the chi-square test. Results were expressed as mean and standard error of the mean. Statistical significance level was set at 5%."
	If statistical analysis was undertaken, was this appropriate?	Yes	This was just a comparison study ANOVA for 3 group analysis Bonferroni test, Chi-square Significance at 5%
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		High	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"There is no significant difference in appearance between study groups (P > 0.05)"*
	If confounding was present, was it controlled for?	No	
IER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Partial	*Not clear* *"Conflict of interest* *The authors have any conflict of interest to declare regarding the manuscript."*

	Was the study sufficiently powered to detect any differences between the groups?	Partial	*"The sample size was calculated; at least 45 people were estimated for each group."*
	If statistical analysis was undertaken, was this appropriate?	Yes	*"Data were analyzed by descriptive statistics (standard deviation, mean, percent, and frequency), followed by Chi-square, ANOVA, and Kruskal–Wallis tests. The Scheffe test was used for post hoc analysis. Data were analyzed using statistical software (version 21) (SPSS Inc., Chicago, IL, USA). The significance level for all tests P < 0.05 was considered.*
COMMENTS			
What is the overall risk of bias?		High	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*All high risk of bias*	

Study ID	***Roy 2012***
Study Citation	Roy KK, Baruah J, Singla S, Sharma JB, Singh N, Jain SK, Goyal M. A prospective randomized trial comparing the efficacy of Letrozole and Clomiphene citrate in induction of ovulation in polycystic ovarian syndrome. J Hum Reprod Sci. 2012 Jan;5(1):20-5. doi: 10.4103/0974-1208.97789. PMID: 22870010; PMCID: PMC3409915.
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	PCOS patients 20–35 years having infertility for more than one year *Age* *Letrozole 26.1 ± 1.8* *CC 26.5 ± 1.3* *BMI* *Letrozole 25.8 ± 2.1* *CC 25.4 ± 1.56*

PCOS diagnostic criteria	Rotterdam's criteria
Presence of infertility	Mean infertility duration (in years) *Letrozole 6.4 ± 3.8* *CC 5.8 ± 3.1*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	*250 screened* *212 randomised* *Letrozole (n=104) (6 dropped out, 98 analysed)* *Clomiphene citrate (n=108) (2 dropped out, 106 analysed)*
Setting	tertiary care hospital from January 2005 to January 2010
Intervention	Letrozole: Starting dose of 2.5 mg letrozole, increasing up to 5 mg daily, administered from Day 3 to Day 7 (total of 5 days) of a spontaneous cycle or withdrawal bleeding after a 5-day course of 10 mg/ day medroxyprogester one acetate. 3 months
Comparison	Clomiphene Citrate: Starting dose of 50 mg, increasing up to 100 mg daily, administered from Day 3 to Day 7 (total of 5 days) of a spontaneous cycle or withdrawal bleeding after a 5- day course of 10 mg/ day medroxyprogester one acetate. 3 months
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Clinical pregnancy (*at least one gestational sac in USG) *Number of miscarriages* *Live birth* Other outcomes not relevant to this systematic review included: mean number of follicles and endometrial thickness.
Follow up Duration	*3 cycles*
Summary Result/s	"The mean number of dominant follicles in letrozole groups and CC groups was 1.86±0.26 and 1.92±0.17, respectively (*P*=0.126). Number of ovulatory cycle in letrozole group was 196 (66.6%) versus 216 (67.9%) in CC group (*P*=0.712). The mean mid-cycle endometrial thickness was 9.1±0.3 mm in letrozole group and 6.3±1.1 in CC group, which was statistically significant (*P*=0.014). The mean Estradiol [E2] level in clomiphene citrate group was significantly higher in CC group (364.2±71.4 pg/mL) than letrozole group (248.2±42.2 pg/mL). 43 patients from the letrozole group (43.8%) and 28 patients from the CC group (26.4%) became pregnant." "Letrozole and CC have comparable ovulation rate. The effect of letrozole showed a better endometrial response and pregnancy rate compared with CC."
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?		Yes	"The aim of this present prospective randomized trial was to compare results of letrozole with CC in patients with PCOS."
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	age group of 20–35 years having infertility for more than one year, body mass index (BMI) <28, patients of anovulatory PCOS oligomenorrhea (i.e., interval between periods were ≥35 days) or amenorrhea (i.e., absence of vaginal bleeding for 6 months), hirsutism, enlarged ovaries with multiple follicles (≥10 measuring 2–8 mm in diameter) as per Rotterdam's criteria on transvaginal ultrasonography (USG), and/or elevated serum testosterone.
Exclusion criteria		Yes	Patients having abnormality in any of the following tests: tubal patency test, pelvic ultrasonography, husband semen analysis, serum hormone measurements (FSH, LH, prolactin, estradiol, progesterone, and testosterone) on the 2nd to 5th day of the cycle Any abnormality found in laparoscopy that may be responsible for infertility
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	Randomization of recruited women was carried out using online software (http://www.randomization.com) to generate a random number table
	Was allocation to intervention group concealed?	Yes	Randomization codes (A, B) were packed into sealed opaque envelopes by an individual not involved in enrollment, treatment and follow-up of subjects to ensure concealment of allocation

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	Documentation of at least one gestational sac in USG was confirmed as clinical pregnancy.
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	6/104 in Letrozole (5.8%) *And* *2/106 in CC (1.9%)*	*8 patients dropped out*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	No	*ITT analysis not done*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Partial	*The outcomes to be assessed are not explicitly mentioned under methods but reported under results* Difficult to determine without a protocol.

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	There was no statistically significant difference in the mean age, BMI, and duration of infertility in both groups of patients.
	If confounding was present, was it controlled for?	Not reported	There was no statistically significant difference in the mean age, BMI, and duration of infertility in both groups of patients.
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	**Source of Support:** Nil, **Conflict of Interest:** None declared.
	Was the study sufficiently powered to detect any differences between the groups?	Yes	"Sample size was calculated using pregnancy rate as a primary outcome measure. On basis of previous studies,[3] to achieve a statistically valid comparison of pregnancy rates in the two groups, with a type I error of 0.05 and a power of 80%, a sample size of at least **40 women in each arm** was required"
	If statistical analysis was undertaken, was this appropriate?	Yes	Student's t-test, Chi-square and Fisher's exact testes were used when appropriate
COMMENTS			
What is the overall risk of bias?		Low	*Not clear whether the outcome assessors and the patients were blinded. The study does not identify itself as a double-blind study.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	**Zeinalzadeh 2010**

Study Citation	Zeinalzadeh, M., Z. Basirat and M. Esmailpour (2010). "Efficacy of letrozole in ovulation induction compared to that of clomiphene citrate in patients with polycystic ovarian syndrome." J Reprod Med **55**(1-2): 36-40.
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Infertile women with PCOS. Not reported whether these women were therapy naïve or clomiphene citrate-resistant. Mean age: letrozole = 23.8 ± 3.6 clomiphene citrate (CC) = 23.1 ± 3.6, p=0.34 BMI not reported.
PCOS diagnostic criteria	Patients had documented PCOS (defined on the basis of ultrasonography, oligo menorrhoea and increased LH / FSH ratio (>3)
Presence of infertility	*<5 years duration* *Duration of infertility (years)* *Letrozole 2.4 ± 1* *CC 2.6 ± 1.2* *(mean ± SD)*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	107 patients Letrozole group- 50 patients CC group - 57 patients
Setting	"Fatemeh Zahra Infertility Centre, Babol, Iran, in 2006 and 2007."
Intervention	Letrozole group- 5 mg of letrozole (Novartis, Basel, Switzerland) daily within days 3-7 of the menstrual cycle for 5 days.
Comparison	CC group - 100 mg of CC (Daroopakhsh Co., Tehran, Iran) daily within days 3-7 of the menstrual cycle for 5 days.
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Pregnancy rate (per patient), (diagnosed by hCG measurement and confirmed by TVS based on foetal heart activity) multiple pregnancy rate (per patient) ovulation rate (ovulation assessed by measuring progesterone 7 days after injection and level of >3ng/ml was considered the occurance)
Follow up Duration	Follow up time not reported
Summary Result/s	"The number and the size of mature follicles were similar between the 2 groups. The pregnancy rate in letrozole group was higher than that in the clomiphene group (20% vs. 14%), but the difference was not significant (p = 0.286). In letrozole group, 86% of patients developed mature follicles, all showing ovulation, whereas 72% of patients in clomiphene citrate group developed mature follicles (p = 0.07)."
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?		Yes	*To evaluate the effects of clomiphene citrate and letrozole on inducing ovulation in infertile patients with PCOS*
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	"Patients with primary infertility, documented PCOS, age >35 years, a history of <5 years of infertility and a body mass index (BMI) between 19 and 26kg/m2 were enrolled in the study." "PCOS was defined on the basis of ultrasonography findings, oligomenorrhea and an increased luteinizing hormone (LH)/follicle stimulating hormone (FSH) ratio (>3)."
Exclusion criteria		Yes	." "Subjects were excluded from the study if in the moderate or severe categories. Also, infertility resulting from male factors, tubular factors and endometriosis was considered an exclusion criterion."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Partial	*"The subjects were assigned to 2 groups using systematic randomization method."*
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	

	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*Not reported*	*Apparently, no drop-outs*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	No	*BMI and ovulation rate is listed as outcomes (data to be collected), however the results for these outcomes are not reported.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	

	If confounding was present, was it controlled for?	Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes	*"The authors have no connection to any companies or products mentioned in this article"*
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		High	*Few criteria fulfilled and the conclusions of the study are likely to be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	***Amer 2009***
Study Citation	Amer, S. A., T. C. Li, et al. (2009). "Randomized controlled trial comparing laparoscopic ovarian diathermy with clomiphene citrate as a first-line method of ovulation induction in women with polycystic ovary syndrome." Human Reproduction 24(1): 219-225.
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants	Women with anovulatory infertility associated with PCOS (therapy naïve). Mean age: group A = 28.1 ± 4.3 group B = 29.1 ± 4.8 Mean BMI: group A = 26.2 ± 3.9 group B = 26.1 ± 3.5
PCOS diagnostic criteria	At least two of the following three features: clinical (oligo/amenorrhoea and/or hyperandrogenaemia), biochemical [LH ≥10 IU/l, LH/FSH ratio _2, testosterone .2.6 nmol/l or free androgen index (FAI) and/or sonographic (polycystic ovaries) features "…all patients in the current study fulfilled the 2003 ESHRE/ASRM (Rotterdam) criteria of PCOS, but only 65 fulfilled the 1990 NIH criteria for PCOS."
Presence of infertility	Duration of infertility of ≥1 year
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	72 women were randomized, 36 in each group. Of the 72 women randomized, 3 from group A and 3 from group B conceived before starting treatment and one patient from the CC group decided to postpone her treatment for personal reasons. The remaining 65 women (33 in the LOD group and 32 in the CC group) completed the study.
Setting	"This study was conducted in the Centre for Reproductive Medicine and Fertility, University of Sheffield."
Intervention	Laparoscopic monopolar ovarian diathermy (group A).
Comparison	"CC was given in incremental doses starting with a daily dose of 50 up to 150 mg on Days 2–6 of a menstrual period or after a progestogen withdrawal bleed using medroxyprogesterone acetate (Proveraw, Pharmacia, Kent, UK)." (Group B)). Once ovulation occurred on a certain dose, CC was continued at the same dose for six cycles.
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Cumulative pregnancy rate at 12 months, rates of ovulation (per patient and per cycle), miscarriage (per patient), multiple pregnancy (per patient) and live birth rates (per patient). "Conception was diagnosed with a positive urinary pregnancy test (Clearview, hCG II, Unipath Ltd, Bedford, UK) taken 1 week after a missed period." Powered for primary outcome – pregnancy rates at 12 months. "Ovulation was diagnosed when the progesterone level was _25 nmol/l."
Follow up Duration	*12 months*

Summary Result/s			"After the primary treatment, more pregnancies (44%) occurred in women receiving CC than in those undergoing LOD (27%), although the difference did not reach statistical significance [P = 0.13, OR 2.1 (0.7 – 5.8)]. After adding the second treatment, the pregnancy rate was still higher, but to a less extent, in the CC group [63% versus 52%, P = 0.2, OR 1.6 (0.6 – 4.2)]." "LOD is not superior to CC as a first-line method of OI in women with PCOS"
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	
Does the study have specified inclusion/exclusion criteria?		Yes	*See below*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	"Diagnostic criteria for PCOS included at least two of the following three features: clinical (oligo/amenorrhoea and/or hyperandrogenaemia), biochemical [LH ≥10 IU/l, LH/FSH ratio ≥2, testosterone >2.6 nmol/l or free androgen index (FAI) and/or sonographic (polycystic ovaries) features. The study included women aged 18–39, with body mass index (BMI) ≤32 kg/m2 and a duration of infertility of ≥1 year. Other inclusion criteria were at least one patent fallopian tube on hysterosalpingogram and normal semen analysis of the male partner."
Exclusion criteria		Yes	"Exclusion criteria were inability to give informed consent (eg. due to language barrier) and contraindication to CC or general anaesthetic. In addition, women who had received any OI therapy such as CC, metformin or gonadotrophin during the preceding 6 months were excluded."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*"Suitable patients were randomized utilizing a block randomization method using a random number table generated by the pharmacist. This table was held centrally by a trial administrator."*
	Was allocation to intervention group concealed?	Yes	*"Randomization was carried out by telephone. The patient was assigned by the principal investigator to treatment Group A (LOD) or B (CC) according to the randomization. Allocation to*

			treatment was concealed, but once allocated, the treatment was revealed to both the investigator and the patient."
PERFORMANCE BIAS	**Were patients blind to intervention group?**	No	*"Allocation to treatment was concealed, but once allocated, the treatment was revealed to both the investigator and the patient."*
	Were investigators and care providers blind to intervention group?	No	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	No	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*No drop outs*	*3 patients each from intervention and control arms conceived after randomisation but before first treatment and one postponed the treatment for personal reasons Analysis was performed on an intention-to-treat basis*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	
	If confounding was present, was it controlled for?	Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	*"From our review of the literature, we hypothesized pregnancy rates of 35% with CC and 70% with LOD. On the basis of this analysis, 36 patients were required in each arm to detect this difference with a 5% level of significance and 80% power."*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Moderate	

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	

Study ID	***Begum 2009***
Study Citation	Begum, M. R., J. Ferdous, et al. (2009). "Comparison of efficacy of aromatase inhibitor and clomiphene citrate in induction of ovulation in polycystic ovarian syndrome." Fertility & Sterility 92(3): 853-7.
Study Country	Bangladesh
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Anovulatory patients with PCOS who failed to ovulate when taking 100 mg/day clomiphene citrate in previous cycles (and therefore are clomiphene citrate – resistant women with PCOS) Mean age: letrozole = 25.47 ± 3.98 CC = 26.09 ± 3.62, p=0.38 Mean BMI: letrozole = 22.72 ± 2.77 CC = 23.63 ± 3.23, p=0.12
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Duration of infertility (y)* *Letrozole 2.66 ± 1.11* *CC 2.58 ± 1.10* *Mean ± SD*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	*64*
Setting	Private infertility care setting between August 2004 and December 2005. Country: Bangladesh.
Intervention	Letrozole group - 7.5 mg of letrozole daily for 5 days starting from day 3 of the cycle.
Comparison	CC group - 150 mg of CC daily for 5 days starting from day 3 of the cycle.
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	The main outcome measure was rate of ovulation rate per patient and pregnancy rate per patient. “Two consecutive cycles were observed to declare ovulation failure. Six ovulatory cycles were observed for pregnancy.” *Follicular monitoring was done by transvaginal ultrasonography (TVS)* *“A level of R100 pg/mL of serum E2 was considered satisfactory”*
Follow up Duration	2-6 cycles? *“Two consecutive cycles were observed to declare ovulation*

		failure. Six ovulatory cycles were observed for pregnancy."	
Summary Result/s		*"Twenty (62.5%) patients from the letrozole group and 12 (37.50%) patients from the CC group ovulated during the observation period. Mean serum E2 level was 817.75 pg/mL and 448.03 pg/mL in the CC and letrozole groups, respectively, on the day of hCG administration. The mean endometrial thickness on the day of hCG administration was 9.03 mm and 10.37 mm in the CC and letrozole groups, respectively. The mean D21 serum P was 13.09 ng/mL and 19.09 ng/mL in the CC and letrozole groups, respectively. Thirteen patients from the letrozole group (40.63%) and six patients from the CC group (18.75%) became pregnant."*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	"the purpose of our study is to compare the efficacy of 7.5 mg of letrozole with that of 150 mg of CC in patients with PCOS who did not respond to 100 mg of CC."
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	"Anovulatory patients with PCOS, who failed to ovulate when taking 100 mg/day CC for 5 days in two consecutive cycles. Polycystic ovary syndrome was diagnosed by the Rotterdam criteria (19). Those patients who did not develop follicles of optimum size (>17 mm) by day 16 of the cycle were recruited for this study."
Exclusion criteria		Yes	."Patients who had hyperprolactinemia, thyroid disorder, male factor infertility, known or suspicious tubal factor infertility (endometriosis and pelvic inflammatory disease), and unexplained infertility were excluded from the study."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Not enough information	*Patients were divided by lottery.*
	Was allocation to intervention group concealed?	Not reported	

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% Not reported	*Apparently no drop-outs*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"Characteristics of age, duration of infertility, and basal hormone levels (Table 1) were similar in both groups of patients."*
	If confounding was present, was it controlled for?	Not reported	*N/A*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		High	*High - Few or no criteria fulfilled or the conclusions of the study are likely or very likely to be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	*Begum 2013*

Study Citation	Begum, M. R., S. Akhter, et al. (2013). "Pretreatment and co-administration of oral anti-diabetic agent with clomiphene citrate or rFSH for ovulation induction in clomiphene-citrate-resistant polycystic ovary syndrome." Journal of Obstetrics & Gynaecology Research 39(5): 966-973.
Study Country	Bangladesh
BRIEF CHARACTERISTICS OF RCT	
	Infertile patients with CC-resistant PCOS. All patients were insulin resistant (by HOMA) Age (years) A: 26.96 ± 4.05 B: 26.84 ± 5.13 C: 27.15 ± 4.20 p=0.830 Body mass index (kg/m2) A: 27.71 ± 3.61 B: 28.36 ± 4.54 C: 28.98 ± 3.19 p=0.554
PCOS diagnostic criteria	"PCOS was diagnosed according to the revised Rotterdam criteria and included two of the following three findings: (i) oligo or anovulation; (ii) clinical and/or biochemical signs of hyperandrogenism; and (iii) polycystic ovaries according to ultrasonography"
Presence of infertility	*Duration of infertility (years)* *Group A (Mean ± SD) 6.13±2.38* *Group B 5.06±3.04* *Group C 4.72±2.78* *Type of infertility* *Primary:* *Group A: 94.55%* *Group B: 80%* *Group C: 74.55%*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	Randomised and analysed: 165 participants - 55 in each group (3 groups)
Setting	"Outpatient Department of Obstetrics and Gynecology of Dhaka Medical College and Hospital and the Infertility Care and Research Centre, Dhaka. The study was carried out from December 2004 until August 2009."
Intervention 1	Group A/M+CC: 500 mg metformin three times daily (1500 mg) for 4 weeks. After 4 weeks, the same dose was continued for another 6 months along with scheduled CC 150 mg daily for 5 days (D3–D7 of the cycle).
Intervention 2	Group B/M+rFSH: 500 mg metformin three times daily (1500 mg) for 4 weeks. After 4 weeks, the same dose was continued for another 6 months along with 75 IU rFSH every alternate day starting from D3 of the cycle (then daily if necessary after first monitoring on D12) till maturity of follicles or maximum 15 doses of rFSH.

Comparison/ control	Group C /rFSH alone: 75 IU rFSH every alternate day starting from D3 of the cycle (then daily if necessary after first monitoring on D12) till maturity of follicles or maximum 15 doses of rFSH.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: clinical pregnancy that occurred within six ovulatory cycles and resultant live birth. Secondary: ovulation, spontaneous abortion, ectopic pregnancy, multiple pregnancies, congenital anomaly and other adverse perinatal or obstetric complications. Serum follicle-stimulating hormone (FSH), luteinizing hormone (LH), thyroid-stimulating hormone (TSH), prolactin, dehydroepiandrosterone sulfate and free testosterone were assayed by VIDAS. Oral glucose tolerance test was done to exclude diabetes mellitus. Fasting serum insulin level was measured to identify insulin resistance Insulin resistance was identified by calculating fasting glucose insulin ratio and homeostatic model assessment (HOMA).	
Follow up Duration	Six ovulatory cycles were assessed.	
Summary Result/s	*"*Ovulation (89.09%) and pregnancy (54.55%) rates were higher in group B. Ovulation (74.55%) and pregnancy (29.09%) rates were also satisfactory in group C but a dose of rFSH requirement was significantly higher (*P* = 0.000). In group A, both ovulation and pregnancy rate were much lower than the other two groups (27.27% and 12.73%, respectively)."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"*The objective of this study was to explore the result of pre-treatment and concomitant use of metformin with clomiphene citrate (CC) and rFSH for ovulation induction in clomiphene-citrate-resistant polycystic ovary syndrome (PCOS)."
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	"PCOS was diagnosed according to the revised Rotterdam Criteria." "PCOS patients who did not produce any mature follicle with 150 mg clomiphene citrate daily for 5 days for two consecutive cycles were considered as CC-resistant8 and were recruited for the study." "All patients were included in the study irrespective of body mass index (BMI)."

Exclusion criteria		Yes	"Patients having hypothyroidism, hyperprolactinemia, altered glucose metabolism, associated endometriosis and pelvic inflammatory disease, suspected or proven tubal factor infertility and partners' abnormal semen parameters were excluded from the study."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	"Patients were divided into three treatment groups, group A, group B and group C by lottery." *Methodology not clear though*
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	*However,* difficult to maintain blinding given the nature of the interventions ie. pill v pill + injection.
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	"Ovulation was confirmed by: (i) transvaginal ultrasonography by observing collapse of the follicle, fluid in the Pouch of Douglas ortriple-lined endometrial development; and (ii) D21 serum progesterone level. A D21 serum progesterone level of ≥5 ng/mL was considered ovulatory."
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% treatment 0% control/ comparison	*None reported*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Not reported	*No dropouts*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	Difficult to determine without a protocol.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	"There was no significant difference between the groups regarding age, duration of marriage and duration of infertility (P > 0.05)…All were comparable between the groups and there were no significant differences in baseline parameters (P > 0.05)."
	If confounding was present, was it controlled for?	Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	The authors declare that: Nothing to be disclosed by any author.
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	

	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Unblinded Missing details on randomisation, dropouts, blinding etc*	
What is the overall risk of bias?		High	*Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.* lacks info on blinding, randomisation and dropouts
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	De Leo 1999
Study Citation	De Leo V, la Marca A, Ditto A, Morgante G, Cianci A. Effects of metformin on gonadotropin-induced ovulation in women with polycystic ovary syndrome. Fertil Steril. 1999 Aug;72(2):282-5. doi: 10.1016/s0015-0282(99)00208-3. PMID: 10438996.
Study Country	Italy
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	N=20 FSH Age: 28.0 ± 4.0 BMI: 27.7 ± 3.1 FSH + metformin Age: 29.5 ± 2.9 BMI: 26.9 ± 4.8
PCOS diagnostic criteria	Chronic oligomenorrhea (fewer than six menstrual periods in the previous year) or amenorrhea and hyperandrogenemia (elevated serum free testosterone concentrations) Ultrasonographic diagnosis of PCOS was based on the presence of 10 or more follicles (2–10 mm in diameter) in one or both ovaries
Presence of infertility	n of infertility (y) 8 ±1 metformin 3.2 ± 0.8
Presence of other condition/s	hene Citrate–resistant PCOS (defined as failure to ovulate or conceive after clomiphene citrate treatment up to a daily dose of 150 mg from cycle days 3–7 during at least three consecutive cycles)

Medication History	"All women had pretreatment concentrations of FSH within normal limits and were normoprolactinemic, normotensive, and had no evidence of any other serious medical disorder. All had normal thyroid function. Their partners had adequate seminal parameters. **None of the women had taken medicines for at least 2 months before the study**."	
N per group	N=20 n=10 FSH n=10 FSH + metformin	
Setting	Department of Obstetrics and Gynaecology, University of Siena.	
Intervention	FSH (75 IU one ampoule per days for x5 days increasing by one ampule per day until an ultrasonically detectable ovarian response was obtained) for 2 cycles, then 1 month with metformin cycle, and then a cycle of combined metformin and FSH	
Comparison	Metformin for a month before undergoing ovarian stimulation with combined metformin and FSH for one cycle	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Not reported under methods. The following outcomes were extracted from results section. Number of cycles FSH (number of ampoules) Days of treatment Daily effective dose (no. of ampules) E2 level (ng/dL) Follicles >15 mm No. of pregnancies (%) No. of cycles with hCG withheld (%) No. with hyperstimulation after hCG (%) Plasma LH, FSH, E2, T, androstenedione (A) were measured by double-antibody RIA with use of Radim kits (Rome, Italy) for LH and FSH; Sorin kits (Saluggia, Italy) for A and T; and Biodata Kits (Rome, Italy) for E2.	
Follow up Duration	NR. AT least 4 cycles based on intervention	
Summary Result/s	"The number of follicles >15 mm in diameter on the day of hCG administration was significantly lower in cycles performed after metformin treatment. The percentage of cycles with hCG withheld because of excessive follicular development was significantly lower in cycles treated with metformin. Plasma levels of E2 were significantly higher in cycles treated with FSH alone than in those treated with FSH and metformin"	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	"The aim of the present study was to evaluate whether metformin administration improves ovarian response to exogenous gonadotropin in women with clomiphene-resistant PCOS."
Does the study have specified inclusion/exclusion criteria?	Partial	

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Partial	Normal pre-treatment FSH concentration Normoprolactinemic Normotensive No evidence of any other serious medical disorder Partners with adequate seminal parameters
Exclusion criteria		Partial	Congenital adrenal hyperplasia
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	"The women were divided randomly, on the basis of a random number table, into two groups of 10 subjects…"
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Partial	

	Were outcomes assessed objectively and independently?	Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	Not reported	Apparently, no drop-outs
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	Outcomes of interest not reported in materials and methods, so difficult to assess because there is no protocol available (pre-2010 study)
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	"As shown in Table 1, there were no statistically significant differences in age, duration of infertility, body mass index (BMI), and in hormonal data between the women divided according to treatments."
	If confounding was present, was it controlled for?	Not reported	N/A (see above)
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	

	If statistical analysis was undertaken, was this appropriate?	Yes	"The results are expressed as means 6 SD. Non–Gaussian-distributed variables were logarithmically transformed before analysis."
COMMENTS			
What is the overall risk of bias?		High	No information on concealment of allocation, blinding and pre-specified outcome data
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?			

Study ID	*Fleming, 2002*
Study Citation	*Fleming, R., Hopkinson, Z. E., Wallace, A. M., Greer, I. A., & Sattar, N. (2002). Ovarian function and metabolic factors in women with oligomenorrhea treated with metformin in a randomized double blind placebo-controlled trial. The Journal of Clinical Endocrinology & Metabolism, 87(2), 569-574.*
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*who had previously failed to conceive or ovulate with CC treatment and undergoing IUI*
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Infertility in:* *No. of patients: placebo-treated, 47 (infertile, 19; hirsutism, 22); metformin-treated, 45 (infertile, 23; hirsutism, 13). P values are NS.*
Presence of other condition/s	*Blood samples were taken for assays of E2, T, androstenedione LH, FSH, triglycerides, cholesterol, lowdensity* *lipoprotein (LDL) cholesterol, and HDL cholesterol. Then, a standardized 75-g oral glucose tolerance test (GTT) was undertaken with blood samples collected at 0, 60, and 120 min for determination of serum glucose and insulin concentrations.*
Medication History	*NR*
N per group	*94 patients randomized, 2 withdrew before treatment commenced, 47 received placebo, and 45 received*

Setting	*University Departments of Obstetrics and Gynecology (R.F., Z.E.H., I.A.G.) and Pathological Biochemistry Royal Infirmary, Glasgow,*	
Intervention	*etrozole (Letroz, Sun Pharmaceuticals, Mumbai, India) 2.5 mg twice daily,*	
Comparison	*CC (Ovofar, Organon India Limited, Mumbai, India) 100 mg daily from day 3 to day 7 of the menstrual cycle and two ampoules of rFSH*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Biochemical pregnancy rate =Y*	
Follow up Duration	*16 Weeks*	
Summary Result/s	*using a comprehensive, detailed endocrinological assessment of ovarian function, we have shown that metformin treatment increases ovulation rates by a significant but modest degree in women with oligomenorrhea and PCOS. Continued treatment also resulted in significant weight loss (and leptin reduction) and an associated change in HDL cholesterol.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*our study was to use a double-blind, placebo-controlled approach with detailed assessment of ovarian activity (two blood samples per week) to assess the validity of this therapeutic approach in this group of women.*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	*Women with oligomenorrhea (cycle length41d;8 cycles per year) or amenorrhea and PCOs, aged less than 35 yr,*
Exclusion criteria	Yes	*Patients with significant hyperprolactinemia, abnormal thyroid function tests, and congenital adrenal hyperplasia were excluded.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	
	Was allocation to intervention group concealed?	Yes	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	
	Were investigators and care providers blind to intervention group?	Yes	
	Aside from the experimental intervention, were the groups treated the same?	Partial	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes	
	Were all outcomes measured in a standard, valid and reliable way?	Partial	
	Were outcomes assessed objectively and independently?	Partial	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**		*2 withdrew before treatment commenced, 47 received placebo, and 45 received metformin*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Partial	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Partial	
	If confounding was present, was it controlled for?	Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	The study power was based upon predicted changes in the ovulation rate and circulating lipoprotein concentrations, using data derived from the literature and our own pilot study
	If statistical analysis was undertaken, was this appropriate?	Partial	

COMMENTS		
What is the overall risk of bias?	Moderate	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No-all Moderate high risk of bias*	

Study ID	*Ghanem 2013*
Study Citation	Ghanem, M. E.; Elboghdady, L. A.; Hassan, M.; Helal, A. S.; Gibreel, A.; Houssen, M.; Shaker, M. E.; Bahlol, I.; Mesbah, Y. Clomiphene citrate cotreatment with low dose urinary FSH versus urinary FSH for clomiphene resistant PCOS: randomized controlled trial.[Erratum appears in J Assist Reprod Genet. 2014 Apr;31(4):505-6]. *J Assist Reprod Genet* **2013**, 30, 1477- 85
Study Country	? Egypt
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	FSH= 24.7±4.3 years FSH+CC= 24.8±4.7 years BMI: FSH= 33.2±5.7 kg/m² FSH + CC= 33.3±5.4 kg/m²
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Mixture of primary and secondary infertility
Presence of other condition/s	Clomiphene citrate resistance. This was the first time these women were undergoing this particular protocol.
Medication History	'Use of medications known to alter insulin secretion or action either currently or within the previous 3 months was an exclusion criteria'.
N per group	The number of participants that were: □ Allocated/randomised: 87 per group □ Assessed at end of study: per protocol- FSH= 77, FSH + CC= 82
Setting	Not reported. Authors based in Egypt.

Intervention	‘37.5 IU/day HP uFSH from the 3rd to the 13th cycle day…if the follicle diameter was medium sized [12–15 mm] the starting dose was maintained. Should the growing follicle[s] was smaller; an increment of 37.5 IU was made. The lowest dose that achieved significant follicular increase was maintained until hCG ovulation trigger. Subsequent visits were scheduled according to ovarian response until the leading follicle mean diameter reached ≥18 mm. At this time ovulation was triggered by injection of hCG 10,000 IU [Choriomon, IBSA, Switzerland] and regular sexual relation advised’	
Comparison	‘CC in 100 mg daily doses for 5 days plus intramuscular injection of 37.5 IU/day HP uFSH from the 3rd to the 13th cycle day…if the follicle diameter was medium sized [12–15 mm] the starting dose was maintained. Should the growing follicle[s] was smaller; an increment of 37.5 IU was made. The lowest dose that achieved significant follicular increase was maintained until hCG ovulation trigger. Subsequent visits were scheduled according to ovarian response until the leading follicle mean diameter reached ≥18 mm. At this time ovulation was triggered by injection of hCG 10,000 IU [Choriomon, IBSA, Switzerland] and regular sexual relation advised’	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcome: ovulation rate Secondary outcome: clinical pregnancy rate per woman randomized	
Follow up Duration		
Summary Result/s	*“Our results have demonstrated that group I compared to group II had significantly higher ovulation rate per intention to treat [ITT] [72.4 % vs. 34.2 %,* p < *0.001]. Clinical pregnancy and live birth rates were comparable between the two groups. Group I consumed significantly lower total FSH dose and needed significantly shorter stimulation duration compared to group II.”*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*“The aim of this study was to examine the effect of clomiphene citrate [CC] co-administration during the use of exogenous low-dose urinary FSH [uFSH] for induction of ovulation in CC-resistant infertile PCOS women”*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	‘CC-resistant PCOS women, age between 18 and 38 years, fertile semen according to WHO standards as regard sperm concentration, motility and Kruger’s strict criteria for sperm morphology, patent fallopian tubes proved by hysterosalpingography and/or dye test with laparoscopy

			within the preceding 6 months, no history of previous genital surgery and no history of treatment by exogenous gonadotropin'
Exclusion criteria		Yes	'Exclusion criteria were: presence of any infertility factors other than anovulatory PCOS, use of medications known to alter insulin secretion or action either currently or within the previous 3 months, presence of other endocrinopathies'
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	Computer generated random numbers
	Was allocation to intervention group concealed?	Partial	Sequentially numbered opaque and sealed envelopes can be subject to manipulation
PERFORMANCE BIAS	**Were patients blind to intervention group?**	No	
	Were investigators and care providers blind to intervention group?	No	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Not reported	Most outcomes are objective measures

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**		FSH= 11.5% FSH + CC= 5.7%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	ITT and analysis per protocol data presented
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	
	If confounding was present, was it controlled for?	N/A	No report of confounding
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	"The authors report no declarations of interest."
	Was the study sufficiently powered to detect any differences between the groups?	Partial	Required sample size for study to be powered was 160, 159 completed the study

	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		Data used from erratum where required	
What is the overall risk of bias?		Moderate	*Moderate - Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	George 2003
Study Citation	George SS, George K, Irwin C, Job V, Selvakumar R, Jeyaseelan V, Seshadri MS. Sequential treatment of metformin and clomiphene citrate in clomiphene-resistant women with polycystic ovary syndrome: a randomized, controlled trial. Hum Reprod. 2003 Feb;18(2):299-304. doi: 10.1093/humrep/deg105. PMID: 12571165.
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Infertile CC-resistant women with PCOS (diagnosis of PCOS was based on clinical features of oligomenorrhoea and hyperandrogenism, along with either biochemical abnormalities of a raised LH/FSH ratio or LH or ultrasound features of polycystic ovary). Age Metformin: 25.1±3.0 hMG: 26.0± 2.9 BMI Metformin: 25.5±3.7 hMG: 24.6±2.6
PCOS diagnostic criteria	PCOS (diagnosis of PCOS was based on clinical features of oligomenorrhoea and hyperandrogenism, along with either biochemical abnormalities of a raised LH/FSH ratio or LH or ultrasound features of polycystic ovary)
Presence of infertility	women were included but no more information
Presence of other condition/s	hene resistant (defined as failure to ovulate to a dose schedule of 200 mg/day for 5 days)

	er medical conditions: “Laboratory investigations showed that all women had normal liver, renal and thyroid function, glucose tolerance and prolactin levels.”
Medication History	NR
N per group	N=60
Setting	Reproductive Medicine Unit of Christian Medical College in southern India between 1999 and 2001
Intervention	Group 1: (n=30) Metformin for 1500 mg/day in three divided doses for 6 months, followed by ovulation induction with clomiphene citrate 150mg/day (increased to 200mg if not ovulated) + metformin
Comparison	Group 2: (n=30) hMG 75 IU increased by increments of 75 units every 7-10 days if no ovarian response (n=30)
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Outcomes of interest not clearly specified under materials and methods. No protocol available Serum FSH, LH, glucose, insulin, testosterone, SHBG Follicular monitoring was carried out using ultrasound scan to study the ovulatory response FSH and LH were measured using a two-site sandwich immunoassay DHEAS and insulin were also estimated using solid-phase competitive radio-immunoassays
Follow up Duration	6 months + 3 cycles
Summary Result/s	“There was no significant difference in pregnancy rates between the two groups (16.7 versus 23.3%). In group I, there was a significant improvement in menstrual function and ovulation after treatment (40%, P < 0.001; and 46.7%, P < 0.001), with a significant decrease in fasting insulin levels (P <0.05). There were no changes in other biochemical parameters. The ovulation rate in group II was 43.3%, with a high drop-out rate. The cost-effective analysis for medications per pregnancy in group I was US$ 71 ± 3 versus US$ 277 ± 171 in group II.”

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	“A randomized, controlled trial was conducted to determine whether sequential treatment with metformin and clomiphene citrate would be as effective as hMG in improving ovulation and pregnancy rates in clomiphene-resistant PCOS women.”
Does the study have specified inclusion/exclusion criteria?	Partial	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	

Inclusion criteria		Partial	PCOS
Exclusion criteria		Yes	Women with associated tubal or male factor infertility and those with a body mass index (BMI) >35 kg/m2
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	"Block randomization was carried out using RALLOC software, with concealment of treatment allocation by use of opaque envelopes."
	Was allocation to intervention group concealed?	Yes	Opaque envelopes
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	The outcomes related to serum immune-assays were measured using standard methods
	Were outcomes assessed objectively and independently?	Yes	The outcomes related to serum immune-assays were measured using standard methods

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	10% treatment 10% control/ comparison Not reported	3 dropped out in Metformin group (group 1) 3 dropped out in hMG group (group 2)
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	ITT
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	"The groups did not differ with respect to either anthropometric variables or biochemical values (Table I)."
	If confounding was present, was it controlled for?	Not reported	N/A
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	"The accepted pregnancy rate with hMG is ~40%, and the expected pregnancy rate in the metformin group was 25%. However, it was decided to favour metformin even if the difference was 20%. By keeping alpha and beta errors at 5 and 20% respectively, the calculated sample size was 30 in each arm of the trial."

	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Moderate	No information on blinding and pre-specified outcome data – blinding not possible with this comparison though so judged as moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?			

Study ID	*Hoeger, 2004*
Study Citation	*Hoeger, K. M., Kochman, L., Wixom, N., Craig, K., Miller, R. K., & Guzick, D. S. (2004). A randomized, 48-week, placebo-controlled trial of intensive lifestyle modification and/or metformin therapy in overweight women with polycystic ovary syndrome: a pilot study. Fertility and sterility, 82(2), 421-429.*
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*All subjects were overweight or obese,* *with a minimum body mass index (BMI) of >25 mg/kg2*
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*NR*
Presence of other condition/s	*All subjects were overweight or obese,* *with a minimum body mass index (BMI) of >25 mg/kg2.*
Medication History	*NR*
N per group	• *lifestyle modification plus metformin 850 mg two times per day (n=9)* • *lifestyle modification plus placebo (n=11)* • *lifestyle + metformin (n=9)* • *placebo alone (n=9)*
Setting	*Academic medical centre*
Intervention	*All subjects (n=38) were randomized to one of four 48-week interventions: metformin 850 mg two times per day,*

	• *lifestyle modification plus metformin 850 mg two times per day (n=9)* • *lifestyle modification plus placebo (n=11)* • *lifestyle + metformin (n=9)* • *placebo alone (n=9)*	
Comparison	*a lifestyle modification program with placebo by mouth two times per day*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Biochemical pregnancy rate*	
Follow up Duration	*48 weeks*	
Summary Result/s	*It was necessary to screen seven women to have one subject randomized. The dropout rate was >39%, with the majority of dropouts occurring within the first 24 weeks. Mean body mass index was >39 mg/kg2. Modest weight reduction was found in all treatment groups, with the most significant reduction occurring with the combination of metformin and lifestyle intervention. Significant androgen reduction occurred in the combination group only. Ovulation rates did not differ significantly between groups. However, when data were analyzed by presence or absence of weight reduction in subjects, independent of treatment group, the estimated odds ratio for weight loss was 9.0 (95% confidence interval 1.2-64.7) with respect to regular ovulation. If weight loss occurred during metformin therapy, the odds ratio for regular ovulation was 16.2 (95% confidence interval 4.4-60.2).*

Study ID	**Homburg 2012**
Study Citation	Homburg R, Hendriks ML, König TE, and Anderson RA, et al., Clomifene citrate or low-dose FSH for the first-line treatment of infertile women with anovulation associated with polycystic ovary syndrome: a prospective randomized multinational study. Hum Reprod. 2012 Feb;27(2):468-73. doi: 10.1093/humrep/der401. Epub 2011 Nov 28. PMID: 22128296.
Study Country	Europe and South America
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Infertile women (<40 years old) with PCOS-related anovulation, without prior ovulation induction treatment. Age (years) CC: 29.4 (SD 4.0) FSH: 29.8 (3.8) BMI (kg/m2) CC: 25.7 (6.0) FSH: 25.1 (5.2)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Infertility duration not reported and some might have had previous pregnancies "Treatment-naive women (n=302) with anovulatory or oligo-ovulatory infertility associated with PCOS…" "Tubo-peritoneal evaluation was performed only in subjects with a previous history of pregnancy resulting in a spontaneous abortion, a previous history of gynaecological or abdominal surgical intervention or pelvic inflammatory disease. Those admitted to the study all had a normal uterine cavity and tubal patency demonstrated by radiological (hysterosalpingogram), laparoscopic or ultrasonic means before entering the study. Male partners all had a normal semen analysis conforming to World Health Organization criteria (World Health Organization, 1999)."
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	302 randomized – 143 participants to CC (340 cycles) and 159 participants to low-dose FSH (326 cycles).

	Analysed participants: 123 in CC (310 cycles) and 132 in FSH (288 cycles)	
Setting	10 centres throughout Europe and South America from August 2005 to March 2009.	
Intervention	CC: "The starting dose of CC was 50 mg/day (oral) for 5 days from Day 4 of a spontaneous or progestin-induced menstruation, rising by 50 mg/day up to 150 mg in subsequent cycles if ovulation was not achieved."	
Comparison	FDH: "Recombinant human FSH (Puregon, Schering-Plough, Houten, The Netherlands) was given s.c. in a low-dose protocol starting with 50 IU on cycle day 4, with weekly increments of 25 IU as necessary to induce a follicular response (Leader, 2006)."	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: Clinical pregnancy rate; Secondary: Rates of miscarriage, multiple pregnancies, live births.	
Follow up Duration	*Three treatment cycles*	
Summary Result/s	"Per protocol analysis revealed that reproductive outcome was superior after OI with FSH than with CC with respect to PR per first cycle [30 versus 14.6%, respectively, 95% confidence interval (CI) 5.3–25.8, P ¼ 0.003], PR per woman, (58 versus 44% of women, 95% CI 1.5–25.8, P ¼ 0.03), LBR per woman (52 versus 39%, 95% CI 0.4–24.6, P ¼ 0.04), cumulative PR (52.1 versus 41.2%, P ¼ 0.021) and cumulative LBR (47.4 versus 36.9%, P ¼ 0.031), within three cycles of OI."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	
Does the study have specified inclusion/exclusion criteria?	Partial	*""Subjects were <40 years old. There were no weight or BMI restrictions…Those admitted to the study all had a normal uterine cavity and tubal patency demonstrated by radiological (hysterosalpingogram), laparoscopic or ultrasonic means before entering the study. Male partners all had a normal semen analysis conforming to World Health Organization criteria (World Health Organization, 1999)."* *Exclusion criteria not reported*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Partial	*"Subjects were <40 years old. There were no weight or BMI restrictions…Those admitted to the study all had a normal uterine cavity and tubal patency demonstrated by*

			radiological (hysterosalpingogram), laparoscopic or ultrasonic means before entering the study. Male partners all had a normal semen analysis conforming to World Health Organization criteria (World Health Organization, 1999).”
Exclusion criteria		Not reported	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	Computer-generated randomization. Randomization was stratified by centre in blocks of 20 inclusions per centre.
	Was allocation to intervention group concealed?	Partial	Sealed opaque envelopes
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	Difficult to maintain blinding given the nature of the interventions ie. pill v injection.
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	To be sure it’s the intervention which is responsible for the effect.
TECTION	**Were outcome assessors blind to intervention group?**	Not reported	

	Were all outcomes measured in a standard, valid and reliable way?	Yes	"Clinical pregnancy was defined as a pregnancy diagnosed by ultrasonographic visualization of one or more gestational sacs with at least one foetus at 6–7 weeks gestation and this pregnancy was deemed as ongoing pregnancy if it continued for more than 20 completed weeks of gestation. A miscarriage was defined as the spontaneous loss of a clinical pregnancy before 20 completed weeks of gestation and a multiple pregnancy as one in which there was more than one foetus. A live birth was defined as the birth of a viable infant, reported on a clinical research form transmitted to the co-ordinating centre."
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	14% CC 17% FSH	20 CC; 27 FSH "In the CC group, 20 patients did not complete the full study (5 inter-cycle and 1 chemical pregnancy and 14 for personal reasons) compared with 27 in the FSH group (4 inter-cycle and 3 chemical pregnancies, 19 for personal reasons and 1 following a cycle cancelled because of overstimulation).
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	"Both per protocol analysis and intention-to-treat analysis were carried out."
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	Difficult to determine without a protocol. "This study was reported according to the CONSORT criteria for RCTs comparing medical treatment in two different arms."
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Partial	"The only demographic or clinical differences between the randomized groups, confirmed by multivariate analysis, were a higher prevalence of clinical hyperandrogenism ($P < 0.01$) and higher serum DHEAS concentrations ($P < 0.04$) in the CC group"

	If confounding was present, was it controlled for?	Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	The authors declared that there were no conflicts of interest. "This study was supported by an unrestricted educational grant from Organon, Oss, The Netherlands (now MSD/ Schering-Plough). The company played no part in study design, collection analysis, interpretation of data, writing of the report nor decision to submit the paper for publication. No medications were supplied"
	Was the study sufficiently powered to detect any differences between the groups?	Partial	"A power calculation, using Russ Lenth's power and sample size comparing two proportions (Lenth, 2006–2009) demonstrated that 150 subjects were required in each arm to achieve a relative increase in PR of 50% from 35 to 52.5% with 80% power, a significance level of 0.05 and allowing for a total of 50 drop outs from the study."
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Moderate	*Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	*Johnson, 2010*
Study Citation	*Johnson, N. P., Stewart, A. W., Falkiner, J., Farquhar, C. M., Milsom, S., Singh, V. P., ... & REACT-NZ (REproduction And Collaborative Trials in New Zealand), a multi-centre fertility trials group. (2010). PCOSMIC: a multi-centre randomized trial in women with PolyCystic Ovary Syndrome*

	evaluating Metformin for Infertility with Clomiphene. Human reproduction, 25(7), 1675-1683.
Study Country	New Zealand
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with oligo- or anovulatory infertility owing to PCOS. 6 to 24% of patients had past treatment with metformin or clomiphenes citrate.* *Age:* *Metformin: 28.9 ± 4.4 years* *Clomiphene citrate: 28.2 ± 4.0 years* *BMI* *M=26.5±3.5* *CC+M=26.9+4.1*
PCOS diagnostic criteria	Rotterdam
Presence of infertility	
Presence of other condition/s	*14 to 20% of patients had past treatment with CC.* *Couples who had undergone previous fertility treatment involving > 5 months treatment with CC were excluded*
Medication History	*important medical disorders were assessed*
N per group	*Total with BMI ≤32 = 71* *Metformin = 35* *Clomiphene citrate = 36*
Setting	*Four recruiting centres in New Zealand*
Intervention **Comparison**	*Metformin 500 mg standard release tablets, CC 50 mg tablets with identical placebo tablets (to maintain blinding) for both metformin and CC. Each patient received up to two 3-month treatment packages. Drugs were commenced concurrently and standard monitoring as for a CC cycle was undertaken in each case, with any required dose modifications initiated as previously described (Johnson, 2006). Briefly, metformin 500 mg three times daily in a gradual increasing dose over 2 weeks was given; for CC 50 mg was the initial dose and 150 mg the highest dose used. All study drugs were stopped once pregnancy was diagnosed.*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary outcome: clinical pregnancy that occurred within 6 months of randomization and resultant live birth* *Secondary outcomes: adverse events, ovulation, spontaneous abortion, ectopic pregnancy, multiple pregnancy and other adverse perinatal or obstetric complications.*
Follow up Duration	*Treatment duration: 6 months*
Summary Result/s	*For women with BMI . 32 kg/m2, clinical pregnancy and live birth rates were 22% (7/32) and 16% (5/32) with metformin, 15% (5/33) and 6% (2/33) with placebo. For women with BMI ≤ 32 kg/m2, clinical pregnancy and live birth rates were 40% (14/35) and 29% (10/35) with metformin, 39% (14/36) and 36% (13/36) with CC, 54% (19/35) and 43% (15/35) with combination metformin plus CC.*

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	*to assess whether metformin provides benefit when added to standard treatment and to assess the best first line treatment for women with ovulation dysfunction related to PCOS*
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	*However, women known to have stage 1 or 2 endometriosis and men with very mild oligospermia, with sperm count ≥15 million per ml, were included.*
Exclusion criteria		Yes	*Excluded couples who had undergone previous fertility treatment involving more than 5 months treatment with CC or metformin.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Not reported	*Method of randomization was not reported in this paper. It may have been reported in Johnson 2006.*
	Was allocation to intervention group concealed?	Yes	*"Allocation concealment was strictly maintained by a telephone call from the recruiting research nurse to pharmacy, the research pharmacist then executing the assignment by dispensing pre-prepared drugs in a true third party randomization"*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	*"Blinding (masking) of all parties was maintained in all cases by placebo control until the end of the course of treatment or, in the event of pregnancy, until after the pregnancy".*
	Were investigators and care providers blind to intervention group?	Yes	*"Blinding (masking) of all parties was maintained in all cases by placebo control until the end of the course of treatment or, in the event of pregnancy, until after the pregnancy".*

	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes	*"Blinding (masking) of all parties was maintained in all cases by placebo control until the end of the course of treatment or, in the event of pregnancy, until after the pregnancy".*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**		*"Among 36 women with BMI ≤ 32 kg/m2 receiving CC, 32 completed treatment and follow-up (all of whom were fully adherent to treatment)—there was one loss to follow-up and three either stopped or failed to start treatment. Of 35 women with BMI ≤ 32 kg/m2 receiving metformin, 32 completed treatment and follow-up (all of whom were fully adherent)—three breached the protocol by stopping treatment early, one of whom failed to resume treatment after a pregnancy miscarried."* *CC = 4 drop outs (11%)* *Met = 3 drop outs (8.6%)*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*"This analysis was conducted on an intention-to-treat basis using 'worst case' assumptions that women lost to follow-up did not become pregnant, or that they did not have a live birth if pregnant at the time of loss to follow-up."*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	
	If confounding was present, was it controlled for?	No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes	*All conflicts of interest were noted and authors state that "The researchers maintained complete independence from the funders".*
	Was the study sufficiently powered to detect any differences between the groups?	Yes	*""Our power calculation (Johnson, 2006) suggested a sample size of 160 women distributed between the five treatment arms in the study would be required to show an increase in the pregnancy rate from 30 to 55% by adding metformin to standard therapy (to comfortably allow for attainment of at least 122 participants required to have adequate power for this primary comparison of 'standard care' versus 'standard care plus metformin')."* *"A sample size of 61 participants per group was required for 80% power to detect an increase in pregnancy rate from 30% in the 'standard care' group to 55% in the 'standard care plus metformin' group. Thus, 122 analysed participants were required."* *"The target number of 153 analysed participants (92 BMI ≤ 32 kg/m2; 61 BMI >32 kg/m2) was increased to 160 (97 BMI ≤ 32 kg/m2; 63 BMI ≤ 32 kg/m2) to allow for losses to follow-up and the possibility of preferential allocation to one treatment arm."*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	

What is the overall risk of bias?	Moderate	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes Moderate of bias*	

Study ID	*Kar 2015*
Study Citation	*Kar, S., & Sanchita, S. (2015). Clomiphene citrate, metformin or a combination of both as the first line ovulation induction drug for Asian Indian women with polycystic ovarian syndrome: A randomized controlled trial. Journal of human reproductive sciences, 8(4), 197.*
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with complaints of infertility and oligomenorrhea*
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Duration of infertility (years)* *Group I: 2.75 ± 1.56* *Group II: 1.7 ± 1.056* *Group III: 2.53 ± 2.15*
Presence of other condition/s	*"We noted CC resistance in 47.5% women (14/32) who failed to ovulate with 150mg of CC for 5 days."*
Medication History	*NR*
N per group	*Group I (CC 50-150 mg/day),* *Group II (metformin 1700 mg/day),* *Group III (CC + metformin in similar dosage to Groups I and II).* *Patients underwent follicular monitoring and advice on timed intercourse.*
Setting	*private hospital in Bhubaneswar, India*
Intervention	*CC 50-150 mg/day)*
Comparison	*metformin 1700 mg/day*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Live birth rate; Clinical pregnancy rate; Ovulation rate*

Follow up Duration		*6 months*	
Summary Result/s		*There was no significant difference among the groups in baseline characteristics and biochemical parameters. LBR was 41.6%, 37.5%, and 28.1%, respectively in Groups III, II, and I. Group III (CC + metformin) had the highest ovulation (83.3%), pregnancy (50%), and LBRs (41.6%). Group II(metformin) was as good as Group I (CC) in all the outcomes. CC + metformin (Group III) had statistically significantly higher ovulation rate as compared to CC alone (Group I) (P= 0.03; odds ratio: 95% confidence interval: 3.888 [1.08-13.997]).*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	*To compare clomiphene citrate (CC), metformin or the combination of CC and metformin as the first line ovulation induction drug in Asian Indian women with polycystic ovary syndrome (PCOS)*
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	*Women with PCOS* *"Only treatment naive patients with the 1 st time diagnosis and the evaluation of infertility were included."*
Exclusion criteria		Yes	*"Women with any major systemic illness such as diabetes, liver, heart, or kidney disease were excluded from the study."*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*"Eligible women were randomized by picking up envelopes to either one of the three groups, consisting of CC (Group I), metformin (Group II), or a combination of metformin and CC (Group III). Equal numbers of envelopes for the three groups labelled I, II, and III were prepared by a nurse, naive to this study. The patients picked up the envelope and returned to the investigator for further advice."*
	Was allocation to intervention group concealed?	Partial	*Allocation revealed in envelopes but not clear if opaque or sealed*

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	*Participants and personnel were blinded*
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*"A total of 105 patients diagnosed as PCOS and found eligible for this study were randomized into thirty-five patients in each group. However, a total of eighty-one women completed the study, that is, 6 months of follow-up, or till pregnant, or CC resistant. Group I 32 patients (104 cycles), Group II 24 (70 cycles), and Group III 24 patients (84 cycles)."* *Dropouts: 25 (3 in the CC group, 11 in metformin group, 11 in combined group - 22.9% dropout rate, without reasons given)*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	No	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Partial

Study ID	**Kjotrod 2011**
Study Citation	Kjotrod, S. B., S. M. Carlsen, et al. (2011). "Use of metformin before and during assisted reproductive technology in non-obese young infertile women with polycystic ovary syndrome: a prospective, randomized, double-blind, multi-centre study." Human Reproduction 26(8): 2045-2053.
Study Country	Denmark, Finland, Norway and Sweden
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women diagnosed with PCOS, aged <38 years and with a BMI of <28 kg/m2. The majority of patients had previously received unsuccessful clomiphene citrate (CC) treatment. Mean (SD) age, years M: 29.6 (3.4) P: 29.5 (3.8) Mean (SD) BMI, kg/m2 M: 24.0 (2.7) P: 23.6 (2.8)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Duration of infertility (years) mean (SD)* *Metformin (n=74) : 2.6 (1.8)* *Placebo (n=75) : 2.8 (1.8)* *Cause of infertility, n* *PCOS only* *Metformin 45* *Placebo 44* *Additional male factor* *Metformin 21* *Placebo 26* *Additional tubal disease* *Metformin 6 (n=38)* *Placebo 6 (n=40)* *Additional endometriosis* *Metformin 4 (n=36)* *Placebo 2 (n=37)*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	□ Screened: 179 participants □ Allocated/randomised: 150 participants – M: 74, P:76 □ Assessed pre-ART: M: 74, P:75 □ Followed up – not relevant to this systematic review

Setting	"The study was planned as a multi-centre study (EUDRACTnr-2004-001124-20). Originally a centre in Leeds, UK was planned to be included; but we did not get the approval for study medications by the medical authorities in UK. One private IVF clinic in Helsinki, one in Oslo and one in Cophenhagen were also supposed to participate, but dropped out very early due to recruitment problems. To compensate for this, The Oslo University Hospital was recruited into the study during the last 1.5 years of the inclusion period." February 2005 - March 2010.	
Intervention	Metformin for ≥12 weeks prior to controlled ovarian stimulation (COS). "The dose of metformin was gradually increased from 500 to 2000 mg per day during the first 2 weeks of treatment." (spontaneous pregnancy (SP) group only) "Following a spontaneous menstrual period or a gestagen-induced shedding of the endometrium, pituitary down-regulation (nafarelin, 400 mg administered twice daily intranasally) was initiated (on cycle Day 20)" – assuming this to be post SP group data. The study continued throughout IVF/ICSI, and until the day of pregnancy testing, however we will only collect data relevant to pre-ART.	
Comparison	*Placebo*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: clinical pregnancy rate; Secondary: biochemical pregnancy and live birth rate – these were not reported for SP population. Safety variables included the incidence of adverse events (AEs) and OHSS. *Pregnancy was detected initially by a serum pregnancy test performed on Days 13–15 after embryo transfer and women with a positive test underwent an ultrasound in week 7 of pregnancy*	
Follow up Duration	Haven't used entire study data, only pre ART data. The total study period was ~5 years.	
Summary Result/s	Among IVF treated women (n = 112), biochemical pregnancy rates were identical in both groups (42.9%), and there were no significant differences in the metformin versus the placebo group in CPR [39.3 versus 30.4%; 95% confidence interval (CI): 28.6 to 26.5]. The LBR was 37.5 versus 28.6% (95% CI: 28.4 to 26.3). However, prior to IVF there were 15 (20.3%) spontaneous pregnancies in the metformin group and eight (10.7%) in the placebo group (95% CI: 21.9 to 21.1; P = 0.1047). According to intention to treat analyses (n = 149); significantly higher overall CPR were observed in the metformin versus placebo group (50.0 versus 33.3%; 95% CI: 21.1 to 32.3; P = 0.0391). LBR was also significantly higher with use of metformin versus placebo (48.6 versus 32.0; 95% CI: 1.1 to 32.2; P = 0.0383). No major unexpected safety issues or multiple births were reported. More gastrointestinal side effects occurred in the metformin group (41 versus 12%; 95% CI: 0.15 to 0.42; P< 0.001).	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	"To study the effect of metformin before and during assisted reproductive technology (ART) on the clinical pregnancy

			rate (CPR) in non-obese women with polycystic ovary syndrome (PCOS)."
	Does the study have specified inclusion/exclusion criteria?	Yes	
	If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
	Inclusion criteria	Yes	"The included patients had been trying, unsuccessfully, to conceive for at least 1 year and have a diagnosis of PCOS based on fulfilling at least two of the following three criteria: oligomenorrhoea/ amenorrhoea, clinical or biochemical hyperandrogenism and/or polycystic ovaries on ultrasound (The Rotterdam ESHRE/ASRM-Sponsored PCOS Consensus Workshop Group, 2004)."
	Exclusion criteria	Yes	"Patients were excluded if they were contraindicated for a starting dose of 112.5 IU recombinant human follicle-stimulating hormone (r-hFSH), or had a basal serum FSH level of .10 IU/l. Patients with liver or kidney disease, diabetes mellitus (or fasting plasma glucose ≥7.0 mmol/l), alcoholism or drug abuse were excluded. Patients with hyperprolactinaemia (serum prolactin .700 mIE/l), abnormal thyroid function tests, congenital adrenal hyperplasia, androgen-secreting tumours or Cushing's syndrome were also excluded. Finally, patients who had received oral steroid hormones, cimetidine, anticoagulants, erythromycin or other macrolides were also excluded. A 1-month washout period was required for women who had previously received metformin."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	"Randomization was performed in blocks of four by the hospital pharmacy using a computer-generated list."
	Was allocation to intervention group concealed?	Yes	"The trial clinician and a study nurse at each site enrolled the patients." "Identical blister packs containing metformin or placebo tablets (of the same appearance, smell and taste) were made, and each centre was assigned 20 identical packs. The study medicine was delivered to the patients either by the hospital pharmacy or by a third, independent person who was not involved in the study. The patient screened and randomized as number one in the centre received package number one, randomization patient number two received package number two, etc. Randomization codes remained blinded until the database lock had taken

			place.”
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	
	Were investigators and care providers blind to intervention group?	Yes	“All study site personnel, the sponsor and the monitor Operationally involved in the monitoring or conduct of the study were blinded to the study drug codes.”
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	Unblinding was performed prior to serum analyses.
	Were all outcomes measured in a standard, valid and reliable way?	Yes	“The primary efficacy end-point was the CPR, defined by ultrasound evidence of an intrauterine gestational sac (with a beating heart) at Week 7 in the ITT population. Secondary efficacy endpoints included the SP rate during the pretreatment period (SP population); biochemical pregnancy (defined by a positive serum hCG test on Day 14 after embryo transfer) and CPRs following IVF/ICSI in the ART population and LBR (in the ITT, ART and SP populations). Safety variables included the incidence of adverse events (AEs), OHSS and coasting. According to prespecified criteria, OHSS and coasting were not considered AEs.”
	Were outcomes assessed objectively and independently?	Yes	
ATTRITIO N BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% M 1.3% P	This relates only to SP and not drops outs post ART.

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	However we have not used the ITT population, we have used the pre-ART population.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	Difficult to determine without a protocol.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	Both groups were matched for age, cause and duration of infertility, weight, and BMI.
	If confounding was present, was it controlled for?		Both groups were matched for age, cause and duration of infertility, weight, and BMI.
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Partial	All were clearly declared.
	Was the study sufficiently powered to detect any differences between the groups?	Yes	"In our previous pilot study (Kjotrod et al., 2004) an increased pregnancy rate of almost 100% was observed among metformin-relative to placebo treated non-obese women with PCOS. A CPR of 0.35 was expected in the placebo group. With a study power of 0.80 and a significance level of 0.05, it was estimated that 120 patients were needed in each group to demonstrate a 50% increase in the CPR in the metformin group." However we will only use pre-ART data which which is in 74 participants and thus not adequately powered for that component of data.

	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		Moderate	*Moderate - Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	*Kocak 2002*
Study Citation	Kocak M, Caliskan E, Simsir C, Haberal A. Metformin therapy improves ovulatory rates, cervical scores, and pregnancy rates in clomiphene citrate-resistant women with polycystic ovary syndrome. Fertil Steril. 2002 Jan;77(1):101-6. doi: 10.1016/s00150282(01)02941-7.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Fifty-six women with clomiphene citrate–resistant PCOS.* *Age years (mean ± SD)* *Group 1: 26.2 ± 3.7* *Group 2: 27.1 ± 4.5; p=0.3* *BMI* *Group 1: 31.91 ± 5.38* *Group 2: 30.8 ± 4.4*
PCOS diagnostic criteria	Align with Rotterdam “The diagnosis of PCOS was made according to following findings: oligomenorrhea (fewer than six menstrual periods in the preceding year) with hirsutism, hyperandrogenemia, or presence of multiple subcapsular follicles by vaginal ultrasound during the first 3 days of spontaneous menstrual bleeding. Adrenal, thyroid disorders, and hyperprolactinemia were specifically excluded by means of hormone assays.”

Presence of infertility	*Mean infertility period (3.2 ± 1.1 years) of group I (MET) women was not significantly different from the the mean infertility period (3.4 ± 0.9; P=.4) of group II (Placebo) women.*	
Presence of other condition/s	*Documented history of resistance to Clomiphene Citrate (CC) at doses ranging from 50 to 150 mg/day for 5 days (Clomiphene citrate resistance was defined as failure to have an ovarian response for three consecutive cycles on transvaginal ultrasonographic examination with concomitant failure of E2 levels to increase after treatment with CC, 150 mg daily for 5 days)*	
Medication History	*"None of the subjects had taken any medication that could influence carbohydrate metabolism for 2 months before the onset of the study, including oral contraceptives."*	
N per group	*N=56* *Met n=28* *Placebo n=28*	
Setting	*"Infertility clinic of a tertiary referral center"*	
Intervention	*MET (Group I): Two cycles of oral metformin therapy (850 mg, twice daily)* *Clomiphene citrate (100 mg/day) on cycle days 3–7 of the second cycle in both groups*	
Comparison	*Placebo (Group II): placebo therapy (twice daily)* *Clomiphene citrate (100 mg/day) on cycle days 3–7 of the second cycle in both groups*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Insulin, T, DHEAS, FSH, LH, body mass index (BMI), waist-to-hip ratio, endometrial thickness, cervical score, ovulation, and pregnancy rates*	
Follow up Duration	*Two cycles*	
Summary Result/s	*"Metformin therapy resulted in a significant decrease in total T, LH level, LH/FSH ratio, insulin resistance, and mean BMI. No difference in waist-to-hip ratio, DHEAS level, and fasting insulin level was observed. Clomiphene citrate induction resulted in higher ovulation rates and thicker endometrium in the metformin group than in the placebo group. There was higher cumulative pregnancy rate in the metformin group; however, there was no significant difference in the pregnancy rate between the two groups."*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"To evaluate the effect of metformin therapy on hyperandrogenism, insulin resistance, cervical*

			scores, ovulation, and pregnancy rates in clomiphene citrate–resistant women with polycystic ovary syndrome (PCOS).”
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	*PCOS* *Infertile* *CC resistant (failure to have an ovarian response for three consecutive cycles on transvaginal ultrasonographic examination with concomitant failure of E2 levels to increase after treatment with CC, 150 mg daily for 5 days)*
Exclusion criteria		Yes	*Diabetes* *Male factor infertility* *Tubal–uterine factor infertility* *Adrenal, thyroid disorders* *Hyperprolactinemia*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	No	*The admission was based on odd and even admission numbers.* *However, the study design mentions “Prospective, randomized, double-blind, placebo-controlled study”.* *“At the first presentation, each patient was given an individual admission number that was written in a sealed envelope and recorded by a nurse in the order of admission.”*
	Was allocation to intervention group concealed?	Partial	*“At the first presentation, each patient was given an individual admission number that was written in a sealed envelope and recorded by a nurse in the order of admission.”* *“After 75-g oral glucose challenge test, one of the authors opened the sealed envelope. Women having odd admission numbers were assigned to receive oral metformin”* *“Women having even admission numbers received oral placebo”*

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Partial	*Whether placebo looked similar to metformin not reported*
	Were investigators and care providers blind to intervention group?	Partial	*"These measurements were taken by one of the authors who was blinded to the admission number of the patients."*
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes	*"The authors obtaining these measurements were blinded to the medication received by the patient."*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Apparently, only one (1/26= 3.8%) dropped off from the Metformin group and none dropped off from placebo group*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	No	*However, only one dropped out from the study and the effect may be negligible*

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"There was no significant change between the two treatment groups in waist-to-hip ratio and FSH, compared to the baseline values (Table 1)."*
	If confounding was present, was it controlled for?	No	*No confounding identified*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	*No conflict of interest statement available.*
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes	*"Comparisons of the data at baseline, after placebo administration or after metformin administration in the study group were performed using the distribution of continuous variables with the Shapiro-Wilk normality tests. Results within a group were compared using paired samples t-test or the Wilcoxon's signed rank test. Student's t-test or the Mann-Whitney rank sum test was used to compare results between the groups. Proportions were compared by using the X^2 test or Fisher's exact test whenever suitable. Differences were considered to be significant (P <.05), and data are reported as the mean ± SD."*
COMMENTS		Mod (randomisation method unclear, no SS calc, 1 drop out); no BL diff	

What is the overall risk of bias?	Moderate	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		

Study ID	**Lopez 2004**
Study Citation	Lopez, E., et al., Ovulation induction in women with polycystic ovary syndrome: randomized trial of clomiphene citrate versus low-dose recombinant FSH as first line therapy. Reproductive Biomedicine Online, 2004. 9(4): p. 382-90.
Study Country	Spain
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women aged <40 years with anovulatory infertility due to PCOS of at least 1 year duration who were therapy naïve. Median age (years), FSH = 30 (22-39) CC= 29 (23-38) Body mass index (kg/m2), FSH = 21.9 ± 1.9 CC= 22.3 ± 1.9
PCOS diagnostic criteria	Rotterdam
Presence of infertility	All women presented with oligomenorrhoea or amenorrhoea and primary infertility of a median duration of 3 years (range 1–8 years).
Presence of other condition/s	*Not reported*
Medication History	*Treatment naïve*
N per group	Assessed for eligibility = 76 patients Randomised total = 76 patients Randomised to FSH = 38 patients; all received allocated intervention; 1 patient refused to be treated for cycles 2 and 3; analysed 38 patients (ITT), 91 cycles Randomised to CC = 38; all received allocated intervention; analysed 38 patients, 104 cycles
Setting	Infertility clinic at the Hospital Virgen de la Arrixaca in Murcia in Spain over the period April 2000 to December 2001.
Intervention	Low-dose recombinant FSH for up to three cycles. “Treatment with recombinant FSH (Gonal-F; Serono S.A.) was commenced on day 3 following spontaneous or induced menses. The chronic low-dose, step-up regimen consisted of a starting dose of75 IU daily s.c., with dose increments of 37.5 IU daily every 7 days if there was

	no evidence of ovarian response by ultrasonography (i.e. no follicle >I0 mm in diameter). This stepwise increase was continued until ovarian activity was seen, at which time the dose was maintained. In successive treatment cvcles, the starting dose of FSH could be modified, based on the ovarian response in the previous cycle. Criteria for HCG injection (5000 1U i.m.) were the same as for clomiphene citrate treatment cycles. A treatment cycle was cancelled if there was no follicle growth after 21 days of gonadotrophin administration. The injection of HCG was withheld if four or more follicles >I4 mm in diameter were present, because of the increased risks of OHSS and multiple pregnancy." "Couples were advised to have sexual intercourse the evening of the HCG injection and the following day." "Women not conceiving after three cycles of treatment crossed over to the alternative treatment for a further three cycles, with an interval of at least 45 days between treatments." – wasn't required and only first arm data presented here.
Comparison	Clomiphene citrate for up to three cycles. It was "given at a daily dose of 50 mg for 5 days, starting on day 5 following spontaneous or induced uterine bleeding. If ovulation was documented but no pregnancy ensued, the same dose was used in the next cycle. However, if no ovulatory response occurred, the daily dose was increased by 50 mg for the subsequent cycle, up to a maximum daily dose of 150 mg in the third treatment cycle. Human chorionic gonadotrophin (HCG,Profasi; Serono S.A., Madrid, Spain), at a dose of 5000 IU i.m., was administered when the lead follicle was >I7 mm in diameter on transvaginal ultrasonography. The cycle was cancelled if no growing follicle was seen by day 18-20." "Couples were advised to have sexual intercourse the evening of the HCG injection and the following day." "Women not conceiving after three cycles of treatment crossed over to the alternative treatment for a further three cycles, with an interval of at least 45 days between treatments." – wasn't required and only first arm data presented here.
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	"The primary outcome measure was cumulative pregnancy after undergoing up to three treatment cycles. Secondary outcomes were cycle cancellation rate, ovulation rate per cycle, cumulative ovulation rate, pregnancy rate per cycle, incidence of OHSS, cumulative live birth rate, and multiple birth rate." "Ovarian response was monitored by transvaginal ultrasonography." "Pregnancy was diagnosed by increasing serum concentrations of β-HCG after missed menses, and the subsequent demonstration of an intrauterine gestational sac by transvaginal ultrasonography."
Follow up Duration	*Three cycles*
Summary Result/s	"The relative risk and its 95% confidence interval were 1.17 (0.97–1.46) for HCG cycles with ovulation, 1.78 (0.92–3.54) for the pregnancy rate per woman, and 1.83 (0.79–4.40) for live births per woman in favour of FSH.

	The cumulative pregnancy rate after three treatment cycles was 43% with FSH and 24% with clomiphene citrate (P = 0.06)."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	"A history of amenorrhoea (no menstrual periods for three or more months) or oligomenorrhoea (fewer than nine menstrual periods in a year), monophasic basal body temperature charting, proliferative endometrium on biopsy, or serum progesterone concentrations <l ng/ml were accepted as demonstration of anovulation. In addition, subjects were required to have the ultrasonographic appearance of polycystic ovaries (Adams et al., 1986), a positive response to the progestin challenge test (normal withdrawal bleeding after treatment with oral medroxyprogesterone acetate, 10 mg daily for 5 days), normal serum prolactin, dehydroepiandrosterone sulphate, and fasting glucose concentrations, a normal hysterosalpingogram (and laparoscopy when appropriate), and no history of pelvic surgery or pelvic inflammatory disease. When the study was started the criteria for PCOS that were used were as described and these are also in keeping with the ESHREIASRM guidelines for PCOS (Rotterdam ESHREIASRM sponsored PCOS consensus workshop group, 2003). Obesity was not an inclusion or exclusion criterion. The male partner had to have normal semen parameters according to World Health Organization criteria (Rowe et al., 2000)."
Exclusion criteria	Yes	"Women with a previous pregnancy or previous treatment with ovarian stimulation drugs were excluded."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION **Did the study have an adequate method of randomisation?**	Yes	*"Women were allocated to the treatment groups according to a computer generated randomization table."*

	Was allocation to intervention group concealed?	Yes	*"Concealment of treatment allocation was achieved with the use of sealed opaque envelopes each containing a unique study number and prepared independently by a secretary."*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	2.6% treatment 0% control/ comparison	*FSH = 2.6%* *CC = 0%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"there was no significant difference between groups for any characteristic."*
	If confounding was present, was it controlled for?	Not reported	*Not reported-probably not "there was no significant difference between groups for any characteristic."*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	No	*"The sample size calculation was based on experience with ovulation induction in women with WHO group 11 anovulation, in whom cumulative pregnancy rates were obtained after three treatment cycles of 25% with clomiphene citrate and 40% with FSH, an absolute difference of 15% (Balasch, 1986; Balasch et al., 1996). The sample size required to provide power of 80% to detect this magnitude of treatment effect was calculated to be 152 women per treatment group, using a two-tailed analysis with a detection limit of 5% of avoiding a type I error in hypothesis testing. Recruitment was terminated after 21 months when it became evident that it would not be possible to recruit this number of subjects from a single centre in a reasonable time period."*
	If statistical analysis was undertaken, was this appropriate?	Yes	*Yes*
COMMENTS			

What is the overall risk of bias?	High	*lack of blinding info and small n*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		

Study ID	*Legro, 2007*
Study Citation	*Legro, R. S., Barnhart, H. X., Schlaff, W. D., Carr, B. R., Diamond, M. P., Carson, S. A., ... & Myers, E. R. (2007). Clomiphene, metformin, or both for infertility in the polycystic ovary syndrome. New England Journal of Medicine, 356(6), 551-566.*
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*infertile women with the polycystic ovary syndrome* *metformin and CC vs CC vs metformin* *• Mean age (SD) 28.3 (4.0), 27.9 (4.0), 28.1 (4)* *• Mean BMI (SD) 34.2 (8.4), 36.0 (8.9), 35.6 (8.5)*
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Length of time subject had been attempting conception — months* *CC: 41.4±39.4* *MET: 39.0±31.9* *CC+MET: 40.7±36.0*
Presence of other condition/s	*Some had insulin resistance*
Medication History	*NR*
N per group	*626 into three groups* *CC: n=209,* *MET: n=208* *CC+MET: n=209*
Setting	*Multicentre study*
Intervention	*Main intervention: 2 extended-release metformin 500 mg or 2 placebo tablets twice daily*

Comparison	*CC 50 mg or second matching placebo tablet was commenced concurrently from day 3-7 of the cycle.* *When women had no or poor response, the dose was increased by 50 mg or 1 additional placebo tablet with the maximum dose of 150 mg or 3 placebo tablets*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary: live birth rate, gastrointestinal side effects* *Secondary: clinical pregnancy, ovulation: progesterone > 5 ng/mL, BMI, fasting glucose, fasting insulin, serum testosterone, miscarriage, multiple pregnancy, other adverse events*
Follow up Duration	*6 months*
Summary Result/s	*The live-birth rate was 22.5% (47 of 209 subjects) in the clomiphene group, 7.2% (15 of 208) in the metformin group, and 26.8% (56 of 209) in the combination therapy group (P<0.001 for metformin vs. both clomiphene and combination therapy;* *P = 0.31 for clomiphene vs. combination therapy). Among pregnancies, the rate of multiple pregnancy was 6.0% in the clomiphene group, 0% in the metformin group, and 3.1% in the combination-therapy group. The rates of first-trimester pregnancy* *loss did not differ significantly among the groups. However, the conception rate among subjects who ovulated was significantly lower in the metformin group (21.7%) than in either the clomiphene group (39.5%, P = 0.002) or the combination therapy group (46.0%, P<0.001).*

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	*oligomenorrhoea (< 8 periods/year), biochemical hyperandrogenism (elevated* *testosterone level documented within the previous year on the basis of local laboratory results)* *Women should have at least 1 proven patent fallopian tube. Normal uterine cavity. Normal semen* *analysis (sperm concentration > 20 million/mL)*
Exclusion criteria	Yes	*hyperprolactinaemia, CSH, thyroid disease, Cushings's syndrome, androgen-secreting tumour*

INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*Computer-generated; participants were randomised by means of an interactive voice system and stratified based on study site and previous exposure to study drugs*
	Was allocation to intervention group concealed?	Yes	*Each participant received a medication package on a monthly basis that consisted of a bottle M (metformin or placebo) and a bottle C (CC or placebo). Data co-ordinating centre at the clinical research institute*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	*Participants and personnel were blinded*
	Were investigators and care providers blind to intervention group?	Yes	*Participants and personnel were blinded*
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes	*Investigators were blinded*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**		*49 (23.7%) in the metformin and CC group, 55 (26.3%) in the placebo and CC group, 72 (34.6%) in the metformin group. The differences were not significant.*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	All primary and secondary outcome measures reported. 3-arm study however outcome data presented for all 3 arms clearly.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	
	If confounding was present, was it controlled for?	No	*"There were no significant differences in baseline variables among the study groups".*
IER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	*Conflict of interest clearly documented*

	Was the study sufficiently powered to detect any differences between the groups?	Yes	*Based on the initial sample size calculation, 678 was needed to detect a 15% absolute difference in live birth rates with a power of 80% and a type I error of 0.05. Due to limitations in the supplying metformin and the matching placebo tablets, the number of required women was reduced to 626. This was approved after the assessment by the data safety and monitoring board. Because the observed live birth rate was lower than projected, the number of recruited participants (626) was sufficient to detect a 15% difference with the same magnitude of power and type I error.* *The original sample size was 678 to detect a 15% absolute difference in live birth rates. However, due to drug supply logistics, the sample size later reduced to 626 after the data safety and monitoring board review*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Low	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*all outcomes Low risk of bias*	

Study ID	*Morin-Papunen, 2012*
Study Citation	*Morin-Papunen, L., Rantala, A. S., Unkila-Kallio, L., Tiitinen, A., Hippeläinen, M., Perheentupa, A., ... & Tapanainen, J. S. (2012). Metformin improves pregnancy and live-birth rates in women with polycystic ovary syndrome (PCOS): a multicenter, double-blind, placebo-controlled randomized trial. The Journal of Clinical Endocrinology, 97(5), 1492-1500.*
Study Country	Finland
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants	*women aged 18–39 yr at entry, with a body mass index (BMI) greater than 19 kg/m2 and diagnosed with PCOS* *Metformin vs placebo* *• mean age (SD) 28.4 (3.9) vs 27.9 (4.1)* *• mean BMI (SD) 27.1 (6.3) vs 27.4 (6.2)* *• mean fasting insulin, microIU/mL (SD) 11.0 (11.2) vs 11.4 (11.8)* *• testosterone, ng/dL (SD) 43.2 (17.3) vs 45.8 (20.2)* *• mean fasting glucose, mg/dL (SD) 91.9 (7.2) vs 91.9 (9.0)*
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Duration of infertility (months)* *Met: 23.8 ± 18.8* *Placebo: 25.3 ± 22.3*
Presence of other condition/s	*Abnormal sperm (%)* *Met: 42 (26.2)* *Placebo: 39 (24.4)*
Medication History	*NR* *"Exclusion criteria were type 2 diabetes mellitus, active liver disease (alanine aminotransferase >100 IU/liter), history of cardiac or renal failure, hormone medication, alcohol use, and regular smoking."*
N per group	*N=320 (160 for each group)*
Setting	*Multicentre RCT (parallel-group study)*
Intervention	*Metformin 500 mg 1/d for 1 week, then increased weekly by 1 extra tablet/d to 1.5 g/d in non-obese and 2 g/d in obese women versus placebo)*
Comparison	*Placebo* *If pregnancy did not occur, ovulation induction was commenced: if the woman ovulated after clomiphene*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary: live birth rate, gastrointestinal side effects* *Secondary: clinical pregnancy rate, BMI, miscarriage rate*
Follow up Duration	*3-9 months*
Summary Result/s	*Miscarriage rates were low and similar in the two groups (metformin 15.2% vs. placebo 17.9%, P=0.8). Intent-to-treat analysis showed that metformin significantly improved PR and LBR (vs. placebo) in the whole study population (PR: 53.6 vs. 40.4%, P = 0.006; LBR: 41.9 vs. 28.8%, P = 0.014) and PR in obese women (49.0 vs. 31.4%, P=0.04), and there was a similar trend in nonobese(PR:*

		58.6 vs. 47.6%, P=0.09; LBR: 46.7 vs. 34.5%, P=0.09) and in obese women with regard to LBR (35.7 vs. 21.9%, P = 0.07). Cox regression analysis showed that metformin plus standard infertility treatment increased the chance of pregnancy 1.6 times (hazard rate 1.6, 95% confidence interval 1.13–2.27).
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	*"We investigated whether metformin decreases the early miscarriage rate and improves the pregnancy rates (PR) and live-birth rates (LBR) in PCOS."*

Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	*PCOS (irregular cycles of ≤ 21 days or ≥ 35 days and cycle-to-cycle variation of > 4 days, anovulation with mid-luteal progesterone < 16 nmol/L whilst taking CC 100 mg for 5 d over 3 cycles, exclusion of other endocrinopathy (raised prolactin, thyroid disorder*), US findings of PCO, age <40, day 2 FSH < 10, bilateral patent tubes demonstrated by laparoscopy, normal semen parameters*
Exclusion criteria		Yes	*Taking any sex hormones in previous 3 months, smokers, renal impairment*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*computer-generated list in sealed envelopes*

	Was allocation to intervention group concealed?	Yes	*In sealed envelopes however, does not state whether the envelopes were opaque. Double, identical appearance and packed by the hospital pharmacy. Code kept in the pharmacy department until the end of the trial*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	*Participants and personnel were blinded*
	Were investigators and care providers blind to intervention group?	Yes	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes	*Investigators were blinded*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	*In spite of the fact that anovulation and CC resistance was an inclusion criteria, 7 out of 9 women taking placebo ovulated (3 with placebo alone, and 4 out of the 6 remaining in the trial who had CC and placebo)*
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**		*5 (25%), 3 in placebo arm, 2 in metformin.*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*Analysis on ITT*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	*All primary outcome measures reported*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"Both groups were comparable with respect to age of women, duration of infertility, proportion of primary/secondary infertility, total ovarian volume, baseline body mass index (BMI)"*
	If confounding was present, was it controlled for?	No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Partial	*Funding body is mentioned.* *No conflict of interest statement.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes	*8 in each arm needed. 10 recruited.*
	If statistical analysis was undertaken, was this appropriate?	Yes	

COMMENTS		
What is the overall risk of bias?	Moderate	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes* moderate *risk of bias*	

Study ID	Qublan 2009
Study Citation	H. S. Qublan, S. Al-Khaderei, A. N. Abu-Salem, A. Al-Zpoon, M. Al-Khateeb,N. Al-Ibrahim, M. Megdadi & N. Al-Ahmad (2009) Metformin in the treatment of clomiphene citrate-resistant women with polycystic ovary syndrome undergoing in vitro fertilisation treatment: A randomised controlled trial, Journal of Obstetrics and Gynaecology, 29:7, 651-655, DOI: 10.1080/01443610903147576
Study Country	Jordan
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	Rotterdam ESHRE/ASRAM
Presence of infertility	Assumed due to anovulation/ CCR
Presence of other condition/s	CC-resistance (defined as failure to ovulate after CC treatment up to a daily dose of 150 mg from cycle day 5–9 for at least three consecutive cycles)
Medication History	Clomiphene citrate resistance: failure to ovulate after CC treatment up to a daily dose of 150 mg from cycle day 5–9 for at least three consecutive cycles.
N per group	Allocated/randomised: Not reported (NR drop outs, same numbers) Assessed: 34 metformin Assessed at end of study: 32 placebo
Setting	NR
Intervention	850 mg of metformin (n = 34) (Glucophage: Lipha Sante, Lyon, France)
Comparison	Placebo n=32

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		Clinical pregnancy rates; implantation rates; hormones including FSH, LH, testosterone (T), androstenedione (A), 17-hydroxyprogesterone (17-OHP), oestradiol (E2) and dehydroepiandrosterone sulphate (DHEAS)	
Follow up Duration		1 month before IVF until day of pregnancy test. If pregnant, continued metformin for 12 wks.	
Summary Result/s		Compared with the metformin-treated group, women who received a placebo had a significant increase in terms of days of stimulation with HMG, number of HMG ampoules, number of follicles 414 mm, number of oocytes retrieved, number of mature eggs, fertilisation rate and oestradiol level on the day of hCG administration	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Partial	Determine the efficacy of metformin vs placebo in women with PCOS undergoing IVF treatment- primary outcomes not stated
Does the study have specified inclusion/exclusion criteria?		Yes	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	Yes
Inclusion criteria		Yes	Congenital adrenal hyperplasia, Cushing's syndrome, hyperprolactinaemia and thyroid disease were excluded by appropriate tests. Liver and kidney function tests were assessed in all patients and all were normal. Clomiphene citrate resistance was defined as failure to ovulate after CC treatment up to a daily dose of 150 mg from cycle day 5–9 for at least three consecutive cycles. Progesterone level on day 21 and 28 410 ng/mL was indicative of ovulation. All patients were required to have normal uterine cavity and tubal patency on hysterosalpingography. All male partners had normal semen parameters according to World Health Organization criteria (WHO 1992).
Exclusion criteria		Yes	As above
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION	**Did the study have an adequate method of randomisation?**	Not reported	Not reported

	Was allocation to intervention group concealed?	No	Not reported
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	Yes, single-blind
	Were investigators and care providers blind to intervention group?	No	No
	Aside from the experimental intervention, were the groups treated the same?	Yes	Yes
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Partial	Standard immunoassays but no QC info provided
	Were outcomes assessed objectively and independently?	Not reported	Unclear who assessed the outcomes eg. biochemical assays
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	Not reported	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Not reported	Drop outs Not reported

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Partial	Appears to be but this is difficult to determine if there isn't a protocol and no primary outcomes stated
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	No significant differences between the two groups in terms of age, BMI, type, cause and duration of infertility or biochemical measures
	If confounding was present, was it controlled for?	No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	The sample size was calculated at the design stage to detect an improvement rate in the treatment group of 20% with an alpha 0.05 in a one-sided test (Gordis 2000).
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		Lack of randomisation information and single-blinding main reasons behind mod RoB	
What is the overall risk of bias?			Moderate

Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	No – all outcomes mod risk of bias

Study ID	***Roy 2012***
Study Citation	Roy KK, Baruah J, Singla S, Sharma JB, Singh N, Jain SK, Goyal M. A prospective randomized trial comparing the efficacy of Letrozole and Clomiphene citrate in induction of ovulation in polycystic ovarian syndrome. J Hum Reprod Sci. 2012 Jan;5(1):20-5. doi: 10.4103/0974-1208.97789. PMID: 22870010; PMCID: PMC3409915.
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	PCOS patients 20–35 years having infertility for more than one year *Age* *Letrozole 26.1 ± 1.8* *CC 26.5 ± 1.3* *BMI* *Letrozole 25.8 ± 2.1* *CC 25.4 ± 1.56*
PCOS diagnostic criteria	Rotterdam's criteria
Presence of infertility	Mean infertility duration (in years) *Letrozole 6.4 ± 3.8* *CC 5.8 ± 3.1*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	*250 screened* *212 randomised* *Letrozole (n=104) (6 dropped out, 98 analysed)* *Clomiphene citrate (n=108) (2 dropped out, 106 analysed)*
Setting	tertiary care hospital from January 2005 to January 2010
Intervention	Letrozole: Starting dose of 2.5 mg letrozole, increasing up to 5 mg daily, administered from Day 3 to Day 7 (total of 5 days) of a spontaneous cycle or withdrawal bleeding after a 5-day course of 10 mg/ day medroxyprogester one acetate. 3 months
Comparison	Clomiphene Citrate:

	Starting dose of 50 mg, increasing up to 100 mg daily, administered from Day 3 to Day 7 (total of 5 days) of a spontaneous cycle or withdrawal bleeding after a 5- day course of 10 mg/ day medroxyprogester one acetate. 3 months	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Clinical pregnancy (*at least one gestational sac in USG) *Number of miscarriages* *Live birth* Other outcomes not relevant to this systematic review included: mean number of follicles and endometrial thickness.	
Follow up Duration	*3 cycles*	
Summary Result/s	"The mean number of dominant follicles in letrozole groups and CC groups was 1.86±0.26 and 1.92±0.17, respectively (*P*=0.126). Number of ovulatory cycle in letrozole group was 196 (66.6%) versus 216 (67.9%) in CC group (*P*=0.712). The mean mid-cycle endometrial thickness was 9.1±0.3 mm in letrozole group and 6.3±1.1 in CC group, which was statistically significant (*P*=0.014). The mean Estradiol [E2] level in clomiphene citrate group was significantly higher in CC group (364.2±71.4 pg/mL) than letrozole group (248.2±42.2 pg/mL). 43 patients from the letrozole group (43.8%) and 28 patients from the CC group (26.4%) became pregnant." *"*Letrozole and CC have comparable ovulation rate. The effect of letrozole showed a better endometrial response and pregnancy rate compared with CC."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"*The aim of this present prospective randomized trial was to compare results of letrozole with CC in patients with PCOS."
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	age group of 20–35 years having infertility for more than one year, body mass index (BMI) <28, patients of anovulatory PCOS oligomenorrhea (i.e., interval between periods were ≥35 days) or amenorrhea (i.e., absence of vaginal bleeding for 6 months), hirsutism, enlarged ovaries with multiple follicles (≥10 measuring 2–8 mm in diameter) as per Rotterdam's criteria on transvaginal ultrasonography (USG), and/or elevated serum testosterone.

Exclusion criteria		Yes	Patients having abnormality in any of the following tests: tubal patency test, pelvic ultrasonography, husband semen analysis, serum hormone measurements (FSH, LH, prolactin, estradiol, progesterone, and testosterone) on the 2nd to 5th day of the cycle Any abnormality found in laparoscopy that may be responsible for infertility
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	Randomization of recruited women was carried out using online software (http://www.randomization.com) to generate a random number table
	Was allocation to intervention group concealed?	Yes	Randomization codes (A, B) were packed into sealed opaque envelopes by an individual not involved in enrollment, treatment and follow-up of subjects to ensure concealment of allocation
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	Documentation of at least one gestational sac in USG was confirmed as clinical pregnancy.
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	6/104 in Letrozole (5.8%) *And* *2/106 in CC (1.9%)*	*8 patients dropped out*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	No	*ITT analysis not done*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Partial	*The outcomes to be assessed are not explicitly mentioned under methods but reported under results* Difficult to determine without a protocol.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	There was no statistically significant difference in the mean age, BMI, and duration of infertility in both groups of patients.
	If confounding was present, was it controlled for?	Not reported	There was no statistically significant difference in the mean age, BMI, and duration of infertility in both groups of patients.
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	**Source of Support:** Nil, **Conflict of Interest:** None declared.
	Was the study sufficiently powered to detect any differences between the groups?	Yes	"Sample size was calculated using pregnancy rate as a primary outcome measure. On basis of previous studies,[3] to achieve a statistically valid comparison of pregnancy rates in the two groups, with a type I error of 0.05 and a power of 80%, a sample size of at least **40 women in each arm** was required"

	If statistical analysis was undertaken, was this appropriate?	Yes	Student's t-test, Chi-square and Fisher's exact testes were used when appropriate
COMMENTS			
What is the overall risk of bias?		Low	*However, not clear whether the outcome assessors and the patients were blinded. The study does not identify itself as a double-blind study.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Sahin,2004
Study Citation	Sahin Y, Yirmibeş U, Keleştimur F, Aygen E. The effects of metformin on insulin resistance, clomiphene-induced ovulation and pregnancy rates in women with polycystic ovary syndrome. Eur J Obstet Gynecol Reprod Biol. 2004 Apr 15;113(2):214-20. doi: 10.1016/j.ejogrb.2003.09.036. PMID: 15063963.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	No specific population but range across both arms: Age range : 19 - 31 years, with BMI range (23.1 - 35.7),
PCOS diagnostic criteria	3 or more of following criteria: Polycystic ovaries on pelvic ultrasound examination (presence of >=10 cysts, 2-10mm in diameter, arranged around a dense stroma or scattered), oligo/amenorrhoea, hirsutism, hyperandrogenaemia (total testosterone > 80 ng/dl and/or free testosterone > 3:18 pg/ml)) and elevated serum LH:FSH ratio (LH:FSH > 2).
Presence of infertility	Metformin + Clomiphene : 5 (2-10 years) Clomiphene: 3.5 (1-8 years)
Presence of other condition/s	NR
Medication History	For at least 12 weeks before the study, none of the subjects in both groups had received any medication known to affect pituitary–gonadal function or carbohydrate metabolism
N per group	Intervention – Metformin + Clomiphene (11), Control – Clomiphene (10)

Setting	No specifics on setting though authors are from ob/gyn & endocrinology at Ericyes University
Intervention	Metformin + Clomiphene Citrate
Comparison	Clomiphene Citrate
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Not reported Extracted from article: FGS, BMI, FSH, LH, Oestradiol, Total Test, Free Test, Androstenedione, SHBG, DHEAS, Prolactin, Fasting glucose, Fasting Insulin, AUC Glucose, AUC Insulin, Fasting glucose : insulin ratio, AUC glucose: AUC insulin ratio, HCG day, follicles >= 15 mm, cycles with ovulation, number of pregnancies, number of abortions, number of preterm deliveries, number of full term healthy babies
Follow up Duration	3 months
Summary Result/s	Serum androgens and insulin response to OGTT decreased significantly after metformin therapy. Midluteal serum P level was significantly higher in cycles treated with metformin plus CC (P < 0:05). The ovulation (38 of 51 cycles, 74.4% versus 34 of 55 cycles, 61.8%) and pregnancy rates (5 of 11 women, 45.5% versus 3 of 10 women, 30%) were higher, but not significantly, in the metformin plus CC group than in the CC alone group. All the patients who conceived had insulin resistance in group 1 whereas non-insulin resistance in group 2.

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Partial	**Partial – no comparator** “The aim of the present study was to evaluate the effect of metformin on insulin resistance, ovarian androgen production, and clomiphene-induced ovulation and pregnancy rates in infertile women with PCOS for a relatively long treatment period.”.
Does the study have specified inclusion/exclusion criteria?	Not reported	**Not reported** (Not specifically signposted) – needed to be extracted
If there were specified inclusion/ exclusion criteria, were these appropriate?	Not reported	**Not reported**

Inclusion criteria		Partial	**Partial:** All patients had primary infertility
Exclusion criteria		Partial	**Partial:** Male factor & tubal-uterine factor infertility excluded with semen analyses and hysterosalpingogram and/or laparoscopy. "…A complete clinical and laboratory evaluation were performed to exclude the patients with androgen secreting tumors of ovarian or adrenal origin, Cushing's syndrome, thyroid dysfunctions, nonclassic adrenal hyperplasia and hyperprolactinemia.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	ot reported	**Not reported** (method not specified)
	Was allocation to intervention group concealed?	ot reported	**Not reported**
PERFORMANCE BIAS	**Were patients blind to intervention group?**	ot reported	Blinding was **not reported**
	Were investigators and care providers blind to intervention group?	Not reported	**Not reported**
	Aside from the experimental intervention, were the groups treated the same?	Yes	Yes
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	ot reported	**Not reported**

	Were all outcomes measured in a standard, valid and reliable way?	Yes	Yes
	Were outcomes assessed objectively and independently?	Partial	Partial
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	Not reported	**Not reported**
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Not reported	**Not reported**
REPORT BIAS	**Is the paper free of selective outcome reporting?**	ot reported	**Not reported**
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	Yes
	If confounding was present, was it controlled for?	Not reported	**Not reported**

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	**Not reported**
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	**Not reported**
	If statistical analysis was undertaken, was this appropriate?	Yes	The results were reported as means +/- S:E:M: or median and range. Wilcoxon-signed rank test was used to evaluate the effect of metformin on hormones and glucose levels. Chi-square test was used to evaluate ordinal variables, and Mann–Whitney U-test and the unpaired Student's t-test were used to evaluate continuous numeric variables. **Yes**
COMMENTS		*Lack of specifics on randomisation and lack of blinding lead to high RoB*	
What is the overall risk of bias?		High	***High***
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes high risk of bias*	

Study ID	*Sohrabvand,2006*
Study Citation	Sohrabvand F, Ansari Sh, Bagheri M. Efficacy of combined metformin-letrozole in comparison with metformin-clomiphene citrate in clomiphene-resistant infertile women with polycystic ovarian disease. Hum Reprod. 2006 Jun;21(6):1432-5. doi: 10.1093/humrep/del020. Epub 2006 Feb 14. PMID: 16478764.
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Mean BMI +/- SD : 29.98 +/- 4.83 in intervention group, 30.21 +/- 3.92 in comparison group, cc-resistant*

PCOS diagnostic criteria	Rotterdam	
Presence of infertility	*Yes – Mean in Met + Letrozole (Intervention) : Mean in Met + CC (Comparison) : 3.81*	
Presence of other condition/s	*Clomiphene Resistant*	
Medication History	*N/A*	
N per group	*Intervention : 29, Comparison : 30 (60 randomised – 1 drop out, per protocol analysis)*	
Setting	*Infertility clinic of Vali-e-Asr Hospital (Tehran, Iran)*	
Intervention	**Metformin** (500mg 3 times a day) for 6 - 8 weeks, in case of failure of pregnancy after the end of this period, 100 mg **clomiphene citrate** for 5 days starting from day 3 of their menstrual cycle,	
Comparison	**Metformin** (500mg 3 times a day) for 6 - 8 weeks, in case of failure of pregnancy after the end of this period, 2.5 mg **letrazole** for 5 days starting from day 3 of their menstrual cycle,	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Not specifically specified – extracted from paper: Regular menses after metformin Ovulation Adverse effects of metformin (not specified what adverse effects) Pregnancy Miscarriage Full term pregnancy Pregnancy per cycle	
Follow up Duration	*6 – 8 weeks*	
Summary Result/s	*Mean total E2 and E2 per mature follicle were significantly higher in clomiphene group without a difference in mean number of mature follicles >18 mm and ovulation rate. Endometrial thickness was significantly higher in letrozole group. The pregnancy rate in letrozole group (10 patients, 34.50%) as compared with clomiphene group (5 patients, 16.67%) did not show significant difference, whereas full-term pregnancies were higher in letrozole group [10 patients (34.50%) versus 3 patients (10%)].*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	***Yes***
Does the study have specified inclusion/exclusion criteria?	Yes	***Yes***

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	***Yes***
Inclusion criteria		Yes	***Yes*** *Inclusion criteria were consisting of PCOS patients who had failed to become pregnant after three courses of 150 mg clomiphene citrate* *(considered as clomiphene resistant)*
Exclusion criteria		Yes	***Yes*** *Exclusion criteria included patients with a history of liver and kidney failure, cardiovascular disease, diabetes (based on criteria set by the American Diabetic Association) or patients who consumed metformin or drugs effecting insulin secretion* *or clomiphene citrate in the previous 2 months*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Partial	***Partial*** *– randomised by choosing envelopes* *"The patients were visited and examined by two gynaecologists. A series of blind envelopes numbered from 1 to 60 had been prepared. Each patient was invited to pull out an envelope and was placed by the clinic secretary in either the metformin–letrozole group (Group A: envelopes number 1–30) or metformin–clomiphene citrate group (Group B: envelopes number 31–60)"*
	Was allocation to intervention group concealed?	Yes	***Yes***
PERFORMANCE BIAS	**Were patients blind to intervention group?**	No	***No*** *Tablets had different shapes*

	Were investigators and care providers blind to intervention group?	No	***No***
	Aside from the experimental intervention, were the groups treated the same?	Yes	***Yes***
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes	***Yes***
	Were all outcomes measured in a standard, valid and reliable way?	Partial	***Partial -*** *Estrogen levels unsure how it was measured : Endometrial thickness, number of mature follicles, estradiol (E2) level and the ratio of E2 to number of mature follicle were determined on the day of HCG administration.*
	Were outcomes assessed objectively and independently?	Partial	***Partial –*** *Estrogen levels unsure how it was measured : Endometrial thickness, number of mature follicles, estradiol (E2) level and the ratio of E2 to number of mature follicle were determined on the day of HCG administration.*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*1 drop out after therapy* *After metformin administration, one of the patients in the letrozole group became pregnant and was excluded from the study.*

	If statistical analysis was undertaken, was this appropriate?	Partial	*Partial – did not specify which test applied to which outcome* ***SPSS version 12.0 software was used for statistical analysis and the t-test i-square tests were used as appropriate. P-values less than 0.05 were considered as statistically significant***
COMMENTS		*Moderate due to partial outcome reporting and partial blinding, imperfect randomisation with envelopes*	

What is the overall risk of bias?	Moderate	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		

Study ID	*Vandermolen,2001*
Study Citation	Vandermolen DT, Ratts VS, Evans WS, Stovall DW, Kauma SW, Nestler JE. Metformin increases the ovulatory rate and pregnancy rate from clomiphene citrate in patients with polycystic ovary syndrome who are resistant to clomiphene citrate alone. Fertil Steril. 2001 Feb;75(2):310-5. doi: 10.1016/s0015-0282(00)01675-7. PMID: 11172832.
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Anovulatory women with the polycystic ovary syndrome (PCOS) who were resistant to CC, BMI - 37.6 +/- 4.3 in intervention group, 38.4 +/- 2.2 in placebo group, 18–35 years of age, cc-resistant
PCOS diagnostic criteria	Oligoovulation (< 6 menstrual periods annually); hyperandrogenism (by laboratory assay of androstenedione, free T, or total T or by clinical evidence of hirsutism); normal levels of TSH, PRL, and 17-hydroxyprogesterone (< 200 ng/dL); normal renal function (serum creatinine concentration < 1.4 mg/dL); and normal results on liver function tests.
Presence of infertility	*Not reported*
Presence of other condition/s	*N/A*
Medication History	*N/A*
N per group	*11 in intervention (metformin), 14 in placebo*
Setting	*Multicentre environment*
Intervention	metformin, 500 mg three times daily, for 7 weeks.
Comparison	*Placebo*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary: Ovulation and pregnancy rates*

Follow up Duration		*6 cycles*	
Summary Result/s		In the metformin and placebo groups, 9 of 12 participants (75%) and 4 of 15 participants (27%) ovulated, and 6 of 11 participants (55%) and 1 of 14 participants (7%) conceived, respectively. Comparisons between the groups were significant.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	"We therefore conducted a double-blind, randomized study of metformin versus placebo in CC-resistant women with PCOS and assessed ovulatory rates, pregnancy rates, and hormonal variables while attempting ovulation induction with CC."
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	"Participants were also required to have oligoovulation (< 6 menstrual periods annually); hyperandrogenism (by laboratory assay of androstenedione, free T, or total T or by clinical evidence of hirsutism); normal levels of TSH, PRL, and 17-hydroxyprogesterone (, 200 ng/dL); normal renal function (serum creatinine concentration , 1.4 mg/dL); and normal results on liver function tests" "In addition, participants were required to have tubal patency on hysterosalpingography if they had a history of pelvic surgery or pelvic inflammatory disease, and they were required to have a partner with a normal semen analysis according to World Health Organization criteria."
Exclusion criteria		Yes	"Participants who had diabetes mellitus according to American Diabetic Association criteria (25) for oral glucose tolerance testing were excluded."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*Yes - Randomization was done by computer generation in blocks of six.*

	Was allocation to intervention group concealed?	Partial	*Partial – mentions double blinded but no specifics on how this was done*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Partial	*Partial – mentions double blinded but no specifics on how this was done*
	Were investigators and care providers blind to intervention group?	Partial	*Partial – mentions double blinded but no specifics on how this was done*
	Aside from the experimental intervention, were the groups treated the same?	Yes	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	*Yes*
	Were outcomes assessed objectively and independently?	Partial	*Partial – objective outcome measures, however unclear if assessed by independent clinician*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*1/12 in intervention group, 1/15 in comparison group*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Partial	*Partial - Occurrence of ovulation was analyzed by intention to treat. Because women who ovulated before addition of CC may not clinically need CC for ovulation induction, such women were excluded from the study and were not included in the analysis of pregnancy rates*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	*Yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*Yes*
	If confounding was present, was it controlled for?	Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	No	*No – "First, our strict entrance criterion (documented failure to ovulate with CC) limited the number of women available for enrollment and may have prevented us from having the power to detect a change in insulin or free T levels"*

	If statistical analysis was undertaken, was this appropriate?	Yes	*Yes*
COMMENTS			
What is the overall risk of bias?		High	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	***Bayram 2004***
Study Citation	Bayram N, van Wely M, Kaaijk EM, Bossuyt PM, van der Veen F. Using an electrocautery strategy or recombinant follicle stimulating hormone to induce ovulation in polycystic ovary syndrome: randomised controlled trial. BMJ. 2004 Jan 24;328(7433):192. doi: 10.1136/bmj.328.7433.192. PMID: 14739186; PMCID: PMC318481.
Study Country	The Netherlands
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS resistant to CC* *Age years (SD)* *Electrocautery: 28.5 (3.7)* *rFSH: 28.7 (4.1)* *BMI* *Electrocautery: 27.9 (6.3)* *rFSH: 27.3 (8.8)*
PCOS diagnostic criteria	Women with chronic anovulation (World Health Organization type II) and polycystic ovaries diagnosed by transvaginal ultrasonography
Presence of infertility	*Type of infertility: Primary* *Electrocautery: 63/83 (76%)* *rFSH: 64/85 (75%)* *Duration of infertility (years) mean (SD)* *Electrocautery: 2.8 (2.2)* *rFSH: 2.8 (2.1)*

Presence of other condition/s	*clomiphene citrate resistant (persistent anovulation after taking 150 mg clomiphene citrate daily for five days)*	
Medication History	*NR*	
N per group	*Electrocautery n=83* *rFSH n=85*	
Setting	*29 Secondary and tertiary hospitals in the Netherlands between February 1998 and October 2001*	
Intervention	*Laparoscopic electrocautery of the ovaries followed by clomiphene citrate and recombinant follicle stimulating hormone if anovulation persisted* *"A bipolar insulated needle electrode (length 345 mm, shaft diameter 5 mm) was pressed at right angles to the surface of a follicle, and the needle (length 15 mm, diameter 0.9 mm) was inserted into the follicle and surrounding tissue. Each ovary was randomly punctured 5-10 times, depending on its size"* *If ovulated in 6 subsequent cycles: no further treatment* *If anovulation persisted after 8 weeks: 50 mg clomiphene citrate started* *Still no ovulation: CC increased to a maximum of 150 mg*	
Comparison	*Induction of ovulation with recombinant follicle stimulating hormone.* *10 mg medroxyprogesterone for 10 days after randomisation to induce a withdrawal bleed.* *Ovulation induction was started on cycle day 3 by subcutaneous injection of 75 IU recombinant follicle stimulating hormone daily according to the chronic low dose step up regimen and increased based on the size of the developing follicles*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary: Ongoing pregnancy within 12 months.* *Secondary: ovulation, miscarriage, ectopic pregnancy, multiple pregnancy, and live birth*	
Follow up Duration	*6 cycles or until pregnancy (if became pregnant)*	
Summary Result/s	*"The cumulative rate of ongoing pregnancy after recombinant follicle stimulating hormone was 67%. With only electrocautery it was 34%, which increased to 49% after clomiphene citrate was given. Subsequent recombinant follicle stimulating hormone increased the rate to 67% at 12 months (rate ratio 1.01, 95% confidence interval 0.81 to 1.24). No complications occurred from electrocautery with or without clomiphene citrate. Patients allocated to electrocautery had a significantly lower risk of multiple pregnancy (0.11, 0.01 to 0.86)."*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	*Yes*	*"To compare the effectiveness of an electrocautery strategy with ovulation induction using recombinant follicle stimulating hormone in patients with polycystic ovary syndrome."*

Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		*Yes*	*Women with PCOS and CC resistance*
Exclusion criteria		*Yes*	*Primary: other causes of infertility, including severe male factor subfertility, and age over 40 years* *Secondary: tubal obstruction, extensive adhesions of the ovaries or fallopian tubes, and endometriosis stages III or IV according to the classification of the American Fertility Society.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*"…computer generated block randomisation during laparoscopy, stratified for centre."*
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	*However, difficult to blind patients/ clinicians / outcome assessors due to the nature of the intervention*
	Were investigators and care providers blind to intervention group?	Not reported	*However, difficult to blind patients/ clinicians / outcome assessors due to the nature of the intervention*
	Aside from the experimental intervention, were the groups treated the same?	Yes	

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	*However, difficult to blind patients/ clinicians / outcome assessors due to the nature of the intervention*
	Were all outcomes measured in a standard, valid and reliable way?	*Yes*	
	Were outcomes assessed objectively and independently?	*Yes*	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*6/83 in Electrocautery group* *16/85 in rFSH group*	*7.2% in intervention* *18.8% in control*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	*Yes*	*ITT*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	*Yes*	*However, no protocol*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	*Yes*	*"Table 1 lists the characteristics of the patients at baseline. The treatment groups did not differ."*
	If confounding was present, was it controlled for?		*N/A*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	*Yes*	*Funding sources declared* *Funding: Serono Benelux provided financial support for recombinant follicle stimulating hormone during the first eight months of the study when this drug was not funded by the health services. FvdV was supported by a grant from the Health Insurance Funds Council (OG 97/007), Amstelveen, Netherlands.* *Competing interests: None declared.*
	Was the study sufficiently powered to detect any differences between the groups?	*Yes*	*"We designed our study as a non-inferiority trial for pregnancy rates because of the anticipated benefits of electrocautery. The electrocautery strategy started with a single procedure, leading to consecutive ovulations with minimal risks of multiple follicle growth and multiple pregnancy, and was expected to have fewer adverse events. We therefore considered the strategy sufficient to show a pregnancy rate within 12 months of no lower than 5% of that achieved by ovulation induction with recombinant follicle stimulating hormone. Assuming an ongoing pregnancy rate within 12 months of 38% after treatment with gonadotrophins, with an alpha of 5% and a β of 20%, and a pregnancy rate of 52% with the electrocautery strategy, we required 168 patients to exclude a difference of 5% or more to the detriment of electrocautery of the ovaries.20 21 All outcomes were analysed on an intention to treat basis"*
	If statistical analysis was undertaken, was this appropriate?	*Yes*	
COMMENTS			
What is the overall risk of bias?		*High*	*Due to non-blinding and drop outs in the control group* small n and unblinding- consistent with the others and high drop out rate
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	***Farquhar 2002***

Study Citation	Farquhar CM, Williamson K, Gudex G, Johnson NP, Garland J, Sadler L. A randomized controlled trial of laparoscopic ovarian diathermy versus gonadotropin therapy for women with clomiphene citrate-resistant polycystic ovary syndrome. Fertil Steril. 2002 Aug;78(2):404-11. doi: 10.1016/s0015-0282(02)03225-9. PMID: 12137881.
Study Country	New Zealand
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with anovulatory infertility secondary to clomiphene-resistant polycystic ovary syndrome. 20 to 38 years of age, clomiphene citrate resistance, body mass index of <33 kg/m2 for women of European descent and of<35 kg/m2 for women of Pacific Island or NZ Maori descent*
PCOS diagnostic criteria	polycystic ovaries on ultrasound scan according to accepted criteria (10),, ref: Adams J, Franks S, Polson DW, Mason HD, Abdulwahid NA, Tucker M. Multifollicular ovaries: clinical and endocrine features and response to pulsatile gonadotrophin releasing hormone. Lancet 1985;1375–9.
Presence of infertility	*Infertility duration range from 11 months to >= 35 month.* *10%(n=3) of women had 11 month infertility in intervention group,* *38%(n= 11) women had infertility 12 – 35 months in intervention group, 81%(n=17) of women had infertility 12 – 35 months in comparison group* *proportion of women who had length of infertility of >= 36 months (52%(n=15) in group 1 compared with 19%(n=4) in group 2).*
Presence of other condition/s	*CC resistant*
Medication History	*NR*
N per group	*29 in intervention, 21 in comparison*
Setting	*A tertiary referral fertility clinic*
Intervention	*Laparoscopic ovarian diathermy (n=29)*
Comparison	*Urinary or recombinant gonadotropins (n=21)*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Main: Cumulative pregnancy and miscarriage rates.* *Secondary: multiple pregnancy, live birth, birth weight, pregnancy with 6-12 mo follow-up period, number of women with >= 1 pregnancy during 0 – 12 month of follow up*
Follow up Duration	*6-12 months*
Summary Result/s	*Cumulative pregnancy rates were 28% at 6 months for laparoscopic ovarian diathermy and 33% for three cycles of ovulation induction with gonadotropins. There were three miscarriages in each group. Women in the laparoscopic ovarian diathermy arm of the study had four additional spontaneous pregnancies* *6 to 12 months after surgery.*

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	*Yes*	*"The aim of this study was to compare laparoscopic ovarian diathermy with three cycles of FSH in women who had clomiphene citrate–resistant PCOS and who wished to conceive."*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	*Yes*	*"The inclusion criteria for the study were as follows: 20 to 38 years of age, clomiphene citrate resistance (no ovulation after one or more cycles of150 mg ofclomiphene citrate from day 2 to day 6 each month), infertility of ¬12 months duration, polycystic ovaries on ultrasound scan according to accepted criteria (10), a body mass index of ↕33 kg/m2 for women ofEuropean descent and of↕35 kg/m2 for women of Pacific Island or NZ Maori descent, and normal semen analysis (≏20 million per milliliter, ∉96% abnormal forms, and ¬50% motility). Elevations of LH and androgen levels were not inclusion criteria."*
Exclusion criteria	*Yes*	*"The exclusion criteria were other known causes of infertility, including male factor infertility or known tubal disease. The trial conditions were determined within the funding restrictions of a public fertility clinic. Tubal status in women with anovulatory infertility was only established after three ovulations had been induced with clomiphene citrate or gonadotropins. Therefore, not all women who were randomized had had tubal status established"*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Yes	*Randomization was performed using computer-generated sequences that were sealed in numbered opaque envelopes.* *Randomization was not blocked.*
SELECTION BIAS **Was allocation to intervention group concealed?**	Yes	*Opaque envelopes*

PERFORMANCE BIAS	**Were patients blind to intervention group?**	*No*	*Not possible due to the nature of intervention*
	Were investigators and care providers blind to intervention group?	*No*	*Not possible due to the nature of intervention*
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	*No*	*Not possible due to the nature of intervention*
	Were all outcomes measured in a standard, valid and reliable way?	*Yes*	
	Were outcomes assessed objectively and independently?	*Yes*	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**		*1/29 in intervention group, 2/21 in comparison group*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	*Yes*	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	*Yes*	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	*Partial*	*The numbers are different in each group and the reason explained.* *"The baseline characteristics of women at the entry to the study are presented in Table 1. The numbers of women in each group are dissimilar because of unblocked randomization. There are no statistically significant differences between the two groups, with the exception of the proportion of women who had length of infertility of>36 months (52% in group 1 compared with 19% in group 2)."*
	If confounding was present, was it controlled for?	Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	*Not reported*	
	Was the study sufficiently powered to detect any differences between the groups?	*No*	*It was estimated that 55% of women, undergoing laparoscopic diathermy would conceive in the 6-month follow-up period (based on the results of a review by Donesky and Adashi [6]) and that only 30% of women having three cycles of gonadotropin therapy would conceive (8). Twenty-seven women were required in each arm of the study to detect a true difference at the 95% confidence level with 80% power. Taking dropouts into account, it was estimated that 30 women would be needed in each arm of the study to observe the difference described.* *"These difficulties, compounded by a failure to receive renewed funding, led to the study being closed after 50 patients were recruited, 10 short of the planned 60."*
	If statistical analysis was undertaken, was this appropriate?	*Yes*	
COMMENTS			
What is the overall risk of bias?		*High*	*small n and unblinded*

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	

Study ID	***Yarali 2002***
Study Citation	*Yarali H, Yildiz BO, Demirol A, Zeyneloğlu HB, Yiğit N, Bükülmez O, Koray Z. Co-administration of metformin during rFSH treatment in patients with clomiphene citrate-resistant polycystic ovarian syndrome: a prospective randomized trial. Hum Reprod. 2002 Feb;17(2):289-94. doi: 10.1093/humrep/17.2.289. PMID: 11821265.*
Study Country	? Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*PCOS patients with normal glucose tolerance* *Age* *Intervention: 29.7 ± 5.6 (years)* *Control: 28.4 ± 5.1 (years)* *BMI* *Intervention: 28.6 ± 4.0 (kh/m2)* *Control: 29.6 ± 4.8*
PCOS diagnostic criteria	Based on peripubertal onset of oligo-amenorrhoea, elevated serum testosterone levels (>80 ng/dl; conversion factor = 0.03467; >2.4 nmol/l) and ultrasonographic evidence of polycystic ovaries (PCO)
Presence of infertility	*Duration of infertility* *Intervention: 57.8 ± 37.9 (months)* *Control: 62.3 ± 41.9 (months) p>0.05*
Presence of other condition/s	*Clomiphene Citrate-resistant (defined as failure to ovulate with incremental doses of clomiphene citrate up to 250 mg/day for 5 days, if necessary, for 6 months)*
Medication History	*None of the patients had undergone any previous exogenous gonadotrophin treatment cycle.*
N per group	*N=32* *Intervention (metformin) n= 16* *Control (Oral placebo) n= 16* *"At the time of entry into the study, all the women were in the equivalent of the follicular phase of the menstrual cycle and they had either spontaneous or progesterone-induced menses during the preceding week."*
Setting	*?*
Intervention	*Metformin (850mg daily) for 6-12 weeks* *Followed by FSH 75 IU per days staring on the day 3 after menstrual bleeding, continued for 14 days or until follicles mature. Dose increased by*

	37.5 IU to 187.5 IU per day until dominant follicle emerged if follicles did not develop	
Comparison	*Oral placebo* *Followed by same FSH procedure as above*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*fasting glucose to insulin ratio* *insulin sensitivity index* *LH, FSH, E2, total testosterone and DHEAS were measured by chemiluminescent enzyme immunoassay* *Leptin was measured by using an immunoradiometric assay* *Free testosterone, androstenedione and insulin were measured by radioimmunoassay* *Plasma 17-OH progesterone was measured by radioimmunoassay* *How pregnancy was ascertained not reported*	
Follow up Duration	*12 weeks of pre-treatment + 1 cycle with FSH*	
Summary Result/s	*"There was no significant change in all insulin sensitivity indices in both groups. The only change noted was a decline in mean serum free testosterone concentration in the metformin group (P = 0.049). One patient on placebo and six patients on metformin ovulated spontaneously (P < 0.05). All parameters of ovarian response were comparable between the two groups during rFSH treatment. Combining the 6 week placebo or metformin-only period with a single rFSH treatment cycle, the overall ovulation rates were 75 and 94% in the placebo and metformin groups respectively (P > 0.05). The respective figures for pregnancy were 6.3 and 31.3% (P > 0.05)."*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	*Yes*	*"The aim of this prospective randomized, placebo-controlled study is to analyse the impact of metformin on ovarian response when co-administered during a low-dose step-up protocol using recombinant (r)FSH."*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	*Yes*	*PCOS* *Normal semen analysis according to World Health Organization criteria* *Normal hysterosalpingography and/or laparoscopy within the preceding 6 months* *No history of previous genital surgery.* *Normal glucose tolerance*

Exclusion criteria		*Yes*	*Presence of any infertility factor other than PCOS, The use of medications known to alter insulin secretion or action,* *Endocrinopathies, including non-classic congenital adrenal hyperplasia due to 21-hydroxylase deficiency* *Cushing's syndrome* *Hyperprolactinaemia* *Thyroid dysfunction* *IGT*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*Divided into intervention and control groups using computer-generated numbers*
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	*Yes*	*The study says it is 'double blind'. No further information is available*
	Were investigators and care providers blind to intervention group?	Yes	*The study says it is 'double blind'. No further information is available*
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	*Not reported*	
	Were all outcomes measured in a standard, valid and reliable way?	*Yes*	
	Were outcomes assessed objectively and independently?	*Yes*	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*0%*	*"There was no drug discontinuation due to side-effects."*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	*Yes*	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	*Yes*	*No protocol available. Difficult to determine.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	*Yes*	*"On entry into the study, the metformin and placebo groups did not differ with respect to the anthropometric variables (Table I)"*
	If confounding was present, was it controlled for?	N/A	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	*Not reported*	
	Was the study sufficiently powered to detect any differences between the groups?	*Not reported*	

	If statistical analysis was undertaken, was this appropriate?	*Yes*	
COMMENTS			
What is the overall risk of bias?		*Moderate*	*Small study (n=32), it says consecutive PCOS patients were recruited, no information on allocation concealment and no information on blinding. Perhaps these were done but did not report in the study, but difficult to ascertain without contacting the authors.* small and lacks info on blinding
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	*Sharma,2006*
Study Citation	Sharma M, Kriplani A, Agarwal N. Laparoscopic Bipolar Versus Unipolar Ovarian Drilling in Infertile Women with Resistant Polycystic Ovarian Syndrome: A Pilot Study. Journal of Gynecologic Surgery. 2006;22(3):105-11.
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	CC Resistant, Average BMI: Intervention (26.68), Comparison (24.13) Average Age: Intervention (27.3 (21-32)), Comparison (25.5 (23.30)
PCOS diagnostic criteria	National Institute of Health Consensus Conference on PCOS
Presence of infertility	Yes (Avg: 4.5 years in intervention, 3.9 years in comparison)
Presence of other condition/s	1 patient developed gestational diabetes mellitus during the study, otherwise N/A Clomiphene Citrate resistant
Medication History	N/A

N per group	10 in intervention, 10 in comparison	
Setting	Department of Obstetrics and Gynaecology of the All India Institute of Medical Sciences	
Intervention	*Unipolar electrocautery (average number of punctures: 14.8)*	
Comparison	*Bipolar electrocautery ((average number of punctures: 14.9)*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Clinical outcomes: Oligomenorrhoea, secondary amenorrhoea, cycle length, duration of flow, ovulation (spontaneous), ovulation (induced), Pregnancy, live birth rate* *Biomarker changes: LH, FSH, Testo, Insulin, GI Ratio*	
Follow up Duration	*1 and 3 months*	
Summary Result/s	*After ovarian drilling, 6 patients (60%) in group I and 8 (80%) in group II ovulated spontaneously (p = 0.63), and 3 (30%) more patients ovulated after clomiphene citrate in group I and 1 (10%) in group II, with a total ovulation rate of 90% in both groups (p = 0.46). Six (6; 60%) pregnancies resulted in group I and 8 (80%) pregnancies resulted in group II (p = 0.63). LH levels fell significantly only in group II after 3 months (11.11 +/- 1.25 to 4.88 +/- 1.34 mIu/mL; p = 0.036), and there was no significant change in FSH and testosterone levels in either group. The fasting serum insulin levels increased nonsignificantly from 17.70 +/- 5.27 micoIU/mL to 21.90 +/- 7.43 microIU/mL (p = 0.71) in group I and from 7.73 +/- microIU/mL to 13.11 +/- 3.55 microIU/mL (p = 0.27) in group II 3 months after surgery. Area under curve (AUC) glucose and insulin values fell postoperatively in both the groups.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	***Yes*** *"to find the response of bipolar ovarian drilling in resistant PCOS on clinical outcome, endocrine profile, and insulin resistance in comparison of unipolar cautery"*
Does the study have specified inclusion/exclusion criteria?	Not reported	***Not reported***

If there were specified inclusion/ exclusion criteria, were these appropriate?		Not reported	***Not reported***
Inclusion criteria		Partial	**Partial** *Tubal patency, cc-resistance and normal semen analysis required and + PCOS diagnosis* However, no set inclusion criteria on age or bmi However, not explicitly signposted
Exclusion criteria		Not reported	***Not reported***
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	***Yes*** *– computerised random table*
	Was allocation to intervention group concealed?	Not reported	***Not reported***
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	***Not reported***
	Were investigators and care providers blind to intervention group?	No	***No***
	Aside from the experimental intervention, were the groups treated the same?	Yes	***Yes***
DEDETECTION BIAS	**Were outcome assessors blind to**	Not reported	***Not reported***

	intervention group?		
	Were all outcomes measured in a standard, valid and reliable way?	Yes	***Yes*** *"Serum LH, FSH, and testosterone were measured by Elecsys 1010 by electrochemiluminiscence assay by Boehringer Mannheim (Mannheim, Germany). Serum insulin levels were measured by an Enzyme Immunoassay (EIA) kit from Mercodia (Uppsala, Sweden). Clinical outcome was assessed on the basis of achievement of regular cycles, ovulation, and conception. Endocrine parameters were assessed on the basis of changes in biochemical values. Hyperinsulinism was con-* *sidered when the glucose to insulin ratio (G/I) was more than 4.5."*

Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*CC resistant, aged 21-35 yrs-Hospital setting* *Age (years)* *Gonadotrophin: 26.23 ± 2.9* *LOD: 26.11 ± 2.7* *BMI* *Gonadotrophin: 24.94 ± 2.8* *LOD: 25.0 ± 2.35*
PCOS diagnostic criteria	Chronic anovulation and polycystic ovaries diagnosed by transvaginal ultrasonography-Any standard criteria not reported.
Presence of infertility	*Duration of infertility (years)* *Gonadotrophin: 4.5 ± 2.24* *LOD: 4.62 ± 2.36*
Presence of other condition/s	*NR*
Medication History	*NR*
N per group	*Group gonadotropin:44 randomised, 44 analysed;* *Group LOD 45 randomised, 45 analysed*
Setting	*Hospital setting*
Intervention	rFSH (subcutaneous injection of 37.5/75 IU daily started on cycle day 3)-If the diameter of the follicle remained <10 mm, the dose was increased by half an ampoule (37.5 IU) on days 16 and 23. If no follicle development was seen on day 30, the cycle was terminated because of poor response.

Comparison	*LOD* *If women underwent LOD failed to ovulate spontaneously at 8 weeks, were then subsequently added with clomiphene citrate for one cycle followed by gonadotropin.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*The primary endpoint was ongoing pregnancy within 12 months, defined as a viable pregnancy of at least 12 weeks. Secondary endpoints were ovulation, miscarriage, ectopic pregnancy, multiple pregnancies, and live birth. The effectiveness of the ovarian drilling strategy was compared with recombinant FSH.*	
Follow up Duration	*3-6 months*	
Summary Result/s	*The ongoing pregnancy rate from ovulation induction with LOD alone was significantly less but if supplemented by clomiphene citrate and gonadotropin, it seems equivalent to ovulation induction with gonadotropin, but the former procedure carries a lower risk of multiple pregnancies.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	*Yes*	*"To compare the effectiveness of laparoscopic ovarian drilling (LOD) for ovulation induction with gonadotropins in clomiphene-resistant PCOS in terms of ovulation, pregnancy, live birth, abortion, multiple pregnancies, and complication like ovarian hyperstimulation syndrome (OHSS)."*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	*Yes*	*Women were invited to participate if they had chronic anovulation and polycystic ovaries diagnosed by transvaginal ultrasonography. They had also to be resistant to clomiphene citrate, which is shown by persistent anovulation after taking 150 mg clomiphene citrate daily for 5 days for at least 3 cycles. Women aged between 21 and 35 years were included*
Exclusion criteria		*Exclusion criteria were severe male factor subfertility and other causes of infertility like tubal obstruction and extensive adhesion (endometriosis) stages III and IV according to the classification of the American Fertility Society.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Not reported	
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	*Not reported*	*However, difficult to blind this type of intervention / control*
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	*Not reported*	
	Were all outcomes measured in a standard, valid and reliable way?	*Yes*	
	Were outcomes assessed objectively and independently?	*Yes*	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*0%*	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	*Yes*	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	*Not reported*	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	*Yes*	
	If confounding was present, was it controlled for?	Yes	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	*No*	*"Source of support: Nil* *Conflict of interest: None"*
	Was the study sufficiently powered to detect any differences between the groups?	*Not reported*	
	If statistical analysis was undertaken, was this appropriate?	*Yes*	
COMMENTS			
What is the overall risk of bias?		*High*	*insufficient info on blinding, randomisation, drop outs etc.*

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No*

Study ID	***Zheng 2022***
Study Citation	Zheng X, Guo W, Zeng L, Zheng D, Yang S, Xu Y, Wang L, Wang R, Mol BW, Li R, Qiao J. In vitro maturation without gonadotropins versus in vitro fertilization with hyperstimulation in women with polycystic ovary syndrome: a non-inferiority randomized controlled trial. Hum Reprod. 2022 Jan 28;37(2):242-253. doi: 10.1093/humrep/deab243. PMID: 34849920; PMCID: PMC9115328.
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Infertile women aged 20–38 years with PCOS and infertility scheduled for their first IVF attempt.* *IVM* *Age: 28.9 ± 2,9* *BMI: 24.9 ±* *IVF* *Age: 29.5 ± 3.2* *BMI: 24.8 ± 4.0*
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*A total of 231 were not eligible (43 women with a male partner diagnosed with azoospermia; 32 women or their male partner with a known abnormal chromosome karyotype)*
Presence of other condition/s	*NR*
Medication History	*"To initiate the IVM or IVF treatment cycle in anovulatory cases, patients were administered oral dydrogesterone (Duphaston, Abbott, OLST, Netherlands) 20mg daily for 10–14 days and oral contraceptives Diane-35 (cyproterone acetate 2mg, ethinylestradiol 35mg, Bayer and its generics) for 21 days."*
N per group	*IVM (n=175)* *IVF (n=176)*
Setting	*This single-centre, in an academic infertility centre in China was performed between March 2018 and July 2019.*
Intervention	*IVM (n=175)*

	"Transvaginal ultrasound-guided oocyte retrieval was conducted…All cumulus-oocyte complexes (COCs) were transferred into IVM medium …" "All MII oocytes were inseminated using intracytoplasmic sperm injection (ICSI)."	
Comparison	*IVF (n=176)* *Standard IVF with a flexible GnRH antagonist protocol (n=176)* *"Recombinant FSH with a starting dose ranging from 112.5 to 225 IU was administered on day 2/3 of the menstrual cycle. Transvaginal ultrasound, serum luteinizing hormone (LH), serum oestrogen, and progesterone were measured to monitor follicle growth. The doses of rFSH were adjusted according to the ovarian response. GnRH antagonist 0.25 mg daily was administered subcutaneously when at least one follicle reached a diameter of 12mm (usually between Day 5 and Day 8 of ovarian stimulation), until and including the ovulatory trigger day. When two or more follicles reached a diameter of at least 17mm, 250 mg of rhCG (Ovidrel; Serono, Aubonne, Germany) was administered for triggering. Oocyte retrieval was performed 36 (±2) hours after triggering with the use of intravenous sedation. IVF or ICSI was used for fertilization based on the semen analysis results.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary: ongoing pregnancy (leading to live birth, defined as a baby born live at ≥ 22 weeks of gestation within 6months of the first oocyte retrieval cycle after randomization)* *Secondary: implantation, clinical pregnancy, and time to ongoing pregnancy leading to live birth.* *Safety outcomes included OHSS (classified as mild, moderate, miscarriage, ectopic pregnancy and obstetric and perinatal complications* *Initial pregnancy diagnosis: positive pregnancy test (not specified)* *Confirmed by: gestational sac*	
Follow up Duration	*1 cycle*	
Summary Result/s	*"The IVM procedure without additional gonadotropin resulted in a lower ongoing pregnancy (leading to live birth) within 6 months after randomization compared to standard IVF treatment (22.3% vs. 50.6%; rate difference 28.3%; 95% confidence interval [CI]: -37.9% to -18.7%). Moderate-severe OHSS did not occur in the IVM group, while in the IVF group, ten women (5.7%) had moderate OHSS and one woman (0.6%) had severe OHSS. There was no statistically significant difference in the occurrence of obstetric and perinatal complications"*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	*Yes*	*"Therefore, we performed an RCT to assess the effectiveness and safety of one cycle of IVM without the use of gonadotropins or hCG priming versus one cycle of standard IVF with ovarian stimulation and hCG as the ovulatory stimulus, both with a freeze-all and singleblastocyst transfer strategy, in women with PCOS."*

Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		*Yes*	*PCOS* *Awaiting first IVF attempt*
Exclusion criteria		*Yes*	*Couples scheduled for preimplantation genetic testing (PGT) with abnormal results on parental karyotyping* *Women who had undergone unilateral ovariectomy or had congenital/ acquired uterine malformations* *Male partner diagnosed with azoospermia*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*"…computer-generated randomization list, with a variable block size of 4 or 6"*
	Was allocation to intervention group concealed?	Yes	*"Opaque sealed envelopes with randomized assigned groups printed inside were numbered consecutively……."*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	*No*	*"Due to the nature of the interventions, the study was not blinded."*
	Were investigators and care providers blind to intervention group?	No	*"Due to the nature of the interventions, the study was not blinded."*
	Aside from the experimental intervention, were the groups treated the same?	*Yes*	*"Due to the nature of the interventions, the study was not blinded."*

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	*No*	*"Due to the nature of the interventions, the study was not blinded."*
	Were all outcomes measured in a standard, valid and reliable way?	*Yes*	
	Were outcomes assessed objectively and independently?	*Yes*	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*3.4% IVM* *10.2% IVF*	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	*Yes*	*ITT conducted*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	*Yes*	*Clinicaltrials.gov NCT03463772*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	*Yes*	*"The baseline characteristics of the women were comparable between the two groups (Table I)."*
	If confounding was present, was it controlled for?		*N/A*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	*Yes*	*"*B.W.M. was supported by a NHMRC Investigator (GNT1176437). All other authors declare no competing interests."
	Was the study sufficiently powered to detect any differences between the groups?	*Yes*	*"Assuming a live birth rate of 35% in the IVF group which was based on our clinical data, a sample size of at least 175 women per group was required to demonstrate non-inferiority with a power of 80%, and a non-inferiority margin of 15% for the lower limit of the two-sided 95% CI, including a dropout rate of 10%."*
	If statistical analysis was undertaken, was this appropriate?	*Yes*	
COMMENTS			
What is the overall risk of bias?		Low	*All of the criteria have been fulfilled or where criteria have not been fulfilled it is very unlikely the conclusions of the study would be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	***Ashrafi 2005***
Study Citation	Ashrafi, Mahnaz & Moini, Ashraf & Mohammadzadeh, Afsaneh & Ezabadi, Zahra & Zafarani, Fatemeh & Baghestani, Ahmad. (2005). A comparative study of GnRH antagonist and GnRH agonist in PCO patients undergoing IVF/ICSI cycles. Iranian Journal of Reproductive Medicine (ISSN: 1680-6433) Vol 3 Num 1. 3.
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Patients under 35 years old patients with oligomenorrhea, hyperandrogenism, LH/FSH>2.5 and ultrasonographic features of PCOS (Adams criteria)* *Age (years)* *GnRH agonist 28.3 ± 4* *GnRH antagonist 29.2 ± 4.6* *BMI (kg/m2)*

	GnRH agonist 30.45 ± 6.09 *GnRH antagonist 27.97 ± 6.71*
PCOS diagnostic criteria	patients with oligomenorrhea, hyperandrogenism, LH/FSH>2.5 and ultrasonographic features of PCOS (Adams criteria) (Adams's criteria) [Ref: Adams J, Franks S, Polson DW, Mason HD, Abdulwahid N, Tucker M, et al . Multifollicular ovaries: clinical and endocrine features and response to pulsatile gonadotropin releasing hormone. Lancet 1985; 2: 1375-1379.]
Presence of infertility	*Duration of infertility (yr)* *GnRH agonist 9.2 ± 4.1* *GnRH antagonist 8.8 ± 4.7*
Presence of other condition/s	The patients have no history of thyroid disorder and hyperprolactinemia
Medication History	All patients received OCP (LD) before starting the treatment from 5th day of their previous menstrual cycle
N per group	*GnRH agonist randomised 30, analysed n=24* *GnRH antagonist randomised 30, analysed n=23*
Setting	Royan institute between 2001 and 2002.
Intervention	Agonist: underwent standard long GnRH analogue protocol 21st day of cycle with the GnRH agonist (Suprefact, Hoechst, Germany) 500µg/day When pituitary suppression was achieved (on second day of menstrual cycle FSH≤5IU/ml, LH≤5IU/ml, progesterone≤1ng/ml, and Estradiol≤50pg/ml), Buserline was reduced to 200µg/day and gonadotrophin (Pregonal, Organon, Netherland) 150IU/day was started based on the follicular growth When more than 3 follicles≥18mm were seen, HCG (Pregnyle, Organon, Germany) 10000 IU were injected
Comparison	*Antagonist:* HMG (150 IU/day) was started from third day of cycle. Then GnRH antagonist (0.25mg) was administered from 6th day after HMG initiation (LH≤5 IU/ml) to the day of HCG injection.
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Duration of treatment, Duration of HMG stimulation, Serum LH and E2, follicle development, risk of OHSS, number of embryos, fertilisation* *10 to 12 days after embryonic transfer, βHCG was tested.*
Follow up Duration	*1 cycle*
Summary Result/s	"There were no significant differences in age, duration of infertility, BMI, number of HMG ampules, number of follicles≥18mm, serum estradiol level on 6th day of HMG initiation and HCG injection time, fertilization and pregnancy rate between two groups. However there were significant

		differences regarding duration of treatment, duration of HMG usage, LH level at the initiation of HMG, OHSS rate and number of Metaphase II oocytes between two groups (p<0.05)."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	The aim of this study was to compare the effects of GnRH agonists and antagonists in PCOS patients.
Does the study have specified inclusion/exclusion criteria?		Partial	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	*PCOS*
Exclusion criteria		Not reported	."

COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		High	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

- Bahceci 2005

Study ID	***Bahceci 2005***
Study Citation	Bahceci, M.; Ulug, U.; Ben-Shlomo, I.; Erden, H. F.; Akman, M. A. Use of a GnRH antagonist in controlled ovarian hyperstimulation for assisted conception in women with polycystic ovary disease: a randomized, prospective, pilot study. *Journal of Reproductive Medicine* **2005**, 50, 84-90
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants	*PCOD patients admitted to hospital to undergo ART* GnRH agonist Number of patients n= 70 Age (years) (mean ± SD) 29.43 ± 4.3 Range (21-38) Median 29 BMI (kg / m^2) 26.03 ± 4.2 GnRH antagonist n= 59 30.06± 4.8 (21-38) 30 26.1 ± 3.8
PCOS diagnostic criteria	Patients with PCOD, defined as primary infertility, oligomenorrhea, clinical hyperandrogenism (hirsutism Ferriman-Galway score >7), reversed FSH /LH ratio and polycystic appearance of ovaries on ultrasound with no known history of previous ART or hyperprolactinemia or thyroid abnormalities.
Presence of infertility	*N=26 male partners of women (34.6%) in the antagonist arm and 35 (46.6%) in the agonist arm had oligoasthenoteratospermia as a coexisting infertility factor.* *Other n=87 couples had multiple unsuccessful attempts at ovulation induction with gonadotropins and intrauterine insemination attempts.* GnRH agonist Number of patients n= 70 Duration of infertility (years) (mean ± SD) 5.15 ± 2.2 Range (1-11) Median 5 GnRH antagonist n= 59 4.73 ± 2.6 (2-8) 5
Presence of other condition/s	*Not reported*
Medication History	*NR*
N per group	*N=148* *Antagonist protocol: n=73 (Cetrorelix)* *Agonist protocol: n=75 (Leuprolide acetate)*
Setting	*German Hospital, Istanbul, Turkey*
Intervention	All patients received OC for 21 days from the preceding menstrual period Agonist Protocol:

	The ovulation induction protocol in the agonist arm began with pituitary desensitization with daily LA, 0.5mg, on day 14 of the cycle. Daily administration of gonadotropins, 2 or 3 ampules was initiated on the 3rd day of the anteceding menstrual period. Pituitary desensitisation was confirmed by serum E_2 assay on the 3rd day (<50 pg/ml). Starting regimen was fixed for the first 4 days and then adjusted based on response on individual basis. When at least 2 follicles reached 18mm in diameter, 10,000IU of im hCG administered.	
Comparison	All patients received OCP for 21 days from the preceding menstrual period Antagonist protocol: Gonadotropins were administered in 2-3 ampoules on the 3rd day of the antecedent bleeding after OC usage. After 4 days, the starting regimen was adjusted based on the individual response. Cetrorelix 0.25 mg/d sc was starte when the leading follicle reached 14 mm. Cetrorelix was continued daily until hCG injection (10,000 IU) when at least 2 follicles reached 18 mm in diameter.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Not specified* *Extracted from the paper: (table 2)* • *Stimulation duration* • *Ampoules consumed* • *E2 level on hCG day (pg/ml)* • *Number of retrieved oocytes* • *Fertilization rate* • *Number of pregnancies Pregnancy rate* • *Multiple pregnancy rate* *Clinical pregnancy was defined as a demonstrable gestational sac accompanied by foetal heart activity on ultrasonography.*	
Follow up Duration	*Not reported*	
Summary Result/s	*"* …in the antagonist arm a shorter duration of ovarian stimulation was recorded as compared to the agonist arm. Although similar numbers of oocytes was retrieved from both groups of patients, the quality of the oocytes, as measured by metaphase 2/total oocyte ratio, was lower in the antagonist arm as compared to the agonist arm. Pregnancy rates were 57.6% and 58.5% in the antagonist and agonist arms, respectively (p > 0.05). Implantation rates were not different (34.0% and 34.6%, respectively). The frequency of ovarian hyperstimulation syndrome also did not differ between the treatment groups (5% and 7.1%, respectively)."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Partial	*"To examine the possible advantage of using GnRH antagonists in PCOD patients undergoing COH for ART, we designed a randomised, prospective, pilot study to compare the outcome of treatment with a GnRH agonist versus antagonist."*
Does the study have specified inclusion/exclusion criteria?	Partial	

If there were specified inclusion/ exclusion criteria, were these appropriate?		Partial	
Inclusion criteria		Not reported	
Exclusion criteria		Partial	Couples with co-existing male factor infertility due to nonobstructive azoospermia
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*Using a table of random numbers*
	Was allocation to intervention group concealed?	Not reported	however not possible to do so given differing protocol
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	

	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**		*5 (6.6%) from the agonist arm* *14 (19.1%) from the antagonist arm* *Dropped out after randomisation but before starting ovulation induction*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Partial	*Apparently, 148 patients were randomised but 19 dropped out before treatment. Only the participants who underwent treatment had been analysed.*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	
	If confounding was present, was it controlled for?	Not reported	*Groups were similar at baseline (table 1)*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	*"Authors have no connection to any companies or products mentioned in this article"*
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	*Not applicable* *Simple statistical analysis was used and a probability value of <0.05 was considered significant*

	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		Moderate (technical report)	*Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.* *I would say the risk of bias is high: LP (16/09/2022)*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*

Study Citation	Engmann L, DiLuigi A, Schmidt D, Nulsen J, Maier D, Benadiva C. The use of gonadotropin-releasing hormone (GnRH) agonist to induce oocyte maturation after cotreatment with GnRH antagonist in high-risk patients undergoing in vitro fertilization prevents the risk of ovarian hyperstimulation syndrome: a prospective randomized controlled study. Fertil Steril. 2008 Jan;89(1):84-91. doi: 10.1016/j.fertnstert.2007.02.002. Epub 2007 Apr 26. PMID: 17462639.
Study Country	US
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	patients under 40 years of age with polycystic ovarian syndrome, polycystic ovarian morphology, or previous high response undergoing IVF *Age (yrs)* *Intervention: 32.0 ± 3.7 (GnRH antagonist)* *Control: 33.1 ± 3.6 (GnRH agonist)* *BMI (kg/m2)* *Intervention: 28.3 ± 7.1* *Control: 30.7 ± 6.4*
PCOS diagnostic criteria	Polycystic ovary syndrome was defined according to the Rotterdam consensus guidelines
Presence of infertility	*Duration of infertility (years)* *Intervention: 2.7 ± 1.8* *Control: 3.0 ± 2.1*
Presence of other condition/s	*NR*
Medication History	*NR*

N per group	*Intervention n=34 (Study group – GnRH antagonist)* *Control n=32 (control group; GnRH agonist)*
Setting	University-based tertiary fertility center.
Intervention	All of the women in the study group underwent pretreatment with OCPs for 21 days. If the ovaries were quiescent on ultrasound, COH was commenced on day 2 of withdrawal bleeding, as described in the following. Ganirelix acetate (Organon USA, Roseland, NJ) was commenced once the leading follicle was R14 mm and continued every morning until and including the day of trigger In both groups, COH was achieved using a step-down protocol of recombinant FSH (rFSH; Follistim; Organon USA) in a starting dose of 112–225 IU depending on the patient's age, body mass index, or previous ovarian response. Both groups received luteal phase and early pregnancy supplementation with IM progesterone (P), and patients in the study group also received E2 patches and their doses were adjusted according to the serum levels
Comparison	Pre-treatment with OCP for 25 days overlapping with 1 mg leuprolide acetate commencing on day 21 of the OCP. Once pituitary suppression was achieved, the dose of leuprolide was reduced to 0.5 mg daily and COH was commenced as follows; Ganirelix acetate was commenced once the leading follicle was R14 mm and continued every morning until and including the day of trigger. In both groups, COH was achieved using a step-down protocol of recombinant FSH (rFSH; Follistim; Organon USA) in a starting dose of 112–225 IU depending on the patient's age, body mass index, or previous ovarian response. Both groups received luteal phase and early pregnancy supplementation with IM progesterone (P), and patients in the study group also received E2 patches and their doses were adjusted according to the serum levels
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: incidence of OHSS, Secondary: implantation rate. Others: number of oocytes retrieved, proportion of mature oocytes retrieved, fertilization rate, midluteal phase mean ovarian volume (MOV), clinical and ongoing pregnancy rates, and luteal phase serum E2 and P levels. *"…*until a negative pregnancy test or a viable fetus was documented by transvaginal sonography."
Follow up Duration	*1 cycle*
Summary Result/s	*"*None of the patients in the study group developed any form of OHSS compared with 31% (10/32) of the patients in the control group. There were no significant differences in the implantation (22/61 [36.0%] vs. 20/64 [31.0%]), clinical pregnancy (17/30 [56.7%] vs. 15/29 [51.7%]), and ongoing pregnancy rates (16/30 [53.3%] vs. 14/29 [48.3%]) between the study and control groups, respectively."

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	"To determine whether there are any differences in the incidence of ovarian hyperstimulation syndrome (OHSS) and implantation rates in high-risk patients undergoing IVF using a protocol consisting of GnRH agonist trigger after cotreatment with GnRH antagonist or hCG trigger after dual pituitary suppression protocol"
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	age 20–39 years at the time of screening, normal early follicular phase serum FSH concentration (%10.0 IU/L), and undergoing their first cycle of IVF with either PCOS or PCOM or undergoing a subsequent cycle with a history of high response in a previous IVF cycle.
Exclusion criteria		Yes	." Women with hypogonadotropic hypogonadism
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	"Eligible women were recruited and randomly assigned to either group in a ratio of 1:1 by means of computer-generated random numbers."
	Was allocation to intervention group concealed?	Yes	"Selection into the groups and randomization into the appropriate treatment protocol were performed by a research nurse by using a series of consecutively numbered sealed opaque envelopes (one for each category of previous cycle), and therefore the sequence of allocation was concealed."
PERFORMANCE BIAS	**Were patients blind to intervention group?**	No	"The study was not blinded, because the patients as well as the clinicians were aware of the treatment group."
	Were investigators and care providers blind to intervention group?	No	"The study was not blinded, because the patients as well as the clinicians were aware of the treatment group."

	Aside from the experimental intervention, were the groups treated the same?	Yes	*"*patients in the study group also received E2 patches and their doses were adjusted according to the serum levels"
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	No	*"*The study was not blinded, because the patients as well as the clinicians were aware of the treatment group."
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	11% treatment 9% control/ comparison	*Four patients from the intervention and three from comparison group discontinued*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Partial	*"*All patients randomized and commencing ovarian stimulation were included in the analyses of the primary efficacy end point (intention-to-treat analysis" Other endpoints: per protocol
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial	*"*No significant differences between the two groups."

	If confounding was present, was it controlled for?	N/A	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Partial	*"*Supported in part by an unrestricted educational grant from Organon USA, Roseland, New Jersey."
	Was the study sufficiently powered to detect any differences between the groups?	Yes	*"*…based on earlier publications (15) we hypothesized that GnRH agonist trigger should lead to a 95% relative decline in the incidence of OHSS. Further, the implantation rate after GnRH agonist trigger has been reported to be 3.4% compared with 34% after hCG trigger" *"*Based on a two-sided significance level of .05, we calculated that a sample size of 30 subjects in each group would provide 88% power to detect a significant difference in the incidence of OHSS between the control group proportion of 0.32 and a study group proportion of 0.016 (i.e., 95% decline). This sample size would also provide about 84% power to show a significant difference in implantation rate assuming the control group proportion of 0.34 and a study group proportion of 0.034. It was anticipated that with a fallout rate of about 10%, at least 66 patients would need to be recruited over an 18–24-month period."
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		Moderate	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

- Haydardedeoglu 2012

Study ID	***Haydardedeoglu 2012***
Study Citation	Haydardedeoglu, B., Kilicdag, E. B., Parlakgumus, A. H., & Zeyneloglu, H. B. (2012). IVF/ICSI outcomes of the OCP plus GnRH agonist protocol versus the OCP plus GnRH antagonist fixed protocol in women with PCOS: a randomized trial. *Archives of Gynecology & Obstetrics, 286*(3), 763-769
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	"All selected couples were in their first IVF/ICSI cycles" GnRH agonist group= 27.70±3.59 years GnRH antagonist group= 27.57±3.54 years *BMI:* *GnRH agonist: 24.97 ± 4.36* *GnRH antagonist: 25.74 ± 4.37*
PCOS diagnostic criteria	Rotterdam criteria
Presence of infertility	Duration of infertility: GnRH agonist group= 5.85±3.42 years GnRH antagonist group= 6.24±3.64 years
Presence of other condition/s	*None reported*
Medication History	"Patients treated with hormonal medications and other oral anti-diabetics within the previous 3 months were excluded from the study"
N per group	The number of participants that were: N=300 □ Allocated/randomised: 150 (GnRH agonist group), 150 (GnRH antagonist group) □ Assessed at end of study: Not reported
Setting	Baskent University Department of Obstetrics and Gynecology, Turkey
Intervention	GnRH agonist long protocol (Leuprolide acetate) 1 mg/d from day 21 of the preceding menstruation (last 3 tablets of OCP). After ovarian suppression was achieved, dose reduced to 0.5 mg until the day of hCG. If there were no cysts ≥2 cm and the E2 was <50 pg/ml, gonadotropin stimulation with 150 IU of gonadotropins rFSH was performed. When at least three follicles had a maximum diameter of >17 mm, 10000 IU hCG was administered. "In the GnRH agonist group, ovarian downregulation was initiated with daily

	leuprolide acetate 1 mg (Lucrin, Abbott, France), beginning on day 21 of the preceding menstruation (last 3 tablets of OCP). After ovarian suppression was achieved, the dose was reduced to 0.5 mg until the day of hCG. If there were no cysts ≥2 cm and the E2 was <50 pg/ml, gonadotropin stimulation with 150 IU of gonadotropins rFSH (Puregon, MSD, The Netherlands) was performed, with E2 monitoring commencing on the morning of stimulation day 5. Ultrasound and blood E2 monitoring continued until hCG administration criteria were met with at least three follicles having a maximum diameter of >17 mm…. The cycle was cancelled if there was monofollicular development (single dominant follicle over 17 mm) and/or serum progesterone level was >1.5 ng/ml on the day of hCG). Likewise, women deemed under high risk of OHSS based on the number of growing follicles or high serum E2 levels, and women who had abruptly decreasing E2 levels during coasting and couples with total fertilization failure had their cycles cancelled. 35–36 h after 10,000 IU hCG injection (Pregnyl, MSD, The Netherlands), transvaginal ultrasound-guided oocyte retrieval was performed under sedation with propofol (propofol 1 % Fresenius KabiR, Germany). The oocyte-corona complexes (OOC) were denuded, and ICSI was performed after 2 h of incubation and embryos were transferred on day 3. Our clinical policy is to use ICSI routinely in all patients. A maximum of three embryos were transferred to each participant before 6 March 2010. Thereafter, only a single embryo was transferred to all women under the age of 35 years due to the new national regulations” **Adjuvant hormonal treatment during study:** “All patients received oral contraceptive pills (OCPs) for 21 days containing 30 µg of ethinyl estradiol (E2) and 3 mg of drosprinone (Yasmin, Schering, Istanbul, Turkey) starting on day 3 of spontaneous menses of the cycle prior to the treatment cycle… All patients received luteal support with 90 mg/day progesterone administered intravaginally (Crinone 8 % gel, Serono, Turkey) starting after embryo transfer. Pregnant women continued luteal support until the 8th gestational week”
Comparison	150 IU rFSH was initiated on day 3 of menstruation after discontinuation of OCPs, then GnRH antagonist protocol (Ganirelix) 0.25 mg/d was initiated on day 6 of gonadotropin stimulation, until day of hCG. “In the GnRH antagonist group, gonadotropin stimulation with 150 IU of gonadotropins rFSH (Puregon, MSD, The Netherlands) was initiated on day 3 of menstruation after discontinuation of OCPs. In the fixed GnRH antagonist protocol (antagonist group) daily s.c administration of ganirelix 0.25 mg (Orgalutran, MSD, The Netherlands) was initiated on day 6 of gonadotropin stimulation. Ultrasound and blood E2 monitoring continued until hCG

	administration criteria were met with at least three follicles having a maximum diameter of >17 mm. The cycle was cancelled if there was monofollicular development (single dominant follicle over 17 mm) and/or serum progesterone level was >1.5 ng/ml on the day of hCG). Likewise, women deemed under high risk of OHSS based on the number of growing follicles or high serum E2 levels, and women who had abruptly decreasing E2 levels during coasting and couples with total fertilization failure had their cycles cancelled. 35–36 h after 10,000 IU hCG injection (Pregnyl, MSD, The Netherlands), transvaginal ultrasound-guided oocyte retrieval was performed under sedation with propofol (propofol 1 % Fresenius KabiR, Germany). The oocyte-corona complexes (OOC) were denuded, and ICSI was performed after 2 h of incubation and embryos were transferred on day 3. Our clinical policy is to use ICSI routinely in all patients. A maximum of three embryos were transferred to each participant before 6 March 2010. Thereafter, only a single embryo was transferred to all women under the age of 35 years due to the new national regulations"
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcomes: □ Ongoing pregnancy rates (defined as a pregnancy proceeding beyond 12 weeks of gestation) Secondary outcomes: *E2 and progesterone levels on the day of hCG administration, duration of rFSH stimulation,* *total dose of rFSH administered,* *cost of COH,* *cycle cancellation rate,* *number of metaphase II oocytes,* *fertilization rates,* *cryopreservation rates,* *hospitalized OHSS rates.* Ultrasound and blood E2 monitoring Hospitalized OHSS was diagnosed when the hematocrit level rose above 45 % and abdominal discomfort, and/or progressive oliguria and/or respiratory difficulties were found together with moderate ascites and/or thrombocytosis (platelet count greater than 400,000/_l), and leucocytosis (white blood cell count greater than 12,000/_l). *"Clinical pregnancy was defined as the presence of an embryo with cardiac activity detectable by transvaginal ultrasonography."*
Follow up Duration	*Not reported. Measured ongoing pregnancy rates. Interim analysis conducted when the sample size reached 300. The study recruitment was terminated due to futility.*
Summary Result/s	"Ongoing pregnancy rates were 36.4 % in the OCP + GnRH agonist group and 35.9 % in the OCP + GnRH antagonist group (p > 0.05). Progesterone levels on the day of hCG (0.76 ± 0.71 vs. 0.58 ± 0.50), endometrial thickness on the day of hCG (11.57 ± 2.50 vs. 10.50 ± 2.01), t`otal gonadotropin used (1388.71 ± 482.39 vs. 1253.25 ± 415.81), and duration of COH (9.07 ± 1.96 vs. 8.39 ± 1.75) were significantly lower in the OCP + GnRH antagonist group."

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	"women with PCOS younger than 35 years old and older than 23 years old were recruited. All selected couples were in their first IVF/ICSI cycles. Women with PCOS whose body mass index was lower than 30 kg/m2 and higher than 20 kg/m2 were included in the study"
Exclusion criteria		Yes	. "We excluded women with PCOS whose ovaries did not appear polycystic… Patients treated with hormonal medications and other oral anti-diabetics within the previous 3 months were excluded from the study"
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	Random numbers table. Study subjects were randomized in blocks of 30.
	Was allocation to intervention group concealed?	No	"Assigned using consecutively numbered opaque, sealed envelopes on the day of initiation of OCP… The envelopes were opened by the ART nurse coordinator who had no other involvement in the trial"
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	

	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*Apparently 0%*	No drop outs reported. Interim analysis conducted when the sample size reached 300.
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	No	Additional outcomes were reported to what was listed in the methods and the registered protocol.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	

	If confounding was present, was it controlled for?	Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	No	"Based on our previous results we assumed an ongoing pregnancy rate of 35 % in women younger than 35 years who had PCOS. Testing for 5 % difference in favor of one protocol, which could be regarded as the minimum clinically significant difference would require approximately 1,500 patients in each arm to achieve 80 % power at 5% significance level. This was not deemed feasible for a single center trial, and we decided to conduct an interim analysis when 10 % of this sample size, i.e. 300 women, was reached. The trial would be continued if there was a difference of ≥3 % between trial arms. However, the difference between ongoing pregnancy rates was <1 % and we decided to terminate recruitment due to futility. We anticipate that our data can contribute to future meta-analysis on the issue" *"*Although this study consisting three hundred patients, seems to be large enough, we could not reach to the actual size of power analysis. We were able to recruit 300 patients through 27 months in a single center. This is the major weakness of this trial."
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		High	*Few criteria fulfilled and the conclusions of the study are likely to be affected.*

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	

- Kurzawa 2008

Study ID	***Kurzawa 2008***
Study Citation	Kurzawa, R.; Ciepiela, P.; Baczkowski, T.; Safranow, K.; Brelik, P. Comparison of embryological and clinical outcome in GnRH antagonist vs. GnRH agonist protocols for in vitro fertilization in PCOS non-obese patients. A prospective randomized study. J Assist Reprod Genet 2008, 25, 365-74
Study Country	Poland
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Non-obese PCOS patients were considered eligible if they were scheduled for controlled ovarian stimulation and intracytoplasmic sperm injection (ICSI). Age <35 years BMI<268kg/m^2 FSH <12IU/l Indications for ICSI included: male factor subfertility, several unsuccessful intrauterine inseminations, previous ineffective IVF (none or <30% of fertilizations). GnRH agonist GnRH antagonist Number of patients 33 37 Age (years) 31.33±3.91 30.36±3.40 BMI (kg/m2) 23.1±1.3 22.3±1.6
PCOS diagnostic criteria	Rotterdam
Presence of infertility	GnRH agonist GnRH antagonist Number of patients 33 37 Male cause of infertility (number of patients) Coexisting male factor 24 31 Mild OAT 10 13 Moderate OAT 8 11 Severe OAT 6 7

	[OAT oligoasthenoteratozoospermy]
Presence of other condition/s	*Not reported*
Medication History	All patients received oral contraceptives pills (Cilest; Janssen-Cilag, Belgium) for a month before starting COH. None of the patients used oral antidiabetic medications (biguanides or thiazolidinediones). GnRH agonist GnRH antagonist Number of patients 33 37 Previous treatment history (number of patients) Laparoscopy 19 31 IUI 17 21 IVF/ET 5 6 ICSI/ET 16 25
N per group	*Agonist protocol n=33* *Antagonist protocol n=37*
Setting	Department of Reproductive Medicine and Gynecology, Pomeranian University of Medicine in Szczecin – a single centre study
Intervention	GnRH agonist protocol During OCP use on day 16-18 of the preceding cycle, GnRH agonist (Triptorelin) was given, then rFSH 150 IU/d* after confirmation of pituitary desensitization, continued until β-hCG trigger (10000 IU when 3 follicles reached mean diameter ≥17mm) "During oral contraception (OC) on days 16–18 of the preceding cycle, after transvaginal ultrasonographic screening of ovaries, an intramuscular injection of GnRH agonist triptorelin (Diphereline SR 3.75; Boufor Ibsen Pharma, France) was given. After confirmation of pituitary desensitization (LH <2 mIU/mL and estradiol <40 pg/mL) the administration of FSH was commenced." "Women were given regular daily recombinant human FSH (Gonal F; Merck Serono, Switzerland) subcutaneous injections (usually between 1800 and 2000 hours). Also in this protocol starting dose was 150 IU/day, adjusted

	individually depending on ovarian response. Ultrasound and estradiol level monitoring started after five doses of rFSH and was continued every second day until the day of hCG administration." *dose adjusted according to individual ovarian response
Comparison	Antagonist protocols rFSH 150 IU/d* from 2nd day of cycle. GnRH antagonist (Cetrorelix) 0.25mg when at least 2 follicles reached 14mm in diameter (average 4 injections per day), then 10000 IU hCG administered when dominant follicle reached diameter ≥18mm "From the second day of the cycle women were given regular daily recombinant human FSH (Gonal F; Merck Serono, Switzerland) subcutaneous injections (usually between 1800 and 2000 hours). Starting dose of a 150 IU/day was adjusted individually depending on an ovarian response measured by transvaginal ultrasonography and the level of estradiol. Ultrasound and estradiol level monitoring started from the seventh day of the cycle (sixth day of COH) after five doses of rFSH and was continued every second day until the day of human chorionic gonadotropin (hCG) administration. A GnRH antagonist—cetrorelix (Cetrotide; Merck Serono, Germany) was administered subcutaneously between 900 and 1200 hours when at least two ovarian follicles reached 14 mm in diameter. The protocol consisted of daily Cetrotide 0.25 mg subcutaneous injections, average 4, until the criteria for recombinant hCG administration were met."
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary endpoints: Embryological: • Matured oocytes (M2) rate, defined as proportion of metaphase II to total number of retrieved oocytes • Fertilization rate, defined as proportion of two pronuclei oocytes to number of injected oocytes • Quality of zygotes on the first day of culture • Quality of embryos on the third day of culture Secondary endpoints: Clinical: • Delivery per attempt, defined as a live birth after 32 weeks of gestation • Clinical pregnancy per attempt, defined as an ongoing pregnancy at 12 weeks of gestation • Implantation rate; defined as gestational sacs per number of transferred embryos • Multiple pregnancy per viable pregnancy • Miscarriage per intrauterine pregnancy, defined as a miscarriage of an ongoing pregnancy after 12 weeks of gestation • Occurrence of severe OHSS • Number of days of gonadotropin treatment • Gonadotropin consumption • Correlation between serum LH level and IVF outcome Serum LH and estradiol levels were measured by an electrochemiluminescence immunoassay (ECLIA) Ultrasound Pregnancy was checked by pregnancy test in serum 14 days after ET and confirmed by vaginal ultrasound scan at 12 weeks of gestation.

Follow up Duration	*Not reported*	
Summary Result/s	Similar mature metaphase II oocyte rate (76% vs. 76%) was observed in both protocols. Optimal pronuclear morphology zygotes dominated in both groups (64% vs. 66%). Transferred embryo quality did not differ in both protocols. No significant differences between both protocols were found in delivery rate (p=0.481), pregnancy rate (p=0.810), multiple pregnancy rate (p=0.501), miscarriage rate (p=0.154), fertilization rate (p=0.388) and implantation rate (p=1.000). Duration of stimulation and total follicle-stimulating hormone (FSH) dose were significantly lower in GnRH antagonist protocol (p=0.0005).	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*To verify the embryological and clinical effectiveness of the GnRH antagonists protocols in comparison with GnRH agonist protocols in non-obese women with PCOS*
Does the study have specified inclusion/exclusion criteria?	Yes	*See below*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	*See below*
Inclusion criteria	Yes	(1) meeting of 2003 Rotterdam PCOS criteria (two of the following three manifestations: irregular or absent ovulation, elevated levels of androgenic hormones, and/or enlarged ovaries containing at least 12 follicles each; other conditions with similar signs, such as androgen-secreting tumors or Cushing's syndrome were ruled out); (2) age≤35 years; (3) body mass index<26 kg/m2; (4) FSH<12 mIU/ml on the third day of the cycle; (5) negative screening for hepatitis B and C virus infection and human immunodeficiency virus (HIV) infection.
Exclusion criteria	Yes	≥2 miscarriages, ≥3 unsuccessful IVF/ICSI cycles, anatomical abnormalities of the uterus on laparoscopy or hysteroscopy and existence of ovarian cysts.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	computer generated random letters

	Was allocation to intervention group concealed?	Yes	concealed in opaque sealed envelopes,
PERFORMANCE BIAS	**Were patients blind to intervention group?**	No	However not possible to do so given differing protocol
	Were investigators and care providers blind to intervention group?	No	"In both protocols, only two clinicians and two embryologists, also not blinded to treatment group, were involved in the study."
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	No	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*4/74 were lost after randomisation (5.4%)*	*"*4 women in the GnRH antagonist group were excluded after randomization, two of them because of insufficient compliance with medication as established by the respective protocol. Further two patients quit the preparations for the treatment without notice. " *"*All 70 women included in the study underwent embryo transfer and none was lost to follow-up."
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	No	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	
	If confounding was present, was it controlled for?	N/A	"The clinical characteristics and the history of treatment of the patients in both examined groups are shown in Table 1. Baseline patient characteristics did not differ."
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	"Acknowledgement Financial support—grant number KBN 2 P05E 034 28 from State Committee for Scientific Research"
	Was the study sufficiently powered to detect any differences between the groups?	Yes	"The sample size analysis assuming comparison of two groups (with at least 40% patients in one of them) using Mann–Whitney test showed that 70 women in total will need to be recruited for a power of 80% and an alpha of 5% to detect the hypothetical true difference between the groups equal to 15% of mature oocyte (M2) when the estimated standard deviation of the parameter is 20% (M2% was approximately 75±20% according to our laboratory results), 66 women in total will need to be recruited for a power of 80% and an alpha of 5% to detect the hypothetical true difference between the groups equal to 2 of quality of zygotes on the first day of the culture when the estimated standard deviation of the parameter is 2.5 (optimal pronuclear morphology of all embryos (Z1+Z2) was approximately 5±2.5 according to our laboratory results), 42 women in total will need to be recruited for a power of 80% and an alpha of 5% to detect the hypothetical true difference between the groups equal to 0.5 of quality of zygotes on the 3rd day of the culture when the estimated standard deviation of the parameter is 0.5 (optimal pronuclear morphology of transferred on day 3 embryos (Z1+Z2) was approximately 2±0.5 according to our laboratory results)."

	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Low	*All of the criteria have been fulfilled or where criteria have not been fulfilled it is very unlikely the conclusions of the study would be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

- Lainas 2007

Study ID	***Lainas 2007***
Study Citation	Lainas, T. G.; Petsas, G. K.; Zorzovilis, I. Z.; Iliadis, G. S.; Lainas, G. T.; Cazlaris, H. E.; Kolibianakis, E. M. Initiation of GnRH antagonist on Day 1 of stimulation as compared to the long agonist protocol in PCOS patients. A randomized controlled trial: effect on hormonal levels and follicular development. *Hum Reprod* **2007**, 22, 1540-6
Study Country	Greece
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Antagonist group (n = 26) Agonist group (n = 52) P-value Baseline characteristics Age (years) 32.0 (14) 30.5 (16) 0.079 BMI (kg m22) 23.2 (20.9) 23.6 (18.9) 0.585 Duration of infertility (years) 4.0 (11) 3.5 (11) 0.905 Subjects with previous IVF attempts n (%) 10 (38.5) 16 (30.8) 0.497 Values are expressed as median (interquartile range) unless stated otherwise.
PCOS diagnostic criteria	Presence of oligoovulation/anovulation (Ehrmann et al., 2006) and polycystic ovaries
Presence of infertility	*Antagonist group 4.0 years (11)* *Agonist group 3.4 years (11)* median (interquartile range)
Presence of other condition/s	*Not reported*

Medication History	"All patients received oral contraceptive pill (OCP) starting on Day 2 of spontaneous menses of the cycle prior to the treatment cycle, after blood test confirmed the presence of a baseline hormone profile"	
N per group	Patients were treated either by GnRH antagonist starting from the first day of stimulation, (n = 26, antagonist group), or by a long GnRH agonist protocol (n = 52, agonist group)	
Setting	Single Centre - Eugonia-Iatriki Erevna IVF unit from January 2003 to January 2005 in Greece	
Intervention	rFSH* daily (Puregon) + GnRH antagonist protocol (Ganirelix) 0.25mg/d from day 2 of menses, until and including day of β-hCG trigger (10000 IU when 3 follicles reached mean diameter ≥17mm)	
Comparison	GnRH agonist (Triptorelin) 0.1mg/d, commenced 3 days before discontinuation of OCP. rFSH* 150 IU/d when desensitization achieved (GnRH agonist reduced to 0.05mg/d that day), continued until β-hCG trigger (10000 IU when 3 follicles reached mean diameter ≥17mm) *dose adjusted after day 5 of stimulation	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcome measure: E2 levels on Day 5 of stimulation, Secondary outcome measures: Follicular development, LH and progesterone levels *[*Ovarian stimulation was monitored by transvaginal ultrasound measurement of follicular growth, typically on days 1, 3, 5, 7 and 8 of stimulation and on the day of HCG administration. FSH, LH, E2 and progesterone levels were measured on an Immulite analyser using the corresponding commercially available kits]	
Follow up Duration	*Apparently 1 cycle*	
Summary Result/s	*"Significantly more follicles on days 5, 7 and 8 of stimulation, significantly higher estradiol (E2) levels on days 1, 3, 5, 7 and 8 and significantly higher progesterone levels on days 1, 5 and 8 of stimulation were observed in the antagonist when compared with the agonist group. E2 was approximately twice as high in the antagonist when compared with the agonist group on day 5 of stimulation (432 versus 204 pg ml21, P < 0.001). These differences were accompanied by significantly lower LH levels on days 3 and 5 and significantly higher LH levels on days 1, 7 and 8 of stimulation in the antagonist when compared with the agonist group."*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	"The purpose of this RCT is to provide endocrine and follicular data during ovarian stimulation for IVF in patients with PCOS treated either with a long-GnRH agonist scheme or a fixed GnRH antagonist protocol in which GnRH antagonist is initiated on Day 1 of stimulation."

Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	• PCOS (as define above) • age 18–39 years • less than three previous IVF/ICSI attempts • no endometriotic cyst present as assessed by transvaginal ultrasound examination and basal hormonal levels of FSH in the early follicular phase of ≤10 IU l^{-1}
Exclusion criteria		Yes	." Patients with known previous poor ovarian response (Kolibianakis et al., 2004) were excluded"
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	"Random allocation was performed by a study nurse on the basis of a computer-generated randomization list in a 1:2 ratio."
	Was allocation to intervention group concealed?	Not reported	however not possible to do so given differing protocol
PERFORMANCE BIAS	**Were patients blind to intervention group?**	No	"The responsible physicians (investigators) were not involved in the randomization process. Neither patients nor doctors were blinded to the treatment assigned."
	Were investigators and care providers blind to intervention group?	No	"The responsible physicians (investigators) were not involved in the randomization process. Neither patients nor doctors were blinded to the treatment assigned."
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDE TECTI	**Were outcome assessors blind to intervention group?**	No	

	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0%	*However, the analysis contains 78 patients so it is assumed that no one dropped out from the study even this was not explicitly mentioned*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	"No significant differences were observed between the antagonist and the agonist group. All patients in this study reach the HCG criteria and all patients underwent oocyte retrieval."
	If confounding was present, was it controlled for?		*Not relevant (see above)*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	Yes	"It was calculated that group sample sizes of 26 and 52 would achieve 81% power to detect a difference in E2 levels on Day 5 of stimulation of 225 pg ml21 between the null hypothesis that both group means are 450 pg ml^{-1} of E2 and the alternative hypothesis that the mean of E2 in the agonist group is 225 pg ml^{-1} with a significance level (alpha) of 0.05 using a two-sided Mann–Whitney U test"
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		Moderate	*Moderate - Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

- Lainas 2010

Study ID	***Lainas 2010***
Study Citation	Lainas, T. G., Sfontouris, I. A., Zorzovilis, I. Z., Petsas, G. K., Lainas, G. T., Alexopoulou, E., & Kolibianakis, E. M. (2010). Flexible GnRH antagonist protocol versus GnRH agonist long protocol in patients with polycystic ovary syndrome treated for IVF: a prospective randomised controlled trial (RCT). *Human Reproduction, 25*(3), 683-689.
Study Country	Greece
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Baseline characteristics Agonist group (n=110) Antagonist group (n=110) Age (years) 32 (29–35) 31 (28–35) BMI (kg/m2) 23.2 (20.9–25.8) 24.6 (20.9–29.3) Number of previous IVF attempts 1 (0–4) 1 (0–3) Subjects with previous IVF attempts, n (%) 69 (62.7, 53.7–71.7) 69 (62.7, 53.7–71.7) Values are expressed as medians (lower-upper quartiles) unless stated otherwise. Differences between groups are not statistically significant.
PCOS diagnostic criteria	Aligns with Rotterdam?

	"Patients could enter the study only once after being diagnosed as PCOS [presence of oligoovulation/anovulation (Ehrmann et al., 2006) and polycystic ovaries]."
Presence of infertility	*Duration:* *Agonist group (years) 3 (2-5)* *Antagonist group (years) 3 (2-5)* *median (lower-upper quartiles)* Indication for IVF, n (%, 95% CI) Agonist group (n=110) Antagonist group (n=110) PCOS only 22 (20.0, 12.5–27.5) 28 (25.5, 17.3–33.6) PCOS þ male factor 53 (48.2, 38.9–57.5) 52 (47.3, 38.0–56.6) PCOS þ tubal factor 27 (24.5, 16.5–32.5) 18 (16.4, 9.5–23.3) PCOS þ other 8 (7.3, 2.4–12.2) 12 (10.9, 5.1–6.7)
Presence of other condition/s	*See above for the reasons of infertility. Other conditions not reported*
Medication History	*Not reported*
N per group	*N=220* long GnRH agonist down-regulation protocol (n = 110) flexible GnRH antagonist protocol (n = 110)
Setting	"…single center RCT performed at the Eugonia-Iatriki Erevna IVF unit from November 2004 to February 2008"
Intervention	GnRH agonist long protocol (Triptorelin) 0.1 mg, commenced 3 days before the discontinuation of the OCP. Once desensitization was achieved (~10-15 days after Triptorelin commenced), 150 IU/d* rFSH (Puregon) was commenced (GnRH agonist was decreased on that day to 0.05 mg/d and continued until and including the day of hCG trigger)* *5000 IU hCG when three follicles reached a mean diameter of ≥17 mm
Comparison	rFSH from Day 2 of cycle that followed discontinuation of the OCP, then GnRH antagonist (Ganirelix) commenced at 0.25mg/d when at least one of the following criteria were fulfilled: (i) the presence of at least one follicle measuring >14 mm; (ii) (ii) serum E2 levels >600 pg/ml; (iii) (iii) serum LH levels>10 IU/l. Both continued until and including the day of hCG trigger*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Used ultrasound and laboratory assays. The primary outcome measure:

	• ongoing pregnancy rate per patient randomized (defined as the presence of gestational sac with fetal heart beat detection at 12 weeks and at 6–7 weeks of gestation, respectively) Secondary outcome measures: • incidence of OHSS, • duration of rFSH stimulation, • total dose of rFSH, E2 and progesterone concentration on the day of hCG administration, • cycle cancellation rate, • number of cumulus-oocyte complexes (COCs) retrieved, • number of metaphase II oocytes and fertilization rates.	
Follow up Duration	*1 cycle*	
Summary Result/s	"No differences were observed in ongoing pregnancy rates [50.9 versus 47.3%, difference 3.6%, 95% confidence interval (CI): -9.6 to +16.8%] in the agonist and antagonist protocols, respectively. Incidence of OHSS Grade II was lower in the antagonist compared with agonist group (40.0 versus 60.0%, difference -20.0%, 95% CI: -7.1 to -32.9%, P < 0.01). Duration of stimulation (10 versus 12 days, difference 2 days, 95% CI: +1 to +2, p <0.001) and total gonadotrophin required (1575 versus 1850 IU, difference -275 IU, 95% CI: -25 to -400, P < 0.05) were also lower in the antagonist compared with agonist protocol."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"*The aim of the present RCT was to compare the flexible GnRH antagonist and the GnRH agonist long protocols in a large group of PCOS patients undergoing IVF treatment, with primary end-point being ongoing pregnancy rate per patient randomized."
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	age 18–39 years, no endometriotic cyst present, as assessed by transvaginal ultrasound examination, basal hormonal levels of FSH in the early follicular phase of ≤10 IU/ml.
Exclusion criteria	Yes	." Patients with known previous poor ovarian response (Kolibianakis et al., 2004)….."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*"*Random allocation was performed by a study nurse at consultation, using a computer generated randomization list, in a 1:1 ratio."
	Was allocation to intervention group concealed?	No	Probably not possible to do so given differing protocol *"*Neither patients nor doctors were blinded to the treatment assigned."
PERFORMANCE BIAS	**Were patients blind to intervention group?**	No	May not be possible to do so given differing protocol *"*Neither patients nor doctors were blinded to the treatment assigned."
	Were investigators and care providers blind to intervention group?	No	*"*Neither patients nor doctors were blinded to the treatment assigned."
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	No	*"*Neither patients nor doctors were blinded to the treatment assigned."
	Were all outcomes measured in a standard, valid and reliable way?	Yes	*Laboratory assays and ultrasound scans*
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0%	*No drop outs reported*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*No drop-outs reported*

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"*No significant differences were observed between the agonist and the antagonist group regarding baseline characteristics and hormonal profile."
	If confounding was present, was it controlled for?		*Not applicable*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	No	"We selected to set the baseline ongoing pregnancy rate for PCOS patients at 35%, and the detectable difference between groups at 5%, assuming an alpha level of 0.05. It was calculated that a sample size of 1471 patients was required in each group to achieve a 0.80 power. In confirmation of the values used for power analysis, Griesinger et al. (2006) reported 41.6 and 37.1% clinical pregnancy rates in PCOS patients treated by agonist and antagonist protocols respectively. In addition, Heijnen et al. (2006) showed that PCOS and control IVF patients achieve similar clinical pregnancy rates of approximately 35%, a percentage that was also accepted by The Thessaloniki ESHRE/ASRM-Sponsored PCOS Consensus Workshop Group (2008)." **"Obtaining such a sample size (1471 patients per group) is not easy to achieve in a single center, and is also extremely difficult for multicenter studies, especially when it refers to a small proportion of the population, such as PCOS patients, even during a 4-year period."** "Even for a 20% baseline pregnancy rate with 5% difference, more than 900 patients per group would be required. In addition, detecting a difference of 10% in pregnancy rates, which is not supported by the data published so far, would still require a considerable number of patients in each group (n = 376)."
	If statistical analysis was undertaken, was this appropriate?	Yes	*Also, see above* "Proportions were compared with the Fisher's exact test or the x2 test, where appropriate. Continuous variables (age, BMI), were compared with the Student's t-test for independent samples or the Mann–Whitney depending on the normality of their distribution. Statistical significance was accepted when P ≤ 0.05."
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		Moderate	*Moderate - Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

- Vrtacnik-Bokal 2009

Study ID	***Vrtacnik-Bokal 2009***
Study Citation	Vrtacnik-Bokal E, Virant Klun I, Verdenik I. Follicular oestradiol and VEGF after GnRH antagonists or GnRH agonists in women with PCOS. Reprod Biomed Online. 2009 Jan;18(1):21-8. doi: 10.1016/s1472-6483(10)60420-8. PMID: 19146765.
Study Country	Slovenia
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Consecutive women with PCOS who were referred for intracytoplasmic sperm injection (ICSI) between January 2006 and February 2007 because of male factor infertility* *Age (years)* *GnRH GnRH antagonists: 29.8 ± 3.2* *GnRH agonists: 31.2 ± 3.4* *BMI (kg/m2)* *GnRH GnRH antagonists: 24.5 ± 4.3* *GnRH agonists: 25.3 ± 6.6*
PCOS diagnostic criteria	Rotterdam criteria
Presence of infertility	*male factor infertility*
Presence of other condition/s	*NR*
Medication History	*NR*
N per group	*Intervention n=10 (GnRH antagonist)* *Control n=10 (GnRH agonist)*
Setting	*NR*
Intervention	Antagonist: A daily dose of 225 IU recombinant FSH (follitropin alpha) (rFSH) was started on day 2 of the menstrual cycle. The GnRH antagonist cetrorelix acetate at a dose of 0.25 mg per day was administered from the day when the dominant follicle reached a mean diameter ≥14 mm until the day of HCG administration. In both treatment groups, ovarian stimulation was started with a fixed daily dose of 225 IU rFSH for the first 5 stimulation days. Thereafter, the dose of gonadotrophin was adjusted according to the ovarian response monitored via ultrasonography daily from day 5 of stimulation to the day of HCG administration. In both groups, HCG at a dose of 10,000 IU was administered when three or more follicles reached a diameter of 18 mm.
Comparison	*Agonist:* *Ovarian stimulation was performed using GnRH agonist buserelin*

	administered from day 22 of the cycle in a daily dose of 0.6 ml (600 pg) s.c. After 14 days, pituitary desensitization was checked by oestradiol determination and B-mode ultrasound scan. Once the criteria for desensitization were fulfilled (oestradiol ≤0.05 nmol/l, follicle diameter ≤5 mm and endometrial thickness ≤6 mm), ovarian stimulation with a daily dose of 225 IU rFSH was started. GnRH agonist administration was continued until HCG administration. *In both treatment groups, ovarian stimulation was started with a fixed daily dose of 225 IU rFSH for the first 5 stimulation days. Thereafter, the dose of gonadotrophin was adjusted according to the ovarian response monitored via ultrasonography daily from day 5 of stimulation to the day of HCG administration.* *In both groups, HCG at a dose of 10,000 IU was administered when three or more follicles reached a diameter of 18 mm.*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Not reported under method, extracted from outcomes:* *Oocyte quality, fertilization competence and embryo quality* *Vascular endothelial growth factor (VEGF) and oestradiol concentrations* *Oestradiol was measured using a commercial kit* *VEGF was measured using an enzyme-linked immunosorbent assay kit*	
Follow up Duration	*1 cycle*	
Summary Result/s	*"In the GnRH antagonist group 254 follicles and in the GnRH agonist group 245 follicles, were aspirated. Fewer metaphase II (MII) and more immature and degenerative oocytes were registered in the GnRH antagonist group. Follicular oestradiol and VEGF were lower in the GnRH antagonist group (P = 0.014 and P < 0.001, respectively). Moreover, higher oestradiol concentrations were related to embryos of higher quality (P = 0.037)."*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	"The aim of this study was to determine whether follicular oestradiol and VEGF concentrations differ according to the use of GnRH antagonists or GnRH agonists in women with PCOS."
Does the study have specified inclusion/exclusion criteria?	Partial	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	

Inclusion criteria		Yes	*only women with PCOS with a favourable prognosis were included (≤35 years, undergoing first or second ICSI attempt).*
Exclusion criteria		Not reported	."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	No	"The allocation was not randomized, the first 10 patients were allocated to the GnRH agonist group and the second group of 10 to the GnRH antagonist group."
	Was allocation to intervention group concealed?	No	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	No	
	Were investigators and care providers blind to intervention group?	No	
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	No	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% treatment 0% control/ comparison	*No drop-outs*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Partial	*FSH (IU/ml)* *GnRH Antagonist 5.8 ± 1.07* *GnRH Agonist: 4.1 ± 1.55 0.016* *Significantly higher FSH level in antagonist group*
	If confounding was present, was it controlled for?	N/A	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes	*"Declaration: The authors report no financial or commercial* *conflicts of interest."*

	Was the study sufficiently powered to detect any differences between the groups?	Yes	"Sample size was calculated based on a review of the literature and the early results. It was assumed that a 10% difference in mean oestradiol concentrations with a 40% SD could be expected; after logarithmic normalization this changed to approximately a 1.6% difference and a 16% SD. This assumption yielded a required sample size of 214 in each group (using conventional values of 80% chance of rejecting the hypothesis of no difference at the 0.05 level). With 20–25 follicles per woman that meant that 10 women should be included in each group."
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		High	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	*Doldi 2006*
Study Citation	Doldi, N., Persico, P., Di Sebastiano, F., Marsiglio, E., & Ferrari, A. (2006). Gonadotropin-releasing hormone antagonist and metformin for treatment of polycystic ovary syndrome patients undergoing in vitro fertilization-embryo transfer. Gynecological Endocrinology, 22(5), 235-238.
Study Country	Italy
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	PCOS No data on age or BMI available
PCOS diagnostic criteria	Two of the following criteria: chronic anovulation manifested by the symptoms of oligomenorrhea (>40 days per cycle), amenorrhea or irregular menstrual cycles; clinical or biochemical (serum testosterone concentration >0.8 ng/ml) signs of hyperandrogenism; and ultrasonographic evidence of polycystic ovaries.

Presence of infertility	*Not reported*
Presence of other condition/s	*Not reported*
Medication History	*The patients did not take any ovulation drugs or hormones for at least 3 months prior to the trial.*
N per group	*N=40* *(Group A n=20* *Group B n=20)*
Setting	*IVF Unit, Ob-Gyn Department, Vita-Salute University, Milan*
Intervention	*Group A **[MET + rFSH + GnRH]*** *Pre-treated with MET 1.5g/day for 2 months and then stimulated with rFSH 150 IU/day starting on day 3 of menstrual cycle.* *Then GnRH antagonist, cetrorelix acetate 0.25 mg/day was started when the leading follicle reached 14 mm diameter on ultrasound scan*
Comparison	*Group B **[rFSH + GnRH]*** *Stimulated with rFSH 150 IU/day starting on day 3 of menstrual cycle* *Then GnRH antagonist, cetrorelix acetate 0.25 mg/day was started when the leading follicle reached 14 mm diameter on ultrasound scan*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*The number and quality of oocytes, fertilization rate, number of embryos and cases of OHSS* *How pregnancy was detected not reported* *"…oocyte retrieval and was continued until menstruation or a positive pregnancy test."* *The information on how the other outcomes were assessed not available*
Follow up Duration	*2 months + 1 cycle*
Summary Result/s	"In group A we found a statistically significant (p50.05) decrease in the number of ampoules of rFSH (A vs. B: 18+6 vs. 24+8) and estradiol levels (A vs. B: 2400+600 vs. 3370+900 pg/ml) (all values mean+standard deviation). Group A had significantly fewer cancelled cycles (A vs. B: 1 vs. 3; p50.05). The incidence of ovarian hyperstimulation syndrome was 5% in group A and 15% in group B (p50.05). In patients treated with metformin, the total number of follicles on the day of human chorionic gonadotropin treatment (23+1.2 vs. 33+2.6) was decreased with no change in the number of follicles _14 mm in diameter (A vs. B: 18+1.2 vs. 19+1.7). However, the mean number of mature oocytes (A vs. B: 8.4+1.5 vs. 5.0+1.5) was increased with metformin treatment (p50.05). No difference was found in the number of cleaved embryos (A vs. B: 2.5+0.5 vs. 2.2+0.3)."
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?		Yes	*"The aim of the present study was to compare the stimulation characteristics and in vitro fertilization (IVF)–embryo transfer (ET) outcomes of the standard short GnRH antagonist protocol for ovarian stimulation with or without metformin."*
Does the study have specified inclusion/exclusion criteria?		Partial	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Partial	*PCOS* *Attending the clinic*
Exclusion criteria		Yes	Congenital adrenal hyperplasia, Cushing's syndrome, androgen-producing tumour, hyperprolactinemia and thyroid dysfunction were all excluded. Exclusion criteria included patients age older than 40 years, serum FSH level >12 mIU/ml and the presence of other pathology.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Not reported	*"The population was randomly divided into two groups (A and B)."*
	Was allocation to intervention group concealed?	Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Not reported	
	Were investigators and care providers blind to intervention group?	Not reported	

	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Not reported	
	Were outcomes assessed objectively and independently?	Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	Not reported	*Perhaps no drop-outs*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes

	If confounding was present, was it controlled for?	Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes	*"All data are expressed as mean+standard deviation. Data were analyzed by the Student t test. A value of p50.05 was considered statistically significant. Data were tabulated and analysed using Instat 3…"*
COMMENTS			
What is the overall risk of bias?		High	*Small study and important information missing. This should go either under insufficient information or high risk.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

- Fedorcsak 2003

Study ID	***Fedorcsak 2003***
Study Citation	Fedorcsak, P.; Dale, P. O.; Storeng, R.; Abyholm, T.; Tanbo, T. The effect of metformin on ovarian stimulation and in vitro fertilization in insulin-resistant women with polycystic ovary syndrome: an open-label randomized crossover trial. *Gynecol Endocrinol* **2003**, 17, 207-14 *DOI: 10.1080/gye.17.3.207.214*

Study Country	Norway
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Age (years) 31 (23-35)* *BMI (kg/m2) 31.5 (27.1-40.7)* *Median (range)*
PCOS diagnostic criteria	Aligns with Rotterdam PCOS was diagnosed when polycystic ovaries were seen on vaginal ultrasound scan according to the criteria of Adams *et al*. and two or more of the following conditions were present: oligo/amenorrhea, hirsutism and hyperandrogenism
Presence of infertility	The causes of infertility were not reported.
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	*N=17* metformin–control (*n* = 9) control–metformin (*n* = 8)
Setting	University Hospital, Oslo, Norway
Intervention	500mg Metformin t.i.d (3-week pretreatment and 1 cycle co-administration with IVF protocol*, until hCG injection).
Comparison	No co-treatment, IVF protocol* * Long protocol GnRH-agonist suppression + rFSH (150IU starting dose, step-up protocol) + hCG (10,000IU in presence of at least 2 dominant follicles >18mm)
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	• **Primary outcomes** a) clinical pregnancy rate per woman b) incidence of OHSS • **Secondary outcomes:** a) total dose of FSH (IU) given during stimulation b) number of collected oocytes c) number of days of gonadotrophin d) fertilisation rate e) number of embryos transferred f) miscarriage rate g) incidence of adverse side effects
Follow up Duration	*two consecutive cycles*
Summary Result/s	*"Nine women completed both cycles, the results of eight women being excluded because of pregnancy after the first cycle (*n = *4) or because the protocol of the study was not followed (*n = *4). Mean total FSH dose was 2301 IU (range 1500–6563 IU) in metformin cycles and 2174 IU (range 1200–3900 IU) in parallel control cycles, while the mean number of*

		collected oocytes was 8.6 (range 2–28) and 4.6 (range 1–16), respectively. *Bayesian analysis showed probabilities of 0.05 that metformin reduces FSH requirement by at least 10%, and of 0.61 that at least 10% more oocytes are collected after metformin co-treatment."*
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	"the purpose of the present study was to examine whether metformin affects gonadotropin requirement and the number of collected oocytes during ovarian stimulation in insulin-resistant women with PCOS."
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	Diagnosis of PCOS followed the Rotterdam criteria (ESHRE/ASRM). All women had insulin-resistance, based on an insulin resistance index.
Exclusion criteria		Yes	a) congenital adrenal hyperplasia b) Cushing's syndrome c) androgen-producing tumours d) hyperprolactinaemia Age: 23 to 35 years (median 31) The causes of infertility were not reported. Only the first arm was compared: 8 participants in the no-treatment group versus 9 participants in the metformin group.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	The randomization list was derived from a table of random numbers in blocks of 4, 6, or 8.
	Was allocation to intervention group concealed?	Yes	The list was concealed in a sequence of sealed envelopes from the single clinician who performed assignment and supervised treatment (T.T.).
PERFORMANCE	**Were patients blind to intervention group?**	No	This was an open-label trial as it was not placebo-controlled or blinded.

	Were investigators and care providers blind to intervention group?	No	This was an open-label trial as it was notplacebo-controlled or blinded.
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	No	This was an open-label trial as it was not placebo-controlled or blinded.
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0%	There were no withdrawals in the phase analysed (pre-cross-over phase).
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	There were no withdrawals in the phase analysed (pre-cross-over phase).
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Partial	Live birth rate was not evaluated
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	

	If confounding was present, was it controlled for?	Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	"This work was supported by grants from the Research Council of Norway, the Norwegian Women's Health Society, the Hungarian Eötvös fellowship, and the Gyermek-Áldás Foundation"
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	In this study, prior and observed probabilities were expressed as normal distributions.
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		High	*High - Few or no criteria fulfilled or the conclusions of the study are likely or very likely to be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*

Study Country	UK

BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*PCOS women recruited from IVF clinic waiting list between October 2009 and June 2014* *Age (years)* *MET: 29.9 ± 4.4* *Placebo: 29.6 ± 3.9* *BMI* *MET: 25.3 ± 3.4* *Placebo: 25.0 ± 3.3*
PCOS diagnostic criteria	Rotterdam criteria All women therefore had at least two of the following characteristics: evidence of hyperandrogenism (clinical or biochemical), oligo/anovulation (cycles longer than 35 days) polycystic ovarian morphology (PCOM) on ultrasound (one or more ovaries with ≥12 follicles and/ or volume ≥10 cm3)
Presence of infertility	*The patients' had on average entered their fourth year of subfertility (3.6 ± 2.3 years) with an average 94% undergoing their first IVF cycle.*
Presence of other condition/s	*NR*
Medication History	*No participant had received metformin within the 3 months prior to recruitment.*
N per group	*Of the 153 patients, 77 received metformin and 76 placebo.*
Setting	*tertiary infertility clinic.*
Intervention	***MET + rFSH + GnRH*** *(n=77)* *Metformin in the range 100-150 IU started 7 days prior to the patient's anticipated menstruation in those with a regular menstrual cycle (mid luteal) or Day 1 of the period if irregular and continued until the day before egg collection.* *Daily recombinant FSH (rFSH) was started from Day 2 of the menstrual cycle, at a dose adjusted for patient age, ovarian reserve and BMI.* *A GnRH antagonist (250 µg; Orgalutron, Organon or Cetrotide, Merck Serono) was added on Day 6 of the cycle.*
Comparison	***Placebo + rFSH + GnRH*** *(n=76)* *See intervention for rFSH and GnRH*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary: Severe OHSS within 6 weeks of completing an IVF cycle* *Secondary: ovarian stimulation characteristics, embryological measures (including fertilisation rate and good quality Day 3 embryos) and cycle outcome including clinical pregnancy rate (CPR) and live birth rate (LBR).* *Detailed information provided in supplementary materials*

	"Demographic and baseline data were recorded at the start of the treatment cycle including a baseline transvaginal ultrasound scan (TVUSS) and hormone profile (including serum anti-Müllerian hormone (AMH), testosterone and sex hormone-binding globulin (SHBG))." *An embryo was referred to as good quality if graded ≥6.3.3 for Day 3 embryos or ≥2 Bb for blastocysts.* *A serum pregnancy test was taken on Day 14 or a urine test on Day 18 from oocyte collection. A serum hCG of >2 IU/l was deemed positive If a foetal heart was seen on this scan, it was deemed a clinical pregnancy.*	
Follow up Duration	*? 1 cycle*	
Summary Result/s	"There was no reduction in the incidence of moderate–severe OHSS (Placebo (PLA) 12.2%, metformin (MET) = 16%, 95% CI −0.08–0.16, P = 0.66). There was no difference in total gonadotrophin dose (PLA = 1200, MET = 1200, 95% CI −118.67–118.67, P = 0.75), oocytes retrieved (PLA = 15, MET = 14, 95% CI −2.37–4.37, P = 0.66) or fertilisation rate (PLA = 60.7%, MET = 53.3%, 95% CI −0.96–14.94, P = 0.07). However, using metformin resulted in a reduced clinical pregnancy rate (CPR) per cycle started (PLA = 48.7%, MET = 28.6%, 95% CI 0.04–0.35, P = 0.02) and live birth rate (PLA = 51.6%, MET = 27.6%, 95% CI 0.05–0.40, P = 0.02). Furthermore, when ethnicity was taken into account there was a significant reduction in pregnancy outcome for the South Asian population irrespective of metformin or placebo use (CPR per cycle started, White Caucasian = 44.4%, South Asian = 19.4%; 95% CI 0.06–0.39, P = 0.01)."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"Does 'metformin' reduce the incidence of ovarian hyperstimulation syndrome (OHSS) for women with polycystic ovary syndrome (PCOS) undergoing a GnRH antagonist assisted conception treatment cycle?"*
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	*PCOS (see under diagnosis criteria)* *FSH <8.0 IU/l,* *age 20–39 years,* *BMI <35,* *serum testosterone <5.0 nmol/l,* *normal renal, liver and haematological indices.*
Exclusion criteria	Yes	*Concomitant use of medication that could interfere with the absorption, metabolism and excretion of metformin including anti-virals, cimetidine and other oral anti-diabetic medication*

			Patients with significant systemic disease or diabetes (Type 1 or 2)
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	*"Randomisation was blinded to both patient and investigator, using a random permuted blocks method with a 50:50 allocation ratio."*
	Was allocation to intervention group concealed?	Yes	*"Randomisation was done by the hospital pharmacy, using a random permuted blocks method with a 50:50 allocation ratio. This process was blinded to both patient and investigator by using identical over-encapsulated tablets"* *"The allocation code was only broken when all women had been recruited and commenced treatment."*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	*"Randomisation was blinded to both patient and investigator…."* *"This process was blinded to both patient and investigator by using identical over-encapsulated tablets…"*
	Were investigators and care providers blind to intervention group?	Yes	*"Randomisation was blinded to both patient and investigator…."* *"This process was blinded to both patient and investigator by using identical over-encapsulated tablets…"*
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	*Not sure whether the outcome assessor was the same investigator. If so, this should be "Yes"* *"Randomisation was blinded to both patient and investigator…."*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% treatment 0% control/	*2 from MET and 3 from placebo either discontinued or attained natural conception*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*ITT conducted*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	*TRIAL REGISTRATION NUMBER:* *EudraCT number 2009-010952-81.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"There were no significant differences in baseline characteristics between the two groups of women (Table II)."*
	If confounding was present, was it controlled for?	Yes	*N/A*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes	*"STUDY FUNDING/COMPETING INTEREST(S): None."*
	Was the study sufficiently powered to detect any differences between the groups?	Yes	*"This study was powered to assess metformin's ability to reduce OHSS as an adjunct in an ART cycle."* *"The study was completed over 5 years (2009–2014) with 153 randomised patients. A sample size calculation based on the incidence of OHSS was completed prospectively suggesting a minimum of 146 recruits was required for the trial with a power of 80% and a type 1 error of 0.05."*

	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Low	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

- Onalan 2005

Study Citation	Onalan G, Pabuçcu R, Goktolga U, Ceyhan T, Bagis T, Cincik M. Metformin treatment in patients with polycystic ovary syndrome undergoing in vitro fertilization: a prospective randomized trial. Fertil Steril. 2005 Sep;84(3):798-801. doi: 10.1016/j.fertnstert.2005.03.043. PMID: 16169430.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Age (y), mean ± SD *Metformin 29.3 ± 3.9* *Placebo 29.76 ± 5.3* *BMI (kg/m^2)* *Metformin 25 (19.41)* *Placebo 23.5 (19-34)*
PCOS diagnostic criteria	Diagnosis of PCOS followed the Rotterdam criteria (ESHRE/ASRM).
Presence of infertility	*Duration of infertility* *Metformin (n=53) years 7 (2-15)* *Placebo (n=55) years 7 (2-22)* *Median (range)*
Presence of other condition/s	All patients had oligomenorrhea or amenorrhea since menarche as a surrogate for oligo-anovulaton All other causes of hyperandrogenism were ruled out before diagnosis of PCOS.
Medication History	*Not reported*
N per group	*N=110 (2 withdrew for personal reasons)* *108 randomised (53 in the metformin group and 55 in the placebo group).*
Setting	Centrum IVF Clinic, Turkey
Intervention	Metformin 850 mg twice or 3 times daily (according to BMI) for 8 weeks before their first ICSI cycle, through the luteal phase and until a positive pregnancy test
Comparison	*Placebo*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	• **Primary outcomes:** a) clinical pregnancy rate per woman b) incidence of OHSS • **Secondary outcomes:** a) number of days of gonadotrophins b) number of ampoules of gonadotrophins c) number of follicles (> 16 mm) d) number of mature oocytes

	e) fertilisation rate f) number of embryos transferred g) pregnancy rate per woman h) miscarriage rate i) serum E2 levels j) glucose/insulin rate Insulin, LH, FSH, E2, and PRL levels were assessed with an autoanalyzer	
Follow up Duration	*2 months + One cycle?(or NR)*	
Summary Result/s	"In the metformin group, compared with the placebo group, patients with a glucose/insulin ratio <4.5 had lower day-3 serum levels of LH (4.8 IU/mL [range, 2.8–8.1 IU/mL] vs. 6.8 IU/mL [5–13.1 IU/mL], *P*=.04) and E2 (49 pg/mL [37–68 pg/mL] vs. 68.5 pg/mL [54–88 pg/mL], *P*_.002) and lower numbers of follicles ≥17 mm in diameter (5.5 [3– 8] vs. 8 [6–13], *P*=.01)." "Patients with a BMI <28 had similar measures of outcome in both placebo and metformin groups." "Patients with a BMI ≥28 in the metformin group had lower serum levels of LH (4.2 IU/mL [2.8–8.1 IU/mL] vs. 7.5 IU/mL [5.1–13.1 IU/mL], *P*=.006), increased numbers of antral follicles (12 [9 –15] vs. 8.5 [7–14], *P*=.015), and increased numbers of follicles ≥17 mm in diameter (9 [6 –13] vs. 5.5 [3–10], *P*=.046), compared with those in the placebo group." "…metformin had no effect on duration of stimulation, total dose of FSH, number of follicles 10 –16 mm and _17 mm in diameter, serum peak levels of E2 on the day of hCG injection, number of retrieved metaphase I and II oocytes, fertilization rate, number of transferred embryos, and total and clinical pregnancy rates."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	"we investigated the effects of metformin therapy on ICSI outcome in patients with PCOS."
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	Infertile women <40 years old No concomitant causes of infertility Undergoing first IVF/ICSI attempts All patients had oligomenorrhea or amenorrhea since menarche as a surrogate for oligo-anovulaton At least one of the criteria of hyperandrogenism, including a hirsutism score of >7

Exclusion criteria		Yes	” previous treatments with hormonal medications and insulin-lowering agents in the last 3 months”
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	computer randomisation system
	Was allocation to intervention group concealed?	Not reported	“… women were given an envelope containing either metformin (Glucophage Retard 850 mg; Ilsan-Iltas¸ Pharmaceuticals, Istanbul, Turkey) or placebo (identical to metformin capsules), according to the code provided by computer-generated randomization in blocks.”
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	*“*…prospective, randomized, double-blind, placebo-controlled study,…” *“*Both patients and investigators were blinded to the content of tablets.”
	Were investigators and care providers blind to intervention group?	Yes	*“*…prospective, randomized, double-blind, placebo-controlled study,…” *“*Both patients and investigators were blinded to the content of tablets.”
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	3.6% in metformin *0% in placebo*	

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	No	ITT analysis was not performed.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Partial	Live birth rate was not reported, however, the Cochrane authors have received them from the trail authors after contacting them However, which outcomes would be measured not reported in methods
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	*"*There were no statistically significant differences between the two groups regarding baseline characteristics, duration of stimulation, total dose of FSH, number of follicles 10–16 mm and ≥17 mm in diameter, serum peak levels of E2 on the day of hCG injection, number of retrieved metaphase I and II oocytes, fertilization rate, number of transferred embryos, and total and clinical pregnancy rates (all *P*≥.05)"
	If confounding was present, was it controlled for?	N/A	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	*No power calculation*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Statistical analysis was performed with Student *t*,Mann-Whitney *U*, _2, and Fisher exact tests, as appropriate. Data are reported as mean _ SD or median (range). A *P* value of _.05 was considered significant.
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	

What is the overall risk of bias?	High	*High - Few or no criteria fulfilled or the conclusions of the study are likely or very likely to be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		

- Kjotrod 2004

Study ID	***Kjotrod 2004***
Study Citation	Kjotrod, S. B.; von During, V.; Carlsen, S. M. Metformin treatment before IVF/ICSI in women with polycystic ovary syndrome; a prospective, randomized, double blind study. *Hum Reprod* **2004**, 19, 1315-22
Study Country	Norway
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*The data below are for patients who started IVF stimulation (i.e. drop outs and spontaneous pregnancies not included)* *Age (years)* *Placebo (n=32) mean 30.2 (95% CI 29.0-31.5)* *Metformin (n=31) mean 28.9 (95% CI 27.6-30.2)* *BMI <28 (kg/m2)* *Placebo (n=13) mean 30.7 (95% CI 28.7-32.7)* *Metformin (n=14) mean 29.0 (95% CI 27.3-30.7)* *BMI ≥28 (kg/m2)* *Placebo (n=19) mean 29.9 (95% CI 28.1-31.8)* *Metformin (n=17) mean 28.9 (95% CI 26.7-31.0)*
PCOS diagnostic criteria	Aligns with Rotterdam criteria “All the patients had oligo/amenorrhoea, defined as either menstruation periods between 32 and 42 days (30%), an interval of between 42 days and 6 months (47%), or >6 months between periods (23%). In addition, at least one of the following five criteria had to be fulfilled: testosterone >2.0 nmol/ l (65%), sex hormone-binding globulin (SHBG) <30 nmol/l (60%), LH/FSH ratio >2 (38%), fasting insulin C-peptide >1.0 nmol/l (41%) or hirsutism (37%).”
Presence of infertility	Duration of infertility (years) Placebo (n=32) 4.0 (3.3-4.6) Metformin (n=31) 4.2 (3.1-5.3)

Presence of other condition/s	"Of the 73 patients randomized, 41 patients (60%) had undergone a laparoscopy. Of these patients,12 (29 %) had tubal disease and three (7%) had endometriosis in addition to PCOS."
Medication History	*Not reported*
N per group	*73 randomised* *4 withdrew* *Metformin (n=35)* *Placebo (n=34)*
Setting	Seventy-three consecutive, infertile women with PCOS referred for treatment at the IVF-unit at Trondheim University Hospital between January 2001 and June 2002
Intervention	Metformin 500 mg (Metformin, Weifa, Oslo, Norway)
Comparison	Placebo
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary:* total number of days of FSH stimulation serum oestradiol on the day of HCG injection *Secondary:* number of oocytes, total gonadotrophin dose used, fertilization rates, embryo quality, pregnancy rates, clinical pregnancy rate (defined as a verified intrauterine gestational sac by ultrasound performed in week 7) live birth rates *Clinical pregnancy was defined as a verified intrauterine gestational sac by ultrasound performed in week 7*
Follow up Duration	*12 weeks + 1 cycle?* Pre-treatment with metformin for 16 weeks
Summary Result/s	"No differences were found in the primary end-points: duration of FSH stimulation 14.4 (13.1±15.7) versus 14.2 (12.6±15.7) days or estradiol on the day of HCG injection 6.8 (5.3±8.2) versus 7.6 (5.6±9.6) nmol/l in the metformin and placebo groups, respectively. The secondary end-points number of oocytes, fertilization rates, embryo quality, pregnancy rates and clinical pregnancy rates were equal. However, in the normal weight subgroup (BMI <28 kg/m2, n = 27), pregnancy rates following IVF were 0.71 (0.63±0.79) versus 0.23 (0.15±0.31) in the metformin and placebo groups, respectively (P = 0.04). Overall clinical pregnancy rates were equal: 0.51 (0.34±0.68) versus 0.44 (0.27±0.62) in the metformin and placebo groups, respectively. However, in the normal weight subgroup, clinical pregnancy rates were 0.67 (0.43±0.91) and 0.33 (0.06±0.60), respectively (P = 0.06)."

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"*to investigate the effect of pre-treatment with metformin in women with polycystic ovary syndrome (PCOS) scheduled for IVF stimulation"

Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	*"*All patients had polycystic ovaries (PCO) with at least 10 follicles 2±10 mm in diameter, and increased density and area of ovarian stroma determined by the use of ultrasound (Adams et al., 1986). All the patients had oligo/amenorrhoea, defined as either menstruation periods between 32 and 42 days (30%), an interval of between 42 days and 6 months (47%), or >6 months between periods (23%)." *"*In addition, at least one of the following five criteria had to be fulfilled: testosterone >2.0 nmol/ l (65%), sex hormone-binding globulin (SHBG) <30 nmol/l (60%), LH/FSH ratio >2 (38%), fasting insulin C-peptide >1.0 nmol/l (41%) or hirsutism (37%)."
Exclusion criteria		Yes	diabetes mellitus, renal insufficiency (creatinine >130 mmol/l), liver disease (alanine aminotransferase >80 U/l) or treatment with oral glucocorticoids. Patients with hyperprolactinaemia, abnormal thyroid function tests, congenital adrenal hyperplasia and androgen-secreting tumours were excluded
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	Randomization codes were kept in the pharmacy until the last patient had finished the IVF procedure
	Was allocation to intervention group concealed?	Yes	Patients were treated with identical capsules of metformin or placebo.
PERFORMANCE	**Were patients blind to intervention group?**	Yes	Patients were treated with identical capsules of metformin or placebo.

	Were investigators and care providers blind to intervention group?	Yes	*Double-blind study*
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	*22.22% in placebo and 21.6% in metformin*	*From the patients that were randomised, 22.22% of placebo and 21.6% in metformin did not undergo embryo transfer*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	*Intention to treat analysis conducted*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Partial	"Except for testosterone levels and the free testosterone index (FTI) in the lean subgroup, there were no significant differences between the study groups regarding inclusion criteria and demographics"

	If confounding was present, was it controlled for?	Partial	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	"We gratefully thank Weifa AS, Norway, for supplying the metformin used free of charge, and Organon AS, Norway, for supporting gonadotrophin for the last 15 cycles (after public financing of IVF changed in Norway on January 1, 2002)."
	Was the study sufficiently powered to detect any differences between the groups?	Partial	"A treatment effect of 63 days or D-estradiol 63.5 nmol/l was considered to be of clinical significance. **Thirty-two patients** would be needed in each group to detect such changes with a 80 percentage power and with a P-value of 0.05." *Around 20% of each arm have not had ET due to various reasons and this may affect the analysis*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Low	*Low - Many of the criteria have been fulfilled or where criteria have not been fulfilled it is very unlikely the conclusions of the study would be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

- Kjotrod 2011

Study ID	**Kjotrod 2011**
Study Citation	Kjotrod, S. B., S. M. Carlsen, et al. (2011). "Use of metformin before and during assisted reproductive technology in non-obese young infertile women with polycystic ovary syndrome: a prospective, randomized, double-blind, multi-centre study." Human Reproduction 26(8): 2045-2053.

Study Country	Denmark, Finland, Norway and Sweden
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women diagnosed with PCOS, aged <38 years and with a BMI of <28 kg/m2. The majority of patients had previously received unsuccessful clomiphene citrate (CC) treatment. Mean (SD) age, years M: 29.6 (3.4) P: 29.5 (3.8) Mean (SD) BMI, kg/m2 M: 24.0 (2.7) P: 23.6 (2.8)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Duration of infertility (years) mean (SD)* *Metformin (n=74) : 2.6 (1.8)* *Placebo (n=75) : 2.8 (1.8)* *Cause of infertility, n* *PCOS only* *Metformin 45* *Placebo 44* *Additional male factor* *Metformin 21* *Placebo 26* *Additional tubal disease* *Metformin 6 (n=38)* *Placebo 6 (n=40)* *Additional endometriosis* *Metformin 4 (n=36)* *Placebo 2 (n=37)*
Presence of other condition/s	*Not reported*
Medication History	*Not reported*
N per group	□ Screened: 179 participants □ Allocated/randomised: 150 participants – M: 74, P:76 □ Assessed pre-ART: M: 74, P:75 □ Followed up – not relevant to this systematic review
Setting	"The study was planned as a multi-centre study (EUDRACTnr-2004-001124-20). Originally a centre in Leeds, UK was planned to be included; but we did not get the approval for study medications by the medical authorities in UK. One private IVF clinic in Helsinki, one in Oslo and one in Cophenhagen were also supposed to participate, but dropped out very early due to recruitment problems. To compensate for this, The Oslo University Hospital was recruited into the study during the last 1.5 years of the inclusion period." February 2005 - March 2010.
Intervention	Metformin for ≥12 weeks prior to controlled ovarian stimulation (COS). "The dose of metformin was gradually increased from 500 to 2000 mg per day during the first 2 weeks of treatment." (spontaneous pregnancy (SP) group only) "Following a spontaneous menstrual period or a gestagen-induced shedding of the endometrium, pituitary down-regulation (nafarelin, 400 mg administered twice daily intranasally) was initiated (on cycle Day 20)" – assuming this to be post SP group data.

	The study continued throughout IVF/ICSI, and until the day of pregnancy testing, however we will only collect data relevant to pre-ART.	
Comparison	*Placebo*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: clinical pregnancy rate; Secondary: biochemical pregnancy and live birth rate – these were not reported for SP population. Safety variables included the incidence of adverse events (AEs) and OHSS. *Pregnancy was detected initially by a serum pregnancy test performed on Days 13–15 after embryo transfer and women with a positive test underwent an ultrasound in week 7 of pregnancy*	
Follow up Duration	Haven't used entire study data, only pre ART data. The total study period was ~5 years.	
Summary Result/s	Among IVF treated women (n = 112), biochemical pregnancy rates were identical in both groups (42.9%), and there were no significant differences in the metformin versus the placebo group in CPR [39.3 versus 30.4%; 95% confidence interval (CI): 28.6 to 26.5]. The LBR was 37.5 versus 28.6% (95% CI: 28.4 to 26.3). However, prior to IVF there were 15 (20.3%) spontaneous pregnancies in the metformin group and eight (10.7%) in the placebo group (95% CI: 21.9 to 21.1; P = 0.1047). According to intention to treat analyses (n = 149); significantly higher overall CPR were observed in the metformin versus placebo group (50.0 versus 33.3%; 95% CI: 21.1 to 32.3; P = 0.0391). LBR was also significantly higher with use of metformin versus placebo (48.6 versus 32.0; 95% CI: 1.1 to 32.2; P = 0.0383). No major unexpected safety issues or multiple births were reported. More gastrointestinal side effects occurred in the metformin group (41 versus 12%; 95% CI: 0.15 to 0.42; P< 0.001).	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	"To study the effect of metformin before and during assisted reproductive technology (ART) on the clinical pregnancy rate (CPR) in non-obese women with polycystic ovary syndrome (PCOS)."
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	
Inclusion criteria	Yes	"The included patients had been trying, unsuccessfully, to conceive for at least 1 year and have a diagnosis of PCOS based on fulfilling at least two of the following three criteria: oligomenorrhoea/ amenorrhoea, clinical or biochemical hyperandrogenism and/or polycystic ovaries on

			ultrasound (The Rotterdam ESHRE/ASRM-Sponsored PCOS Consensus Workshop Group, 2004).“
Exclusion criteria		Yes	“Patients were excluded if they were contraindicated for a starting dose of 112.5 IU recombinant human follicle-stimulating hormone (r-hFSH), or had a basal serum FSH level of .10 IU/l. Patients with liver or kidney disease, diabetes mellitus (or fasting plasma glucose ≥7.0 mmol/l), alcoholism or drug abuse were excluded. Patients with hyperprolactinaemia (serum prolactin .700 mIE/l), abnormal thyroid function tests, congenital adrenal hyperplasia, androgen-secreting tumours or Cushing’s syndrome were also excluded. Finally, patients who had received oral steroid hormones, cimetidine, anticoagulants, erythromycin or other macrolides were also excluded. A 1-month washout period was required for women who had previously received metformin.”
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	“Randomization was performed in blocks of four by the hospital pharmacy using a computer-generated list.”
	Was allocation to intervention group concealed?	Yes	“The trial clinician and a study nurse at each site enrolled the patients.” “Identical blister packs containing metformin or placebo tablets (of the same appearance, smell and taste) were made, and each centre was assigned 20 identical packs. The study medicine was delivered to the patients either by the hospital pharmacy or by a third, independent person who was not involved in the study. The patient screened and randomized as number one in the centre received package number one, randomization patient number two received package number two, etc. Randomization codes remained blinded until the database lock had taken place.”
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	
	Were investigators and care providers blind to intervention group?	Yes	“All study site personnel, the sponsor and the monitor Operationally involved in the monitoring or conduct of the study were blinded to the study drug codes.”

	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	Unblinding was performed prior to serum analyses.
	Were all outcomes measured in a standard, valid and reliable way?	Yes	"The primary efficacy end-point was the CPR, defined by ultrasound evidence of an intrauterine gestational sac (with a beating heart) at Week 7 in the ITT population. Secondary efficacy endpoints included the SP rate during the pretreatment period (SP population); biochemical pregnancy (defined by a positive serum hCG test on Day 14 after embryo transfer) and CPRs following IVF/ICSI in the ART population and LBR (in the ITT, ART and SP populations). Safety variables included the incidence of adverse events (AEs), OHSS and coasting. According to prespecified criteria, OHSS and coasting were not considered AEs."
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% M 1.3% P	This relates only to SP and not drops outs post ART.
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	However we have not used the ITT population, we have used the pre-ART population.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	Difficult to determine without a protocol.

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	Both groups were matched for age, cause and duration of infertility, weight, and BMI.
	If confounding was present, was it controlled for?		Both groups were matched for age, cause and duration of infertility, weight, and BMI.
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Partial	All were clearly declared.
	Was the study sufficiently powered to detect any differences between the groups?	Yes	"In our previous pilot study (Kjotrod et al., 2004) an increased pregnancy rate of almost 100% was observed among metformin-relative to placebo treated non-obese women with PCOS. A CPR of 0.35 was expected in the placebo group. With a study power of 0.80 and a significance level of 0.05, it was estimated that 120 patients were needed in each group to demonstrate a 50% increase in the CPR in the metformin group." However we will only use pre-ART data which which is in 74 participants and thus not adequately powered for that component of data.
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		Moderate	*Moderate - Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	***Tang 2006a***
Study Citation	Tang, T.; Glanville, J.; Orsi, N.; Barth, J. H.; Balen, A. H. The use of metformin for women with PCOS undergoing IVF treatment. *Hum Reprod* **2006**, 21, 1416-25
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Age (years)* *31.3 (4.0) Metformin* *31.1 (4.0) Placebo* *BMI (kg/m^2)* *27.9 (5.6) Metformin* *26.9 (4.8) Placebo* *Mean (SD)*
PCOS diagnostic criteria	Diagnosis of PCOS followed the Rotterdam criteria (ESHRE/ASRM) "…presence of polycystic ovaries on transvaginal ultrasound scan (TVUS), more than 10 cysts, 2–8 mm in diameter, usually combined with increased ovarian volume >10 cm3 (after the transabdominal ultrasound criteria of Adams *et al*., 1985), together with either oligomenorrhoea/amenorrhoea or clinical/ biochemical hyperandrogenism. Anovulation was defined as the presence of amenorrhoea or oligomenorrhoea (cycle length greater than 35 days) (Munster and Schmidt Lone Helm, 1993; Berek *et al*., 1996). This criterion would also meet the recent consensus (Rotterdam ESHRE/ASRM-Sponsored PCOS Consensus Workshop Group, 2004)."
Presence of infertility	Causes of infertility not reported *Duration of infertility (years)* *4.5 (Metformin)* *4.0 (Placebo)* *Median*
Presence of other condition/s	All women with BMI over 30 kg/m2 would have been advised to loose weight 6–12 months prior to the treatment through lifestyle modification
Medication History	No participant had received metformin treatment within the 3 months prior to recruitment.
N per group	101 PCOS participants were randomised (52 in the metformin group and 49 in the placebo group) 5 cycles in the metformin group and 2 in the placebo group were abandoned due to poor response. 47 cycles in each arm completed through to oocyte retrieval.
Setting	*Single fertility unit*

Intervention	Metformin 850 mg twice a day from the first day of downregulation GnRH-agonist to the day of oocyte retrieval	
Comparison	*Placebo (*were identical in appearance)	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	• **Primary outcome:** a) fertilisation rate • **Secondary outcomes:** a) number of days of gonadotrophins b) total dose of FSH given during stimulation c) number of follicles (> 14 mm) d) number of oocytes e) number of embryos transferred f) implantation rate g) pregnancy rate per woman h) clinical pregnancy rate per woman i) pregnancy rate per transfer j) clinical pregnancy rate per transfer k) live birth rate l) incidence of OHSS that required hospitalisation m) side effects n) fasting insulin o) fasting glucose p) SHBG q) free androgen index r) testosterone	
Follow up Duration	*1 cycle*	
Summary Result/s	*"*There was no difference in the total dose of rFSH required per cycle (median dose: MET = 1200 U, PLA = 1300 U; *P* = 0.937). The median number of oocytes retrieved per cycle (MET = 17.2, PLA = 16.2; *P* = 0.459) and the overall fertilization rates (MET = 52.9%, PLA = 54.9%; *P* = 0.641) did not differ. However, both the clinical pregnancy rates beyond 12 weeks gestation per cycle (MET = 38.5%, PLA = 16.3%; *P* = 0.023) and per embryo transfer (MET = 44.4%, PLA = 19.1%; *P* = 0.022) were significantly higher in those treated with metformin. Furthermore, a significant decrease in the incidence of severe ovarian hyperstimulation syndrome (OHSS) was observed (MET = 3.8%, PLA = 20.4%; *P* = 0.023), and this was still significant after adjustment for BMI, total rFSH dose and age (OR = 0.15; 95% CI: 0.03, 0.76; *P* = 0.022)."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	*"…*to perform a randomized, placebo-controlled, double-blind study (RCT) to explode the potential benefits of using metformin during IVF treatment."
Does the study have specified inclusion/exclusion criteria?	Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes	

Inclusion criteria		Yes	a) serum testosterone concentration < 5.0 nmol/L b) normal prolactin concentration, thyroid, renal, and haematological indices.
Exclusion criteria		Yes	a) concurrent hormone therapy within the previous 6 weeks b) any chronic disease that could interfere with the absorption, distribution, metabolism, or excretion of metformin c) renal or liver disease d) systemic disease or diabetes (types 1 and 2)
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	random numbers table
	Was allocation to intervention group concealed?	Yes	codes kept by a third party in the trial office
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes	Double-blinded
	Were investigators and care providers blind to intervention group?	Yes	Double-blinded
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	9.6% in treatment; 4% control/ comparison	Five cycles in the metformin group and two cycles in the placebo group were abandoned due to poor response. The difference was not significant (*P* = 0.487)
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	Reasons for withdrawals were reported. ITT analysis was performed
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	All main outcomes were reported.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes	
	If confounding was present, was it controlled for?		*Not applicable*
ER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	Partial	At the time when the study was planned, no RCT had been carried out to investigate the use of metformin during IVF treatment. Therefore, the power calculation was based on the data from retrospective studies. "…fertilization rate as our primary power calculation. The fertilization rates from the study by MacDougall *et al*. (1993) were 52.8 □□3.4% and 66.1 □□3.4% for patients with PCOS and non-PCOS, respectively. With an improvement of 20%, the calculated standardized difference (*d*) would be 0.67. The chosen power in the study was 90%, with a type I error of 0.05. From the power table (Machin and Campbell, 1987), when *d* = 0.67 and the power = 0.90, the projected sample size was 100 with 50 subjects in each arm." *1 subject in placebo arm (4%) but 5 (9.6%) in the intervention withdrew due to poor response*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		*Low*	*Low - All of the criteria have been fulfilled or where criteria have not been fulfilled it is very unlikely the conclusions of the study would be affected.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

GUIDELINE DEVELOPMENT METHODS

This guideline was developed as outlined in National Health and Medical Research Council (NHMRC) standards and procedures for rigorously developed external guidelines and according to the GRADE (Grading of Recommendations, Assessment, Development and Evaluation) approach. These methods were aligned with European Society of Human Reproduction and Embryology (ESHRE) guideline development methods.

The work builds on the original Australian guideline in PCOS, the update in 2014, the World Health Organisation (WHO) guideline evidence synthesis in infertility management, and the International Guideline in the assessment and management of PCOS.

The International evidence–based guideline for the assessment and management of PCOS underpins an international initiative to engage women affected by PCOS and their health professionals to improve health outcomes. The Centre for Research Excellence in PCOS and the CRE in Women's Health in Reproductive Life, funded by the National Health and Medical Research Council and led by Monash University, partnered with the American Society for Reproductive Medicine, the Endocrine Society, the European Society of Endocrinology and the European Society of Human Reproduction and Embryology. Extensive international health professional and consumer engagement informed the gaps, needs, priorities and core clinical outcomes for the guideline, through the CRE, partners and several organisations engaged in formal collaboration.

Guideline development groups (GDGs) included members nominated by the engaged international societies. Society-nominated panel members included women with PCOS, paediatricians, endocrinologists, gynaecologists, primary care physicians, reproductive endocrinologists, psychologists, dietitians, exercise physiologists, public health experts, researchers and other co-opted experts including in sleep and bariatric/ metabolic surgery. Other experts were engaged outside GDG meetings where specific individual questions required including dermatology and psychiatry. They were supported by an experienced project management, Evidence Synthesis Team and International Early Career Network and the translation team to develop the guideline. Here we provide a comprehensive review of the evidence and formulate recommendations using the GRADE Framework.

Governance and process

Governance included an international advisory board from across the continents, a project board, five GDGs, a paediatric advisory panel, and a translation and consumer committees (See Figure 1). The Australian Centre for Research Excellence in PCOS (CREPCOS) and the CRE in Women's Health in Reproductive Life, funded by the National Health and Medical Research Council and led by Monash University, partnered with the American Society for Reproductive Medicine, the Endocrine Society, the European Endocrine Society and the European Society of Human Reproduction and Embryology and collaborated with several organisations. The majority of the funding was provided by the Australian government, with contributions from partner organisations. Advisory, project board, GDG, translation and consumer committee meetings occurred online and face to face over 8 months across Europe, USA and Australia and enabled guideline training, development and informed translation. Feedback from the partner and collaborating societies and their convened special interest groups of experts and consumers as well as public consultation, have informed the final guideline.

Multidisciplinary international guideline development groups

GDGs were convened to address each of the five key clinical areas. Expertise was sought through partner and collaborator organisations aiming for multidisciplinary, consumer and geographical participation within each GDG. Each GDG comprised a chair, professional group members with specific expertise in PCOS and the clinical area of interest (i.e. psychologists in the emotional wellbeing GDG), consumer representatives, evidence officers and representative to consider cultural aspects (See Appendices). Co-opted experts were also included as needed.

Consumer participation

In the development of this guideline, we have sought not only to inform or consult with those affected by PCOS, but to partner with and empower them as the ultimate beneficiaries of this work. We have engaged with international consumer bodies in PCOS to this end. This included Polycystic Ovary Syndrome Association Australia (POSAA) (Australia), Verity (United Kingdom), PCOS Challenge (United States), and PCOS Vitality (Ireland), all of whom were actively partnered in the guideline process. Other groups including and PCOS consumer groups in India, were actively involved.

An international survey was completed by over 1500 women and focus groups were held with women with PCOS to inform priorities for the guideline update and we built here on the 2018 guideline process of priority setting and prioritised outcomes for each intervention. This work also informed guideline translation, education and support needs and preferred methods of delivery.

Consumer representatives participated in the development of the Centre for Research Excellence funding submission, in the guideline Project Board, International consumer advisory group and in all of the GDGs. Consumers have been involved in every stage, including development of the guideline scope, public consultation on the scope and developing and refining the clinical questions and recommendations as part of the GDGs. Consumer representatives are also extensively engaged and are partnering in the guideline translation activities.

Indigenous representation and CALD (culturally and linguistically diverse)

Ethnicity and culture were considered when making all recommendations. Indigenous representation was present on the PCOS Guideline Project Management Committee and the GDGs comprised clinicians with experience working with CALD and Indigenous communities. The translation of the guideline allows for adaptions on cultural and ethnicity grounds.

Declarations and conflicts of interest and confidentiality

Conflict of interest has been proactively managed throughout the guideline development process as outlined in

NHMRC Procedures and requirements for meeting the 2011 NHMRC standard for clinical practice guidelines. All members of the GDGs have provided signed declarations of interest and a confidentiality agreement. These conflicts are publicly available (refer to official guideline document). Additionally, declarations of interest were a standing agenda item at each meeting and at the GDG meeting where recommendations were endorsed and GRADE templates completed, all declarations of interest were presented. GDG members were requested to declare all interests.

The process for managing conflicts of interest and confidentiality and recorded declarations can be provided on request (cre-whirl@monash.edu).

Training of GDGs in evidence review and guideline development methods

All GDG members attended training sessions on both guideline development and on research integrity, where the methods of reviewing evidence and guideline development were described in detail. The purpose of these sessions was to familiarise the chairs and GDG members with:

- the process of guideline development overall
- the process of identifying, appraising and synthesising evidence in a format to facilitate the formulation of evidence-based recommendations
- the new research integrity process (Appendix III)
- grading the strength of evidence and its suitability to support evidence-based recommendations
- when to facilitate discussion and clinical judgement to formulate clinical consensus recommendations in the absence of evidence.

Clinical question development and prioritisation

An International survey and Delphi exercise was conducted to develop and prioritise clinical questions to be addressed in 2018 and informed work here, supplemented by extensive consultation with the development of the core outcome set in PCOS in 2020. For 2023, the prioritisation process involved a global survey of over 1500 women with PCOS to help determine the aspects of PCOS women prioritised, followed by all GDG members and consumer advisory groups to rank the importance of the 2018 guideline, considering clinical relevance and the evolution of evidence in the past five years. New questions were either put forward by chairs of each GDG group after discussion with panel members, or ranked as being high priority for inclusion by the consumer survey.

A scoping exercise was performed to identify published research since the 2018 PCOS guideline evidence review to assist expert GDGs and consumer advisory groups in deciding which clinical questions were to be addressed by a systematic review or by narrative review. Systematic reviews were performed for all questions where systematic evidence appraisal was suited. Narrative evidence reviews were completed where questions were less well suited to a PICO systematic review format.

Of the 55 questions, 52 were addressed by guideline systematic reviews, and three by narrative reviews of isolated PCOS studies supported by systematic reviews/guidelines in the general population. Of the 52 systematic reviews, some searches identified no evidence addressing the specific question and/or PICO (i.e. no eligible studies), in which case results were described narratively, drawing on clinical expertise and evidence from the general population.

The clinical questions addressed by each GDG are as follows:

GDG 1 – Screening, diagnostic assessment, risk assessment and life-stage

- In adolescents, at what time point after onset of menarche do irregular cycles indicate ongoing menstrual dysfunction?
- In women with suspected PCOS, what is the most effective measure to diagnose PCOS related hyperandrogenism (biochemical)?
- In women with suspected PCOS, what is the most effective measure to clinically diagnose PCOS related hyperandrogenism?
- What is the most effective ultrasound criteria to diagnose PCOS?
- When is ultrasound indicated to diagnose PCOS?
- Is anti-mullerian hormone (AMH) effective for diagnosis of PCOS?
- Is AMH effective for diagnosis of PCOM?
- In women with PCOS, is there evidence of ethnic variation in prevalence and presentation?
- What is the post-menopausal phenotype of PCOS and how elevated should androgens be to indicate PCOS? Are women with PCOS at increased risk for cardiovascular disease (CVD)?
- Are women with PCOS at increased risk for impaired glucose tolerance (IGT) and type 2 diabetes mellitus (T2DM)?
- In women with PCOS, what is the most effective tool/method to assess risk of T2DM?
- Are women with PCOS at increased risk for sleep apnoea?
- Are women with PCOS at increased risk of endometrial cancer?
- What is the risk of PCOS and cardiometabolic outcomes (CVD, T2DM) in relatives of women with PCOS?

GDG 2 - Prevalence, screening, diagnostic assessment and management of emotional wellbeing and models of care

- In women with PCOS, what is the prevalence and severity of reduced quality of life (QoL)? In women with PCOS, what dimensions of QoL are most affected?
- In women with PCOS, what is the prevalence and severity of depression and anxiety?
- In women with PCOS what is the prevalence and severity of psychosexual dysfunction?
- In women with PCOS, what is the prevalence and severity of body image distress?
- In women with PCOS what is the prevalence and severity of disordered eating?
- What are the information, resource and education needs of women, adolescents, CALD groups and healthcare providers regarding PCOS?
- What are the characteristics of available models of care implemented in PCOS clinic or service?
- How can we best support women to navigate the impact of PCOS on family and interpersonal relationships?
- What are the key challenges for those with PCOS when interacting with healthcare professionals about polycystic ovary syndrome and related features?
- Are anti-depressants and anxiolytics effective for management and support of depression and/or anxiety or disordered eating in women with PCOS?
- Is psychological therapy effective for management and support of depression and/or anxiety, disordered eating, body image distress, self-esteem, feminine identity or psychosexual dysfunction in women with PCOS?

GDG 3 – Lifestyle management

- In women with PCOS, are lifestyle interventions (compared to minimal or nothing) effective for

anthropometric, metabolic, reproductive, fertility, QoL and emotional wellbeing outcomes?
- In women with PCOS, are behavioural interventions (compared to different types of behavioural interventions) effective for improving anthropometric, metabolic, reproductive, fertility, QoL and emotional wellbeing outcomes?
- In women with PCOS, are diet interventions (compared to different diets) effective for improving anthropometric, metabolic, fertility, and emotional wellbeing outcomes?
- In women with PCOS, are exercise interventions (compared to different exercises) effective for improving anthropometric, metabolic, reproductive, fertility, QoL and emotional wellbeing outcomes?
- Why are women with PCOS at increased risk of weight gain?
- What is the burden of weight stigma in PCOS?

GDG 4 – Pharmacological treatment for non-fertility indications

- Is the oral contraceptive pill alone or in combination, effective for management of hormonal and clinical PCOS features in adolescents and adults with PCOS?
- Is metformin alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
- Are anti-obesity pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
- Are anti-androgen pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
- In adults and adolescents with PCOS, is inositol alone or in combination with other therapies, effective for management of hormonal and clinical PCOS features, weight and reproductive outcomes?
- Is permanent hair reduction alone or in combination with other therapies, effective for management of hirsutism in adolescents and adults with PCOS?
- In adults and adolescents with PCOS, is bariatric surgery effective for management of hormonal and clinical PCOS features and weight?
- In women with PCOS in pregnancy, is metformin compared to placebo/standard care effective in reducing pregnancy complications and adverse neonatal outcomes?
- Are women with PCOS at increased risk of adverse pregnancy outcomes?

GDG 5 – Screening, diagnostic assessment and management of infertility

- In women with PCOS with infertility, what are the preconception risk factors associated with poor/negative fertility outcomes?
- Should women with PCOS and infertility due to anovulation alone with normal semen analysis undergo tubal patency testing prior to starting ovulation induction with timed intercourse or intrauterine insemination (IUI) treatment?
- In women with PCOS, are aromatase inhibitors (AIs) effective for improving fertility outcomes?
- In women with PCOS, is clomiphene citrate (CC) effective for improving fertility outcomes?
- In women with PCOS, is metformin effective for improving fertility outcomes?
- In women with PCOS and a BMI <30-32, what is the effectiveness of metformin compared to CC for improving fertility outcomes?
- In women with PCOS, are gonadotrophins effective for improving fertility outcomes?
- In women with PCOS, is ovarian surgery effective for improving fertility outcomes?
- In women with PCOS, is stimulated IVF/ICSI effective for improving fertility outcomes?
- In women with PCOS undergoing IVF/ICSI treatment, is the gonadotropin-releasing hormone (GnRH) antagonist protocol or GnRH agonist long protocol the most effective for improving fertility outcomes?
- In women with PCOS undergoing GnRH antagonist IVF/ICSI treatment, is the use of human chorionic

gonadotropin (hCG) trigger or GnRH agonist trigger the most effective for improving fertility outcomes?

- In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI (In-vitro fertilisation/Intra- cytoplasmic sperm injection), does the choice of follicle-stimulating hormone (FSH) affect fertility outcomes?
- In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, is exogenous luteinizing hormone (LH) treatment during IVF/ICSI effective for improving fertility outcomes?
- In women with PCOS undergoing (controlled) ovarian (hyper) stimulation for IVF/ICSI, is adjuvant metformin effective for improving fertility outcomes?
- In women with PCOS, is In Vitro Maturation (IVM) effective for improving fertility outcomes?
- In women with PCOS, are anti-obesity pharmacological agents, alone or in combination with other therapies, effective for improving fertility outcomes in adolescents and adults with PCOS?
- Is inositol alone or in combination with other therapies, effective for management of fertility outcomes in adolescents and adults with PCOS?

* *Not all questions resulted in a recommendation. Where evidence was inadequate only research recommendations were made.*

Outcome prioritisation using the GRADE method

The most relevant outcomes were prioritised by ranking their importance by health professionals and consumers to help resolve or clarify disagreements and assist with grading the evidence. The importance of outcomes may vary across cultures and from different perspectives e.g. patients, public, health professionals or policy-makers. Table 1 outlines the considerations when deciding importance of outcomes. GDG members, including consumers also participated in this exercise.

Table 1: Steps for considering the relative importance of outcomes

What	Assessment and prioritisation of outcomes as critical, important but not critical, or low importance. Requires judgement of the balance between the desirable and undesirable health outcomes of an intervention.
Why	To focus attention on those outcomes that are considered most important when conducting evidence review and to resolve or clarify disagreements. To support making a recommendation and to determine the strength of the recommendation.
How	Scoping the relevant literature. By asking GDG members, including consumers to prioritise outcomes in light of the considerations for 'what' and 'why'.
Evidence	These judgments are ideally informed by a systematic review of the literature focusing on what the target population considers as critical or important outcomes for decision-making. Prior knowledge of the research evidence through systematic reviews; and information about values, preferences or utilities has been explored in the original guideline, that was systematic. Additionally, the collective experience of the GDG members, including consumers, will be used using transparent methods for documenting and considering them.

To facilitate ranking of outcomes according to their importance the following scale was used:

RATING SCALE:

1	2	3	4	5	6	7	8	9
of **least** importance							of **most** importance	
Of limited importance for making a decision (not included in evidence profile)			Important, but not critical for making a decision (included in evidence profile)			Critical for making a decision (included in evidence profile)		

Outcomes considered critical (rated 7-9) most greatly influenced a recommendation and the overall quality of evidence supporting the recommendation and the strength of the recommendation.

Adaptation of existing evidence-based guidelines

Given the time and resource-intensive nature of guideline development, existing high-quality evidence-based guidelines that address the clinical questions and PICO (Population, Intervention, Comparison, Outcome) of interest should be sought for adaptation before starting a new one. Apart from the International evidence-based guideline for the assessment and management of PCOS, completed by this group in 2018, no other international guideline covering all health aspects related to the syndrome was available. Professional society positions statements or clinical practice guidelines are more limited in scope, do not follow AGREE II (Appraisal of Guidelines for Research and Evaluation) process, involve more limited expertise and geographical representation and are often conflicting in recommendations. Here all partnering and collaborating organisations have agreed to adopt and if required adapt these guidelines and we have updated and expanded the scope and evidence from the 2018 guidelines. This process involved new questions and updated evidence review for all existing questions from 2018. It also included a new research integrity process aligned to the tools applied by Cochrane (Appendix III).

Evidence reviews to answer the clinical questions

Evidence reviews were conducted for each clinical question and from the evidence reviews, the GDGs developed guideline recommendations. The evidence reviews for each question can be found in the supplementary Technical report. The links between the body of evidence, the clinical need for the question and the clinical impact of the resulting recommendation(s), including potential changes in usual care and the way care is organised, acceptability, feasibility and resource implications are clearly explained in the accompanying GRADE evidence to decision framework supporting the recommendation.

Selection criteria

The PICO framework was used by the GDGs to explore the components of each clinical question and finalise the selection criteria for each question. These components were used to include and exclude studies in the evidence review. Details of the selection criteria for each question can be found in the supplementary Technical report.

The highest form of evidence, the most current (within 5 years), comprehensive (with the most outcomes relevant
to PICO) and highest quality systematic reviews that met our benchmark criteria (see Table 2) and met the selection criteria, was used as a starting point for the updated search and systematic review. For most questions, the systematic review and search results from the 2018 guideline were used as a starting point and updated as required. Additional randomised controlled trials (RCTs) that were not included in the previous systematic reviews, but met the current selection criteria were also used, with meta-analyses updated as needed. Where

applicable, risk of bias appraisals from previous systematic reviews were adopted.

Table 2. Benchmark criteria for a systematic review to be used as a starting point:

1. Must have met the PICO and completed a search in at least Medline and another relevant database;
2. Must have listed key search terms;
3. Must have listed selection criteria;
4. Must have used an appropriate framework to assess risk of bias/quality appraisal; and
5. Where the evidence is sought for an intervention question and a systematic review has included non-RCTs, the analysis must be sub-grouped by RCTs to be eligible for inclusion.

Systematic search for evidence

A broad-ranging systematic search for terms related to PCOS was developed by the Evidence Synthesis Team. This PCOS search string was then combined with specific searches tailored for each clinical question according to the PICO developed by the GDG. The search terms used to identify studies addressing the population of interest (i.e. women with PCOS) were only limited to PCOS terms. Therefore, studies addressing women with PCOS in all cultural, geographical and socioeconomic backgrounds and settings were identified by the search. Furthermore, whilst a systematic review of health economic analyses was performed in this guideline, very limited evidence curtailed consideration of costs. Costs were considered based on GDG expertise in the GRADE process. The search strategy was limited to English language articles and limits on year of publication are specified in the PICO for each clinical question.

The following electronic databases were employed to identify relevant literature:

- CINAHL (Cumulative Index to Nursing and Allied Health Literature)
- Medline (OVID)
- Medline in-process and other non-indexed citations (OVID)
- PsycINFO (OVID)
- EMBASE
- All EBM Reviews (OVID), which includes:
  - Cochrane Database of Systematic Reviews (Cochrane Reviews)
  - Database of Abstracts of Reviews of Effects (Other Reviews)
  - Cochrane Central Register of Controlled Trials (Clinical Trials)
  - Cochrane Database of Methodology Reviews (Methods Reviews)
  - The Cochrane Methodology Register (Methods Studies)
  - Health Technology Assessment Database (Technology Assessments)
  - NHS Economic Evaluation Database (Economic Evaluations)

GDG members were consulted, and the bibliographies of relevant reviews/meta-analysis studies identified by the search strategy were also searched for identification of additional studies. Details of the search strategies and search results for each evidence review can be found in the supplementary Technical report.

Inclusion of studies

To determine the literature to be assessed further, one to two reviewers scanned the titles, abstracts and keywords of every record retrieved by the search strategy. This process was supervised by the expert Evidence

Synthesis Team and GDG key contacts who also engaged in decisions on included studies. Full articles were retrieved for further assessment if the information given suggested that the study met the selection criteria. Studies were selected by one to two reviewers in consultation with an additional reviewer to resolve conflicts if required, using the PICO selection criteria established a priori. Where there was any doubt regarding these criteria from the information given in the title and abstract, the full article was retrieved for clarification.

Appraisal of the methodological quality/risk of bias of the evidence

Methodological quality of the included studies was assessed using criteria developed a priori according to study design (i.e. quality appraisal criteria used for an RCT is different to that used for a cohort study). Individual quality items were investigated using a descriptive component approach. Any disagreement or uncertainty was resolved by discussion among the Evidence Synthesis Team (or key contacts for content related queries) to reach consensus. Using this approach, each study was allocated a risk of bias rating (see Table 3). Quality appraisal tables for each evidence review can be found in the supporting document titled Technical report. This follows the NHMRC approved 2018 evidence synthesis process.

Table 3. Risk of bias ratings

RATING	DESCRIPTION
Low	All of the criteria have been fulfilled or where criteria have not been fulfilled it is very unlikely the conclusions of the study would be affected.
Moderate	Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.
High	Few or no criteria fulfilled or the conclusions of the study are likely or very likely to be affected.
Insufficient information	Not enough information provided on methodological quality to be able to determine risk of bias.

Data extraction

Data, according to the selection criteria, were extracted from included studies using a specially developed data extraction form developed by the Evidence Synthesis Team [604]. Information was collected on general details (title, authors, reference/source, country, year of publication, setting), participants (age, sex, inclusion/exclusion criteria, withdrawals/losses to follow-up, subgroups), results/ outcomes (point estimates and measures of variability, frequency counts for dichotomous variables, number of participants, intention-to-treat analysis) and validity results. Data extraction tables for each evidence review can be found in the supporting Technical report.

Data synthesis

In order to make a summary statement about the effect of the intervention and thus inform evidence-based recommendations, data were presented qualitatively by presenting the findings narratively in tables or discussion text; and where possible quantitatively, using statistical methods such as meta-analyses. A meta-analysis is a statistical technique for combining (pooling) the results of a number of studies, that report data for the same outcome for the same intervention, to produce a summary statistic to represent the effect of one intervention compared to another.

When high-quality trials were used, a meta-analysis summary statistic can be more powerful than an individual study to confirm or refute effectiveness of an intervention and thus to inform an evidence-based recommendation. Data were summarised statistically using meta-analysis if data were available, sufficiently

homogenous, and of sufficient quality. Clinical homogeneity was satisfied when participants, interventions, outcome measures and timing of outcome measurement were considered to be similar. Meta-analyses were performed using Review Manager 5.3. or 5.4. or STATA software. Where appropriate, subgroup analysis was conducted according to factors that may cause variations in outcomes, are likely to be a confounder, or may change the way the treatment works e.g. age, subtype, duration of treatment or study quality. These can be found in the supporting Technical report.

Research Integrity Process

Findings from systematic reviews are underpinned by the assumption that the included studies follow good clinical research practice to produce trustworthy results. However, the last decade has seen a rapid rise in the frequency of "problematic studies", the most visible of which are retracted studies (1, 2, 3), suggesting that these studies are increasing in number and/or that there is increased awareness of them among the scientific community. While there is no universally accepted definition of a "problematic study", the term generally refers to a study with questionable data or findings, irrespective of its retraction status. This could be a result of scientific misconduct, poor research practices, or naïve but honest error(s). Regardless of the cause, the resultant erroneous findings have significant and far-reaching consequences, jeopardising the validity of systematic reviews and undermining patient and public trust in scientific research. In response to this increasingly recognised issue, tools and policies have been introduced by several groups, including the Cochrane collaboration (4,5), the Committee on Publication Ethics (COPE) (6), and others (e.g. RIA (7) TRACT (8) to incorporate research integrity assessments as routine steps in systematic reviews and publishing processes. As yet, however, no process has been established to ensure the authenticity and accuracy of evidence in the context of guideline development. This is of critical importance since the evidence included in guidelines is used to formulate clinical practice recommendations which directly influence patient care, often on a global scale.

Here, we have developed the *Research Integrity for Guideline Development (RIGID)* framework - a transparent, unbiased, and rigorous process to identify and manage problematic studies encountered during the guideline development process. The RIGID framework, outlined in Appendix III, is a complementary but critical process to be integrated alongside risk of bias and GRADE assessments to ensure that recommendations are based on high-quality, authentic and accurate evidence. The framework was piloted across all clinical questions in GDG 5, with details provided in the supplementary Technical report and in our publication (9).

Briefly, the RIGID framework begins with the search and screening of studies for inclusion as per usual systematic review methodology. Once full text screening is complete and the final list of included studies is determined, the following integrity assessment steps are applied:

(1) Review team identifies and excludes studies on the Retraction Watch database (tabulated with reasons);

(2) Independent reviewer(s) assess(es) the remaining included studies using a research integrity tool/ checklist (e.g. Cochrane, RIA, TRACT, etc.), clearly documenting areas of concern;

(3) An integrity committee made up of guideline team members and external members independently reviews the checklist scores/ results. Each member places a vote on whether the study should be classified as low, moderate or high risk. Votes are tallied to reach a final classification and, if required, a meeting is convened to reach consensus;

(4) Studies considered *low risk* are included as part of the guideline evidence (and meta-analyses where applicable);

(5) Studies considered *moderate or high risk** are awaiting classification, and authors are contacted to clarify

the integrity issues identified. If authors respond with an acceptable explanation and/or supporting evidence to satisfy concerns, the study is reclassified as low risk and included as per step 4. If the authors provide an intention to submit (response indicating intention to supply the required information/ data within a specified timeframe) or if no response is provided, the study remains as moderate or high risk and is not included in the guideline until a satisfactory response is received as determined by the integrity committee;

(6) All moderate and high risk studies excluded from the guideline are tabulated with reasons/ integrity scores and/or contact log in technical documents or supplemental material for transparency.

*Classification as moderate or high risk does not imply fraudulent data or research misconduct. These classifications reflect a medium to high score on the integrity checklist, suggesting that issues were identified that require clarification (and may indeed be adequately justified) before guideline development groups can be confident in using these studies to inform recommendations with direct impact to patient care.

Quality (certainty) of the body of evidence using GRADE evidenceprofiles

As per the 2018 guideline, GRADE evidence profile was prepared for each comparison within each clinical question addressed by a systematic review. For each prioritised outcome, a certainty rating was documented with consideration of the following:

- information about the number and design of studies addressing the outcome; and
- judgments about the quality of the studies and/or synthesised evidence, such as risk of bias, inconsistency, indirectness, imprecision and any other considerations that may influence the quality of the evidence.

The definitions of these factors are described below:

- overall quality of evidence rating using the judgments made above (see ratings in Table 4);
- key statistical data; and
- classification of the importance of the outcome.

The certainty of evidence reflects the extent to which our confidence in an estimate of the effect is adequate to support a particular recommendation.

Although the quality of evidence represents a continuum, the GRADE approach results in an assessment of the quality of a body of evidence in one of four grades (adapted from GRADE).

Table 4. Quality of evidence

High	⊕⊕⊕⊕	We are very confident that the true effect lies close to that of the estimate of the effect.
Moderate	⊕⊕⊕◯	We are moderately confident in the effect estimate: The true effect is likely to be close to the estimate of the effect, but there is a possibility that it is substantially different.
Low	⊕⊕◯◯	Our confidence in the effect estimate is limited: The true effect may be substantially different from the estimate of the effect.
Very Low	⊕◯◯◯	We have very little confidence in the effect estimate: The true effect is likely to be substantially different from the estimate of effect.

GRADE notes that the quality of evidence is a continuum; any discrete categorisation involves some degree of arbitrariness. Nevertheless, advantages of simplicity, transparency, and vividness outweigh these limitations. Evidence profiles can be found in the Technical report.

Formulation of recommendations using the GRADE evidence to decision framework

As per the 2018 NHMRC approved guideline, the Evidence to Decision (EtD) framework was used to transparently document the judgments and decisions using the GRADE method for development of evidence-based recommendations. The framework prompts transparent documentation and discussion of decisions through assessment of the evidence, clinical expertise and patient preference capturing the strength of the recommendation and capturing factors including:

- desirable and undesirable effects of the intervention;
- certainty of the evidence;
- values associated with the recommended intervention;
- balance of effects;
- resource requirements;
- cost-effectiveness;
- equity; acceptability;
- feasibility;
- subgroup considerations;
- implementation considerations;
- monitoring and evaluation; and
- research priorities.

Using the framework, each of the evidence-based and consensus recommendations are given an overall grading of conditional or strong. Clinical practice points have also been included, where important issues

(such as safety, side effects or risks) arose from discussion of evidence-based or clinical consensus recommendations. Strong recommendations are reflected using the term “should” and conditional recommendations are reflected using the terms “could” or “should/could consider”.

Table 5. Recommendation types

EBR	Evidence based recommendations: Evidence sufficient to inform a recommendation made by the guideline development group.
CR	Clinical Consensus Recommendations: In the absence of adequate evidence, a clinical consensus recommendation has been made by the guideline development group, also informed by evidence from the general population.
PP	Clinical Practice Points: Evidence not sought. A practice point has been made by the guideline development group where important issues arose from discussion of evidence-based or clinical consensus recommendations.

The strength of the recommendations can be identified throughout the guideline by the following (adapted from ESHRE manual for guideline development and the GRADE approach).

Table 6: Strength of recommendations (adapted from GRADE and the ESHRE Manual)

TARGET GROUP	STRONG RECOMMENDATIONS*	CONDITIONAL (WEAK) RECOMMENDATIONS FOR THE OPTION (TEST OR TREATMENT)	CONDITIONAL (WEAK) RECOMMENDATION FOR EITHER THE OPTION OR THE COMPARISON	RESEARCH ONLY RECOMMENDATIONS	CLINICAL PRACTICE POINTS (CPP)**
CONSUMERS	Most people in your situation would want the recommended course of action and only a small proportion would not.	The majority of people in your situation would want the recommended course of action, but some would not.	There is considerable lack of clarity over whether the majority of people in your situation would want the recommended course of action or not.	The test or intervention should only be considered by patients and clinicians within the setting of a research trial with appropriate approvals and safety precautions have been established.	Clinicians, patients and policy makers are informed on the clinical implications relevant to implementation of recommendations.
HEALTH PROFESSIONALS	Most patients should receive the recommended course of action.	Recognise that different choices will be appropriate for different patients and that greater effort is needed with individuals to arrive at management decisions consistent with values and preferences. Decision aids and shared decision making are important here.		The test or intervention should only be considered by patients and clinicians within the setting of a research trial for which appropriate approvals and safety precautions have been established.	
POLICY MAKERS	The recommendation can be adopted as policy in most situations.	Policy making needs to consider perspectives and involvement of diverse stakeholders.	Policy decisions remain unclear.	Policy makers need to be aware of the need for evidence gaps and health professional and consumer prioritised research gaps.	

* Strong recommendations based on high quality evidence will apply to most patients for whom these recommendations are made, but they may not apply to all patients in all conditions; no recommendation can consider all of the often-compelling unique features of individual patients and clinical circumstances.

** A practice point (PP) is developed by the GDG to support recommendations. Advice can be provided to enhance shared decision making, and on factors to be considered in implementing a specific test or intervention

The words “should”, “could” and “should not” do not directly reflect the strength (strong or conditional) allocated to a recommendation and are independent descriptors intended to reflect the judgment of the multidisciplinary GDG on the practical application of the recommendation, balancing benefits and harms. Where the word “should” was used in the recommendations, the GDG judged that the benefits of the recommendation (whether evidence-based or clinical consensus) clearly exceed the harms, and that the recommendation can be trusted to guide practice. Where the word “could” was used, either the quality of evidence was underpowered, or the available studies demonstrated little clear advantage of one approach over another, or the balance of benefits to harm was unclear. Where the words “should not” are used, there is either a lack of appropriate evidence, or the harms outweigh the benefits.

Evidence to decision frameworks can be found in the supplementary document titled Technical report. Each recommendation is supported by a discussion (in the chapters of this document) about the clinical need for the question, the body of evidence identified to answer the question and a clinical justification for the recommendation(s).

The GDGs acknowledge that lack of evidence is not evidence of lack of effect and they have attempted to reflect this in the strength of the grading given to recommendations on interventions that are not directly supported by evidence in women with PCOS. In addition, some interventions were not supported by evidence in the recommendations due to lack of evidence of effect. The GDGs acknowledge that this refers to lack of evidence of effect over placebo; that is, patients may receive some beneficial outcomes from the intervention but these do not exceed the beneficial effects that can be expected from a placebo therapy.

Public consultation

Public and targeted consultation will be conducted for a period of thirty days commencing 6th February to 7th March 2023 in accordance with the legislative requirements set out in section 14A of the National Health and Medical Research Council Act 1992 as outlined in the NHMRC Procedures and requirements for meeting the 2011 NHMRC standard for clinical practice guidelines. The public consultation strategy is available upon request, email cre-whirl@monash.edu

External review

This guideline will be reviewed by the International Advisory Group, independently by relevant professional colleges and societies and consumer groups and through public consultation.

Scheduled review and update of the guideline

The GDGs will be re-convened to review relevant sections of this guideline if any of the following occur within five years:

- a change in the indications registered by regulatory bodies for any drug included in this guideline; or
- publication of any new major randomised controlled trials or systematic reviews that potentially have a bearing on the safety of the recommendations in this guideline

After five years the societies and organisations will be reengaged, the guideline panels revised and reconvened and the guideline updated as per NHMRC processes.

GUIDELINE DEVELOPMENT GROUPS

Terms of reference for each committee can be provided upon request (cre-whirl@monash.edu).

GDG1: Topic area – Screening, diagnostic assessment, risk assessment and life-stage

GDG ROLE	TITLE	NAME	DISCIPLINE	ORGANISATION	COUNTRY
Chair	Professor	Joop Laven	Obstetrician-Gynaecologist; Reproductive Endocrinologist	Erasmus MC Rotterdam	Netherlands
Deputy Chair	Doctor	Anju Joham	Endocrinologist	Monash University	Australia
Member	Professor	Wiebke Arlt	Endocrinologist	University of Birmingham	UK
Member	Professor	Ricardo Azziz	Reproductive Endocrinologist	University of Alabama at Birmingham	USA
Member	Ms	Lorna Berry	Consumer Representative	Polycystic Ovary Syndrome Association Australia	Australia
Member	Doctor	Caroline Ee	General Practitioner	Western Sydney University	Australia
Member	Associate Professor	Marla Lujan	Reproductive Sciences; Nutrition	Cornell University	USA
Member	Professor	Ronald Ma	Endocrinologist	Chinese University of Hong Kong	Hong Kong
Member	Doctor	Malika Patel	Obstetrician-Gynaecologist; Reproductive medicine sub-specialty	University of Cape Town; Groote Schuur Hospital	South Africa
Member	Doctor	Alexia Pena	Paediatric Endocrinologist	The Robinson Institute at the University of Adelaide	Australia
Member	Professor	Sharon Oberfield	Paediatric Endocrinologist	Columbia University Medical Center	USA
Member	Professor	Duru Shah	Obstetrician-Gynaecologist; Fertility Specialist	The PCOS Society of India; Gynaecworld: The Centre for Women's Health and Fertility	India
Member	Professor	Fahimeh Ramezani Tehrani	Obstetrician-Gynaecologist; Reproductive Endocrinologist	Shahid Beheshti University of Medical Sciences, Tehran	Iran

GDG2: Topic area – Prevalence, screening, and management of psychological features and models of care

GDG ROLE	TITLE	NAME	DISCIPLINE	ORGANISATION	COUNTRY
Chair	Professor	Anuja Dokras	Reproductive Endocrinologist and infertility	University of Pennsylvania	USA
Deputy Chair	Professor	Jacky Boivin	Psychologist	Cardiff University	UK
Member	Associate Professor	Leah Brennan	Psychologist	La Trobe University	Australia
Member	Associate Professor	Tania Burgert	Paediatric Endocrinologist	University Missouri – Kansas School of Medicine	USA
Member	Mrs	Maureen Busby	Consumer Representative	PCOS Vitality	Ireland
Member	Doctor	Rhonda Garad	Registered Nurse	Monash University	Australia
Member	Doctor	Melanie Gibson	Women's Public Health Researcher	Te Tātai Hauora o Hine --National Centre for Women's Health Research Aotearoa, Victoria University of Wellington; Monash University	New Zealand Australia
Member	Professor	Elisabet Stener-Victorin	Researcher in Reproductive Endocrinology and Metabolism	Karolinska Institutet	Sweden
Member	Doctor	Chau Thien Tay (Jillian)	Endocrinologist, Research Fellow	Monash University	Australia
Member	Doctor	Mala Thondan	General Practitioner	Harp Family Medical	Australia

GDG3: Topic area – Lifestyle management

GDG ROLE	TITLE	NAME	DISCIPLINE	ORGANISATION	COUNTRY
Chair	Associate Professor	Lisa Moran	Dietitian, Research Fellow	Monash University	Australia
Deputy Chair	Professor	Leanne Redman	Obesity; Lifestyle Interventions	Pennington Biomedical Research Centre	USA
Member	Ms	Lorna Berry	Consumer Representative	Polycystic Ovary Syndrome Australia	Australia
Member	Associate Professor	Leah Brennan	Psychologist	La Trobe University	Australia
Member	Doctor	Cheryce Harrison	Exercise Physiologist; Health Coach	Monash University	Australia
Member	Professor	Kathleen Hoeger	Reproductive Endocrinologist	University of Rochester	USA
Member	Professor	Angelica Lindén Hirschberg	Obstetrician-Gynaecologist	Karolinska Institutet and Karolinska University Hospital	Sweden
Member	Doctor	Kate Marsh	Dietitian; Diabetes Educator	Private Practice	Australia
Member	Doctor	Mala Thondan	General Practitioner	Harp Family Medical	Australia
Member	Professor	Chandrika Wijeyaratne	Endocrinologist	University of Colombo	Sri Lanka

GDG4: Topic area – Management of non-fertility features

GDG ROLE	TITLE	NAME	DISCIPLINE	ORGANISATION	COUNTRY
Chair	Professor	Terhi Piltonen	Obstetrician-Gynaecologist; Reproductive Endocrinologist	Oulu University Hospital, University of Oulu	Finland
Deputy Chair	Associate Professor	Jacqueline Boyle	Obstetrician-Gynaecologist	Monash University	Australia
Member	Doctor	Carolyn Ee	General Practitioner	Western Sydney University	Australia
Member	Professor	Rong Li	Obstetrician-Gynaecologist	Reproductive Medical Centre, Peking University Third Hospital	China
Member		Rachel Morman	Chair of Verity/ Patient Representative	Verity – PCOS Charity	UK
Member	Doctor	Aya Mousa	Academic Epidemiology	Monash University	Australia
Member	Doctor	Alexia Pena	Paediatric Endocrinologist	The Robinson Institute at the University of Adelaide	Australia
Member	Doctor	Daniela Romauldi	Obstetrician-Gynaecologist	Fondazione Policlinico Universitario Agostino Gemelli IRCCS, Rome	Italy
Member	Professor	Poli Mara Spritzer	Endocrinologist	Universidade Federal do Rio Grande do Sul	Brazil
Member	Professor	Eszter Vanky	Obstetrician-Gynaecologist	Dept. of Clinical and Molecular Medicine, Norwegian University of Science and Technology; Dept. of Obstetrics and Gynecology, St.Olavs Hospital, University hospital of Trondheim	Norway
Member	Professor	Selma Witchel	Paediatric Endocrinologist	Children's Hospital of Pittsburgh of UPMC, University of Pittsburgh	USA
Member	Professor	Bulent Yildiz	Endocrinologist	Hacettepe University Turkey	Turkey
Co-opted Member	Professor	Wendy Brown	Bariatric Surgeon	Department of Surgery, Central Clinical School, Monash University; Alfred Health	Australia

GDG5: Topic area – Assessment and treatment of infertility

GDG ROLE	TITLE	NAME	DISCIPLINE	ORGANISATION	COUNTRY
Chair	Doctor	Michael Costello	Obstetrician-Gynaecologist; Reproductive Endocrinologist	University of NSW	Australia
Deputy Chair	Professor	Robert Norman	Obstetrician-Gynaecologist; Reproductive Endocrinologist; Chemical pathologist	University of Adelaide	Australia

EVIDENCE INTEGRITY COMMITTEE

Role: The Evidence Integrity Committee is responsible for investigating and managing integrity issues in the identified literature, to ensure recommendations are based on sound evidence. Specifically, the Committee has developed and implemented the RIGID framework (Research Integrity in Guideline Development) to independently review and categorise all relevant studies and to contact authors, before evidence can be used to inform recommendations.
