☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

No research evidence.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Common cancer but uncommon in premenopausal women.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

The knowledge base of non-gynecologist health professionals regarding assessment of the endometrium is variable. Health system and resource variability will impact on feasibility.

Prescribing OCP's cyclic Progestogens or Levonorgestrel containing IUD's could be done either by GP's or (reproductive) endocrinologist or gynecologists.

PART 1

EVIDENCE SUMMARY AND GRADE

Compiled by ECR Lead: Su Jen Chua
Other Members: Tahani Al-Kindi, Xin Yi Wu
Supervised, edited and supported by the Evidence Team

GDG 1
Question 1.12.

What is the risk of PCOS and cardiometabolic outcomes (CVD, T2D) in relatives of women with PCOS?

1. SELECTION CRITERIA

Table 1. PICO Criteria for Inclusion – Not to be adapted To be used by evidence team to decide which studies will be included when screening search results.	
Question	Q 1.12) What is the risk of PCOS and related cardiometabolic outcomes (CVD, T2D) in relatives of women with PCOS?
Clinical leads (key contacts)	Dr Anju Joham Endocrinologist Monash Health, Monash University, Australia Anju.Joham@monash.edu
Allocation ranking	Level 1 - New systematic review

	P	I	C	O	S
Inclusion criteria PCOS	First degree relatives (only women) of women with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity, weight or phenotype of PCOS	PCOS (diagnosed by Rotterdam, NIH or AES)	General population	Prevalence of PCOS in first degree relatives of women with PCOS	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials, comparative cohort studies. Can include cross sectional or case control if it compares PCOS and non-PCOS
Inclusion criteria CVD	First degree relatives (both men and women) of women with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity, weight or phenotype of PCOS	Diagnosed CVD – defined as a CVD event including: • angina (heart pain), heart attack, stroke, peripheral vascular disease, CVD-related death	General population	Prevalence of cardiovascular disease and cardiovascular risk factors in first degree relatives of women with PCOS Secondary: CVD risk factors • Waist circumference • Waist-to-hip ratio (WHR) • BMI • Lipid profile (triglycerides, total cholesterol, HDL, LDL) • Blood pressure	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials, comparative cohort studies. Can include cross sectional or case control if it compares CVD events in PCOS and non-PCOS
Inclusion criteria IGT or T2DM	First degree relatives (both men and women) of women with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity, weight or phenotype of PCOS	Diagnosed IGT or T2DM	General population	Prevalence of IGT or T2DM in first degree relatives of women with PCOS Other outcomes: Waist circumference • Waist-to-hip ratio (WHR) • BMI	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials, comparative cohort studies and cross sectional or case control if it compares IGT or T2DM in PCOS and non-PCOS

				• Fasting glucose • Glucose tolerance test	
Exclusion criteria	Non blood or second degree or greater relatives of women with PCOS	None	None		Non-evidence based guidelines, non-systematic reviews, non- comparative cohort studies, case series, editorials, letters, commentaries.

2. SEARCH STRATEGY

Table 2.1. Search details

Search strategy source:	
Evidence source	Date of search
Medline (Ovid)	2/8/22: 4558

Clinicaltrials.gov	2/8/22: 13
WHO ICTRP	2/8/22: 2
Any subsequent updates - enter database and date:	

Table 2.2. Questions addressed by this search *(add more rows as needed)*:

GDG	Q#	Question
1	1	What is the risk of PCOS in first degree relatives of women with PCOS?
1	2	What is the risk of T2DM / IGT in first degree relatives of women with PCOS?
1	3	What is the risk of cardiovascular disease (MI, heart failure, stroke, PVD) in first degree relatives of women with PCOS?
1	4	What is the risk of surrogate markers of cardiovascular risk (hypertension and hyperlipidaemia) in first degree relatives of women with PCOS?

Evidence processing: Studies were selected and appraised by 2 reviewer/s in consultation with the evidence team/ key contact using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by 2 reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. **In total, 30 studies met inclusion criteria for this review.**

5. STUDY CHARACTERISTICS TABLE

Author, year, country	Population/ Setting	Country / Ethnicity	Study Design	Method of deriving Control group	Sample Size per group	FDR details	Age (years) / BMI (kg/m^2) of FDRs	Diagnostic criteria for PCOS / DM	Outcomes	Summary of findings	Source of funding / conflict of interest
Baillargeon 2007	Brothers of women with PCOS / Academic hospital / single centre/ timeframe not defined	Canada	Case control	Hospital personnel, university students, local newspaper advertisement	FDR group = 17 Control = 28	Brothers	Age: 31±9 BMI: 27.6±3.7	NICHD (PCOS) / NCEP/ATPIII criteria (metabolic syndrome)	BMI, BP, waist circumference, glucose, lipids, metabolic syndrome	Brothers of women with PCOS had insulin resistance compared to age and BMI matched controls	Yes (government funding)
Coviello 2009	Fathers and brothers of women with PCOS / Academic hospital / multicenter / timeframe not defined	USA	Cross-sectional	Nationwide database NHANES III	FDR group = 211 Control = 1153	Fathers, brothers (data for brothers not extracted as duplicated in Sam 2008 study)	Fathers Age: 57 ±9; BMI: 30.2 ± 5.6	NICHD (PCOS) / NCEP/ATPIII criteria (metabolic syndrome)	Metabolic syndrome	Fathers and brothers of women with PCOS had higher rates of obesity and metabolic syndrome	No
Crisosto 2017	Sons of women with PCOS by Tanner stage / Academic hospital / single center / timeframe not defined	Chile	Cross-sectional	Not defined	FDR group = 69 Control = 84	Sons	Tanner I age: median 9.1 / range 8.4-9.6; BMI: median 18.7 / range 17.3-22.4 Tanner II-III age: median 10.8 / range 10.3-11.6; BMI: median 21 / range 18.4-24.8 Tanner IV-V age: median 14.4 / range 13-16.1; BMI: median 23 / range 20-26.2	NICHD (PCOS) / ADA criteria (glucose intolerance)	WHR, glucose, lipids	Son of women with PCOS had higher rates of hyperlipidaemia and central adiposity	Yes (government / foundation funding)
Crisosto 2019	Postmenarcheal daughters of women with PCOS / Academic hospital/ single center / timeframe not defined	Chile	Case control	Not defined	FDR group = 43 Control = 28	Daughters	Age: median 15.42 / IQR 14.17–16.17 BMI: median 25.28 / IQR 21.70–28.72 BMI z score: median 1.24 (IQR 0.48-2.07)	NICHD (PCOS)	BP, glucose, lipids	No difference in any parameter was found.	Yes (government funding)

deWilde2018	Offspring of women with PCOS / Academic hospital / multicenter / Feb 2013 - July 2014	Netherlands	Prospective cohort	Healthy newborns from a different population follow-up study recruited from same geographical regions	FDR group = 74 Control = 298	Daughters, sons	Age: 3.3 ±0.6; BMI: 15.9 ± 1.6 (younger subgroup) Age: 7.0 ±0.8; BMI: 15.3 ± 1.5 (older subgroup)	Rotterdam (PCOS)	BP, glucose, lipids	Offspring of women with PCOS had higher rates of hyperlipidaemia than healthy controls	Yes (government / university / pharmaceutical company funding)
Diamanti-Kandarakis 2004	Sisters of women with PCOS / Academic hospital / Single center / timeframe not defined	Greece	Case control	Not defined	FDR group = 17 Control = 20	Sisters	Age: 22.88 ±0.93; BMI: 22.98 ± 1.16	NICHD (PCOS)	WHR, glucose, lipids	Sisters of women with PCOS had higher rates of insulin resistance	Not reported
Harnois-Leblanc 2017	Late / postpubertal first degree relatives of women with PCOS / Academic hospital / Single center / 2007-2015 / 4-6 years follow-up	Canada	Prospective cohort	Paediatric endocrine clinic	FDR group = 8 Control = 8	Daughters, sisters	Median age: 17.5 IQR: 14.4-20.1; Median BMI: 22.7 IQR (21.5-30.8)	AE-PCOS (PCOS)	BMI, WHR, glucose, lipids	Late/post pubertal female first degree relatives of women with PCOS had similar rates of insulin resistance	Yes (medical foundation funding)
Joharatnam 2011	Sisters of women with PCOS / Academic hospital / multicenter / timeframe not defined	United Kingdom	Retrospective cohort	Not defined	FDR group = 214 Control = 76	Sisters	Age: 31.3 ±6; BMI: 25.1 ± 0.6 (subgroup with polycystic ovaries) Age:37.8 ±7.7; BMI: 24.5 ± 1.1 (subgroup without polycystic ovaries)	Rotterdam (PCOS)	BMI, WHR, glucose, lipids	Sisters of women with PCOS had higher rates of hyperlipidaemia than healthy controls	Yes (government / medical foundation funding)
Karthik 2019	Siblings of women with PCOS / Academic hospital / single center / January 2016 - July 2017	India	Case control	Hospital staff / relatives of patients	FDR group = 76 Control = 76	Sisters, brothers	Sisters age: median 24; BMI: median 21.2 Brothers age: 23.3 ±4.3; BMI: 23.7 ± 4.2	Rotterdam (PCOS)	BP, WHR, glucose, lipids	Siblings of women with PCOS had higher rates of metabolic syndrome and hyperlipidaemia than healthy controls	Yes (university funding)
Kent 2008	Children of women with PCOS / Academic hospital / single center / timeframe not defined	USA	Case control	Not defined	FDR group = 32 Control = 38	Sons, daughters (data for daughters not extracted as	Daughters Age: 9.1 ±3.4; BMI: 20.0 ± 5.3 Sons Age: 9.7 ±3.4; BMI: 20.9 ± 5.1	NICHD (PCOS) / de Ferranti criteria (metabolic syndrome)	BMI, BP, WHR, glucose, lipids, metabolic syndrome	Children of women with PCOS had higher rates of metabolic syndrome	Yes (university funding)

						duplicated in Legro 2017 study)					
Kulshreshtha 2019	Sisters of women with PCOS / Academic hospital / single center / 2013-2016	India	Case control	Hospital staff and their family members	FDR group = 200 Control = 99	Sisters	Age: 25.4 ±8; BMI: 24.3 ± 5.0	Rotterdam (PCOS)	BMI, BP, WHR, glucose, lipids, metabolic syndrome	Sisters of women with PCOS had higher rates of metabolic syndrome than healthy controls	Yes (government funding)
Krysiak 2021	Hypertensive brothers of women with PCOS / Academic hospital / single center / timeframe not defined	Poland	Interventional cohort	Hypertensive men treated in community centers	FDR group = 24 Control = 26	Brothers	Age: 39 ±8; BMI: 28.3 ± 4.2	Rotterdam (PCOS)	BMI, BP, glucose, lipids	Hypertensive brothers of women with PCOS had higher rates of hyperlipidaemia and insulin resistance than hypertensive controls	No
Krysiak 2021 2	Hypercholesterolaemic brothers of women with PCOS / Academic hospital / single center / timeframe not defined	Poland	Interventional cohort	Hypercholesterolaemic men treated in community centers	FDR group = 20 Control = 20	Brothers	Age: 50 ±12; BMI: 28.5 ± 4.8	Rotterdam (PCOS)	BMI, BP, glucose, lipids	Hypercholesterolaemic brothers of women with PCOS had higher rates of insulin resistance than controls	Yes (government funding)
Legro 2017	Daughters of women with PCOS / Academic hospital / single center / timeframe not defined	USA	Case control	Not defined	FDR group = 76 Control = 80	Daughters	Tanner I age: 7.02 ±1.96; BMI: 17.66 ± 3.43 Tanner II-III age: 11.46 ±1.33; BMI: 21.37 ± 5.63 Tanner IV-V age: 15.24 ±1.17; BMI: 27.56 ± 8.7	NICHD (PCOS)	BMI, BP, waist hip circumference	Daughters of women with PCOS had similar rates of insulin resistance	Yes (government funding)
Lenarcik 2011	Siblings of women with PCOS / Academic hospital / single center / timeframe not defined	Poland	Case control	Not defined	FDR group = 200 Control = 99	Sisters, brothers	Sisters Age: 25.52 ±5.78; BMI: 24.22 ± 6.09 Brothers Age: 23.52 ±5.05; BMI: 24.44 ± 4.00	Rotterdam (PCOS)	WHR, glucose, lipids	Siblings of women with PCOS had higher rates of glucose intolerance and hyperlipidaemia	No
Li 2020	Young children of women with PCOS / Academic hospital / single center / timeframe not defined	China	Case control	Same hospital as experimental group	FDR group = 172 Control = 529	Daughters, sons	Age 4.65 ± 1.34 BMI z score: median 0.2 IQR -0.5-0.6 (Zhang 2021 substudy)	Rotterdam (PCOS)	BMI, Glucose, lipids	Offspring of women with PCOS had higher rates of insulin resistance.	Yes (government funding)

Raissouni 2012	Premenarchal first degree relatives of women with PCOS / Academic hospital / multicenter / timeframe not defined	Multinational (USA/Canada/Chile)	Cross-sectional	School-based study (USA centers)	FDR group = 18 Control = 21	Daughters, sisters	Age: 11.6 ± 1.4; BMI: 21.5 ± 3.5	NICHD (PCOS)	BMI, waist circumference	Premenarchal first degree relatives of women with PCOS had higher rates of insulin resistance	Yes (government / university funding)
Recabarren 2008	Sons of women with PCOS / Academic hospital / timeframe not defined	Chile	Case control	Not defined	FDR group = 80 Control = 56	Sons (infancy, childhood, adulthood)	Infancy median Age: 2.0; IQR 2.0 –3.0 months Childhood median age: 6.0 IQR (4.0 –7.5 years; median BMI: 17.4 IQR 14.9 –24.7 Adulthood median age: 22.0 IQR 18.0 – 29.0; median BMI: 25.1 IQR 20.0 – 45.4	NICHD (PCOS)	BMI, weight, waist circumference, glucose, lipids	If unadjusted for BMI, sons of PCOS women have higher weight during early infancy; higher weight, BMI, waist circumference, total cholesterol and LDL during childhood and adulthood.	Yes (1 author received pharmaceutical company funding)
Sam 2005	Sisters of women with PCOS / Academic hospital / multicenter / timeframe not defined	USA	Case control	Not defined	FDR group = 385 Control = 125	Sisters	Age: 28 ±7; BMI: 32.9 ± 7.0	NICHD (PCOS) ATPIII criteria (metabolic syndrome)	BMI, BP, waist circumference, glucose, metabolic syndrome	Sisters of women with PCOS had higher rates of metabolic syndrome	Yes (government funding)
Sam 2006	Mothers of women with PCOS / Academic hospital / multicenter / 1993-2004	USA	Case control	2 control groups (Not defined / NHANES III)	FDR group = 215 Control = 62	Mothers	Age: 52 ±8; BMI: 29.9 ± 7.0	NICHD (PCOS) NCEP/ATPIII criteria (metabolic syndrome) WHO (glucose intolerance)	BMI, BP, waist circumference, glucose, lipids	Mothers of women with PCOS had higher rates of dyslipidaemia and insulin resistance	Yes (government funding)
Sam 2008	Brothers of women with PCOS / Academic hospital / multicenter / January 1995 - October 2005	USA	Case control	Not defined	FDR group = 196 Control = 169	Brothers	Age: 30 ±8; BMI: 28.4 ± 5.7	NICHD (PCOS)	BMI, BP, waist circumference, glucose	Brothers of women with PCOS had higher rates of hyperlipidaemia and insulin resistance	Yes (government funding)

6. FINDINGS

- **EVIDENCE SUMMARY:**

All outcomes
31 studies were included in the systematic review and 27 in the meta-analysis. These consisted of 25 cross sectional and 6 cohort studies. One study was assessed as low risk of bias (Wang 2021), one study was assessed as high risk of bias (Lenarcik 2011) and all other studies were judged as moderate risk of bias.

Metabolic Syndrome
Six studies were suitable for meta-analysis for the outcome of metabolic syndrome in first degree relatives of women with PCOS. All studies were cross sectional studies. All studies were judged as moderate risk of bias (Baillargeon 2007; Coviello 2009; Karthik 2019; Kent 2008; Kulshreshtha 2019; Vipin 2016).

Obesity
Two studies were suitable for meta-analysis for the outcome of obesity in first degree relatives of women with PCOS (Harnois-Leblanc 2017; Sir Petermann 2012). One study was a cohort study (Harnois-Leblanc 2017), while the other was a cross sectional study (Sir Petermann 2012). All studies were judged as moderate risk of bias.

Hypertension
Two studies were suitable for meta-analysis for the outcome of hypertension in first degree relatives of women with PCOS (Kent 2008; Vipin 2016). All studies were cross sectional studies. All studies were judged as moderate risk of bias.

Diabetes
Three studies were suitable for meta-analysis for the outcome of diabetes in first degree relatives of women with PCOS (Kent 2008; Vipin 2016; Yilmaz 2005). All studies were cross sectional studies. All studies were judged as moderate risk of bias.

PCOS
Two studies were suitable for meta-analysis for the outcome of PCOS in first degree relatives of women with PCOS (Crisosto 2019; Karthik 2019).All studies were cross sectional studies. All studies were judged as moderate risk of bias.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

When compared to first degree relatives of normal control women, first degree relatives of women with PCOS were more likely to suffer from metabolic syndrome, hypertension, diabetes and PCOS. The quality of evidence for these outcomes were low due to the small number of studies resulting in serious imprecision, with exception of metabolic syndrome, which was of moderate quality due to larger numbers of studies.

On subgroup analysis, fathers of women with PCOS were more likely to suffer from metabolic syndrome, hypertension and diabetes, while mothers of women with PCOS were more likely to suffer from metabolic syndrome. Brothers of women with PCOS were more likely to suffer from metabolic syndrome but not sisters. Offspring of women with PCOS did not appear to have higher incidence of diabetes, obesity or metabolic syndrome. These analysis were moderate to low quality due to low numbers of participants and different ages and short follow-up times due to the cross sectional nature of a majority of the studies. Additionally, not all studies captured the outcome of diabetes and hypertension (particularly for siblings and children of women with PCOS). When analysing by subgroup, daughters and sisters of women with PCOS did not appear to be at risk of PCOS, however this was confounded by serious imprecision driven by very small numbers of participants.

In summary, more longitudinal studies with follow-up from infancy to adulthood are required to thoroughly capture the cardiometabolic risk for first degree relatives of women with PCOS.

7. GRADE ASSESSMENTS AND EVIDENCE PROFILE

Female first degree relatives versus normal controls[10]												
	Quality assessment						No. participants					
No. studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other	FDR	Control	Effect, random [95% CI]	Results	Certainty	Importance

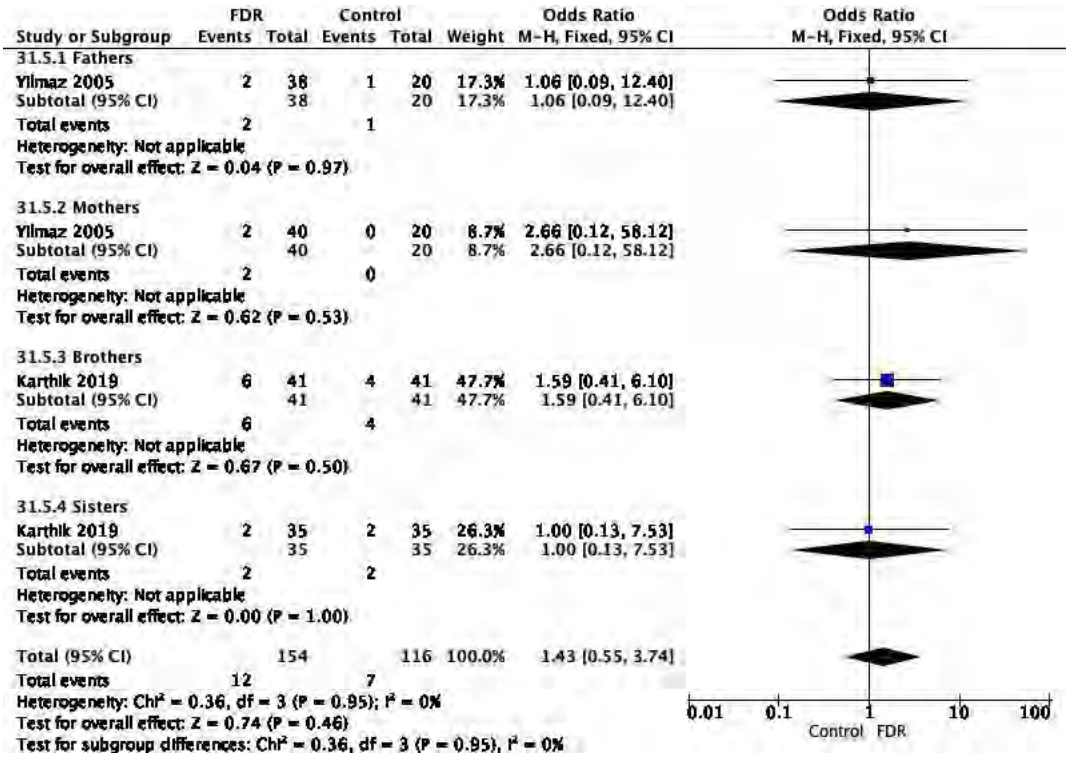
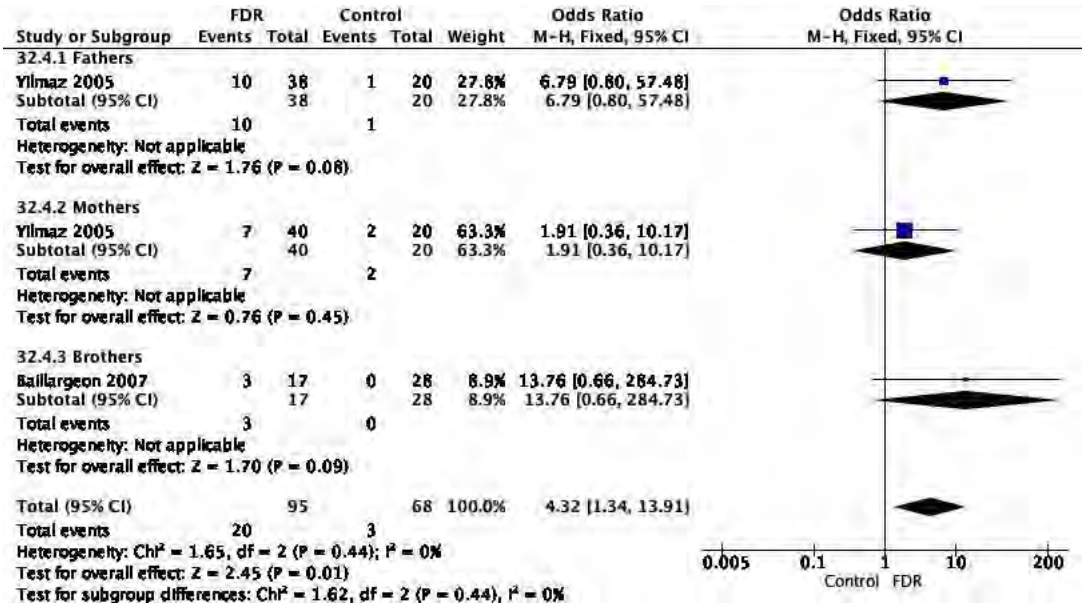
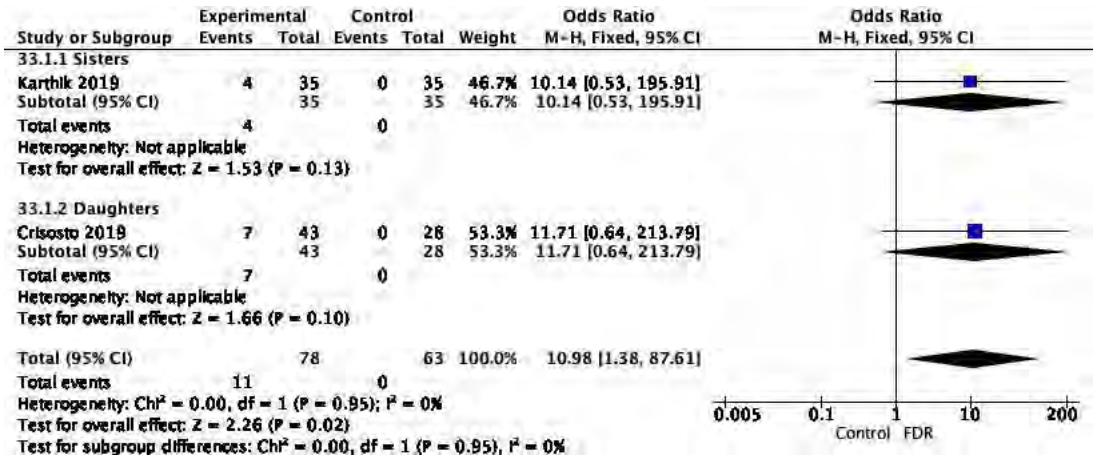
Prevalence of impaired fasting glucose



Prevalence of impaired glucose tolerance



Prevalence of PCOS



11. DATA EXTRACTION TABLES – DICHOTOMOUS OUTCOMES

OUTCOME: Metabolic syndrome				OUTCOME TYPE: Dichotomous				
Parents								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Vipin 2016	Prevalence	IDF criteria	55	86	26	86	Crude	Age and BMI matched (mean age 50.4 ± 5.6 years)
Fathers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Coviello 2009	Prevalence	NCEP/ATPIII criteria	89	211	369	1153	Crude	Age range similar, however mean age varied (Mean age 57 ± 9 years), ethnicity matched
Vipin 2016	Prevalence	IDF criteria	23	41	7	42	Crude	Age and BMI matched (mean age 53.1 ± 5.1 years)
Mothers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Vipin 2016	Prevalence	IDF criteria	32	45	19	44	Crude	Age and BMI matched (mean age 47.9 ± 4.9 years)
Brothers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Baillargeon 2007	Prevalence	NCEP/ATPIII	3	17	2	28	Crude	Age and BMI matched (mean age 31 ± 9 years)
Karthik 2019	Prevalence	NCEP/ATPIII	11	41	2	41	Crude	Age and BMI matched (mean age 23.3 ± 4.3 years)
Sisters								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?

Karthik 2019	Prevalence	NCEP/ATPIII	2	35	0	35	Crude	Age and BMI matched (median age 24; IQR 19-27 years)
Kulshreshtha 2019	Prevalence	NCEP/ATPIII criteria	55	200	30	99	Crude	Age matched (Mean age 25.42 ± 7.89 years)
All offspring								
Author, year	Ufnit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Kent 2008	Prevalence	de Ferranti criteria (for adolescents)	5	15	1	12	Crude	Tanner stage matched (mean age 9.3 ± 3.1 years)

OUTCOME: Obesity				OUTCOME TYPE: Dichotomous				
Female first degree relatives								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Harnois-Leblanc 2017	Prevalence	>95th centile	2	8	2	8	Crude	Age matched. (median age 17.5 years; IQR 14.4-20.1 years)
Daughters								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Slr-Petermann 2012	Prevalence	>95th centile	14	135	8	93	Crude	Age matched. (median age 17.5 years; IQR 14.4-20.1 years)

OUTCOME: Hypertension				OUTCOME TYPE: Dichotomous				
Parents								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values	If adjusted, what variables were included in the model?

							adjusted or crude?	
Vipin 2016	Prevalence	JNC criteria	22	86	10	86	Crude	Age and BMI matched (mean age 50.4 ± 5.6 years)
Fathers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Vipin 2016	Prevalence	JNC criteria	10	41	3	42	Crude	Age and BMI matched (mean age 53.1 ± 5.1 years)
Mothers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Vipin 2016	Prevalence	JNC criteria	12	45	7	44	Crude	Age and BMI matched (mean age 47.9 ± 4.9 years)
All offspring								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Kent 2008	Prevalence	de Ferranti criteria (for adolescents)	10	32	7	28	Crude	Tanner stage matched (mean age 9.3 ± 3.1 years)

OUTCOME: Diabetes					OUTCOME TYPE: Dichotomous			
Parents								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Vipin 2016	Prevalence	ADA criteria	19	86	4	86	Crude	Age and BMI matched (mean age 50.4 ± 5.6 years)
Fathers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Vipin 2016	Prevalence	ADA criteria	14	41	0	42	Crude	Age and BMI matched (mean age 53.1 ± 5.1 years)

Yilmaz 2005	Prevalence	ADA 2003 (OGTT)	8	38	1	20	Crude	Age and weight matched (mean age 51.87 ± 8.54 years)
Mothers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Vipin 2016	Prevalence	ADA criteria	5	45	4	44	Crude	Age and BMI matched (mean age 47.9 ± 4.9 years)
Yilmaz 2005	Prevalence	ADA 2003 (OGTT)	7	40	1	20	Crude	Age and weight matched (mean age 46.38 ± 7.95 years)
Sons								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Kent 2008	Prevalence	de Ferranti criteria (fasting glucose >6.1mmol/L)	0	10	0	6	Crude	Tanner stage, Age 9.7 ± 3.4 years (FDR)

OUTCOME: Impaired fasting glucose				OUTCOME TYPE: Dichotomous				
Fathers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Yilmaz 2005	Prevalence	ADA 2003 (OGTT)	2	38	1	20	Crude	Age and weight matched (mean age 51.87 ± 8.54 years)
Mothers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Yilmaz 2005	Prevalence	ADA 2003 (OGTT)	2	40	0	20	Crude	Age and weight matched (mean age 46.38 ± 7.95 years)
Brothers								

Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Karthik 2019	Prevalence	ADA 2019 (OGTT)	6	41	4	41	Crude	Age and BMI matched (mean age 23.3 ± 4.3 years)
Sisters								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Karthik 2019	prevalence	ADA 2019	2	35	2	35	Crude	Age and BMI matched (Median age 24 years; IQR 19-27)

OUTCOME: Impaired glucose tolerance				OUTCOME TYPE: Dichotomous				
Fathers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Yilmaz 2005	Prevalence	ADA 2003 (OGTT)	10	38	1	20	Crude	Age and weight matched (mean age 51.87 ± 8.54 years)
Mothers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Yilmaz 2005	Prevalence	ADA 2003 (OGTT)	7	40	2	20	Crude	Age and weight matched (mean age 46.38 ± 7.95 years)
Brothers								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Baillargeon 2007	Prevalence	Not defined	3	17	0	28	Crude	Age and BMI matched (mean age 31 ± 9 years)

OUTCOME: PCOS	OUTCOME TYPE: Dichotomous

Sisters								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Karthik 2019	Prevalence	Rotterdam 2003	4	35	0	35	Crude	Age and BMI matched (Median age 24 years; IQR 19-27)
Daughters								
Author, year	Unit of outcome	Method of measurement	N events in First Degree Relatives	N total in First Degree Relatives	N events in control group	N total in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Crisosto 2019	Prevalence	NICHD 1990	7	43	0	28	Crude	Age, gynecologic age, menarchal age, BMI, waist, WHR, and birth weight matched. Age median (IQR): 15.42 (14.17–16.17)

12. DATA EXTRACTION TABLES – CONTINUOUS OUTCOMES

OUTCOME: BMI						OUTCOME TYPE: Continuous				
Female first degree relatives										
Author, year	Unit of outcome	Method of measurement	Mean (specify if median) in First Degree Relatives	SD (or specify if other measure: IQR, SE or 95% CI) in Fist Degree Relatives	Sample size	Mean (specify if median) or median in control group	SD (or specify if other measure: SE, IQR or 95% CI) in control group	Sample size	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Harnois-Leblanc 2017	kg/m^2	Not reported	Median = 22.7	IQR = 21.5-30.8	8	Median = 22.4	IQR = 19.1-27.8	8	Crude	Age matched. (median age 17.5 years; IQR 14.4-20.1 years)
Harnois-Leblanc 2017	z score	Not reported	Median = 0.63	IQR = 0.02-1.71	8	Median = 0.26	IQR = -0.96-1.52	8	Crude	Age matched. (median age 17.5 years; IQR 14.4-20.1 years)
Unluhizarci 2007	kg/m^2	Not reported	24.4	SEM = 0.3 Range = 20–31 SD=2.51	70	24.3	SEM = 0.4 Range = 21–28 SD=1.79	20	Crude SD recalculated from SEM	No matching performed. Mean age 27.3 ± 0.8 years

Fathers										
Author, year	Unit of outcome	Method of measurement	Mean (specify if median) in First Degree Relatives	SD (or specify if other measure: IQR, SE or 95% CI) in Fist Degree Relatives	Sample size	Mean (specify if median) or median in control group	SD (or specify if other measure: SE, IQR or 95% CI) in control group	Sample size	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Coviello 2009	kg/m^2	Not reported	30.2	5.6	211	27.0	4.4	1153	Crude	Age range similar, however mean age varied (Mean age 57 ± 9 years), ethnicity matched
Sisters										
Author, year	Unit of outcome	Method of measurement	Mean (specify if median) in First Degree Relatives	SD (or specify if other measure: IQR, SE or 95% CI) in Fist Degree Relatives	Sample size	Mean (specify if median) or median in control group	SD (or specify if other measure: SE, IQR or 95% CI) in control group	Sample size	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Joharatnam 2011	kg/m^2	Not reported	25.1	0.6	153	24	4.5	76	Crude	Mean age 31.3 ± 6 years-subgroup with polycystic ovaries (duplicate control group)
Joharatnam 2011	kg/m^2	Not reported	24.5	1.2	61	24	4.5	76	Crude	Mean age 37.8 ± 7.7 years - subgroup without polycystic ovaries (duplicate control group)
Kulshreshtha 2019	kg/m^2	Not reported	24.28	5.01	200	23.51	4.05	99	Crude	Age matched (Mean age 25.42 ± 7.89 years)
Unluhizarci 2007	kg/m^2	Not reported	24.4	SEM = 0.8 SD=6.5 Range = 20–31	66	24.3	SEM = 0.4 SD=1.8 Range = 21–28	20	Crude SD recalculated from SEM	No matching performed. Mean age 26.5 ± 0.8 years Similar subgroup to female FDR analysis
All offspring										
Author, year	Unit of outcome	Method of measurement	Mean (specify if median) in First Degree Relatives	SD (or specify if other measure:	Sample size	Mean (specify if median) or median in control group	SD (or specify if other measure: SE, IQR or 95%	Sample size	Are these values adjusted or crude?	If adjusted, what variables were included in the model?

				IQR, SE or 95% CI) in Fist Degree Relatives			CI) in control group			
deWilde 2018	kg/m^2	Stadiometer, digital scales	15.9	1.6	42	16.4	1.3	168	Crude	Age 3.3 ± 0.6 years (FDR)
deWilde 2018	kg/m^2	Stadiometer, digital scales	15.3	1.5	32	15.8	1.7	130	Crude	Age 7.0 ± 0.8 years (FDR)
Li 2020	z score	Not reported	Median = 0.2	IQR = -0.5-0.6	70	Median = 0.4	IQR = -0.5-1.3	71	Crude	Maternal age and BMI matched (median age 3.51; IQR 3.2-5.16 years)
Wang 2021	kg/m^2	Not reported	15.84	1.23	29	16.49	1.37	116	Crude	Age and socioeconomic status matched (mean age 1.82 ± 0.23 years)
Zhang 2022	kg/m^2	Stadiometer, digital scales	17.35	1.29	198	17.19	1.21	227	Crude	Age 3 months
Zhang 2022	kg/m^2	Stadiometer, digital scales	17.91	1.39	198	17.70	1.15	227	Crude	Age 6 months
Zhang 2022	kg/m^2	Stadiometer, digital scales	17.83	1.32	198	17.62	1.13	227	Crude	Age 8 months

CROSS-SECTIONAL or CASE-CONTROL STUDIES

Study ID	Baillargeon 2007
Study Citation	Baillargeon JP, Carpentier AC. Brothers of women with polycystic ovary syndrome are characterised by impaired glucose tolerance, reduced insulin sensitivity and related metabolic defects. Diabetologia. 2007 Dec;50(12):2424-32. doi: 10.1007/s00125-007-0831-9. Epub 2007 Sep 27. PMID: 17898989; PMCID: PMC3846531.
Study Country	Canada
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	17 brothers of women with PCOS diagnosed with PCOS according to1990 NICHD criteria.
Control population	28 control males, matched for age and BMI
PCOS diagnostic criteria	NICHD 1990
N per group	FDR: 17 brothers of women with PCOS Control: 28 control males
Setting	Academic hospital / Single center / timeframe not defined
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcome: insulin clamp Other outcomes of interest: - Metabolic syndrome (NCEP–ATP III guidelines) - Waist circumference Measured with a flexible tape midway between the last rib and iliac crest, at the end of a normal expiration. - Systolic BP (mmHg) BP was recorded following a 5 min rest period in the sitting position. - Diastolic BP (mmHg) - Lipid profile (chemiluminescent immunoassay, Freidewald for LDL) Includes triacylglycerol, HDL, LDL, - Fasting plasma glucose (Glucose hexokinase) - OGTT - 2h glucose (Glucose hexokinase) At approximately 09:00 hours, a standard OGTT was performed by administering 75 g glucose orally - Glucose intolerance (not defined) Outcomes not relevant: - BMI (kg/m^2) - not extracted as controls are matched for BMI - Percentage total fat mass (by standing electrical bioimpedance) - AUC glucose AUC for glucose response curves were calculated by the trapezoidal rule using absolute values. - Fasting hormonal studies Total testosterone, androstenedione, 17α-hydroxyprogesterone levels, DHEAS (RIA) SHBG (IRMA) Calculated free testosterone Calculated by the method of Sodergard et al. using a serum albumin concentration of 40 g/l (4.0 g/dl) Oestradiol, progesterone, folliclestimulating hormone, luteinising hormone, thyrotrophin and prolactin (chemiluminescent immunoassay) - Total cholesterol:HDL-cholesterol ratio

	- hsCRP (ELISA) - PAI-1 (ELISA) - Fibrinogen (modified Clauss technique) - Factor VIII (ELISA) - Fasting insulin - AUC insulin AUC for insulin response curves were calculated by the trapezoidal rule using absolute values. - M value Participants were instructed to maintain an isocaloric standard diet for 48 h prior to the euglycaemic–hyperinsulinaemic clamp. At least 2 days later, after a 12 h overnight fast, insulin sensitivity was directly determined. An insulin dose of 40 mU m−2 min−1 was used and total-body carbohydrate metabolism (M value, μmol kg−1 min−1) was calculated as follows: glucose infusion rate during the last 30 min of the clamp (μmol/min) divided by the participant's weight (kg) - Total-body carbohydrate oxidation In an unselected subgroup of participants, the rates of O2 consumption VO2 and CO2 production VCO2 were measured during a 40 min baseline period and during the last 40 min of the clamp to determine total-body carbohydrate oxidation by indirect calorimetry - Basal and insulin-stimulated total-body oxidative carbohydrate metabolisms Calculated as: (25.196 x VCO2=weight) - (17.749 x VO2/weight) - (0.21349 x 1.047 x 10^-4 x weight) - Insulin-stimulated total-body non-oxidative carbohydrate metabolism Calculated as: M value−CHox *All procedures were performed at the Centre de Recherche Clinique Etienne-Le Bel of the CHUS.	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes. Insulin clamp data.
Inclusion criteria	Yes Partial No Not reported	Yes. PCOS proband: normal serum prolactin and thyroid function tests. All participants were white of European origin, in good health, aged between 18 and 40 years, with BMI between 19 and 40 kg/m2
Exclusion criteria	Yes Partial No Not reported	Yes. All participants: type 2 diabetes according to interview, fasting glucose or 75 g OGTT PCOS proband: Late-onset congenital adrenal hyperplasia All participants had never used insulin-sensitising drugs or medications that affect insulin sensitivity. No control individual had any first-degree relatives with a known diagnosis of PCOS, or features of PCOS, based on interview.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes

Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age and BMI.
Summary Result/s		After adjusting for BMI and age, brothers of PCOS women have higher 2h glucose compared to controls.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Controls were recruited from hospital personnel, students at the Université de Sherbrooke or following an advertisement in Sherbrooke city newspapers. IGT is relatively rare in this age group (7.8% in NHANES II), but we might have unintentionally selected healthier control individuals than expected Whereas brothers of PCOS women were recruited as their PCOS probands were initially treated at the academic hospital.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DE DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. T2DM status was self-reported. BMI measurement may be subject to more variability than laboratory measurements.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported

	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	3 brothers and 1 control participant with type 2 diabetes (self-reported) were excluded for fasting glucose or 75 g OGTT analyses. 1 brother and 1 control participant were on a lipid-lowering drug (statin), and their lipid profiles were excluded from all analyses.
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	No protocol registration. No ethics approval.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No conflict of interest. Funding: Fonds de la Recherche en Santé du Québec (FRSQ; Quebec Health Research Funds; J.-P. Baillargeon, no. 2834) and the Canadian Institutes for Health Research (CIHR; A. C. Carpentier, no. MOP 53094). The Centre de Recherche Etienne-Le Bel is an FRSQ-funded research centre. J.-P. Baillargeon is a Junior 2 Clinical Investigator of the FRSQ and A. C. Carpentier is a Junior 2 Investigator of the FRSQ.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes. 88%.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate.

Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	Yes. T2DM status was self-reported, therefore more prone to risk of bias. BMI measurement may be subject to more variability than laboratory measurements.

Study ID	Coviello 2009	
Study Citation	Coviello AD, Sam S, Legro RS, Dunaif A. High prevalence of metabolic syndrome in first-degree male relatives of women with polycystic ovary syndrome is related to high rates of obesity. J Clin Endocrinol Metab. 2009 Nov;94(11):4361-6. doi: 10.1210/jc.2009-1333. Epub 2009 Oct 16. PMID: 19837913; PMCID: PMC2775643.	
Study Country	USA	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	211 fathers, 58 brothers of 237 women with PCOS diagnosed with PCOS according to1990 NICHD criteria.	
Control population	1153 and 582 men from an age and ethnicity matched control population derived from Third National Health and Nutrition Survey (NHANES III)	
PCOS diagnostic criteria	NICHD 1990	
N per group	FDR: 211 Fathers; 53 brothers Control: 1153 / 582 age and ethnicity matched	
Setting	Hospital / Multicentre (3 centers)	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Metabolic syndrome - Weight (kg) - BMI (kg/m^2) - Waist circumference - Systolic BP (mmHg) - Diastolic BP (mmHg) - Fasting plasma glucose - data not published - Metabolic syndrome (NCEP/ATPIII criteria): Waist circumference >102cm Impaired fasting glucose (>110mg/dL) Hypertriglycerdiaemia (≥150mg/dL) Hypertension (sBP ≥130 / dBP ≥85) Outcomes not relevant: - Testosterone (radioimmunometric assay with interassay coefficients of variation (CVs) of 5%) - Sex hormone binding globulin - DHEAS (radioimmunometric assay with interassay coefficients of variation (CVs) were 8%) Outcomes for brothers not extracted as duplicate data found in another study: SAM, S., COVIELLO, A. D., SUNG, Y.-A., LEGRO, R. S. & DUNAIF, A. 2008. Metabolic phenotype in the brothers of women with polycystic ovary syndrome. Diabetes care, 31, 1237-41.	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes

Inclusion criteria		Yes Partial No Not reported	Yes, Brothers were <40 years old, in the event multiple brothers from one family participated in the study, the youngest brother with complete data was selected. Probands fulfilled diagnostic criteria for PCOS.
Exclusion criteria		Yes Partial No Not reported	Not reported
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, cross-sectional
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age and ethnicity. Fathers were on average younger than control men 57 ±9 years compared with 63 ±13 years (P < 0.0001)
Summary Result/s		Fathers and brothers of women with PCOS had higher rates of metabolic syndrome compared to age and ethnicity matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Control group using healthy volunteer participants from a different population than the FDR population
SELECTION BIAS	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
SELECTION BIAS	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial.
DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Yes

	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to cross-sectional study
ATTRITION BIAS	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Yes Demographic difference between group in age of fathers
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No
OTHER BIAS	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
OTHER BIAS	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS		Control group was derived from a different population	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate

Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	Yes. Laboratory measurements are less subject to bias than measurements of blood pressure from different populations.

Study Citation	Crisosto N, Echiburú B, Maliqueo M, Luchsinger M, Rojas P, Recabarren S, Sir-Petermann T. Reproductive and metabolic features during puberty in sons of women with polycystic ovary syndrome. Endocr Connect. 2017 Nov;6(8):607-613. doi: 10.1530/EC-17-0218. Epub 2017 Sep 14. PMID: 28912339; PMCID: PMC5640572. (primary citation) SIR-PETERMANN, T., VANTMAN, N., CONCHA, F., ECHIBURU, B., PEREIRA, C., DE GUEVARA, A. L., CRISOSTO, N. R., PEREZ-BRAVO, F. A. & SANTOS, J. L. 2014. Metabolic Profile and Eating Behavior Score in Prepubertal and Early Pubertal Sons of Women with Polycystic Ovary Syndrome. Endocr. Rev., 35, 2.
Study Country	Chile
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	69 sons of women with PCOS between age 7 and 18 years of age, subgroup by Tanner stage. Similar cohort present in Recabarren 2008 study however different age
Control population	84 sons of control women without hyperandrogenism between age 7 and 18 years of age, matched by Tanner stage
PCOS diagnostic criteria	NICHD 1990
N per group	Sons of PCOS women: N = 69 - Tanner I (median age 9.1 years): N = 23 - Tanner II - III (median age 10.8 years): N = 26 - Tanner IV-V (median age 14.4 years): N = 20 Sons of control women: N = 84 - Tanner I (median age 9.0 years): N = 20 - Tanner II - III (median age 10.3 years): N = 31 - Tanner IV-V (median age 13.9 years): N = 33
Setting	Academic clinic / single center
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Outcomes: - Weight (kg) - BMI (kg/m^2) Calculated by the Growth Analyzer Program using the U.S. Growth Charts BMI for age (previously shown to be applicable to the Chilean population) - Waist circumference - Waist hip ratio - Obesity (defined as body weight >95th percentile) - Lipid profile (standard colorimetric assays) LDL calculated by Friedewald's formula - Fasting glucose (glucose oxidase method) - OGTT - 2 hour glucose (glucose oxidase method) After a 12-h overnight fast, an oral glucose tolerance test was performed by giving 1.75 g/kg, up to a maximum of 75 g glucose in 250 ml water. 5 ml blood samples were obtained at baseline and 30, 60 and 120 min after glucose administration. Glucose tolerance defined by ADA criteria

		Outcomes not relevant: - Insulin (radioimmunometric assay) - Testicular volume (Prader orchidometer by a single endocrinologist) - HOMA-IR (standardised calculation) - Insulin sensitivity composite index (ISI) (standardised calculation) - Fasting SHBG (radioimmunometric assay) - Fasting adiponectin (radioimmunometric assay) - Fasting leptin (radioimmunometric assay) - CRP (ultrasensitive immunoturbidimetric assay) - Hormonal studies: LH, FSH, SHBG, testosterone, androstenedione, 17-OH progesterone, AMH (enzyme immunoassay) - Lipid profile	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes. All PCOS sons were born at term after spontaneous conceptions, singletons. Control women have a history of singleton pregnancies, regular 28 to 32 day menstrual cycles.
Exclusion criteria		Yes Partial No Not reported	Yes. PCOS probands: Patients with hyperprolactinemia, androgen-secreting neoplasms, Cushing's syndrome, and late-onset 21-hydroxylase deficiency as well as thyroid disease. Control women: hirsutism, other manifestations of hyperandrogenism, history of infertility or pregnancy complications.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Partial, case control. No follow-up for future cardiovascular events
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, Tanner stage.
Summary Result/s		Sons of women with PCOS had higher rates of dyslipidaemia during puberty compared to controls matched by Tanner stage	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of control women recruitment not specified.

BIAS	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. National Institutes of Health consensus criteria.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DE DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial. Tanner stage determined by a single endocrinologist.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to cross-sectional study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. Ethics approval, protocol not registered prospectively.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial Method of control women recruitment not specified.

OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by Fondo Nacional de Desarrollo Científico y Tecnológico (National Fund for Scientific and Technological Research; Fondecyt; Grants 1030487-1151531), and the Alexander von Humboldt Foundation.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. Propensity matching. Median and interquartile range reported, but not mean nor standard deviation.
COMMENTS		Method of control women recruitment not specified.	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate - Non-specified recruitment method of control group. - Single endocrinologist
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No.	

Study ID	Crisosto 2019
Study Citation	Crisosto N, Ladrón de Guevara A, Echiburú B, Maliqueo M, Cavada G, Codner E, Paez F, Sir-Petermann T. Higher luteinizing hormone levels associated with antimüllerian hormone in postmenarchal daughters of women with polycystic ovary syndrome. Fertil Steril. 2019 Feb;111(2):381-388. doi: 10.1016/j.fertnstert.2018.10.011. Epub 2018 Dec 7. PMID: 30527840.
Study Country	Chile
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	43 postmenarcheal daughters of women with PCOS 1.5-6 years after menarche
Control population	28 postmenarcheal daughters of women without hyperandrogenism 1.5-6 years after menarche matched by age, gynecologic age, menarchal age, BMI, waist, WHR, and birth weight
PCOS diagnostic criteria	NICHD 1990
N per group	FDR: 43 daughters Control: 28 daughters
Setting	Academic hospital / Single centre / timeframe not specified
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Waist circumference - not extracted as matched for WHR - Hip circumference - not extracted as matched for WHR - OGTT - 2 hour glucose (glucose oxidase method) After a 12-h overnight fast, an oral glucose tolerance test was performed by giving 1.75 g/kg, up to a maximum of 75 g glucose in 250 ml water. 5 ml blood samples were obtained at baseline and 30, 60 and 120 min after glucose administration.

	Glucose tolerance defined by ADA criteria - Fasting plasma glucose (glucose oxidase method) - PCOS (NICHD criteria) - Lipid profile Total cholesterol, triglycerides, LDL, and HDL-C - Systolic blood pressure - Diastolic blood pressure BP measurement method not defined. - Weight (kg) (could not extract due to weight matching) - Height (m) - BMI (kg/m^2) (could not extract due to weight matching) Calculated by the Growth Analyzer Program using the U.S. Growth Charts BMI for age (previously shown to be applicable to the Chilean population) - Obesity (could not extract due to lack of individual data to extract) Defined as a body weight >95th percentile Outcomes not relevant: - Tanner stage (single observer) - Hirsutism (determining the presence of terminal hair using the modified Ferriman-Gallway score) - Acne and acanthosis nigricans - HOMA-IR - Whole-body insulin sensitivity composite index (ISI) - LH, FSH (electrochemiluminiscence) - SHBG (radioimmunometric assay) - AMH (enzyme immunoassay) - FAI Basal serum testosterone to SHBG ratio x 100 - Ovarian volume (transabdominal ultrasonography - blinded observer) - Cycles per year - GnRH agonist test 10 mg/kg subcutaneous leuprolide acetate administered between 8:00 and 9:00 a.m. Serum LH and FSH levels were measured before and 3 hours after leuprolide injection Serum Testosterone, androstenedione, 17a-hydroxyprogesterone (17-OHP) (radioimmunometric assay) and estradiol concentrations (electrochemiluminiscence) were determined at baseline and 24 hours - Fasting insulin (radioimmunometric assay) Biochemistry studied during the early follicular phase of the menstrual cycle (day 3–7) or whenever feasible in those with amenorrhea	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. All participants:11–17 years old, gynecologic age (years after menarche) of 1.5–6 years, born from singleton pregnancies Control mothers of similar socioeconomic level with a history of singleton pregnancies and regular 28–32-day menstrual cycles.
Exclusion criteria	Yes Partial No Not reported	Yes. All participants: any chronic diseases, history of early puberty,precocious pubarche, previously diagnosed with PCOS,

			oral contraceptives or any other medication during the 6 months before the study Mothers of control girls: hirsutism, clinical manifestations of hyperandrogenism, infertility, pregnancy complications during their early reproductive age were excluded.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, propensity matching for age, gynecologic age, menarchal age, BMI, waist, WHR, and birth weight matched.
Summary Result/s		No difference in fasting glucose and insulin and 2-hour glucose levels, between daughters of PCOS mothers and age, gynecologic age, menarchal age, BMI, waist, WHR, and birth weight matched controls of children of mothers without PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of control group recruitment not specified.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. National Institutes of Health consensus criteria.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial Method of control group recruitment not specified.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DE DETECTION	Were measurements (for exposures or outcomes) carried out and calculated in	Yes Partial No Not reported	Partial.

BIAS	a standard, valid and reliable way?		- Measurement biases can occur with weight, height, waist and hip circumferences, as well as the systolic and diastolic blood pressures (method not specified)
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial. Blinded observer for ultrasound. Single observer for Tanner staging. Other outcomes not reported.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. No protocol registration. Ethics approval obtained.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Yes.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No conflict of interest. Funding source: National Fund for Scientific and Technological Development (FONDECYT) grants 1071007 and 1151531.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. Median and interquartile range reported, but not mean nor standard deviation.
COMMENTS			
What is the overall risk of bias?		Low Moderate	Moderate. Method of deriving control group not reported.

	High Insufficient information	
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	Yes. Systolic and diastolic blood pressures, waist and hip circumferences, and thus the waist to hip ratio were more prone to measurement biases.	

Study ID	Diamanti-Kandarakis 2004	
Study Citation	Diamanti-Kandarakis E, Alexandraki K, Bergiele A, Kandarakis H, Mastorakos G, Aessopos A. Presence of metabolic risk factors in non-obese PCOS sisters: evidence of heritability of insulin resistance. J Endocrinol Invest. 2004 Nov;27(10):931-6. doi: 10.1007/BF03347535. PMID: 15762040.	
Study Country	Greece	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	17 sisters of 54 women with PCOS diagnosed with PCOS according to1990 NICHD criteria.	
Control population	20 healthy control women, matched for age and BMI	
PCOS diagnostic criteria	NICHD 1990	
N per group	FDR: 17 sisters of PCOS women Control: 20 women	
Setting	Hospital / Single center	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Metabolic syndrome - Weight (kg) - not extracted as matched for BMI - BMI (kg/m^2) - not extracted as matched for BMI - Waist circumference - Systolic BP (mmHg) (measured in the morning in the seated position in the right arm after a 5-min rest period. The average of three measurements taken 2 min apart) - Diastolic BP (mmHg) - Hypertension (blood pressure >90th percentile age, height, and gender, as defined by the National High Blood Pressure Education Program for Children and Adolescents) - Fasting plasma glucose (glucose oxidase method) - Lipid profile (enzymatic assay, Freidewald for LDL) - OGTT (glucose oxidase method) After a 12-h overnight fast, glucose load of 1.7 g/kg. In children <8 years old, salivary samples collected at 0, 30, 60, 90, and 120 min to measure salivary insulin levels. In children > 8 years old, blood was drawn at baseline and 120 min after glucose administration for glucose and insulin levels Outcomes not relevant: - Fasting insulin (radioimmunometric assay) - Fasting hormonal studies: testosterone, DHEAS, gonadotropins, SHBG (radioimmunometric assay) - HOMA-IR - QUICKI - Uric acid	
Does the study have a clearly focused question and/or PICO?	Yes Partial	Partial. “Metabolic and hormonal ”

		No Not reported	
Inclusion criteria		Yes Partial No Not reported	Yes. Sisters of women with PCOS diagnosed with NICHD criteria All women had regular ovulatory cycles
Exclusion criteria		Yes Partial No Not reported	Yes. PCOS probands and sisters: non classical congenital adrenal hyperplasia, androgen secreting neoplasm, hyperprolactinaemia, thyroid disease All groups: confounding medications known to affect sex steroids or insulin action. Clinical hyperandrogenism (hirsutism, acne, alopecia), treatment for menstrual disturbances, inferility or hirsutism
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age and BMI
Summary Result/s		Sisters of women with PCOS had higher rates of insulin resistance compared to age and BMI matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Control group method of derivation not described
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Control group method of derivation not described

PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DE DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Anatomical landmarks for waist and hip circumference not reported. Laboratory measurements described with coefficient of variance.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	All included
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Method of deriving control cohort not described
OTHER	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	Not reported.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported

BIAS	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Control group method of derivation not reported.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Waist hip measurements may be subject to more variability than laboratory measurements.

Study Country	India
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	35 unrelated sisters and 41 unrelated brothers of 76 women with PCOS diagnosed with PCOS according to Rotterdam 2003 criteria
Control population	35 women and 41 men age and BMI matched
PCOS diagnostic criteria	Rotterdam 2003
N per group	FDR: 35 sisters; 41 brothers Control: 35 / 41 age and BMI matched controls
Setting	Hospital / Single centre / January 2016 - July 2017
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Carotid intima media thickness (2 independent observers, ultrasound, standardised protocol) - Brachial artery flow-mediated dilatation (2 independent observers, ultrasound, standardised protocol) Other outcomes: - Weight (kg) (single observer) - not extracted as matched for BMI - Height (m) (single observer) - BMI (kg/m^2) (automated BP measurement) - not extracted as matched for BMI - Waist circumference ((WHO standards)

	- Hip circumference (WHO standards) - Systolic BP (mmHg) (automated BP measurement) - Diastolic BP (mmHg) - Fasting plasma glucose - OGTT (75g loading) ADA criteria 2019 to evaluate glucose tolerance - Lipid profile (standard colorimetric assays) - Metabolic syndrome (NCEP/ATPIII criteria) Outcomes not relevant: - HOMA-IR - QUICKI - DHEAS, testosterone (radioimmunoassay) - C-peptide (ELISA) - High sensitivity CRP (chemiluminescence) - Hypertension (not published) - Diabetes (ADA 2019 criteria) - not all data published - Fasting insulin (ELISA)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. First degree relatives of women with PCOS diagnosed by the Rotterdam 2003 criteria. Age 12-40
Exclusion criteria	Yes Partial No Not reported	Yes. Siblings: chronic systemic medical illness, acute illness in past 3 months, pregnant, attending endocrine clinic for metabolic health
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	Yes, age and BMI.
Summary Result/s	Siblings of women with PCOS had higher rates of metabolic syndrome and insulin resistance than age and weight matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Control group using outpatient department staff and relatives of patients admitted in the endocrine ward.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. Rotterdam criteria.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Family members of patients attending endocrine clinic potentially have a family history of diabetes.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DE DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. Method of blood pressure measurement not described
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes (for the primary outcome).
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial. Single observer for BMI, BP and waist measurements.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	No protocol registration. Ethics approval obtained

CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Only age and weight matched
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by university grant - Intramural Research Grant (PGI/DIR/RC/943/2013)
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes. Powered for carotid intima media thickness and flow-mediated dilatation
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes. Only one sibling from each family recruited. Some data in median, IQR.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Method of derivation of control cohort.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Laboratory measurements are less subject to bias than measurements of blood pressure / weight / height.	

Study ID	Kent 2008
Study Citation	Kent SC, Gnatuk CL, Kunselman AR, Demers LM, Lee PA, Legro RS. Hyperandrogenism and hyperinsulinism in children of women with polycystic ovary syndrome: a controlled study. J Clin Endocrinol Metab. 2008 May;93(5):1662-9. doi: 10.1210/jc.2007-1958. Epub 2008 Feb 12. PMID: 18270257; PMCID: PMC2386683.
Study Country	USA
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	32 children of 27 women with PCOS diagnosed with PCOS according to1990 NICHD criteria.
Control population	38 children from control women, subgroup by Tanner stage
PCOS diagnostic criteria	NICHD 1990
N per group	FDR: 17 sons, 15 daughters of women with PCOS Control: 21 sons, 17 daughters of control women recruited by local advertisement Data for daughters not extracted as duplicate of other studies
Setting	Hospital / Single center / June-Dec 2005

Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Weight (kg) - BMI (kg/m^2) - Waist circumference - Systolic BP (mmHg) (measured in the morning in the seated position in the right arm after a 5-min rest period. The average of three measurements taken 2 min apart) - Diastolic BP (mmHg) - Hypertension (blood pressure >90th percentile age, height, and gender, as defined by the National High Blood Pressure Education Program for Children and Adolescents) - Fasting plasma glucose (glucose oxidase method) - Lipid profile (enzymatic assay, Freidewald for LDL) - OGTT (glucose oxidase method) After a 12-h overnight fast, glucose load of 1.7 g/kg. In children <8 years old, salivary samples collected at 0, 30, 60, 90, and 120 min to measure salivary insulin levels. In children > 8 years old, blood was drawn at baseline and 120 min after glucose administration for glucose and insulin levels - Metabolic syndrome (Ferranti criteria for adolescents); at least 3 of: Waist circumference more than the 75th percentile Hypertension defined by either systolic or diastolic blood pressure more than the 90th percentile Fasting triglyceridesmore than or equal to 97.3mg/dl Fasting HDL-C less than 50.2 mg/dl Fasting glucose more than or equal to 110mg/dl. Outcomes not relevant: - Insulin (double antibody method) Salivary insulin levels from children correlated with 30 control adults - Hormonal studies: testosterone, DHEAS, gonadotropins (radioimmunoassay) - HOMA-IR - Ovarian size and morphology on transabdominal ultrasound - Tanner staging (assessed by nursing personnel) - Gestational age - Birthweight Outcomes for daughters not extracted as duplicate data found in another study: Legro RS, Kunselman AR, Stetter CM, Gnatuk CL, Estes SJ, Brindle E, Vesper HW, Botelho JC, Lee PA, Dodson WC. Normal Pubertal Development in Daughters of Women With PCOS: A Controlled Study. J Clin Endocrinol Metab. 2017 Jan 1;102(1):122-131. doi: 10.1210/jc.2016-2707. PMID: 27778640; PMCID: PMC5413094.	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Partial. “Reproductive and metabolic functions”
Inclusion criteria	Yes Partial No Not reported	Yes. Control group: mothers of control children had a history of regular menstrual cycles
Exclusion criteria	Yes Partial No Not reported	Yes. All groups: confounding medications known to affect sex steroids or insulin action Control children: personal or family history of diabetes, mothers of children with hirsutism
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No	Yes

		Not reported	
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, Tanner staging
Summary Result/s		Children of women with PCOS had higher rates of metabolic syndrome compared to age and ethnicity matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Control group method of derivation not described
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Control group method of derivation not described
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DE DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Yes, Blood pressure measurement standardised, clear criteria for metabolic syndrome
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.

	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not all children had serum samples. 53% FDR 45% control
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Method of deriving control cohort not described
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Grant funding from university PHS K24 HD01476, U54 HD034449, General Clinical Research Center Grant MO1 RR 10732, and construction Grant C06 RR016499. One author had pharmaceutical company funding (however no pharmaceutical products used in this study).
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS		Control group was derived from a different population	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No.

Study Country	India	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	200 sisters of women with PCOS not on treatment for diabetes, hypertension or hyperlipidaemia	
Control population	99 age matched healthy controls who did not meet criteria for PCOS from hospital staff or healthy daughters of hospital staff	
PCOS diagnostic criteria	Rotterdam 2003	
N per group	FDR: N = 200 Control: N = 99	
Setting	Academic hospital / single center / 2013 - 2016	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Outcomes: - Weight (kg) - BMI (kg/m^2) - Waist circumference (measured at the narrowest level between the costal margin and the iliac crest) - Hip circumference (measured at the widest level over the buttocks with the participant standing normally) - Blood pressure (in the seated position in the right arm as the average of two separate readings obtained two min apart after a 5-min rest) - Obesity (defined as BMI >23 kg/m^2) - Lipid profile Standard colorimetric assays for triglycerides / cholesterol Direct method for HDL LDL calculated by Friedewald's formula - Fasting glucose (glucose oxidase) - OGTT - 2 hour glucose After an overnight fast, an oral glucose tolerance test was performed by giving 75 g glucose with blood samples obtained at baseline, 60 and 120 min after glucose administration - Metabolic syndrome (NCEP ATP III criteria) Outcomes not relevant: - Insulin (ELISA) - HOMA-IR (standardised calculation) - Hormonal studies: LH, FSH, testosterone, androstenedione, 17-OH progesterone, thyroid function tests, cortisol, prolactin (chemiluminescence and ELISA) - Transabdominal ultrasound for polycystic ovaries - Hypertension (unable to be extracted as control group selected to not have hypertension) - PCOS (unable to be extracted as control group selected to not have PCOS and criteria not clearly defined for sisters)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial	Yes.

		No Not reported	Control women age 15-45 years, regular 27 to 32 day menstrual cycles.
Exclusion criteria		Yes Partial No Not reported	Yes. PCOS sisters: Pregnant, lactating, premenarchal, menopausal, on oral contraceptive pills, oral hypoglycemics, antihypertensives, or lipid-lowering agents Control women: clinical hyperandrogenism (hirsutism, acne, or hair loss), major medical or psychiatric illnesses, hypertension, diabetes, intake of medications known to alter sex hormone metabolism or glucose homeostasis for at least 3 months before the study
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Partial, case control. No follow-up for future cardiovascular events
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age
Summary Result/s		Sisters of women with PCOS have higher risk of metabolic syndrome (especially if they themselves are affected by PCOS) compared to age matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	No Control group from healthy hospital staff
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Some of the sisters of women with PCOS likely had PCOS themselves but not clearly defined by Rotterdam criteria
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.

DE DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case-control study. However, 221 PCOS probands recruited with 354 sisters. 154 sisters declined consent / geographically distant or did not meet inclusion criteria (56% sisters included)
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. Ethics approval, protocol not registered prospectively.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Only age matchced
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government DST grant number---SR/ FT/LS-37/2011.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS			

What is the overall risk of bias?	Low Moderate High Insufficient information	Moderate - Control group method of derivation dissimilar. - 56% sisters of women with PCOS included
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	Yes. Measurement of BP likely more subject to bias than laboratory measures	

Study ID	Legro 2017
Study Citation	Legro RS, Kunselman AR, Stetter CM, Gnatuk CL, Estes SJ, Brindle E, Vesper HW, Botelho JC, Lee PA, Dodson WC. Normal Pubertal Development in Daughters of Women With PCOS: A Controlled Study. J Clin Endocrinol Metab. 2017 Jan 1;102(1):122-131. doi: 10.1210/jc.2016-2707. PMID: 27778640; PMCID: PMC5413094.
Study Country	USA
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	76 daughters of women with PCOS diagnosed with PCOS according to 1990 NICHD criteria.
Control population	80 daughters of control mothers, subgroup by Tanner stage
PCOS diagnostic criteria	NICHD 1990
N per group	FDR: 76 daughters Control: 80 daughters of control women
Setting	Hospital / Single center
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Outcomes: - Metabolic syndrome - Weight (kg) (to the nearest 0.1 kg) - Height (cm) (to the nearest 0.1 cm) - BMI (kg/m^2) - Waist circumference (to the nearest 0.1 cm, measured at the level of the umbilicus) - Hip circumference(to the nearest 0.1 cm, measured at the widest diameter) - Systolic BP (mmHg) (average of three measurements in the right arm in the sitting position after a 15-minute rest) - Diastolic BP (mmHg) Outcomes not relevant: - Tanner stage (single trained study coordinator) - Acne (standardised pictorial methods) - Ferriman-Gallwey score - Transabdominal ultrasound - Hormonal studies: testosterone, DHEAS, gonadotropins (radioimmunoassay), urine LH/FSH (ELISA), urine estrogen/androgen (tandem mass spectrometry / isotope dilution liquid chromatography) (Primary outcome of hyperandrogenism) - HOMA-IR - Metabolic syndrome (ATP III criteria) - could not be extracted as control group selected to not have metabolic syndrome - Lipid profile (enzymatic assay, Freidewald for LDL) - not reported

	- PCOS (NICHD criteria) - could not be extracted as control group selected to not have PCOS - OGTT (75g) After a 12-h overnight fast, glucose load of 1.7 g/kg. In children <8 years old, salivary samples collected at 0, 30, 60, 90, and 120 min to measure salivary insulin levels. In children > 8 years old, blood was drawn at baseline and 120 min after glucose administration for glucose and insulin levels - Insulin (double antibody method) Salivary insulin levels from children correlated with 30 control adults	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes. Hyperandrogenism as the primary outcome
Inclusion criteria	Yes Partial No Not reported	Yes. Women were non-Hispanic Caucasian (to avoid confounding effects of ethnicity on metabolic endpoints) Control women: history of regular menstrual cycles (10 to 14 cycles per year), normal circulating androgen levels, normal levels of 17 OH progesterone (i.e., a morning level ,2 ng/mL) or a normal adrenocorticotropic hormone stimulation test if above that level,
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS probands: secondary causes of oligomenorrhea, including thyroid disease, prolactin excess, and congenital adrenal hyperplasia. Daughters of women with PCOS: preexisting diagnosis of type 1 or 2 diabetes, known history of PCOS in the sisters or mother of the father of the child, medications that could affect hormonal levels or glucose tolerance, such as GnRH agonists, hormonal contraceptives, insulin-sensitizing agents, statins, and many antihypertensives, conceived through in vitro fertilization Control women: personal or family history of history of hypertension or diabetes mellitus, oral contraceptive agents in preceding 3 months, suspicion of Cushing syndrome, clinical/biochemical evidence of hyperandrogenism, sister or mother with PCOS, current use of confounding medications that could affect steroid levels, conceived with the use of clomiphene citrate
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	Yes, Tanner stage

Summary Result/s		Daughters of women with PCOS had similar rates of hyperandrogenism and insulin resistance compared to pubertal stage matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of deriving control group not defined
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial.
DE DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Blood pressure and laboratory measures standardised. Salivary insulin levels validated in adult cohort
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial. Single assessor for Tanner stage
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	FDR: 74/76 (97%) included for BP measurement; 75/76 (99%) for BMI measurement; 75/76 (99%) for WHR measurement COntrol: 81 daughters included for BP measurement; 82 daughters for BMI measurement; 79 for waist hip ratio (despite total stating to be 80 daughters)

REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	No.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government grant (Eunice Kennedy Shriver National Institutes of Child Health and Human Development (NICHD), National Center for Research Resources, and the National Center for Advancing Translational Sciences at the National Institutes of Health, through Grants U54 HD034449 (Specialized Cooperative Centers Program in Reproductive & Infertility Research at VCU) and UL1 TR000127 (Pennsylvania State Clinical andTranslational Institute). Partial funding from Eunice Kennedy Shriver NICHD research infrastructure grant, R24HD042828, to the Center for Studiesin Demography & Ecology at the University of Washington. 3 authors receive pharmaceutical company funding (however non interventional study).
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. Multiple daughters from the same mother included if eligible, random effect model used to control for this.
COMMENTS		Control group was derived from a different population	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Some attrition in measurements. No blinding / independent assessment of blood pressure and waist hip ratio.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Blood pressure / WHR more subject to bias than laboratory measurements.

Study Citation	Lenarcik, A., Bidzinska-Speichert, B. and Tworowska-Bardzinska, U. (2011) 'Metabolic Abnormalities in Siblings of Women with Polycystic Ovary Syndrome', ADVANCES IN CLINICAL AND EXPERIMENTAL MEDICINE, 20(2), pp. 165–175.
Study Country	Poland

CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	44 sisters and 42 brothers of women with PCOS	
Control population	70 healthy women and 30 healthy men (age and BMI matched)	
PCOS diagnostic criteria	Rotterdam 2003	
N per group	FDR: 44 sisters; 42 brothers Control: 70 women and 30 men age and BMI matched	
Setting	University Hospital / Single centre	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Weight (kg) - not extracted as matched for BMI - Height (m) - BMI (kg/m^2) - not extracted as matched for BMI - Waist circumference (anatomical landmarks not described) - Hip circumference (anatomical landmarks not described) - Fasting plasma glucose (glucose oxidase) - OGTT (did not describe protocol) - Lipid profile (Standard colorimetric assays ; Friedewald calculation for LDL Outcomes not relevant: - Fasting insulin (chemiluminescence) - HOMA-IR - Insulin sensitivity index - FIRI - insulin resistance index - QUICKI - MATSUDA index	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Partial. “metabolic parameters”
Inclusion criteria	Yes Partial No Not reported	Yes. First degree relatives of women with PCOS diagnosed by the Rotterdam 2003 criteria. Only occasional alcohol use.
Exclusion criteria	Yes Partial No Not reported	Partial. Hypercortisolemia, hyperprolactinemia, impaired thyroid function, ovarian tumour, adrenal tumor, hormonal treatment, insulin sensitising drugs, special diet, intense physical exercises, smoking >5 cigarettes a day Control group defined as those who’s sisters did not have PCOS, menstrual disturbances or hirsutism
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial. No mention of how control group women were defined not to have PCOS in themselves.
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control.

Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age and weight.
Summary Result/s		Siblings of women with PCOS had high rates of hyperlipidaemia and glucose intolerance than age and weight matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of deriving controls not defined.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. Rotterdam criteria.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Method of deriving controls not defined.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial.
DE DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Method of measuring BP not mentioned
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported.
ATTRITI	What percentage of the individuals recruited into	X% treatment X% control/ comparison	Not relevant to case control study

ON BIAS	each arm of the study were lost to follow up?	Not reported	
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Only age and weight matched
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS		Method of deriving control cohort not described	
What is the overall risk of bias?		Low Moderate High Insufficient information	High. Method of deriving cohort not defined
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Laboratory measurements are less subject to bias than measurements of blood pressure from different populations.

PMID: 34434168; PMCID: PMC8380809.
Study Country	China

CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	172 children of women with PCOS diagnosed with PCOS according to Rotterdam 2003 criteria	
Control population	529 children of women without PCOS of similar age	
PCOS diagnostic criteria	Rotterdam 2003	
N per group	FDR: 172 children Control: 529 children	
Setting	Academic hospital / Single centre (timeframe not defined)	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes of interest: association of SNPs and maternal PCOS Other ouutcomes: - Fasting plasma glucose (oxidase method) - Height (z score) - reported in Zhang 2021 substudy (method of assessment not reported) - Weight (z score) - reported in Zhang 2021 substudy (method of assessment not reported) - BMI (z score) - reported in Zhang 2021 substudy (method of assessment not reported) - Blood pressure - reported in Zhang 2021 substudy (method of assessment not reported) - Cholesterol - Triglycerides - HDL - LDL Levels of serum cholesterol, triglycerides, LDL and HDL were measured using the precipitation and enzymatic methods. Outcomes not relevant: - Fasting insulin (chemiluminescence immunoassays) - HOMA-IR, HOMA-beta - FSH, LH, prolactin, DHEA-S, estradiol, testosterone, prolactin, TSH, AMH, free triiodothyronine. free thyroxine A morning fasting blood sample was obtained for examining circulating serum levels of hormones - Antibodies against thyroglobulin and antibodies against thyroperoxidase - 18 SNPs In the DENND1A gene, the SNPs were rs10818854 and 2479106; in the YAP1 gene, the SNPs were rs1894116 and rs11225161; in the THADA gene, the SNPs were rs12478601 and rs13429458; in the FSHR gene, the SNPs were rs2268361 and rs2349415; and in the C9orf3 gene, the SNPs were rs3802457 and rs4385527. In addition, rs4784165 in TOX3, rs6022786 in SUMO1P1, rs705702 in RAB5B, rs13405728 in LHCGR, rs2059807 in INSR, rs9939609 in FTO, rs2272046 in HMGA2 and 1351592 in ERBB4 were also chosen	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. All children participants were conceived by ART or artificial insemination, aged 1-8 yr.
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS probands:other causes of oligomenorrhea or hyperandrogenism such as Cushing's syndrome and hypothyroidism

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Similar age.
Summary Result/s		Offspring of women with PCOS had higher rates of insulin resistance compared to age matched controls.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Yes.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. Rotterdam criteria.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Recruited from same center but unclear attrition.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Weight method of measurement not described
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.

	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
ATTRITION BIAS	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	618/701 total population for endocrine and metabolic parameters FDR: 123/172 (72%) Control: 495/529 (94%) BP and BMI reported for the following in Zhang 2021 substudy: FDR: 70/123 (57%) Control: 71/495 (14%)
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. No protocol registration. No ethics approval.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Age matched.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funding source: National Key Research and Development Program of China, National Natural Science Foundation of China, National Natural Science Foundation of Shandong Province, and Shandong Provincial Key Research and Development Program. Conflict of interest not reported.
OTHER BIAS	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Partial. Power analysis performed for association between SNPs and maternal PCOS (80%).
OTHER BIAS	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS		Not enough follow-up for clinical cardiovascular outcomes	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Not all participants analysed
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Weight and blood pressure measurements method of assessment not mentioned.

Study Country	Multinational (USA / Canada / Chile)
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	18 premenarchal first degree relatives of women with PCOS (either mother or sister) diagnosed with PCOS according to NICHD 1990
Control population	21 healthy premenarchal girls, matched for age, weight and Tanner stage
PCOS diagnostic criteria	NICHD 1990
N per group	FDR: 18 Control: 21
Setting	Hospital / Multicentre (5 centers)
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Outcomes: - Waist circumference (measured midway between the lower rib margin and the iliac crest) - Weight (kg) - not extracted as matched for weight - Height (cm) - BMI (kg/m^2) - not extracted as matched for weight Reported as z score using National Center for Health Statistics (NCHS) data - Serum glucose (glucose hexokinase) Only reported in substudy by Trottier et al 2012 - OGTT - only reported in substudy by Trottier et al 2012 Blood samples were collected at 15, 5, 0, 15, 30, 60, 90, and 120 minutes after glucose load (40 g/m2 body surface area) for the measurement of glucose, insulin, C-peptide, NEFA, and ghrelin - Lipid profile (enzymatic assay, Freidewald for LDL)

	Outcomes not relevant: - Insulin - Tanner stage (based on DHEAS and E2 levels) - HOMA-IR - QUICKI - AIRg - Glucose disposal index - Body fat composition by bioelectrical impedance - Hormonal studies: DHEAS, E2 (similar assay) - Frequently sampled glucose tolerance test: IV 25% Dextrose at 2 ml/Kg (max 25gm of Dextrose). This was followed by measurements of of serum glucose and insulin at 2, 3, 4 and 5 min after glucose administration	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Partial. Risk of type 2 diabetes measured by insulin sensitivity and reproductive hormones
Inclusion criteria	Yes Partial No Not reported	Yes. All subjects: premenarchal
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS probands: secondary causes of chronic oligomenorrhea or amenorrhea and hyperandrogenism All subjects: medications known to affect either sex steroids or carbohydrate metabolism Mothers of control girls: history of irregular menstrual cycles or hirsutism Control girls: personal history of diabetes or family history of irregular menstruation, diabetes or hirsutism
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial. No mention of exclusion of secondary causes of oligoanovulation in PCOS probands (however likely to have been done as similar protocol to other studies by the same group)
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	Yes, age, weight and Tanner stage
Summary Result/s	Premenarchal first degree relatives of women with PCOS had higher rates of insulin resistance compared to age matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Control group recruited by school based study from centers in USA
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. USA centers only
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Laboratory measures standardised. Anthropometric measures method of assessment not described.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Anthropometric measures method of assessment not described.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained

CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	No.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government and health institution grant AMDeC (Academy for Medical Development and Collaboration) and NIH grant # 1 UL1 RR024156-01.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS		Control group was derived from a different population	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Control group from different population. Laboratory measures standardised.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Anthropometric measurements more at risk for bias.

Pituitary and testicular function in sons of women with polycystic ovary syndrome from infancy to adulthood. J Clin Endocrinol Metab. 2008 Sep;93(9):3318-24. doi: 10.1210/jc.2008-0255. Epub 2008 Jun 10. PMID: 18544620. Recabarren SE et al. (2008) Metabolic profile in sons of women with polycystic ovary syndrome (PCOS). J Clin Endocrinol Metab doi:10.1210/jc.2007-2256.
Study Country	Chile
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	80 sons of women with PCOS (20 infants, 31 children, and 29 adults)
Control population	56 sons of control women without hyperandrogenism (20 infants, 17 children, and 19 adults) of similar age and socioeconomic status
PCOS diagnostic criteria	NICHD 1990

N per group	Sons of PCOS women: N = 80. - Infant: N = 20. - Children: N = 31. - Adults: N = 29. Sons of control women: N = 56. - Infant: N = 20. - Children: N = 17. - Adults: N = 19. Definitions: infancy (2–3 months), childhood (4–7 yr), and adulthood (18–30 yr).	
Setting	Academic hospital / single centre / timeframe not defined	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Outcomes: - Weight (kg) - BMI (kg/m^2) Calculated by the Growth Analyzer Program using the U.S. Growth Charts BMI for age - Waist circumference - Total cholesterol (standard colorimetric assays) - LDL (standard colorimetric assays) LDL calculated by Friedewald's formula - HDL (standard colorimetric assays) - Triglycerides (standard colorimetric assays) - Fasting glucose (glucose oxidase method) - OGTT - 2 hour glucose (glucose oxidase method) After a 12-h overnight fast, an oral glucose tolerance test was performed by giving 1.75 g/kg, up to a maximum of 75 g glucose in 250 ml water. In children, 5 ml blood samples were obtained at baseline and 120 min after glucose administration. In adults, blood was withdrawn before and 30, 60, 90, and 120 min after the glucose load. In infants, a 3ml blood sample was obtained in the fasting state. Outcomes not relevant: - Fasting insulin (radioimmunometric assay) - 2 hour insulin (RIA) - Fasting HOMA-IR (homeostatic model assessment for insulin resistance) - Fasting SHBG (radioimmunometric assay) - Fasting adiponectin (RIA) - Fasting leptin (RIA) - CRP (ultrasensitive immunoturbidimetric assay)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. All PCOS sons were born at term after spontaneous conceptions, singletons. Control women have a history of singleton pregnancies, regular 28- to 32-d menstrual cycles. PCOS probands: normoglycaemic All participants: elevated WHR >0.85
Exclusion criteria	Yes Partial No Not reported	Yes.

			PCOS probands: hyperprolactinemia, androgen-secreting neoplasms, Cushing's syndrome, late-onset 21-hydroxylase deficiency, thyroid disease. Control mothers: hirsutism, other manifestations of hyperandrogenism, history of infertility or pregnancy complications. All participants: unrelated (no siblings)
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age and socioeconomic status.
Summary Result/s		When unadjusted for BMI, sons of PCOS women have higher weight during early infancy; higher weight, BMI, waist circumference, total cholesterol and LDL during childhood and adulthood compared to sons of women without hyperandrogenism.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of control women recruitment not specified.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Because the range definition for childhood (4–7 yr), and adulthood (18–30 yr) are relatively big and can exhibit unanalysed effects of confounding variables.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. - Because the range definition for childhood (4–7 yr), and adulthood (18–30 yr) are relatively big and can exhibit unanalysed effects of confounding variables. - Non-specific recruitment method for the control group.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DETECT	Were measurements (for exposures or outcomes)	Yes Partial	Yes

	carried out and calculated in a standard, valid and reliable way?	No Not reported	
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to cross-sectional study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. Ethics approval, protocol not registered prospectively.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial Method of control women recruitment not specified.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	Partial. One author has received lecture fees from Pfizer and Novo-Nordisk.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. Median and range reported, but not mean nor standard deviation. (Sample size quite small).
COMMENTS		Method of control women recruitment not specified.	
What is the overall risk of bias?		Low Moderate	Moderate

	High Insufficient information	- Non-specified recruitment method of control group. - Range definition for childhood (4–7 yr), and adulthood (18–30 yr) are relatively big and can exhibit unanalysed effects of confounding variables.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	No.

Study Country	USA
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	385 sisters women with PCOS diagnosed with PCOS according to1990 NICHD criteria. Subgrouped by phenotype: diagnosis of PCOS (n=51) / hyperandrogenism (n=38) / no features of PCOS (n=143) / unknown (n=153)
Control population	125 healthy controls with normal ovulatory cycles weight matched
PCOS diagnostic criteria	NICHD 1990
N per group	FDR: 385 sisters Control: 125 weight and ethnicity matched women
Setting	Hospital / Multicentre (3 centers)
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Weight (kg) (some self-reported with validation study) - not extracted as matched for weight - Height (cm) (some self-reported with validation study) - BMI (kg/m^2) - not extracted as matched for weight - Waist circumference - Systolic BP (mmHg) (measured in seated position in the right arm as the average of three separate readings obtained 2 min apart after a 5-min rest) - Diastolic BP (mmHg) - Fasting plasma glucose (glucose oxidase) - OGTT (75g) (glucose oxidase) After a 12-h overnight fast and 3 day carbohydrate diet, 75g glucose load was administered Blood was drawn for glucose and insulin at baseline and 2 h Glucose tolerance defined by WHO criteria

	Outcomes not relevant: - Insulin (double antibody method) - Hormonal studies: testosterone, DHEAS, gonadotropins (radioimmunoassay) - HOMA-IR - Metabolic syndrome (ATP III criteria) - could not be extracted as control group selected to not have metabolic syndrome - Lipid profile (enzymatic assay, Freidewald for LDL) - not reported - PCOS (NICHD criteria) - could not be extracted as control group selected to not have PCOS - Metabolic syndrome (could not be extracted as control group selected to not have metabolic syndrome)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes. Metabolic syndrome and dyslipidaemia
Inclusion criteria	Yes Partial No Not reported	Yes. Women were non-Hispanic Caucasian (to avoid confounding effects of ethnicity on metabolic endpoints) Control women: good health, sedentary
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS probands: other causes of anovulation and hyperandrogenaemia by laboratory testing Control women: personal or family history of history of hypertension or diabetes mellitus, oral contraceptive agents in preceding 3 months, hypertensive medications or insulin-sensitizing medications in preceding 1 month, clinical/biochemical evidence of hyperandrogenism
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	Yes, ethnicity and weight.
Summary Result/s	Sisters of women with PCOS had higher rates of metabolic syndrome compared to weight and ethnicity matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS: Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of deriving control group not defined

	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial.
DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Blood pressure and laboratory measures standardised. However self-report for height and weight
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Self report for height and weight.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not all participants could be assessed for metabolic syndrome (34% FDR included 131/385)
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	No. Some age differences.

OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government grant (National Institutes of Health Grants U54 HD34449, P50 HD44405, K12 RR017707, M01 RR00048, M01 RR10732, and M01 RR02635)
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. To control for the overrepresentation of families with multiple sisters, the data from sisters with the same phenotype was averaged to yield one value per phenotype per family
COMMENTS		Control group was derived from a different population	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Some outcomes self reported
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Some outcomes self reported but metabolic syndrome diagnosis relied on measurements on site by investigators

PMID: 21505042; PMCID: PMC3137384.
Study Country	USA
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	215 mothers of women with PCOS diagnosed with PCOS according to 1990 NICHD criteria.
Control population	62 healthy controls of similar age, weight and ethnicity
PCOS diagnostic criteria	NICHD 1990
N per group	FDR: 215 mothers Control: 62 age, weight and ethnicity matched women
Setting	Hospital / Multicenter / NHANES III (1998-1994) / FDR (1993-2004)

Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcome: LDL level Other outcomes: - Weight (kg) (some self-reported with validation study) - Height (cm) (some self-reported with validation study) - not extracted as matched for weight - BMI (kg/m^2) - not extracted as matched for weight - Waist circumference (some self-reported with validation study) - Systolic BP (mmHg) (measured in seated position in the right arm as the average of three separate readings obtained 2 min apart after a 5-min rest) - Diastolic BP (mmHg) - Fasting plasma glucose (glucose oxidase) - Lipid profile (enzymatic assay, Freidewald for LDL) Outcomes not relevant: - Insulin (double antibody method) - Hormonal studies: testosterone, DHEAS, gonadotropins, SHBG (radioimmunoassay) - HOMA-IR - Metabolic syndrome (NCEP/ATP III criteria) - data could not be extracted as there was no sample size for the NHANES III population used - Diabetes (ADA criteria) - data could not be extracted as control group selected to not have diabetes - OGTT (75g) (glucose oxidase) - could not be extracted as data for control group not reported After a 12-h overnight fast and 3 day carbohydrate diet, 75g glucose load was administered Blood was drawn for glucose and insulin at baseline and 2 h Glucose tolerance defined by WHO criteria	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes. Metabolic syndrome and dyslipidaemia
Inclusion criteria	Yes Partial No Not reported	Yes. Women were non-Hispanic Caucasian (to avoid confounding effects of ethnicity on metabolic endpoints) Control women: regular 27- to 35-day menstrual cycles throughout their reproductive life, normal glucose tolerance according to the World Health Organization criteria
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS probands: other causes of anovulation and hyperandrogenaemia by laboratory testing Control women: hypertension, personal or family history of history of diabetes mellitus, hormonal, antihypertensive antidiabetic medications, clinical/biochemical evidence of hyperandrogenism
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial	Not relevant to this systematic review

		No Not reported	
Was matching performed?		Yes Partial No Not reported	Yes, age, ethnicity and weight.
Summary Result/s		Mothers of women with PCOS had higher rates of hyperlipidaemia and insulin resistance compared to weight and ethnicity matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial. Control women for biochemical measures were a different cohort than control population for metabolic syndrome (method of deriving cohort not defined) NHANES III population (collected at 1988 to 1994 where the prevalence of metabolic syndrome may have been lower) as comparison for metabolic syndrome.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. NHANES III population does not have data on PCOS.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Blood pressure and laboratory measures standardised. However self-report for height and weight
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Self report for height and weight and waist circumference.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes.

ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	All control women and 21% of mothers (n = 45) underwent a 75-g oral glucose tolerance test with fasting and 2-h postchallenge blood sampling for glucose and insulin levels.
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	No. Some age differences despite age matching.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government grant (National Institutes of Health Grants U54 HD34449, P50 HD44405, K12 RR017707, M01 RR00048, M01 RR10732, and M01 RR02635)
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes. Powered for LDL
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS		2 control groups, of which one was derived from a nationwide registry population (NHANES III) and the other the method of derivation was not reported	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Some outcomes self reported
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Some outcomes self reported

Study Country	USA	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	196 brothers of 158 women with PCOS diagnosed with PCOS according to1990 NICHD criteria.	
Control population	169 healthy controls matched for age, BMI and ethnicity	
PCOS diagnostic criteria	NICHD 1990	
N per group	FDR: 196 brothers Control: 169 unrelated control men	
Setting	Hospital / Multicentre (3 centers) / January 1995 - October 2005	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Metabolic syndrome - Weight (kg) (some self-reported with validation study) - not extracted as matched for BMI - Height (cm) (some self-reported with validation study) - BMI (kg/m^2) - not extracted as matched for BMI - Waist circumference (some self-reported with validation study, calibrated tape measure provided) - WHR (data in Legro 2002 study) - Systolic BP (mmHg) (measured in seated position in the right arm single reading after 5-min rest) - Diastolic BP (mmHg) - Fasting plasma glucose (glucose oxidase) - OGTT (75g) (glucose oxidase) After a 12-h overnight fast and 3 day carbohydrate diet, 75g glucose load was administered Blood was drawn for glucose and insulin at baseline and 2 h Glucose tolerance defined by WHO criteria Outcomes not relevant: - Insulin (double antibody method) - Hormonal studies: testosterone, DHEAS, gonadotropins (radioimmunoassay) - HOMA-IR - Metabolic syndrome (ATP III criteria) - could not be extracted as control group selected to not have metabolic syndrome - Lipid profile (enzymatic assay, Freidewald for LDL) - not reported	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes.

Inclusion criteria		Yes Partial No Not reported	Yes. Men were non-Hispanic Caucasian (to avoid confounding effects of ethnicity on metabolic endpoints) Control men:normal glucose tolerance (WHO criteria),
Exclusion criteria		Yes Partial No Not reported	Yes. PCOS probands: nonclassic 21-hydroxylase deficiency, hyperprolactinemia, and androgen-secreting tumors All men: medications known to alter sex hormone metabolism or glucose homeostasis for at least 1 month before the study Control men: major medical / psychiatric illnesses, hypertension, diabetes, family history of diabetes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial. Unable to screen control men for family history of PCOS (not all have female first degree relatives of reproductive age, unknown history, PCOS often remains undiagnosed). Assuming in power calculations that ~7% male control subjects will have a first degree relative with PCOS (general population prevalence)
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes. Age, BMI and ethnicity
Summary Result/s		Brothers of women with PCOS had higher rates of dyslipidaemia and insulin resistance compared to age, BMI and ethnicity matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of deriving control group not defined
SELECTION BIAS	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
SELECTION BIAS	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Control men may have first degree relatives with PCOS.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial. Different sites used for measurements with validation studies.

DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Blood pressure and laboratory measures standardised. However self-report for height and weight
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Self report for height and weight.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	No. Some age differences - brothers significantly younger than control men.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government grant (National Institutes of Health Grants U54 HD34449, P50 HD44405, K12 RR017707, M01 RR00048, M01 RR10732, and M01 RR02635)
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes. Power calculation to account for control men potentially having a first degree relative with PCOS
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. In families with multiple brothers, the brothers' data were averaged to yield one mean value per family.
COMMENTS		Control group method of derivation not described	

What is the overall risk of bias?	Low Moderate High Insufficient information	Moderate. Some outcomes self reported (validation studies performed)
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	Yes. Some outcomes self reported (validation studies performed)	

Study ID	Sir-Petermann 2004	
Study Citation	Sir-Petermann T, Cartes A, Maliqueo M, Vantman D, Gutiérrez C, Toloza H, Echiburú B, Recabarren SE. Patterns of hormonal response to the GnRH agonist leuprolide in brothers of women with polycystic ovary syndrome: a pilot study. Hum Reprod. 2004 Dec;19(12):2742-7. doi: 10.1093/humrep/deh512. Epub 2004 Sep 9. PMID: 15358722.	
Study Country	Chile	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	22 unrelated brothers of 22 women with PCOS between age 20 and 30 years of age	
Control population	14 brothers of normal cycling women matched for age and BMI	
PCOS diagnostic criteria	NICHD criteria; Rotterdam 2003	
N per group	Brothers of PCOS women: N = 22 Brothers of control women: N = 14	
Setting	Academic clinic / single center / 2002-2003	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Outcomes: - Weight (kg) - not extracted as matched for BMI - BMI (kg/m^2) - not extracted as matched for BMI - Waist circumference (to the nearest 0.5 cm at the point of narrowing (as viewed from behind) between the umbilicus and xiphoid process) - Lipid profile (standard colorimetric assays) LDL calculated by Friedewald's formula - Fasting glucose (glucose oxidase method) - OGTT - 2 hour glucose (glucose oxidase method) After a 3 days of a diet containing 300 g of carbohydrate per day and an overnight fast of 10 h, an oral glucose tolerance test was performed by giving 75 g glucose. Blood samples were obtained at baseline and 30, 60, 90 and 120 min after glucose administration. Glucose tolerance defined by WHO criteria Outcomes not relevant: - Insulin (radioimmunometric assay) - Testicular volume (Prader orchidometer by a single endocrinologist) - HOMA-IR (standardised calculation) - Insulin sensitivity composite index (ISI) (standardised calculation) - Hormonal studies: LH, FSH, SHBG, testosterone, DHEAS, 17-OH progesterone, AMH (radioimmunometric) - Leuprolide acetate test - Premature male pattern baldness (Hamilton scale)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No	Yes. Response to leuprolide, OGTT and lipid profile

		Not reported	
Inclusion criteria		Yes Partial No Not reported	Yes. PCOS probands: anovulatory as indicated by progesterone measurements and ultrasound examinations Control brothers: normal medical history and physical examination, sisters with regular 28 to 32 day menstrual cycles,
Exclusion criteria		Yes Partial No Not reported	Yes. PCOS probands: Patients with hyperprolactinemia, androgen-secreting neoplasms, Cushing's syndrome, and late-onset 21-hydroxylase deficiency as well as thyroid disease. Control brother: sisters with hirsutism, other manifestations of hyperandrogenism, history of infertility or pregnancy complications.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Partial, case control. No follow-up for future cardiovascular events
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age and BMI match
Summary Result/s		Sons of women with PCOS had higher rates of dyslipidaemia during puberty compared to controls matched by Tanner stage	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of control recruitment were control women recruited from hospital staff and university students in the same city area as the PCOS patients, with the same socio-economic status, and thne contact of their brothers.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. National Institutes of Health consensus criteria.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.

PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. No report on method of measurement of weight and height
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. No report on method of measurement of weight and height
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. Ethics approval, protocol not registered prospectively.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial Control brothers from similar geographic region and socioeconomic status
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by Fondo Nacional de Desarrollo Científico y Tecnológico (National Fund for Scientific and Technological Research; Fondecyt; Grants 1030487-1151531), and the Alexander von Humboldt Foundation.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. Mean and range reported. Subgroup by response to leuprolide
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Measurement of height and weight not reported.

Study Country	Chile
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	135 daughters of women with PCOS between age 8 and 16 years of age, subgroup by Tanner stage
Control population	93 daughters of control women without hyperandrogenism between age 8 and 16 years of age, matched by Tanner stage and maternal age
PCOS diagnostic criteria	NICHD 1990
N per group	Daughters of PCOS women: N = 135 - Tanner I (mean age 8.6 years): N = 30 - Tanner II (mean age 9.9 years): N = 26 - Tanner III (mean age 10.8 years): N = 26 - Tanner IV (mean age 12.2 years): N = 29 - Tanner V (mean age 13.2 years): N = 24 Daughters of control women: N = 93 - Tanner I (mean age 8.6 years): N = 21 - Tanner II (mean age 9.9 years): N = 17 - Tanner III (mean age 10.8 years): N = 19 - Tanner IV (mean age 12.2 years): N = 17 - Tanner V (mean age 13.2 years): N = 19
Setting	Academic hospital/ Single centre / timeframe not specified
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: AMH and stimulated insulin Other outcomes: - Weight (kg) - BMI (kg/m^2) Calculated by the Growth Analyzer Program using the U.S. Growth Charts BMI for age (previously shown to be applicable to the Chilean population) - Waist circumference - WHR - OGTT - 2 hour glucose (glucose oxidase method) After a 12-h overnight fast, an oral glucose tolerance test was performed by giving 1.75 g/kg, up to a maximum of 75 g glucose in 250 ml water. 5 ml blood samples were obtained at baseline and 30, 60 and 120 min after glucose administration. Glucose tolerance defined by ADA criteria - Fasting plasma glucose (glucose oxidase method) - Fasting insulin (radioimmunometric assay)

	- Obesity Defined as a body weight >95th percentile. Outcomes not relevant: - Hirsutism (determining the presence of terminal hair using the modified Ferriman-Gallway score) - Acne and acanthosis nigricans - HOMA-IR - Whole-body insulin sensitivity composite index (ISI) - LH, FSH, estradiol (electrochemiluminiscence) - Testosterone, androstenedione, 17-OHP, SHBG (radioimmunometric assay) - AMH (enzyme immunoassay) - FAI Basal serum testosterone to SHBG ratio x 100 - Ovarian volume (transabdominal ultrasonography plus the simplified formula for a prolate ellipsoid)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. All girls were born at term from singleton pregnancies; only evaluated in 1 Tanner stage. Control mothers comparable in age with PCOS mothers, had a history of regular 28- to 32-day menstrual cycles.
Exclusion criteria	Yes Partial No Not reported	Yes. Girls taking oral contraceptives or any other medications. Control mothers with hirsutism or other manifestations of hyperandrogenism, or with a history of infertility or pregnancy complications were excluded.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control.
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	Yes, both experimental and control group girls were matched using the Tanner stage score for breast development. Control mothers matched in age,

Summary Result/s		No difference in fasting glucose, fasting insulin, OGTT, weight or waist-to-hip ratio between daughters of PCOS and control of women.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of control group recruitment not specified.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. National Institutes of Health consensus criteria.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial Method of control group recruitment not specified. But Tanner stage matched.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. - Measurement biases can occur with weight, height, waist and hip circumferences (method not specified)
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not relevant to case control study

REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. No protocol registration. Obtained ethics approval.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Method of deriving control group not defined
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No conflict of interest. Funding source: a grant from FONDECYT 1071007 and by the Alexander von Humboldt foundation.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. Mean and SEM reported.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Waist and hip circumferences, and thus the waist to hip ratio were more prone to measurement biases.

Study Country	USA
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	

Patient/population/ participants	12 premenarchal first degree relatives of women with PCOS (either mother or sister) diagnosed with PCOS according to 1990 NICHD criteria.	
Control population	10 daughters of control mothers, matched for age, BMI, visceral adipose tissue and Tanner stage	
PCOS diagnostic criteria	NICHD 1990	
N per group	FDR: 12 premenarchal first degree relatives Control: 10 daughters of control women	
Setting	Hospital / Single center	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Outcomes: - Weight (kg) (to the nearest 0.1 kg) - not extracted as matched for BMI - Height (cm) (to the nearest 0.1 cm) - BMI (kg/m^2) - reported as z score - not extracted as matched for BMI - OGTT (75g) After a 12-h overnight fast, glucose load of 1.7 g/kg, followed by blood samples collected at 0, 30, 60, 90, and 120 min - Lipid profile (enzymatic assay, Freidewald for LDL) Outcomes not relevant: - Insulin (double antibody method) - Tanner stage (single trained study coordinator) - ISI - Acute insulin response to glucose (AIRg) - Disposition index - Glucose clearance - Hormonal studies: AMH, DHEAS, gonadotropins (radioimmunoassay), LH/FSH (ELISA), testosterone (tandem mass spectrometry / isotope dilution liquid chromatography) - Frequently sampled glucose tolerance test (Glucose (0.3 g/kg) was administered iv at time 0 and 0.03 U/kg regular insulin was administered iv at time 20 minutes. This was followed by frequent blood samples for 15 minutes before and 180 minutes after the iv glucose) - Visceral adipose tissue (measured by MRI) - Impaired fasting glucose / impaired glucose tolerance - not extracted as control group selected to not have dysglycaemia	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes. Insulin sensitivity and reproductive hormones
Inclusion criteria	Yes Partial No Not reported	Yes. All subjects: well, age 8 –12 years, Tanner Stage I-III breast development, and 85th to 98th BMI percentile Mothers of control girls: regular menses every 27–35 days
Exclusion criteria	Yes Partial No Not reported	Yes. All subjects: medications known to alter reproductive hormone metabolism or glucose homeostasis for at least 1 month prior to study Mothers of control girls: history of reproductive disorders, signs or symptoms of androgen excess by validated questionnaire

			Control girls: Dysglycemia [fasting glucose 100 mg/dL and/or 2 h postglucose challenge glucose 140 mg/dL
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial. No mention of exclusion of secondary causes of oligoanovulation in PCOS probands (however likely to have been done as similar protocol to other studies by the same group)
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age, BMI, Tanner stage, visceral adiposity
Summary Result/s		Daughters of women with PCOS had higher rates of insulin resistance compared to age, BMI and pubertal stage matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Control group recruited by local media and online advertisements
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Hyperandrogenism in mothers of control women screened by validated questionnaire
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Laboratory measures standardised. Testosterone levels validated in adult cohort
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported

	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
ATTRITION BIAS	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Screened: 14 FDR, 25 control Enrolled: 12 FDR, 10 control (due to not meeting inclusion criteria / not tolerating study procedures) Analysed: 7 FDR, 8 control (completed biochemistry) 2 year follow-up: 6 FDR, 8 control
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	No.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government and health institution grant R01 DK073411, P50 HD044405, UL1 TR000150, U54 HD28934.
OTHER BIAS	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
OTHER BIAS	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. Median and IQR as data not normally distributed
COMMENTS		Control group was derived from a different population	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Some attrition in measurements. No blinding / independent assessment of BMI. Laboratory measures standardised.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No.

CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	21 daughters of women with PCOS diagnosed with PCOS according to 1990 NICHD criteria.	
Control population	36 daughters of control mothers, matched for age and ethnicity	
PCOS diagnostic criteria	NICHD 1990	
N per group	FDR: 21 daughters Control: 36 daughters of control women	
Setting	Hospital / Single center	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Outcomes: - Weight (kg) (to the nearest 0.1 kg) - reported as weight for length z-score (US Centers for Disease Control and Prevention 2000 growth charts) Outcomes not relevant: - Hormonal studies: cortisol / cortisone / androgen / mineralocorticoid metabolites (quantitative gas chromatography-mass spectrometry)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes. Ratio of 5-reduced tetrahydrocortisol (5THF) to its 5-reduced metabolite, THF (5THF/THF), a measure of 5-reductase activity
Inclusion criteria	Yes Partial No Not reported	Yes. All subjects: well, age 1-3 years Mothers of control girls: regular menses every 27–35 days
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS proband: other reproductive disorders causing anovulation All subjects: medications known to alter reproductive hormone metabolism Mothers of control girls: signs or symptoms of androgen excess by validated questionnaire
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial.

Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age and ethnicity
Summary Result/s		Daughters of women with PCOS had higher weight different levels of androgen metabolites compared to age and ethnicity matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Control group recruited by local media and online advertisements
SELECTION BIAS	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. PCOS defined.
SELECTION BIAS	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Hyperandrogenism in mothers of control women screened by validated questionnaire
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial. Weight self reported
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Laboratory measures standardised. Urine steroid metabolites with recalculation of average 24 hour excretion rates. Weight self reported
DEDETECTION BIAS	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
DEDETECTION BIAS	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Were outcomes assessed objectively and independently?	Yes Partial No	Partial. Weight self reported

		Not reported	
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Not reported No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	No.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government and health institution grant P50 HD044405, K12 HD055884, G1001964, 092283
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes, urine metabolites.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS		Control group was derived from a different population	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Control group from a different population. Weight self reported
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Weight self reported

Study Citation	Unlühizarci K, Ozocak M, Tanriverdi F, Atmaca H, Keleştimur F. Investigation of hypothalamo-pituitary-gonadal axis and glucose intolerance among the first-degree female relatives of women with polycystic ovary syndrome. Fertil Steril. 2007 Jun;87(6):1377-82. doi: 10.1016/j.fertnstert.2006.11.075. Epub 2007 Mar 6. PMID: 17336975.
Study Country	Turkey

CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	70 Female first degree relatives of women with PCOS	
Control population	20 control women without hyperandrogenism	
PCOS diagnostic criteria	Rotterdam 2003	
N per group	Female first degree relatives of PCOS women: N = 70 - Sisters (mean age 26.5 years): N = 66 - All Female first degree relatives (mean age 27.3 years): N = 70 Control women: N = 20 - Mean age 26.5 years	
Setting	Academic hospital / single center / timeframe not defined	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Outcomes: - BMI (kg/m^2) - extracted as not specified that matched by BMI - OGTT - 2 hour glucose Glucose level expressed as area under the curve (AUC) estimated by the trapezoidal rule An oral glucose tolerance test (OGTT) was performed between 8:00 and 10:00 AM after 11–12 hours of fasting. A 300-g carbohydrate diet was given for 3 days before the OGTT. After a basal blood sample was obtained, a 75-g glucose load was administered orally and blood samples were obtained at 30-minute intervals for 2 hours for the measurement of glucose and insulin. - Fasting glucose Outcomes not relevant: - Impaired glucose tolerance (Outcome could not be extracted due to lack of data for control group) Glucose tolerance was evaluated by using the criteria of ADA IGT defined as 2-hour post-load glucose 140 mg/dL and 200 mg/dL - PCOS (Outcome could not be extracted as control population selected to not have PCOS) - Rotterdam criteria - Fasting and OGTT insulin (RIA) - HOMA score Calculated with the formula: fasting serum insulin (U/mL) x fasting plasma glucose (mmol/L)/22.5 - Insulinogenic index Calculated as a ratio of the increment of serum insulin 30 minutes after the oral glucose load to blood glucose concentration 30 minutes after the glucose load ([30-min insulin fasting insulin]/[30-min glucose fasting glucose]) - Baseline LH, FSH, estradiol, free testosterone, DHEAS, SHBG, androstenedione, 17-OH progesterone FSH, LH, and estradiol levels measured by automated chemiluminescence system Free testosterone and DHEAS measured by RIA SHBG level measured by IRMA - Hormonal level in buserelin testing: LH, FSH, estradiol, 17-OH progesterone Serum samples for hormone levels were drawn after an overnight fast in the follicular phase of the menstrual cycle.	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes

Inclusion criteria	Yes Partial No Not reported	Yes. Control women: healthy premenopausal eumenorrheic; normal ovarian appearance on ultrasonography.
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS proband: nonclassic adrenal hyperplasia, Cushing's syndrome, thyroid dysfunction, hyperprolactinemia Control women: personal or family history of hirsutism, endocrine disorder, or diabetes. All participants: any medication known to alter carbohydrate metabolism or hormonal investigations.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control.
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	Not reported. BMI appeared similar but unclear if this is by design
Summary Result/s	Female first degree relatives have similar BMI but significantly higher fasting glucose and 2hr glucose than control women. No conclusion about IGT prevalence can be made due to lack of data presented for control group.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of control women recruitment not specified.
SELECTION BIAS – Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. Rotterdam criteria
SELECTION BIAS – Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. No matching performed.

PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Method of BMI measurement not specified.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial Method of BMI measurement not specified.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case-control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported.
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. Not registered. No ethical approval.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial Method of control women recruitment not specified.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	Not reported.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported.

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS		Method of control women recruitment not specified.	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate - Non-specified recruitment method of control group. - Single endocrinologist
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. BMI more prone to measurement biases.

Study Citation	Vipin VP, Dabadghao P, Shukla M, Kapoor A, Raghuvanshi AS, Ramesh V. Cardiovascular disease risk in first-degree relatives of women with polycystic ovary syndrome. Fertil Steril. 2016 May;105(5):1338-1344.e3. doi: 10.1016/j.fertnstert.2016.01.024. Epub 2016 Feb 4. PMID: 26852421.
Study Country	India
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	41 fathers and 45 mothers of 47 women with PCOS diagnosed with PCOS according to Rotterdam 2003 criteria
Control population	42 men and 44 women age and BMI matched
PCOS diagnostic criteria	Rotterdam 2003 (28/47 fulfilled NIH criteria)
N per group	FDR: 41 fathers; 45 mothers Control: 42 / 44 age and BMI matched controls
Setting	University Hospital / Single centre / November 2012 - November 2014
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Carotid intima media thickness (single blinded observer, ultrasound, standardised protocol) - Brachial artery flow-mediated dilatation (single blinded observer, ultrasound, standardised protocol) Other outcomes: - Weight (kg) (single observer) - not extracted as matched for BMI - Height (m) (single observer) - BMI (kg/m^2) (automated BP measurement) - not extracted as matched for BMI - Waist circumference (measured at midpoint between the iliac crest and lower rib margin at the end of normal expiration) - Hip circumference (measured at the widest level of the greater trochanters) - Systolic BP (mmHg) (measured three times in a sitting position) - Diastolic BP (mmHg) - Fasting plasma glucose (glucose oxidase) - OGTT (75g loading) ADA criteria 2019 to evaluate glucose tolerance - Lipid profile (standard colorimetric assays)

	- Metabolic syndrome (IDF criteria) - T2DM (ADA criteria) - Hypertension (JNC 7 criteria) - IFG (ADA criteria) - IGT (ADA criteria) Outcomes not relevant: - HOMA-IR - QUICKI - DHEAS, testosterone (radioimmunoassay) - C-peptide (ELISA) - High sensitivity CRP, FSH, LH, TSH, prolactin, SHBG (chemiluminescence) - Fasting insulin (ELISA)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. First degree relatives of women with PCOS diagnosed by the Rotterdam 2003 criteria. Age <70 years
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS probands: attending medical services for metabolic health Parents: >70 years old, had liver or renal failure, malignancy, or any acute medical illness in recent past (within 3 months), attending endocrine clinic for metabolic health
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	No. Insufficient follow-up for clinical cardiovascular events
Was matching performed?	Yes Partial No Not reported	Yes, age and BMI.
Summary Result/s	Siblings of women with PCOS had higher rates of metabolic syndrome and insulin resistance than age and weight matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS: Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Control group using hospital staff and relatives of other endocrine clinic patients

	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. Rotterdam criteria.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Family members of patients attending endocrine clinic potentially have a family history of diabetes.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes (for the primary outcome).
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes for primary outcome. Other outcomes not reported
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	50 families recruited. 47 PCOS probands had parents who consented to participate.
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Only age and BMI matched

OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by university grant - Intramural Research Grant (PGI/DIR/RC/943/2013)
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes. Powered for carotid intima media thickness and flow-mediated dilatation
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes. Some data in median, IQR.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Method of derivation of control cohort.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Laboratory measurements are less subject to bias than measurements of blood pressure / weight / height.	

Study ID	Wang 2021
Study Citation	Wang Y, Guo L, Jiang J, Wang F, Hardiman PJ, Qu F. Development of 1-2 years Offspring Born to Mothers with Polycystic Ovary Syndrome. J Coll Physicians Surg Pak. 2021 Oct;31(10):1186-1190. doi: 10.29271/jcpsp.2021.10.1186. PMID: 34601839.
Study Country	China
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	29 children of women with PCOS diagnosed with PCOS according to Rotterdam 2003 criteria
Control population	116 children of women without PCOS
PCOS diagnostic criteria	Rotterdam 2003
N per group	FDR: 29 children Control: 116 children Matched by socioeconomic status / age 4:1
Setting	Academic hospital / Single centre / June 2018 - January 2019
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - BMI - Denver developmental screening test (DDST) - not extracted Outcomes not relevant: - Demographic characteristics of mothers: age, BMI, employment, education, parity, material weight gain, pregnancy complications, mode of delivery - Neonatal outcomes: gestational age, birth weight, Apgar score

		- Head circumference	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes. Control mothers: regular 28- to 32-day menstrual cycles All participants: singleton pregnancy
Exclusion criteria		Yes Partial No Not reported	Yes. PCOS women with other causes of oligomenorrhea or hyperandrogenism such as Cushing's syndrome and hypothyroidism were excluded. All participants: < 37-week gestational age, < 2500-g birth weight, missing data, birth asphyxia, congenital diseases Control mothers: hirsutism, other manifestations of hyperandrogenism
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review. Not enough follow-up for cardiovascular disease.
Was matching performed?		Yes Partial No Not reported	Yes. Age and socioeconomic status
Summary Result/s		1-2 year old children of women with PCOS were of lower BMI than age and socioeconomic status matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Yes.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. Rotterdam criteria.

	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. No method of measurement described for BMI
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes. Blinding performed
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. No protocol registration. No ethics approval.
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Not matched for gender.
	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government grant (National Natural Science Foundation of China (81874480; 81873837), the Zhejiang Province Science Foundation for Distinguished Young Scholars (LR16H0 40001))

OTHER BIAS	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low. Method of outcome assessment not fully described but independently assessed and blinded.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No. Independent blinded assessment

Study Country	Turkey
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	26 fathers, 37 mothers, 19 sisters and 25 brothers of 52 women with PCOS diagnosed with PCOS according to NICHD 1990 criteria
Control population	Family members of 35 women who come for routine check-up between the age of 18-35 years with no prior family history of PCOS and DM (75 controls age and weight matched)
PCOS diagnostic criteria	NICHD 1990
N per group	FDR: 24 fathers; 34 mothers; 19 sisters; 25 brothers Control: 12 / 24 / 31 / 15 age and weight matched controls by the above subgroups Mothers subgrouped by pre or postmenopausal state
Setting	Hospital / Single centre
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Weight (kg) - not extracted as matched for weight - Height (m) - BMI (kg/m^2) - not extracted as matched for weight - Waist circumference (measured at midway between the lower rib margin and the iliac crest) - Hip circumference (measured at the widest circumference over the great trochanters) Outcomes not relevant: - Fasting insulin (chemiluminescence) - OGTT (glucose oxidase) - ADA criteria - baseline and 2 hour glucose not reported

	Between 0800–1000 h after a 3-d, 300-g carbohydrate diet and an overnight fast of 10–14 h 75 g load Blood samples for glucose and insulin determinations were collected at 0, 30, 60, 90, and 120 min - HOMA-IR - Insulin, LH, FSH, Estradiol, testosterone, androstenedione, and DHEAS (radioimmunoassay) - PCOS / DM / IGT IFG (cannot be extracted as control group selected to not have the outcome of interest)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. Female controls: pre-menopausal, regular ovulatory cycles (every 27-35 days) All participants: All medications, including oral contraceptives, known to alter sex hormone metabolism or insulin action and/or kinetics discontinued for at least 3 months
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS probands: Cushing's syndrome, nonclassical 21-hydroxylase deficiency, hyperprolactinemia, thyroid dysfunction, androgen-secreting tumors Female controls with personal history of PCOS / hyperandrogenism Controls: family history of PCOS or DM
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case control.
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	Yes, age and weight.
Summary Result/s	First degree relatives of women with PCOS had high rates of glucose intolerance than age and weight matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Method of deriving control group not defined
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. NICHD criteria.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Method of deriving control group not defined
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Method of measurement of height and weight not described.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Method of measurement of height and weight not described.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	No. Single assessor.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Available and living: 51 mothers, 52 fathers, 34 sisters, and 45 brothers Consented to participate: 37 mothers (73%), 26 fathers (50%), 19 sisters (56%), and 25 brothers (56%)
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	No protocol registration. Ethics approval obtained

CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Only age and weight matched
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by government grant (Scientific and Technical Research Council of Turkey)
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate. Single assessor non blinded.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Laboratory measurements are less subject to bias than measurements of BMI/height/weight.	

Study ID	Yilmaz 2005

Study Country	Turkey
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	38 fathers, 40 mothers, 25 sisters and 17 brothers of 55 women with PCOS diagnosed with PCOS according to Rotterdam 2003 criteria Substudy with 120 family members analysed as a whole group reported in another publication
Control population	Family members of 35 women who come for routine check-up between the age of 18-35 years with no prior family history of PCOS and DM (75 controls age and weight matched)
PCOS diagnostic criteria	Rotterdam 2003

N per group	FDR: 38 fathers; 40 mothers; 25 sisters; 17 brothers Control: 20 / 20 / 20 / 15 age and weight matched controls by the above subgroups	
Setting	Hospital / Single centre	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Weight (kg) - not extracted as matched for weight - Height (m) - BMI (kg/m^2) - not extracted as matched for weight - Waist circumference (measured at the narrowest level between the costal margin and the iliac crest) - Hip circumference (measured at the widest level over the buttocks with the subject standing and breathing normally) - Systolic BP (mmHg) - Diastolic BP (mmHg) - Fasting plasma glucose - OGTT (75g loading) ADA criteria 2003 to evaluate glucose tolerance - Lipid profile (standard colorimetric assays) Outcomes not relevant: - Fasting insulin (chemiluminescence) - HOMA-IR - Insulin sensitivity index - QUICKI - Lipoprotein (a), Aproprotein A, Apoprotein B (nephelometric assay) - FSH, LH, prolactin, DHEA-S, insulin, cortisol, TSH (chemiluminescence) - 17-OH progesterone, free testosterone, androstenedione (radioimmunoassay) - B12 (chemiluminescence) - Folate (autoanalyser) - Adiponectin (enzyme-linked immunosorbent assay) - Resistin (competitive enzyme immunoassay) - Homocysteine (high performance liquid chromatography)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. First degree relatives of women with PCOS diagnosed by the Rotterdam 2003 criteria. Control group age range of 18-35 years. Female controls who were pre-menopausal had regular ovulatory cycles (every 21-35 days)
Exclusion criteria	Yes Partial No Not reported	Yes. PCOS probands with DM, hyperprolactinaemia, congenital adrenal hyperplasia, thyroid disorders, Cushing disease, hypertension, hepatic or renal dysfunction were excluded. Female controls with personal history of PCOS / hirsutism (Ferriman Gallwey score >8) / acne were excluded. Controls had no family history of PCOS or DM
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes

Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case control.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Yes, age and weight.
Summary Result/s		First degree relatives of women with PCOS had high rates of hypertension, hyperlipidaemia and glucose intolerance than age and weight matched controls	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	Partial Control group using healthy family members of women presenting for routine care for other reasons.
SELECTION BIAS	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes. Rotterdam criteria.
SELECTION BIAS	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Partial.
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	Partial.
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
DEDETECTION BIAS	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
DEDETECTION BIAS	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported.

ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not relevant to case control study
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	No protocol registration. Ethics approval obtained
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Only age and weight matched
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Laboratory measurements are less subject to bias than measurements of blood pressure from different populations.	

6.3. Template for COHORT STUDIES

Study ID	deWilde 2018
Study Citation	deWilde MA, Eising JB, Gunning MN, Koster MPH, Evelein AMV, Dalmeijer GW, Uiterwaal CSPM, Eijkemans MJC, Ent CKV, Meijboom FJ, Fauser BCJM. Cardiovascular and Metabolic Health of 74 Children From Women Previously Diagnosed With Polycystic Ovary Syndrome in Comparison With a Population-Based Reference Cohort. Reprod Sci. 2018 Oct;25(10):1492-1500. doi: 10.1177/1933719117749761. Epub 2018 Jan 10. PMID: 29320957.
Study Country	Netherlands

EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Offspring of women with PCOS (n=74) compared to healthy offspring from a prospective cohort recruited from the same geographical region (n=298) subgroup by age Younger subgroup Age= FDR: 3.3±0.6 years, controls: 3.7±0.2 years (younger subgroup inclusion age range 2.5-4 Years) BMI= FDR: 15.9±1.6kg/m², controls: 16.4±1.3 kg/m² Older subgroup Age= FDR: 7.0±0.8 years, controls: 8.1±0.5 years (older subgroup inclusion age range 6-8 Years) BMI= FDR: 15.3±1.5kg/m², controls: 15.8±1.7 kg/m²	
PCOS diagnostic criteria	Rotterdam 2003	
N per group	The number of participants that were: Screened: 113 proband women with PCOS (excluded n=39 did not consent; n=1 T1DM in child); control cohort ongoing recruitment with aim of 2000 newborns Enrolled: FDR = 74, controls= 298 Allocated: FDR = 74, controls= 298 Assessed and followed up: FDR = 74, controls= 298	
Setting	Prospective cohort study FDR: single center; PCOS proband delivered a newborn between January 2005 and December 2010 asked to participate; screening took place February 2013 to July 2014 Control: multicenter; all healthy newborns born since 2001 in similar geographical region invited in follow-up study	
Intervention/ indicator	Offspring of women with PCOS	
Comparison/ Control	Healthy newborns (however PCOS criteria during preconception could not be determined) No matching performed outside of age range inclusion criteria and recruitment from same geographical regiom	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcome: Pulse wave velocity of aorta by arteriography Outcomes measured: - Height (stadiometer) - Weight (digital scale) - BMI (calculated as weight / height^2) - Waist circumference (measured twice after expiration between the > superior iliac anterior spine and the lowest rib) - Blood pressure (arteriography and non invasive measurements) - Fasting glucose - Lipid profile (autoanalyser / standard enzymatic assay, Friedewald equation) Outcomes not relevant: - Fasting insulin (chemiluminescence immunoassays) - Breast circumference - Transthoracic echocardiogram (1 observer blinded for clinical measurements of children) - Carotid intima media thickness (1 observer) - HOMA-IR - C reactive protein	
Inclusion criteria reported?	Yes	Yes.
Exclusion criteria reported?	Yes Partial	Yes.

		No Not reported	FDR: heart defect, type I diabetes, or a respiratory infection less than 2 weeks before screening Control: gestational age <36 weeks, major congenital abnormalities, or neonatal respiratory disease Unable to assess PCOS status of mothers of control children
Does the study have a clearly focused question?		Yes Partial No Not reported	Yes.
Is a cohort study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Does the study have specified inclusion/ exclusion criteria?		Yes Partial No Not reported	Yes.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial. PCOS status of the mothers of control children unable to be assessed.
Were the outcomes measured appropriate?		Yes Partial No Not reported	Partial. Pulse wave velocity of the aorta as a primary outcome is not a typically used clinical measure of cardiovascular risk, however
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	No. Duration of follow-up likely not long enough to capture cardiovascular disease
Was matching performed?		Yes Partial No Not reported	No.
Summary of Result/s		Offspring of women with PCOS had higher rates of dyslipidaemia compared to a reference cohort.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Other than the exposure under investigation, were the groups selected from similar populations?	Yes	No. Control cohort came from a prospective study of healthy newborns recruited from the same geographical region of which PCOS status of the mothers could not be ascertained.
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Partial. (35% of screened participants were included)
	Is it clear that the outcome of interest	Yes Partial No	Yes.

	was not present at the start of study?	Not reported	
PERFORMANCE BIAS	Aside from the exposure, were the groups treated the same?	Yes Partial No Not reported	Yes
DETECTION BIAS	Was exposure measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Yes.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Yes..
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	PCOS= 14% Controls= 14%	FDR= 0% Controls= 0%
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Blood pressure FDR= 15% Controls= 11% Blood assessments for glucose and lipid profile FDR= 15% Controls= 11%
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Yes. Ethics approval present. Study registration for included cohorts present (trial number NCT01767051 and NCT02309047)
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Not matched and no possibility of ascertaining PCOS status.
	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Multiple sources of funding disclosed (university grant, heart foundation grant, medical council grant). Pharmaceutical company funding disclosed but no involvement of pharmaceutical company in publication of study.

OTHER BIAS	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Power calculation for pulse wave velocity
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes. Single imputation for missing data.
COMMENTS		Control cohort difficult to ascertain if mothers had no PCOS	
What is the overall risk of bias?		High	Moderate. Difficult to ascertain control cohort. Independent assessment of outcomes.
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No All outcomes low risk of bias.

Study Citation	Harnois-Leblanc S, Trottier A, Leblanc S, Battista MC, Geller DH, Baillargeon JP. Evolution of metabolic alterations 5 Years after early puberty in a cohort of girls predisposed to polycystic ovary syndrome. Reprod Biol Endocrinol. 2017 Jul 24;15(1):56. doi: 10.1186/s12958-017-0275-0. PMID: 28738839; PMCID: PMC5525344. (primary citation) Leblanc, S. H., Leblanc, S., Battista, M. C., Geller, D. H., & Baillargeon, J. P. (2016). Evolution of metabolic alterations 5 years after peri-pubertal years in young girls genetically predisposed to polycystic ovary syndrome compared to age-matched control girls. Endocrine Reviews, 37(2 Supplement 1). doi:https://dx.doi.org/10.1210/endo-meetings.2016.RE.5.SUN-156
Study Country	Canada
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Female first degree relatives of women with PCOS (n=8) compared to age-matched controls without family history of PCOS (n=8). Median Age: 17.5 years; IQR: 14.4-20.1 years Median BMI: 22.7 kg/m²; IQR: 21.5-30.8 kg/m²
PCOS diagnostic criteria	AE-PCOS 2009
N per group	The number of participants that were: Screened: 7 proband women with PCOS; 9 FDR (6 daughters, 1 sister); control cohort (n=10) Enrolled: FDR = 7, controls= 8 Allocated: FDR = 8 (newly recruited FDR), controls= 8 Assessed and followed up (5 year follow-up cohort): FDR = 7, controls= 8
Setting	Prospective cohort study. University Hospital, 2007-2015, Single center, median follow-up 5.4 years
Intervention/ indicator	Sisters / daughters of women with PCOS
Comparison/ Control	Controls without history of PCOS Age matched

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcomes: - Frequently sampled intravenous glucose tolerance test (FSivGTT)-derived insulin sensitivity (IS) and beta-cell function (disposition index, DIFSivGTT) - NEFA suppression during FSivGTT (logn-linear slope of NEFA and T50 of NEFA suppression). Outcomes measured: - Height - Weight - BMI (calculated as weight / height^2) / z score (Center for Disease Control and Prevention growth charts) - Obesity (defined as age and sex adjusted BMI zscore ≥ 95th percentile) - Waist circumference (measured between the inferior costal margin and the iliac crest in standing position) - z score reported - Hip circumference (level of the femoral trochanters) - Waist hip ratio (z score reported) - Fasting glucose (glucose hexokinase) - 75g OGTT Glucose, insulin and NEFA were collected at times −15, −5, 0, 15, 30, 60, 90 and 120 min after glucose load (40 g/m2 body surface area) - Lipid profile (colorimetric assays, Friedewald equation) Only triglycerides reported Outcomes not relevant: - Fasting insulin (electrochemiluminescence) - Lean mass percentage (foot-to-foot bioimpedance) - Hirsutism (modified Ferriman-Gallwey score) - HOMA-IR - C reactive protein - Adiponectin (RIA) - Leptin (ELISA) - Matsuda insulin sensivity index - Corrected insulin response to glucose at 30 min - Disposition index	
Inclusion criteria reported?	Yes	Yes. Oral contraceptives allowed.
Exclusion criteria reported?	Yes Partial No Not reported	Yes. PCOS proband: nonclassical congenital adrenal hyperplasia, abnormal thyroid function, hyperprolactinemia, evidence of androgensecreting tumours, Cushing's syndrome, acromegaly, the use of medications known to affect levels of testosterone or 17OHPg within 3 months of testing. All participants: precocious puberty, medication known to affect glucose homeostasis such as insulin sensitizers, having diabetes or other uncontrolled metabolic disorder or following a highlyrestrictive diet or intense physical activity program
Does the study have a clearly focused question?	Yes Partial No Not reported	Yes.
Is a cohort study the appropriate design to answer this question?	Yes Partial No	Yes.

		Not reported	
Does the study have specified inclusion/ exclusion criteria?		Yes Partial No Not reported	Partial. OCP allowed - unethical to withhold OCP
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes.
Were the outcomes measured appropriate?		Yes Partial No Not reported	Partial. Surrogate markers for beta cell function and not clinical diabetes.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	No. Duration of follow-up likely not long enough to capture cardiovascular disease
Was matching performed?		Yes Partial No Not reported	Age matched
Summary of Result/s		Female first degree relatives of women with PCOS who are late/post-puberty have similar surrogate markers of beta cell function with age matched controls.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Other than the exposure under investigation, were the groups selected from similar populations?	Yes	No. Control cohort from paediatric endocrine clinic with a stable condition
SELECTION BIAS	Was the exposed cohort truly representative?	Yes Partial No Not reported	Partial. Very small numbers
SELECTION BIAS	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes.
PERFORMANCE BIAS	Aside from the exposure, were the groups treated the same?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Was exposure measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
DEDETECTION BIAS	Were outcome assessors blind to the exposure?	Yes Partial No	Not reported.

		Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Not reported.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	PCOS= 14% Controls= 14%	FDR= 12% Controls= 10%
ATTRITION BIAS	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	FDR= 12% Controls= 10% (additional FDR recruited separate from original cohort)
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. Ethics approval present. No protocol registration
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Control population derived from different cohort.
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Funded by medical foundation (La Fondation des étoiles (Montréal, Québec)
OTHER BIAS	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported. No power calculation
OTHER BIAS	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. Median and interquartile range. Data could not be adjusted due to small sample size.
COMMENTS			
What is the overall risk of bias?		High	Moderate. Small sample size
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		Yes Laboratory measurements likely low risk for bias, however measurements of waist hip ratio might be subject of bias.	

Study ID	Joharatnam 2011

Study Citation	Joharatnam J, Barber TM, Webber L, Conway GS, McCarthy MI, Franks S. Determinants of dyslipidaemia in probands with polycystic ovary syndrome and their sisters. Clin Endocrinol (Oxf). 2011 Jun;74(6):714-9. doi: 10.1111/j.1365-2265.2011.03983.x. PMID: 21521255; PMCID: PMC4625580. (primary citation) Franks S, Webber LJ, Goh M, Valentine A, White DM, Conway GS, Wiltshire S, McCarthy MI. Ovarian morphology is a marker of heritable biochemical traits in sisters with polycystic ovaries. J Clin Endocrinol Metab. 2008 Sep;93(9):3396-402. doi: 10.1210/jc.2008-0369. Epub 2008 Jun 17. PMID: 18559912.	
Study Country	United Kingdom	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Sisters of women with PCOS (n=214) compared to controls without polycystic ovaries on sonography with normal ovulatory cycles (n=76). Proband women with PCOS (n=157) also included in study but data not extracted Age= FDR with polycystic ovaries: 3.3±0.6 years, FDR without polycystic ovaries: 3.3±0.6 years; controls: 3.7±0.2 years BMI= FDR with polycystic ovaries: 15.9±1.6kg/m²; FDR without polycystic ovaries: 15.9±1.6kg/m²; controls: 16.4±1.3 kg/m²	
PCOS diagnostic criteria	Rotterdam 2003 (all PCOS probands); NIH criteria (69% PCOS probands)	
N per group	The number of participants that were: Screened: 157 proband women with PCOS; 248 sisters; control cohort (n=76) Enrolled: FDR = 214 (86%), controls= 76 Allocated: FDR = 214, controls= 76 Assessed and followed up: FDR = 214, controls= 76	
Setting	Retrospective cohort study. University Hospital, timeframe not specified, multicenter (2 centers)	
Intervention/ indicator	Sisters of women with PCOS	
Comparison/ Control	Controls without history of PCOS No matching performed	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcome not defined Outcomes measured: - Height - Weight - BMI (calculated as weight / height^2) - Waist hip circumference (anatomical landmarks not reported) - Fasting glucose - Lipid profile (autoanalyser, standard enzymatic assay, Friedewald equation) - PCOS (Rotterdam criteria) Outcome could not be extracted as control population selected to not have PCOS Outcomes not relevant: - Fasting insulin (ELISA) - Hirsutism (assessed by one examiner using the modified Ferriman-Gallwey score in which a score >8 indicates hirsutism) - Hormonal studies (LH, FSH, E2, Testosterone, androstenedione, Sex hormone–binding globulin, free androgen index) - HOMA-IR - C reactive protein	
Inclusion criteria reported?	Yes	Yes.

			Control women had ultrasound-proven normal ovarian morphology, regular menstrual cycles
Exclusion criteria reported?		Yes Partial No Not reported	Yes. PCOS proband: estrogen-deficient amenorrhea, hyperprolactinemia, Cushing's syndrome, and late-onset 21-hydroxylase deficiency Control: family history of PCOS, clinical hyperandrogenism
Does the study have a clearly focused question?		Yes Partial No Not reported	Yes.
Is a cohort study the appropriate design to answer this question?		Yes Partial No Not reported	Yes. Some attrition in sister data - PCOS diagnosis in sisters may be affected by this.
Does the study have specified inclusion/ exclusion criteria?		Yes Partial No Not reported	Yes.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes. Method of deriving control cohort not described
Were the outcomes measured appropriate?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	No. Duration of follow-up likely not long enough to capture cardiovascular disease
Was matching performed?		Yes Partial No Not reported	No.
Summary of Result/s		Sisters of women with PCOS had higher rates of hyperlipidemia compared to healthy controls without PCOS. When adjusted for BMI, sisters did not have higher rates of hyperlipidaemia to women without PCOS	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Other than the exposure under investigation, were the groups selected from similar populations?	Yes	No. Control cohort derivation not defined
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Yesl. (86% of screened participants were included)

	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes.
PERFORMANCE BIAS	Aside from the exposure, were the groups treated the same?	Yes Partial No Not reported	Yes
DEDETECTION BIAS	Was exposure measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Not reported.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial. Waist circumference method not reported
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Not reported.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	PCOS= 14% Controls= 14%	FDR= 0% Controls= 0%
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	FDR= 0% Controls= 0%
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. Ethics approval present. No protocol registration
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Partial. Not matched and method of deriving control cohort not described
	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No. Medical Research Council (G9710020) and a Project Grant from Wellbeing of Women (RG944)

OTHER BIAS	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported. No power calculation
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes.
COMMENTS			
What is the overall risk of bias?		High	Moderate. Control cohort method of derivation not reported. Only 86% sisters included
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		Yes Laboratory measurements likely low risk for bias, however measurements of waist hip ratio might be subject of bias and assessment of PCOS status	

Study ID	Krysiak 2021
Study Citation	Krysiak R, Basiak M, Szkróbka W, Okopień B. The Impact of Telmisartan on Cardiometabolic Risk Factors in Hypertensive Male Siblings of Women With Polycystic Ovary Syndrome. J Clin Pharmacol. 2021 Sep;61(9):1165-1173. doi: 10.1002/jcph.1872. Epub 2021 Jun 17. PMID: 33837974.
Study Country	Poland
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Hypertensive brothers of women with PCOS (n=24) compared to hypertensive controls without family history of PCOS (n=26). Age= FDR: 33±8 years, controls: 41±7 years BMI= FDR: 28.3±4.2kg/m²; controls: 27.8±4.7 kg/m²
PCOS diagnostic criteria	Rotterdam 2003
N per group	The number of participants that were: Screened: Men aged 20-55 years with grade 1 hypertension (n = 188) Enrolled: Meeting inclusion criteria (n=82) Allocated: FDR = 24, controls= 26 Assessed and followed up: FDR = 24, controls= 24 (unclear reason for why 2 participants excluded from analysis)
Setting	Prospective intervention cohort study. University Hospital, timeframe not specified, single center
Intervention/ indicator	Brothers of women with PCOS
Comparison/ Control	Controls without family history of PCOS Matching for age, blood pressure, BMI and fat free mass index
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcome not defined Outcomes measured: - Height - Weight - not extracted as cohorts matched - BMI (calculated as weight / height^2) - not extracted as cohorts matched - Fasting glucose

	- Lipid profile (autoanalyser, standard enzymatic assay, Friedewald equation) Outcomes not relevant: - Fasting insulin (electrochemiluminescence) - not published - Body composition (bioelectrical impedance analysis) - HOMA-IR - Fasting hormonal studies: testosterone, SHBG (electrochemiluminescence) - Vitamin D (electrochemiluminescence) - Homocysteine - Uric acid (routine laboratory techniques) - High sensitivity CRP (chemiluminescence) - Post treatment with telmisartan outcomes not extracted	
Inclusion criteria reported?	Yes	Yes. Age 20-55 years, grade 1 arterial hypertension (systolic blood pressure between 140 and 159 mm Hg and/or diastolic blood pressure between 90 and 99 mm Hg on 2 different days), 12 weeks of non pharmacological treatment of hypertension, ASCVD risk calculator <10% 10 year risk. All participants instructed on lifestyle and exercise changes. Medication adherence by pill count.
Exclusion criteria reported?	Yes Partial No Not reported	Yes. Coronary artery disease, myocardial infarction or stroke within 6 months preceding the study, heart failure, diabetes, thyroid disorders, other endocrine disorders, impaired renal or hepatic function, malabsorption syndromes, poor patient compliance, treated within 6 months preceding the study with any prescription or over-the-counter drug for more than a week
Does the study have a clearly focused question?	Yes Partial No Not reported	Partial. Defined as effect of telmisartan on blood pressure and “cardiometabolic” outcomes
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Partial. RCT design more appropriate
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes.
Were the outcomes measured appropriate?	Yes Partial No Not reported	Yes.
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	No. Duration of follow-up likely not long enough to capture cardiovascular disease. 12 week follow-up
Was matching performed?	Yes	Yes. Age, BP, BMI, body composition

		Partial No Not reported	
Summary of Result/s		Brothers of women with PCOS had higher rates of hyperlipidemia and insulin resistance compared to controls at baseline.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Other than the exposure under investigation, were the groups selected from similar populations?	Yes	Yes.
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Partial. (44% of screened participants were included)
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Partial. Participants were hypertensive at baseline.
PERFORMANCE BIAS	Aside from the exposure, were the groups treated the same?	Yes Partial No Not reported	Yes
DEDETECTION BIAS	Was exposure measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes.
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Partial, laboratory data carried out in duplicate by technicians blinded to patient data.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial, laboratory data carried out in duplicate by technicians blinded to patient data.
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Partial, laboratory data carried out in duplicate by technicians blinded to patient data.
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	PCOS= 14% Controls= 14%	FDR= 0% Controls= 0%
	What percentage of the individuals were not	X% treatment X% control/	FDR= 0% Controls= 8%

	included in the analysis?	comparison Not reported	
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Partial. Ethics approval present. No protocol registration
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	Yes
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	No.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Partial. Power calculation reported but primary outcome for power calculation not reported.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial. For subjects younger than 40 years at presentation, an age of 40 years was assigned.
COMMENTS			
What is the overall risk of bias?		High	Moderate. Not randomised. Not all screened population enrolled and some loss to follow-up in control grouwp.
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		Yes Laboratory measurements low risk for bias, however measurements of waist hip ratio / blood pressure might be subject of bias

Question 1.12.

What is the risk of PCOS and cardiometabolic outcomes (CVD, T2D) in relatives of women with PCOS?

BACKGROUND:

Women with PCOS have a 1.9-fold increased risk of metabolic syndrome (1) and clustering of cardiovascular risk factors; however, the risk of metabolic complications in first-degree relatives (FDR) of PCOS women is unclear (2, 3). Other studies showed that first degree relatives of women with PCOS had higher rates of glucose intolerance, hypertension and hyperlipidaemia (4). There are thought to be significant adverse impacts on children of affected mothers (5).

Family studies suggest a 2.3-fold increased risk for T2DM and a 1.4-fold increased risk for metabolic syndrome in fathers of women with PCOS (6) and a 3.9-fold increased risk for dyslipidaemia (7) in brothers of women with PCOS. Studies suggest a genetically defined, ovarian-independent, male cardiometabolic equivalent for PCOS (8). PCOS propensity risk scoring was associated with obesity, T2DM, dyslipidaemia, coronary artery disease, androgenic alopecia, free androgen index and sex hormone binding globulin in men, with the effect mediated by BMI (8).

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes***
o Female first degree relatives versus normal controls	⨁◯◯◯ VERY LOW
o Parents versus normal controls	⨁◯◯◯ VERY LOW
o Fathers versus normal controls	⨁◯◯◯ VERY LOW
o Mothers versus normal controls	⨁◯◯◯ VERY LOW
o Brothers versus normal controls	⨁◯◯◯ VERY LOW
o Sisters versus normal controls	⨁◯◯◯ VERY LOW
o All offspring versus normal controls	⨁◯◯◯ VERY LOW
o Daughters versus normal controls	⨁◯◯◯ VERY LOW
o Sons versus normal controls	⨁◯◯◯ VERY LOW
o All first-degree relatives versus normal controls	⨁⨁◯◯ LOW
o All female first-degree relatives versus normal controls	⨁◯◯◯ VERY LOW
o All male first-degree relatives versus normal controls	⨁◯◯◯ VERY LOW

* based on the lowest certainty for risk of PCOS, diabetes, metabolic syndrome, IGT, IFG, hypertension, or higher weight, rather than surrogate markers (e.g. lipids, FBG, etc).

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Summary of evidence and comparisons

o Female first degree relatives versus normal controls

Early pubertal female relatives of women with PCOS had similar rates of insulin resistance (9).

o Parents versus normal controls

Parents of women with PCOS had higher rates of metabolic syndrome and cardiovascular disease than healthy controls (2).

o Fathers versus normal controls

First degree relatives (including fathers) of women with PCOS had higher rates of glucose intolerance, hypertension and hyperlipidaemia (4).

First degree relatives (including fathers) of women with PCOS had higher rates of glucose intolerance, hypertension and hyperlipidaemia (10).

o Mothers versus normal controls

Mothers of women with PCOS had higher rates of dyslipidaemia and insulin resistance (11).

o Brothers versus normal controls

Brothers of women with PCOS had insulin resistance compared to age and BMI matched controls (Baillargeon 2007)

Brothers of women with PCOS had higher rates of hyperlipidaemia and insulin resistance (Sam 2008)

Hypertensive brothers of women with PCOS had higher rates of hyperlipidaemia and insulin resistance than hypertensive controls (12).

Hypercholesterolaemic brothers of women with PCOS had higher rates of insulin (13).

o Sisters versus normal controls

Sisters of women with PCOS had higher rates of insulin resistance (14).

Sisters of women with PCOS had higher rates of hyperlipidaemia than healthy controls (15).

Sisters of women with PCOS had higher rates of metabolic syndrome (16).

Sisters of women with PCOS had higher rates of metabolic syndrome than healthy controls (17).

Siblings of women with PCOS had higher rates of metabolic syndrome and hyperlipidaemia than healthy controls (18).

Siblings (both brothers and sisters) of women with PCOS had higher rates of glucose intolerance and hyperlipidaemia (19).

o All offspring versus normal controls

Offspring of women with PCOS had higher rates of hyperlipidaemia than healthy controls (20).

Children of women with PCOS had higher rates of metabolic syndrome (21).

Children of women with PCOS had lower BMI than healthy controls (22).

Offspring of women with PCOS had higher BMI (23).

o Daughters versus normal controls

No difference in post menarcheal daughters - median age 15.42 years (24).

Daughters of women with PCOS had similar rates of insulin resistance (26).

Daughters of women with PCOS – no difference – included pre-menarcheal girls (26).

Daughters of women with PCOS had higher weight and different levels of androgen metabolites (27).

Daughters of women with PCOS had similar rates of insulin resistance (28).

o Sons versus normal controls

Sons of women with PCOS had higher rates of hyperlipidaemia and central adiposity (29).

If unadjusted for BMI, sons of PCOS women have higher weight during early infancy; higher weight, BMI, waist circumference, total cholesterol and LDL during childhood and adulthood (30, 31).

If unadjusted for BMI, sons of PCOS women have higher weight during early infancy; higher weight, BMI, waist circumference, total cholesterol and LDL during childhood and adulthood (32).

o All first-degree relatives versus normal controls

First degree relatives of women with PCOS had higher rates of glucose intolerance, hypertension and hyperlipidaemia (4).

First degree relatives of women with PCOS had higher rates of glucose intolerance, hypertension and hyperlipidaemia (10, 33).

o All female first-degree relatives versus normal controls

Late/post pubertal female first degree relatives of women with PCOS had similar rates of insulin resistance (34).

Premenarchal first degree relatives (daughters, sisters) of women with PCOS had higher rates of insulin resistance (35).

Female first-degree relatives have similar BMI but higher fasting glucose and 2-hour glucose (36).
o All male first-degree relatives versus normal controls
Fathers and brothers of women with PCOS had higher rates of higher weight and metabolic syndrome (37).

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Healthcare professionals could consider that fathers and brothers of women with PCOS may have increased prevalence of metabolic syndrome, type 2 diabetes and hypertension.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT

The cardiometabolic risk in female first degree relatives of women with PCOS remains inconclusive.

GRADE CONSIDERATIONS

Justifications:
First degree male relatives of women with PCOS had a moderately increased risk of metabolic syndrome. Quality of evidence: very low to low.

Subgroup considerations:
Evidence in mothers, daughters and sisters of women with PCOS was very limited due to small number of studies and participants.

Implementation considerations:
It is unclear how often healthcare professionals should screen male first-degree relatives of women with PCOS.

Monitoring and evaluation considerations:
As above.

Research priorities:
More studies in families of women with PCOS and across all age groups, including mechanisms.
Studies including daughters of women with PCOS studied at least 8 years post menarche.

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Very low level of evidence

Very disparate studies

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☒ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

● COSTS

How large are the resource requirements (costs)?

Judgement:

☒ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

There will be a cost for implementing screening of diabetes but this may be offset by prevention of complications.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

[key contact to draft discussion points and justification for above judgement]

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

● EQUITY

What would be the impact on health equity?

Judgement:

☒ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☒ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☒ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

GUIDELINE DEVELOPMENT GROUP 2

Prevalence, screening and management of psychological features and models of care

	Clinical Questions
2.1	1) In women with PCOS, what is the prevalence and severity of reduced QoL? 2) In women with PCOS, what dimensions of QoL are most affected? *CLINICAL PRACTICE POINTS:* *- Should QoL be assessed as part of standard care?* *- In women with PCOS, what tools/methods can be used to assess quality of life?*
2.2	In women with PCOS, what is the prevalence and severity of depression and anxiety? *CLINICAL PRACTICE POINTS:* *- Should anxiety and depression be assessed as part of standard care?* *- In women with PCOS, what tools/methods can be used to assess depression and/or anxiety?*
2.3	In women with PCOS what is the prevalence and severity of psychosexual dysfunction? *CLINICAL PRACTICE POINTS:* *- Should psychosexual dysfunction be assessed as part of standard care?* *- In women with PCOS, what tools/methods can be used to assess psychosexual dysfunction?*
2.4	In women with PCOS, what is the prevalence and severity of body image distress? *CLINICAL PRACTICE POINTS:* *- Should body image distress be screened as part of standard care?* *- In women with PCOS, what tools/methods can be used to assess body image distress?*
2.5	In women with PCOS what is the prevalence and severity of disordered eating? *CLINICAL PRACTICE POINT:* *- Should disordered eating be assessed as part of standard care?* *- In women with PCOS, what tools/methods can be used to assess disordered eating?*
2.6	1) What are the information, resource and education needs of women, adolescents, CALD groups and healthcare providers regarding PCOS? 2) What are the characteristics of available models of care implemented in PCOS clinic or service? 3) How can we best support women to navigate the impact of PCOS on family and interpersonal relationships? 4) What are the key challenges for those with PCOS when interacting with healthcare professionals about polycystic ovary syndrome and related features?
2.7	Is psychological therapy effective for management and support of depression and/or anxiety, disordered eating, body image distress, self-esteem, feminine identity or psychosexual dysfunction in women with PCOS?
2.8	Are anti-depressants and anxiolytics effective for management and support of depression and/or anxiety or disordered eating in women with PCOS?

PART 1

EVIDENCE SUMMARY AND GRADE

Compiled by ECR Lead: Jodie Avery

Other Members: Stephanie Pirotta

Supervised, edited and supported by the Evidence Team (Jillian Tay, Aya Mousa)

GDG 2

Question 2.1.

1) In women with PCOS, what is the prevalence and severity of reduced QoL?

2) In women with PCOS, what dimensions of QoL are most affected? (Narrative Review)

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	Q 2.1) In women with PCOS, what is the prevalence and severity of reduced QoL? Q 2.2) In women with PCOS, what dimensions of QoL are most affected? CLINICAL PRACTICE POINTS: Should QoL be screened as part of standard care? In women with PCOS, what tools/methods can be used to assess quality of life?
Clinical leads (key contacts)	Rhonda Garad
Allocation ranking	Level 2- updated systematic review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits (language, year)
Inclusion	Females of any age, ethnicity and weight. Subgroups: Adolescents Ethnicity Phenotype	Quality of life measured in women with PCOS (diagnosed by Rotterdam, NIH or AES – phenotypes will be captured).	Quality of life measured in a non-PCOS group. Same QoL tool as that used in women with PCOS must be used.	Prevalence and severity of impaired quality of life. Sensitivity, specificity, PPV and NPV of each assessment tool. AUC (when comparing two methods). Acceptability to users/patients. Self- esteem. Timing of assessment. Assessment intervals	Evidence based guidelines, systematic reviews, comparative prospective cohort studies and comparative cross-sectional studies.	English language. New search.
Exclusion				NA	Non-evidence-based guidelines or any study lower than a comparative cross-sectional study.

Evidence processing: Studies were selected and appraised by two reviewer/s in consultation with the evidence team/ key contact using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. A total of 31 studies and 5 reviews met inclusion criteria for this review.

5. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Outcomes	BMI (kg/m2)]	Hirsutism (FGI/S)	Acne	Summary of findings
Acmaz 2013 Turkey	Hospital	Cross-sectional	C: n = 47 P/OH: n = 35 P/I: n = 22 P/W: n = 29	SF-36	SF-36	SF-36	C: 23.37 ± 3.13 P/OH: 24.45 ± 2.75 P/I: 24.35 ± 3.48 P/W: 33.59 ± 2.61	C: 0% P/OH: 60% P/I: 36.4% P/W: 37.9%	C: 6.4% P/OH: 85.7% P/I: 40.9% P/W: 55.2%	Although there were significant differences in all of these parameters compared to the healthy group, the most affected group was oligomenorrhea-hirsutism group in terms of PF, PRF, pain, SF, ERF, and EWB, but it was obesity group that was affected by GH most and it was infertility group that was affected by vitality most.
Bazarganipour 2020 Iran	Women with PCOS according to the Rotterdam criteria who attended an infertility clinic (n = 101)	Cross Sectional	PCOS n= 101 Control n = 100	Completed IBS-QOL	Completed IBS-QOL	IBS-QOL	PCOS: 25.52 ± 4.70 No PCOS: 24.53 ± 3.88	PCOS: 3.35 ± 3.15 No PCOS 0.58 ± 1.39	PCOS: 4.20 ± 5.01 No PCOS 1.76 ± 3.8	Having PCOS and an increased level of LH/FSH tends to cause IBS symptoms. IBS + PCOS women experience significant impaired quality of life scores particularly in relation to worries about health and food avoidance.
Benetti- Pinto 2015 Brazil	University O+G department	Cross-sectional	PCOS: 52 Control: 102	WHOQOL-BREF	WHOQOL-BREF	WHOQOL-BREF	C: 28.5 ± 5.4 P: 31.9 ± 8.5	FGI: 10.4 ± 4.5 (85.7%)	NR	Women with PCOS had a worse sexual function and self-assessment of health condition in comparison to controls. The body weight as isolated symptom was correlated to the worsening in quality of life, but not with the worsening of sexual function.
Benson 2008 Germany	Uni clinics, private practice, community	Cross-sectional	PCOS: 57 Control: 28	SF-36	SF-36	SF-36	C: 23.6 ± 0.7 P: 29.6 ± 1 (SEM)	P: 10.2 ± 5.6 (SEM)	NR	PCOS may be unique in that BMI does not appear to be the major correlate of depression. Other factors, such as infertility or hirsutism, may play a greater role in emotional well-being.
Boivin 2020 USA	Total: 120 undergraduate psychology women 18 to 41 years of age, n = 10 PCOS patients diagnosed medically in a manner consistent with	Cross Sectional	PCOS patients diagnosed medically: n = 10 Screened negative on a 12-item PCOS symptoms	Completed PCOS Quality-of-Life (PCOSQ) questionnaire,	Completed PCOS Quality-of-Life (PCOSQ) questionnaire,	PCOSQ	NA	NA	NA	The PCOS-confirmed women scored more poorly than the screen-negative (reference) and screen-positive groups on all the measures of physical, emotional, social, and spiritual well-being measures.

	evidence-based diagnostic guidelines. 2nd year psychology course at Indiana Wesleyan University, students were given the option to participate in our study for academic extra credit		inventory: n = 74 screened positive on a 12-item PCOS symptoms inventory: n = 25							
Borghi 2018 Italy	Convenience sample of 30 PCOS women referring to an outpatient clinic of Gynecological Endocrinology of a University Hospital in northern Italy during a period of four months	Cross Sectional	PCOS n= 30 Control n= 30	Completed Short Form Health Survey (SF-36)	Completed Short Form Health Survey (SF-36)	Short Form Health Survey (SF- 36)	PCOS: 33.35 ± 5.85 No PCOS: 23.46 ± 3.43	PCOS: 12.13 ± 7.51 No PCOS: 5.87 ± 3.08	NA	PCOS patients had significantly lower scores on SF-36 scales of physical functioning and bodily pain.
Coban 2019 Turkey	Female adolescents aged 13-18 years with and without PCOS from Department of medicine and local high school	Cross Sectional	adolescent with PCOS n = 28 age- and sex-matched healthy peers n = 31	Completed PedsQL	Completed PedsQL	Pediatric Quality of Life Inventory (PedsQL)	PCOS: 22.68 ± 5.21 No PCOS: 20.06 ±1.83	NA	NA	There were no significant differences in the PCOS and control groups in terms of PedsQL scores.
Donbaloglu 2022 Turkey	100 participants aged 13-18 yr were included in the study. Adolescent girls who were diagnosed with PCOS and admitted to the pediatric endocrinology clinic of Çiğli Regional Training Hospital and Akdeniz University Hospital.	Cross Sectional	PCOS group, n=51 control group, n=49	Completed PedsQL	Completed PedsQL	Pediatric Quality of Life Inventory (PedsQL)	PCOS: 24.3 ± 5.1 No PCOS: 20.6 ± 2.48	PCOS: 26 (51%) No PCOS: NA	PCOS: 12 (23.5%) No PCOS: NA	Adolescent girls diagnosed with PCOS demonstrated higher depressive and anxiety symptoms and lower psychosocial quality of life scores than their healthy counterparts
Drosdzol 2007 Poland	Uni O&G/ GE clinics,	Cross-sectional	PCOS: n=50 Control: n=40	SF-36	SF-36	SF-36	C: 22.1 ± 2.9 P: 24.6 ± 3.8	C: 2.7 ± 2.1 P: 12.7 ± 6.1	NR	Quality of life parameters for women with PCOS were lower than for the controls in the aspect of: general health, limitations due to physical health, limitations due to emotional problems, social functioning, energy/fatigue and emotional wellbeing. Studied women showed worse marital sexual functioning. PCOS decreases quality of life and marital sexual functioning among women. A negative effect of hirsutism

										severity on general well-being and marital sexual life is also observed.
Elsenbruch 2003 Germany	Uni clinic & employees	Case-control	PCOS: n= 50 Control: n=50	German SF- 36	German SF-36	German SF- 36	C: 24.4 ± 5.3 P: 30.1 ± 9.8	C: 3 ± 2 P: 12 ± 5	NR	Health related quality of life measured with the 36- revealed significantly decreased scores for physical role function, bodily pain, vitality, social function, emotional role function, and mental health in patients with PCOS.

6. FINDINGS

COMPARISONS INCLUDED:

Comparison 1. Adult women with PCOS vs controls
Intervention 1.1 Short-Form Health Survey 36 (SF 36)
Intervention 1.2 WHO Quality of Life-BREF (WHOQOL-BREF)
Intervention 1.3 PCOS Health related Quality of Life Questionnaire (PCOSQ)

Comparison 2. Adolescent females with PCOS vs controls
Intervention 2.1 Paediatric Quality of Life Inventory

COMPARISON 1: Adult women with PCOS vs control

EVIDENCE SUMMARY:

Health Related Quality of life (HRQoL) is a well-recognised and important health outcome, especially in chronic disease and relates to the patient reported physical, social and emotional effects of a condition and its associated treatments. HRQoL is patient reported subjective perception of wellbeing, has multiple dimensions and is time dependent.

Assessment is based on patient reported outcomes and can be measured through a variety of tools. Commonly used generic tools for screening HRQoL such as the Short Form -36 (SF-36)[1] and WHO- BREF[2] are limited by specificity for PCOS features and are not ideal for PCOS overall as they have a significant focus on unrelated health issues such as mobility, impact on work, pain, environment and propensity to infective illnesses. They also do not measure the impact of key dimensions of PCOS such as infertility and hirsutism. However, the use of these tools is the only way to assess QoL across women with PCOS and women without PCOS.

Condition specific tools have therefore been developed which in PCOS include the PCOSQ[3] and modified PCOSQ (MPCOSQ)[4]. The PCOSQ has 26 items, measuring emotions (8 items), body hair (5 items), weight (5 items), infertility difficulties (4 items) and menstrual problems (4 items). Each item is graded with a seven-point scale ranging from 1 (maximum impairment) to 7 (no problems or difficulties). The MPCOSQ is similar to the PCOSQ and in addition to four more items on acne. The PCOSQ-50[5] was developed to overcome the measurement shortcomings of the above questionnaire and measures PCOS-related HRQOL aspects and well-being and includes two domains important for these women, but overlooked in the previous measures, namely sexual functioning and hirsutism. The PCOSQ-50 has 50 items in six scales: psychosocial and emotional (12 items), fertility (9 items), sexual function (7 items), obesity and menstrual disorder (9 items), hirsutism (6 items), and coping (7 items). Studies in PCOS increasingly use the PCOSQ and the MPCOSQ which have also been adapted and tested in different ethnic populations including in China[6]. However, although these tools are not designed to be used to show how QoL in PCOS differs to non PCOS women, a number of studies have used them to compare PCOS and Non PCOS women.

Additionally, PCOS has different implications for quality of life around the globe[7] and the most significant predictors of lower perceived health status include self-esteem, body image, and sexual dysfunction[6]. It is well known that symptoms associated with PCOS have a great effect on self-perceived health, and that this is also associated with depression and anxiety. In a study regarding patient perceptions of PCOS, the most common response was that women felt "frustration" (67%), followed by "anxiety" (16.3%)8. Often worsening, as a function of the number of comorbid mental disorders9, health related quality of life is recognised as an important health outcome providing information on the physical, social and emotional impacts of a disease/disorder, such as PCOS.

Women with PCOS have been found to have a lower perceived health status (alternatively known as health-related quality of life (HRQoL)), on both on generic self-perceived health scales, such as the Short Form 36[3] and the Short Form 12[10,] as well as PCOS specific scales such as the validated PCOSQ5. The PCOSQ, developed by Cronin et al, encompasses construct addressing the physical, emotional and social consequences of the disease. This questionnaire includes five domains: emotions, body hair, weight problems, menstrual problems and infertility. Each question is associated with a seven-point scale, in which a score of 7 denotes no problems or difficulties and one indicates maximum impairment. Domain scores are calculated using the mean score of all items in a domain. Lower scores indicate a lower health status5. This questionnaire is useful to asses within group treatment or outcomes on women with PCOS, however, it is difficult to use specific PCOS scales to measure the health status of women with PCOS in comparison with other chronic conditions, or alternatively individual risk factors within groups of women with PCOS.

The PCOSQ has been validated against generic health status scales in different populations6,8,11. These studies have been mostly derived from gynaecological or infertility clinics, and usually within a specific age group. Most also do not use controls. Interesting one study has modified the PCOS specific scale comparing women with PCOS against controls specifically for acne (MPCOSQ), but predictably finding comparatively lower health status in the PCOS population[12.] Another study regarding acne also used the specific scale on 34 women from a gynaecology clinic, illustrating the worth of specific scales in a more severe PCOS population undergoing treatment, but not across less severe presentations or the general community as a whole[13].

One study by Coffey et al, specifically comparing the PCOSQ with the SF36 for women with a number of different chronic conditions, recruited twenty-two women with PCOS from an outpatient clinic and 96 control women from a family planning clinic[13]. Although women with PCOS scored lower in both summary scores of the SF-36 and in all domains of the PCOSQ, after adjusting for body mass index, the differences in health status between the groups in the SF-36 disappeared, while those in the PCOSQ remained. When compared with asthma, epilepsy, diabetes, back pain, arthritis and coronary heart disease, the PCOS group had the same or better physical health status but poorer psychological health status[13]. These results are interesting, however the use of the PCOSQ in the control group does not really suit its purpose, the sample size is quite small, and the sample is selected from a clinical population, thus reflecting a group of women with more severe presentations of PCOS.

Another study using both the PCOSQ and the SF36 on 203 PCOS patients from an endocrinological clinic, with no controls, found SF-36 scores were significantly lower than the age- and sex-matched Australian population, including the overweight subset, and health status using the PCOSQ was similar to other published studies[14]. Other clinical studies using the PCOSQ with varying samples sizes found differing results, however these are possibly due to the age range selected. One study with 36 PCOS women aged 17-35 years found the main complaints of the patients were hirsutism and irregular menses. Menstrual and hirsutism problems were the most serious concerns followed by emotional problems on the PCOSQ[15.] Another study with 128 women with PCOS found the most common health status concern reported by women with PCOS was weight, followed in descending order by menstrual problems, infertility, emotions, and body hair[16.] A more comprehensive version of the PCOSQ, the PCOSQ-50 has been developed, as the original is thought to neglect acne and sexuality. This has been compared with the SF36 in a clinical population of 200 women with PCOS, however more studies are needed to ensure its validity[7].

Health status has also been discussed in relation to a number of different comorbidities, health and psychosocial risk factors associated with PCOS. However generally samples obtained of women with PCOS and their controls, often come from infertility or gynaecology clinics, which can only inform us about women with extreme presentations of the syndrome. One study from a gynaecological clinic, administered both the SF36 and the PCOSQ, and found that PCOS did have a negative impact on self- perceived health status even when compared with other serious health conditions[13]. When compared with asthma, epilepsy, diabetes, back pain, arthritis and coronary heart disease, it was found that the PCOS group had the same or better physical health status but poorer psychological health status.

It is noted that generic patient-reported outcome (PRO) measures underestimate the impact of polycystic ovary syndrome (PCOS) on HRQoL[17.] However, the majority of self-perceived health status literature around PCOS, concerns fertility specific or PCOS specific measurement scales, rather than generic such as the SF36 or the SF12. The women in these studies are often retained from infertility clinics. This only enables comparison within a group of affected women, such that they have PCOS or infertility, and does not enable comparison to be made with women with other chronic conditions in the community.

Short Form 36 Health Related Quality of Life

Two studies, Dag 2017 and Wang 2021 used Version 1 of the SF36[1], however Sanchez-Ferrer et al, 2020 used V2, so when combined, although both measure the Physical Component Summary (PCS) and the Mental Component Summary (MCS)– the studies were very heterogeneous. Traditionally the PCS and MCS are scored using norms-based scoring, which did not seem to be the case with the Dag 2017 study, however removing the Dag 2017 from the analysis made no difference to the heterogeneity.

Other studies reported the individual dimensions of the SF36 including Physical Function (PF), Physical Role Function (RF), Bodily Pain (BP), General Health (GH), Vitality (VT), Social Function (SF), Emotional Role Function (RE), Mental Health (SM).

Borghi 2018 reported median scores and interquartile ranges which is a highly unusual way of reporting SF36 scores. So, the median was used for mean and standard deviations were calculated using the

[14] Ching HL, Burke V, Stuckey BG. Quality of life and psychological morbidity in women with polycystic ovary syndrome: body mass index, age and the provision of patient information are significant modifiers. Clin Endocrinol (Oxf). 2007;66(3):373-9.

[15] Cinar N, Harmanci A, Demir B, Yildiz BO. Effect of an oral contraceptive on emotional distress, anxiety and depression of women with polycystic ovary syndrome: a prospective study. Hum Reprod. 2012;27(6):1840-5.

[16] McCook JG, Reame NE, Thatcher SS. Health-related quality of life issues in women with polycystic ovary syndrome. J Obstet Gynecol Neonatal Nurs. 2005;34(1):12-20.

[17] Malik-Aslam A, Reaney MD, Speight J. The suitability of polycystic ovary syndrome-specific questionnaires for measuring the impact of PCOS on quality of life in clinical trials. Value Health. 2010;13(4):440-6.

IQR. Panico 2017 and Borghi 2018 also did not used norms-based scoring. Combing these studies with the Sanchez-Ferrer et al, 2020 could also contribute to the high heterogeneity scores.

The World Health Organization's WHOQOL-BREF quality of life assessment (WHOQoL Bref)[2]

Seven studies including 1834 women assessed quality of life using the WHOQoL Bref, which included four domains Physical Health, Psychological Health, Social Relationships, and Environmental. These studies scored the questionnaires similarly, and used very similar versions, however some used extra questions and domains.

Quality-of-life questionnaire (PCOSQ) for women with polycystic ovary syndrome (PCOS).

Lidaka et al 2022, was concerned with adolescents median age 16 and 17, and used the PCOSQ[3] in Latvian or Russian. Panico et al 2017 used the 26 item PCOSQ with an added Acne domain. Stevanovic et al 2019 used the Serbian version PCOSQ-50, which has similar domains.

As acknowledged in guideline development meetings, quality of life is not necessarily diagnosed and instead is assessed using tools that measure the level of impairment of quality of life. Therefore, we are unable to determine the 'prevalence' of quality of life in women with PCOS as this would require evidence about the number of women diagnosed with impaired quality of life in those with and without PCOS.

Here we have compared the level/severity of impairment of quality of life in women with and without PCOS. Based on studies of low quality and certainty; and with some statistical heterogeneity, the evidence suggests that women with PCOS have lower quality of life compared to women without PCOS. This may suggest the value of quality of life assessment as part of standard care in order to address the aspects leading to reduced quality of life.

No evidence was identified by our search to determine the most effective tool to assess quality of life. A clinical expert recommendation may be made about tools used in the general population such as SF- 36 and WHOQOL or the PCOS specific, PCOSQ.

META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

The following summarises the meta-analysis results by health related quality of life domains.

Quality of Life – Physical

This was measured by SF36 Physical Component Summary, based on data from 1219 patients in 5 studies, SF36 Physical Function, Based on data from 1166 patients in 8 studies, as well as the WHO QoL BREF Physical Health Based on data from 1894 patients in 7 studies.

With a P<0.00001 and a heterogeneity of over 90%, evidence suggests that while scores for the SF36 quality of life domain of Physical Component Summary and as the WHO QoL BREF Physical Health are lower in women with PCOS compared to women without PCOS, high heterogeneity means the results should be interpreted with caution. The SF36 Physical Function had a P=0.08 and a heterogeneity of 60%, evidence suggests that scores for SF36 quality of life domain of Physical Component Summary are lower in women with PCOS compared to women without PCOS, but this is not statistically significant.

QoL Mental

This was measured by SF36 Mental Component summary based on data from 1219 patients in 5 studies, the SF36 Mental Health, cased on data from 1166 patients in 8 studies and the WHO QoL BREF Psychological Health, based on data from 1894 patients in 7 studies.

With a P<0.00001 and a heterogeneity of over 80%, evidence suggests that while scores for the SF36 quality of life domain of Mental Component Summary, and Mental Health and as the WHO QoL BREF Psychological Health are lower in women with PCOS compared to women without PCOS, high heterogeneity means the results should be interpreted with caution.

QoL Emotions / Psychosocial

This was measured by SF36 Emotional role (RE) - High better, Based on data from 1166 patients in 8 studies, SF36 Social function (SF) -High better, Based on data from 1166 patients in 8 studies, PCOSQ Emotions (EMOT) - High better, Based on data from 330 patients in 3 studies, and WHO QoL BREF Social Relationships High better, Based on data from 1894 patients in 7 studies.

The domains from the SF36 and the WHOQol Bref, were all significant but With a high heterogeneity of 88%, evidence suggests that while scores for the SF36 quality of life domain of Emotional role rea lower in women with PCOS compared to women without PCOS, high heterogeneity means the results should be interpreted with caution. The PCOSQ Emotions domain With a P=0.08 and a heterogeneity of 66 %, evidence suggests that scores for the PCOSQ quality of life domain of Emotions are lower in women with PCOS compared to women without PCOS.

QoL Environment

This was measured by the WHO QoL BREF Environment High better, based on data from 1894 patients in 7 studies. With a P<0.00001 and a heterogeneity of 96 %, evidence suggests that while scores for the WHO QoL BREF quality of life domain of Environment are lower in women with PCOS compared to women without PCOS high heterogeneity means the results should be interpreted with caution.

QoL Bodily pain

This was measured by the SF36 Bodily pain (BP) based on data from 1166 patients in 8 studies. With a P=0.0008 and a heterogeneity of 86 %, evidence suggests that while scores for the SF36 quality of life domain of Bodily pain are lower in women with PCOS compared to women without PCOS high heterogeneity means the results should be interpreted with caution.

QoL General Health

This was measured by the SF36 General health (GH) based on data from 1166 patients in 8 studies, With a P<0.00001 and a heterogeneity of 91 %, evidence suggests that while scores for the SF36 quality of life domain of General health are lower in women with PCOS compared to women without PCOS high heterogeneity means the results should be interpreted with caution.

QoL Vitality

This was measured by the SF36 Vitality (VT) based on data from 1166 patients in 8 studies. With a P=0.007 and a heterogeneity of 80%, evidence suggests that while scores for the SF36 quality of life domain of Vitality are lower in women with PCOS compared to women without PCOS high heterogeneity means the results should be interpreted with caution.

QoL Hirsutism

This was measured by the PCOSQ Hirsutism (HIRS) based on data from 1166 patients in 8 studies, With a P<0.00001 and a heterogeneity of 96%, evidence suggests that while scores for the PCOSQ quality of life domain of Hirsutism are lower in women with PCOS compared to women without PCOS high heterogeneity means the results should be interpreted with caution.

QoL Body Weight

This was measured by the PCOSQ Body Weight (BW) based on data from 1166 patients in 8 studies, With a P<0.00001 and a heterogeneity of 97%, evidence suggests that while scores for the PCOSQ quality of life domain of Body Weight are lower in women with PCOS, compared to women without PCOS, high heterogeneity means the results should be interpreted with caution.

QoL Infertility

This was measured by the PCOSQ Infertility (INF) based on data from 1166 patients in 8 studies, With a P<0.00001 and a heterogeneity of 98%, evidence suggests that scores for the PCOSQ quality of life domain of Infertility are lower in women with PCOS compared to women without PCOS.

QoL Menstrual Disorders

This was measured by the PCOSQ Menstrual Disorders (MD) based on data from 1166 patients in 8 studies, With a P<0.00001 and a heterogeneity of 98%, evidence suggests that while scores for the PCOSQ quality of life domain of Menstrual Disorders are lower in women with PCOS compared to women without PCOS high heterogeneity means the results should be interpreted with caution.

COMPARISON 2: Adolescent female with PCOS vs control

EVIDENCE SUMMARY:

The PEDSQL has also be used in populations of younger women with PCOS[18].
The Pediatric Quality of Life Inventory (PedsQL) questionnaires were the same for both Coban 2019 and Donbaloglu 2022.

META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

QoL Physical

Measured by PedsQL Physical Function- With a P=0.04 and a heterogeneity of 76%, evidence suggests that while scores for the PEDSQoL domain of Physical Function are lower in adolescent women with PCOS compared to adolescent women without PCOS, moderate heterogeneity means the results should be interpreted with caution.

QoL Psychosocial

Measured by PedsQL Psychosocial function and based on data from 169 patients in 2 studies. With a P=0.83 and a heterogeneity of 0 %, evidence suggests that scores for the PedsQL quality of life domain of Psychosocial function are lower in adolescent women with PCOS compared to adolescent women without PCOS.

QoL Total (Adolescence)

Measured by the PedsQL Total and based on data from 169 patients in 2 studies. With a P=0.47 and a heterogeneity of 0%, evidence suggests that while scores for the PEDsQoL total quality of life domain are lower in women with PCOS compared to women without PCOS, however this is not statistically significant.

Outcome or Subgroup	Studies	n	Effect Estimate; OR [95% CI], M-H, random	P	Favours	Certainty

APPENDIX. STUDY CHARACTERISTICS AND QUALITY APPRAISAL

Study ID		**Acmaz 2013**	
Study Citation		Açmaz, G., Albayrak, E., Acmaz, B., Başer, M., Soyak, M., Zararsız, G., & İpekMüderris,I (2013). Level of anxiety, depression, self-esteem, social anxiety, and quality of life among the women with polycystic ovary syndrome. The Scientific World Journal,	
Study Country		Turkey	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?			
Patient/population/ participants		86 patients diagnosed with PCOS according to 2003 Rotterdam Criteria, had no physical disease but PCOS, did not receive any treatment (before the treatment) for PCOS and had at least primary school degree. Those who had thyroid disorders, DM, Cushing' disease, positive malignancy, congenital adrenal hyperplasia, psychotic disorders and used antidepressants or steroidal hormone drugs and mood stabilizers were excluded. Patients with personality disorders assessed by SCID-I and SCID-II were not included.	
Control population		47 healthy volunteer participants in reproductive age.	
PCOS diagnostic criteria		Rotterdam	
N per group		PCOS were classified according to the complaints at the time of polyclinic admission. - Infertility group (concern with having child) - Oligomenorrhea-hirsutism group (concerns with hirsutism) - Overweight-obesity group (concerns with losing weight and had a BMI 30 or more)	
Setting		Hospital	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		Primary outcomes: - SF-36 Quality of Life Scale (Short-Form 36) Outcomes not relevant: - LSAS (Liebowitz' Social Anxiety Scale) - RSES (Rosenberg' Self-Esteem Scale) - Beck Anxiety Inventory (BAI) - Beck Depression Inventory (BDI)	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes
Exclusion criteria		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	Not reported
Summary Result/s		Although there were significant differences in all of these parameters compared to the healthy group, the most affected group was oligomenorrhea-hirsutism group in terms of PF, PRF, pain, SF, ERF, and EWB, but it was obesity group that was affected by GH most and it was infertility group that was affected by vitality most.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Partial Control group using healthy volunteer participants in reproductive age, unknown whether also recruit at the hospital.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and	Yes Partial No	Yes.

	reliable way?	Not reported	
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial because of nature of study
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial because of nature of study
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not relevant to cross-sectional study
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes Demographic difference between group in marital status, number of children, obesity due to the aim of the study
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial Some reported in median and percentiles without stating reasons.
COMMENTS		Unknown where to recruit healthy volunteer in control group	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	**Bazarganipour 2020**
Study Citation	Bazarganipour, F.; Taghavi, S. A.; Asemi, Z.; Allan, H.; Khashavi, Z.; Safarzadeh, T.; Pourchangiz, S.; Zare, F.; Ghasemi, S.; Karimi, Z.; Azizi Kutenaee, M. The impact of irritable bowel syndrome on health-related quality of life in women with polycystic ovary syndrome. Health & Quality of Life Outcomes Jul 13 2020;18(1):226 2020 Jul 13 Doi: 10.1186/s12955-020-01428-7
Study Country	Hormozgan Province, Iran
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Women with PCOS according to the Rotterdam criteria who attended an infertility clinic (n = 101)

Control population	Control group of healthy women whose partners had a diagnosis of male infertility (n = 100)	
PCOS diagnostic criteria	Rotterdam diagnostic criteria	
N per group	PCOS n= 101 Control n = 100	
Setting	infertility clinic at a hospital	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: IBS-QOL questionnaire was designed by Patrick, et al., (1998) and contains 34 items with a five degree Likert scale. There are eight domains: dysphoria, relationships, sexual concern, health worry, social reaction, body image, food avoidance, and interference with activity. Scores were between 0 to 100; a higher score in this tool represents a worse quality of life. The validity and reliability of these tools are approved in Iran. Outcomes not relevant: Menstrual history: BMI Body hair: Ferriman-Gallwey Scoring System (F/G score). Acne: Global Acne Grading System (GAGS) Socio-demographic status Laboratory measures ROME III diagnostic criteria: IBS. 9. Bristol scale stool consistency	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes To investigate the prevalence of IBS in women with PCOS compared to healthy women and to compare QOL in a group of women with PCOS and healthy women.
Inclusion criteria	Yes Partial No Not reported	Yes being 15–40 years of age; married; having two of the following Rotterdam diagnostic criteria: Polycystic ovaries visualized on ultrasound scan (presence of 12 follicles or more in one or both ovaries and/or increased ovarian volume i.e., > 10 ml), Clinical signs of hyperandrogenism (hirsutism score based on hirsutism score greater than 7 or obvious acne), having an interval between menstrual periods > 35 days and/or amenorrhea, defined as the absence of vaginal bleeding for at least 6 months (i.e. 199 days).
Exclusion criteria	Yes Partial No Not reported	Yes absence of non-classic adrenal hyperplasia, thyroid dysfunction, hyperprolactinemia; non-smoking; absence of following warning signs that rejected IBS included extreme weight loss over the past few months, fever, nocturnal symptoms, severe chronic constipation, diarrhea, frequent vomiting, progressive dysphasia, a history of travel to areas of parasitic infections, family history of colon cancer, inflammatory bowel disease; not having cough (bronchitis) during the last 3 months; no problems in speaking or listening; Iranian; not taking any prescription medication (except allergy medications and occasional pain medications) for at least 3 months before entering the study;
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Yes 6 months
Was matching performed?	Yes Partial No Not reported	No
Summary Result/s	Having PCOS and an increased level of LH/FSH tends to cause IBS symptoms. IBS + PCOS women experience significant impaired quality of life scores particularly in	

		relation to worries about health and food avoidance.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes – women with PCOS and women whose partners had infertility from the same infertility clinic in Iran
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	The women were requested to complete the study measures in clinic - no mention of blinding
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes, via questionnaire
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Nil
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	0%
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No. The research grant provided by Research Deputy of Hormozgan University of Medical Sciences (HUMS). The role of the funding body was collection and analysis.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	The sample size (201) was calculated using previous study on PCOS Mathur, et al., (2010) information.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Benetti-Pinto 2015
Study Citation	Benetti-Pinto, C. L., Ferreira, S. R., Antunes, A., & Yela, D. A. (2015). The influence of body weight on sexual function and quality of life in women with polycystic ovary syndrome. Archives of gynecology and obstetrics, 291(2), 451- 455.
Study Country	Brazil

CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?			
Patient/population/ participants		150 women aged between 18 and 40 years presenting PCOS diagnosis according to Rotterdam criteria for which they must submit 2 of the 3 characteristics: oligoamenorrhea or amenorrhea, clinical and/or biochemical signs of hyperandrogenism with polycystic ovaries and ultrasound assisted for a period of 10 months. Only 56 women fulfil inclusion criteria.	
Control population		102 women with regular menstrual cycles every 24-35 days, without signs of clinical hyperandrogenism, assisted in the same institution. For both case and control groups, women with any type of cognitive deficiency that could jeopardize the understanding of the study instruments were excluded. Women with arterial hypertension, type 1 or 2 diabetes, autoimmune disease, neoplasia or those were taking antidepressants, anxiolytics medication and pregnant were also excluded.	
PCOS diagnostic criteria		Rotterdam	
N per group		Case group: 150 women for screening for inclusion criteria, 56 women included. Control group: 102 volunteer in the same institution.	
Setting		University O&G department, Brazil	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		Primary outcomes: - Quality of life using WHOQOL-bref Not relevant: - Female Sexual Functional Index	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes
Exclusion criteria		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes Only included patients who have symptoms for 10 months.
Was matching performed?		Yes Partial No Not reported	Not reported
Summary Result/s		Women with PCOS had a worse sexual function and self-assessment of health condition in comparison to controls. The body weight as isolated symptom was correlated to the worsening in quality of life, but not with the worsening of sexual function.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Clarified definition of PCOS
	Was the control status established in a	Yes Partial	Yes Control group only included people with regular menstrual

	standard, valid and reliable way?	No Not reported	cycle
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Not applicable to this study since there is no intervention
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes, Measurement of quality of life is validated.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial Measurement of quality of life is subjective by itself.
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not relevant since it is a cross sectional study.
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not relevant since it is a cross sectional study. All participants consented to study were analysed.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not known because no protocol available.
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	No, may be due to nature of PCOS disease. BMI of PCOS group was significantly higher than the control group (31.9 ± 8.5 vs 28.5 ± 5.4 kg/m2) The control group had significantly higher age than the PCOS group (26.9 ± 4.9 vs 35.6 ± 7.3 years old)
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?			

Study ID		**Benson 2008**	
Study Citation		Benson, S., Janssen O.E., Hahn S. Tan S. Dietz T. Mann K. Pleger K. Schedlowski M. Arck PC. Elsenbruch S (2008). "Obesity, depression, and chronic low-grade inflammation in women with polycystic ovary syndrome." Brain, Behavior, & Immunity 22(2): 177-184.	
Study Country		Germany	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?			
Patient/population/ participants		PCOS women (untreated) with a mean age of 28.9±0.7 yrs and BMI of 29.6±1 kg/m2	
Control population		Healthy women with a mean age of 29.9±1.2 yrs and BMI of 23.6±0.7 kg/m2	
PCOS diagnostic criteria		Cases were diagnosed by NIH & Rotterdam criteria	
N per group		57 women with PCOS and 28 healthy women	
Setting		Cases were recruited from outpatient clinics of the University Hospital and Private Practice whereas controls were from the general community, Germany.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		Health related quality of life (SF-36) Non relevant outcomes Clinical parameters including anthropometric measures Inflammatory markers Psychological assessments particularly levels of depression	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Not reported
Exclusion criteria		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not applicable
Was matching performed?		Yes Partial No Not reported	Not applicable
Summary Result/s		PCOS may be unique in that BMI does not appear to be the major correlate of depression. Other factors, such as infertility or hirsutism, may play a greater role in emotional well-being.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	No Cases were recruited from the hospital while controls were from the community.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Cases were diagnosed by NIH & Rotterdam criteria
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes PCOS diagnosis criteria performed on everyone. Similar criteria was applied to exclude PCOS in controls
PERFORMANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	No Insulin resistance level of the control group was not measured and so similarity of the groups on this regard is not known. Although the control group had a lower BMI than the cases, there is still a possibility that lean people can also be insulin resistant.
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes They were measured objectively using a validated criteria

	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes Almost all of the outcomes were assessed objectively by laboratory tests. Previously validated tools were used for the subjective outcomes
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes, Established case definition and validated tools were used.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not applicable
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not applicable
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported This is difficult to determine if there isn't a protocol.
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Partial The groups were different in BMI, but the authors didn't adjust all the outcomes for this factor. E.g. comparison of psychological parameters (BDI and SF-36) between cases and controls were not adjusted for BMI. Level of insulin resistance in controls and cases was not compared.
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Partial. Sample size determination was not reported, but clinically significant difference was observed between cases and controls.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial - Potential confounders such as BMI was not adjusted for psychological parameters between cases and controls. - the level of significance was not adjusted for multiple comparisons
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	**Boivin 2020**
Study Citation	Boivin, M. J.; Fatehi, F.; Phillips-Chan, A. E.; Richardson, J. R.; Summers, A. N.; Foley, S. A. Exploratory study of a screening measure for polycystic ovarian syndrome, quality of life assessment, and neuropsychological evaluation BMC Women's Health 06 23 2020;20(1):132 2 020 06 23 Doi:10.1186/s12905-020-00994-8
Study Country	USA Indiana Wesleyan University
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	

Patient/population/ participants	Total: 120 undergraduate psychology women 18 to 41 years of age, n = 10 PCOS patients diagnosed medically in a manner consistent with the Teede et al. (2018) evidence-based diagnostic guidelines	
Control population	n = 74 “screened negative” on a 12-item PCOS symptoms inventory. n = 25 “screened positive” on a 12-item PCOS symptoms inventory	
PCOS diagnostic criteria	PCOS patients diagnosed medically in a manner consistent with the Teede et al. (2018) evidence-based diagnostic guidelines	
N per group	n = 10 PCOS patients diagnosed medically n = 74 screened negative on a 12-item PCOS symptoms inventory. n = 25 screened positive on a 12-item PCOS symptoms inventory	
Setting	2nd year psychology course at Indiana Wesleyan University, students were given the option to participate in our study for academic extra credit.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary Outcomes: **The PCOS Quality-of-Life Scale** was devised by researchers at Brigham and Women’s Hospital, Boston, MA and validated with a sample of 100 clinically diagnosed PCOS women. As described above, the present version consists of 26 items provided a composite total PCOS QoL score as an overall item average on a scale from 1 to 10, with a higher score indicating a better QoL. Outcomes not relevant **Foley polycystic ovarian syndrome screening scale (FPCOS)** The PCOS Foley Screening Instrument was developed by SAF to assess the medical risk for PCOS. **Zung self-rating depression scale** assess depression in individuals in a general medical setting. **State-Trait Anxiety Inventory (STAI)** is a 40-item measure that looks at both state (in the moment" and trait (chronic) anxiety. **Fatigue symptom inventory (FSI)** this is a 14-item self-report measure for measuring the intensity, frequency, and impact of symptoms of fatigue on a woman’s quality of life. Higher scores indicate more fatigue symptoms.	
	Bottomley social support scale (BSS) This is a seven-item scale originally designed for cancer patients. **Spiritual beliefs inventory (SBI)** This is a well validated15-item questionnaire that is a brief, yet robust measure of the more universal aspects of religious spiritual and community social support while coping with a life-threatening illness as well as the subsequent quality of life (QoL) issues, particularly in the context of cancer care. **Automated Neuropsychological Assessment Metric (ANAM)** is a computerized neuropsychological assessment for a PC laptop in the hospital or clinic setting. **Bilateral Field Advantage (BFA)** task of interhemispheric brain integration is a computerized assessment.	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Partial. Evaluate the utility of the FPCOS as a screening instrument for clinical practice.
Inclusion criteria	Yes Partial No Not reported	Partial: confirmed to have PCOS following analysis of a blood draw for insulin resistance markers, blood androgen levels, as well as elevated cholesterol and triglyceride level (N = 11, PCOS confirmed group).
Exclusion criteria	Yes Partial No Not reported	Not reported
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Not reported
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Yes
Was matching performed?	Yes Partial No Not reported	No

Summary Result/s		The PCOS-confirmed women scored more poorly than the screen-negative (reference) and screen-positive groups on all the measures of physical, emotional, social, and spiritual well-being measures. On the ANAM neuropsychological battery, PCOS-confirmed women did more poorly on Sternberg Memory and Stimulus Response throughput measures. They also had slower correct response speed for both the unilateral and bilateral dot- and letter-matching tachistoscopic stimulus presentations. However, the bilateral field advantage throughput performance ratio did not differ among groups, which is a global measure of bilateral versus unilateral brain/behavior asymmetries.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Difficult to ascertain as the final numbers don't add up completely and there is no flow chart. Eight of the IWU psychology students scored high enough on the Foley PCOS screening questionnaire for medical follow- up but declined to participate and remained in the "screen positive" group in the present study.
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Five women scored negative on the PCOS screening measure but did not attend their appointments for completing the other study assessments and were not included in this study.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	The authors declare that they have no competing interests
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Partial, Unfortunately, the PCOS medically confirmed sample size (N = 11) from the base sample of 120 women is too small to compute a sensitivity or specificity analysis for our FPCOS screening measure, assuming a disease prevalence of 10% or less and a power of 0.80 at a 5% significance level. Statistical analyses could only be correlational in nature, as a preliminary evaluation of the possible utility of this screening tool in a university population of young women.

If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS		
What is the overall risk of bias?	Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	No	

Study ID	**Borghi 2018**	
Study Citation	Borghi, L.; Leone, D.; Vegni, E.; Galiano, V.; Lepadatu, C.; Sulpizio, P.; Garzia, E. Psychological distress, anger and quality of life in polycystic ovary syndrome: associations with biochemical, phenotypical andsocio-demographic factors. Journal of Psychosomatic Obstetrics & Gynecology 06 2018;39(2):128-137 2018 06	
	Doi: 10.1080/0167482X.2017.1311319	
Study Country	Milan, Italy	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Convenience sample of 30 PCOS women referring to an outpatient clinic of Gynecological Endocrinology of a University Hospital in northern Italy during a period of four months	
Control population	Infertile non pcos women from same clinic	
PCOS diagnostic criteria	NIH criteria.	
N per group	n= 30 PCOS women n= 30 control women	
Setting	Reproductive Medicine Unit for infertility	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: **Quality of life (QoL)** Health-related QoL was assessed using the Italian version of the Short Form Health Survey (SF-36) an instrument composed by eight subscales, namely Physical Functioning, Physical Role Function, Bodily Pain, General Health, Vitality, Social Functioning, Emotional Role Function and Mental Health. The subscales scores range between 0 and 100, with lower scores indicating poorer QoL and a higher concern in the specific domain. Outcomes not relevant: Socio-demographic data **Psychological distress Symptom Checklist-90-Revision (SCL-90-R)** a multidimensional, self-report questionnaire of 90 items on a 5-point Likert scale (ranging from “0: no problem” to “4: very serious”). **Anger and aggressiveness:** Participants’ trait anger and aggressiveness were evaluated using the State-Trait-Anger-Expression-Inventory, version 2 (STAXI-2), a self-report questionnaire of 57-items on a 4-point scale. **Phenotypical and biochemical features** As regards the phenotypical features, BMI (kg/m2) was calculated from height and weight measurements. Abdominal circumference (AC) was recorded and waist-to-hip (W/H) ratio calculated. Hirsutism scoring was done using the modified Ferriman–Gallwey score (mFG score). Nine body areas were scored on a 0–4 scale for facial and body terminal hair growth distribution, with a mFG score of _6 considered to be hirsutism. Presence of acne and/or acanthosis nigricans was noted.	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To investigate the association between polycystic ovary syndrome (PCOS) and psychological disturbances, including anger. To analyze whether the biochemical/phenotypical features of PCOS play a role in the type and severity of psychological disorders
Inclusion criteria	Yes Partial No Not reported	Selected PCOS patients who met the more strict and conservative NIH diagnostic criteria which include the presence of oligomenorrhea (cycles lasting >35 days) or amenorrhea (no periods in 6 months) and
		hyperandrogenemia/hyperandrogenism (hirsutism or obvious

			acne or pronounced alopecia). Enrolled PCOS patients that were all infertile at the moment they filled out the questionnaires, in order to control for the potential confounding role of infertility on psychological outcomes. Control group of 30 women, age matched with the PCOS women, from consecutive women seen in the same outpatient clinic who met the following inclusion criteria: history of regular menstrual cycle, absence of severe gynecologic and nongynecologic diseases. Women of both groups have had spontaneous onset of puberty and regular sexual development.
Exclusion criteria		Yes Partial No Not reported	In both groups, included a prior psychiatric diagnosis, current use of psychiatric medications and difficulties with Italian language comprehension.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	Yes
Summary Result/s		Compared with control women, women with PCOS reported significantly higher scores on SCL-90-R scales of somatization, anxiety, hostility, psychoticism, overall psychological distress and a number of symptoms. At STAXI-2, patients with PCOS scored higher in trait-anger and in the outward expression of anger, while lower in outward anger-control; **PCOS patients had significantly lower scores on SF-36 scales of physical functioning and bodily pain.** Hirsutism was directly associated with anxiety. Regarding the associations between phenotypical/biochemical features and psychological distress in PCOS patients, results showed that waist-to-hip ratio is inversely related to anxiety, psychoticism, hostility and to the indexes of psychological distress; such inverse relationship was also seen between plasmatic levels of testosterone and trait- anger, and between total cholesterol and hostility.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported

	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Out of 43 PCOS women who met study criteria, 30 agreed to participate with a response rate of 70%, and Out of 40 control women who met study criteria, 30 agreed to participate with a response rate of 75%.
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes, all outcomes reported
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	The authors report no conflicts of interest.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Partial: The sample size of patients was small and only one center was involved, which may limit the possibility of generalizing.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	**Coban 2019**	
Study Citation	Coban OG, Tulaci OD, Adanir AS, Onder A. Psychiatric disorders, selfesteem, and quality of life in adolescents with polycystic ovary syndrome. J. Pediatr. Adolesc. Gynecol. 2019; 32: 600–4.	
Study Country	Turkey	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Female adolescents aged 13-18 years with and without PCOS	
Control population	age- and sex-matched healthy peers	
PCOS diagnostic criteria	previously been diagnosed as having PCOS	
N per group	n = 28 adolescent with PCOS n = 31 age- and sex-matched healthy peers were recruited	
Setting	University School of Medicine, Local high school	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: Health-related quality of life was measured using the Pediatric Quality of Life Inventory (PedsQL) Outcomes Not relevant: Assessment of psychiatric disorders through a semistructured interview (Schedule for Affective Disorders and Schizophrenia for School Age Children) conducted by a child and adolescent psychiatrist. self-esteem was measured using the Rosenberg Self-Esteem Scale (RSES).	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To assess psychiatric disorders in adolescents with PCOS and evaluate HRQoL and selfesteem in this group.

Inclusion criteria		Yes Partial No Not reported	Aged 13-19 years who had previously been diagnosed as having PCOS and who voluntarily agreed to participate in the study. The inclusion criteria for the controls were as follows: absence of severe gynecologic and nongynecologic diseases, and history of regular menstrual bleeding.
Exclusion criteria		Yes Partial No Not reported	Exclusion criteria were the lack of consent for the participation in the study and having difficulty in understanding the questionnaires.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	Yes
Summary Result/s		There were no significant differences in the PCOS and control groups in terms of PedsQL scores. Adolescents with PCOS frequently experience psychiatric disorders. Physicians should be aware that adolescents with PCOS are at a high risk for major depression and anxiety disorders.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported Each interview was administered by a child and adolescent psychiatrist
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	0%

Study ID	**Donbaloglu 2022**
Study Citation	Donbaloglu, Z.; Tuhan, H.; Coban, O. G.; Kizilay, D. O.; Ismailoglu, E.; Onder, A.; Acar, S.; Bedel, A.; Cetiner, E. B.; Singin, B.; Erdem, H.; Parlak, M. Hyperandrogenism correlates with psychological symptoms in adolescents with polycystic ovary syndrome. Clinical Pediatric Endocrinology 05 Apr 2022;31(2)():68-76 2022 05 Apr Doi: 10.1297/cpe.31.2022-0010
Study Country	Turkey
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	100 participants (PCOS group, 51; control group, 49) aged 13–18 yr were included in the study. n = 51 Adolescent girls who were diagnosed with PCOS and admitted to the pediatric endocrinology clinic of Çiğli Regional Training Hospital and Akdeniz University Hospital.
Control population	n = 49 age matched healthy volunteers who visited our hospitals for primary health-care services (e.g., vaccination). Participants in the control group had no menstrual irregularity or psychiatric disease and no clinical evidence of hyperandrogenism.
PCOS diagnostic criteria	The PCOS diagnostic criteria used in adults are not applied in adolescents. The diagnosis was made in patients who had at least 2 yr since menarche and were admitted to the endocrine clinic with menstrual irregularity (oligomenorrhea: menstrual cycle > 45 d) and hyperandrogenism (biochemical: free testosterone [fT] level higher than the reference levels of our laboratory; clinical: physical examination findings of hyperandrogenism, such as a modified Ferriman–Gallwey [mFG] score of > 8). Pelvic ultrasound was not used for the diagnosis of PCOS in adolescent patients who had < 8 yr since menarche because of the psychological multifollicular appearance of the ovaries during this period (7).
N per group	PCOS n= 51 Control n=49
Setting	Cross-sectional, multicenter, case–control study, pediatric endocrinology clinic
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: **Pediatric Quality of Life Inventory (PedsQL):** This inventory was designed by Varni et al. to assess the HRQoL of children and adolescents. The 23-item PedsQL scale assesses physical and psychosocial functioning. Items are rated on a five-point Likert-type scale. The reliability and validity of the scale has been confirmed by Cakin Memik et al. Outcomes Not relevant: **Clinical and laboratory investigations. Beck Depression Inventory (BDI):**

		BDI is a self-assessment measure consisting of 21 items that evaluate the severity of somatic, emotional, mental, and motivational symptoms of depression. In this inventory, each item is scored between 0 and 3. High test scores indicate an increase in depressive symptoms. Total scores of 0–9 indicate no or minimal depressive symptoms; 10–18, mild depressive symptoms; 19–29, moderate depressive symptoms; and 30–63, severe depressive symptoms. The validity and reliability coefficients of the Turkish version of the scale are similar to those of the original form. **State–Trait Anxiety Inventory (STAI):** This 40-item self-report scale assesses separate dimensions of anxiety: "state" (STAI-S) and "trait" (STAI-T). Items are rated on a four-point Likert-type scale. Scores range from 20 to 80 for each subtest, with higher scores indicating higher anxiety levels (17). The Turkish version of this inventory has been proven valid and reliable in the adolescent age group.
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	To analyze the depressive and anxiety states of adolescent girls with polycystic ovary syndrome (PCOS) The psychological features of the PCOS group were compared with those of the control group. The relationship between clinical/biochemical parameters and psychiatric scores was also investigated in the PCOS group
Inclusion criteria		Yes Partial No Not reported	Girls aged 13–18 yrs
Exclusion criteria		Yes Partial No Not reported	Adolescent girls who had previously visited the psychiatry clinic and who had been diagnosed with any psychiatric disease and were using psychiatric medications were excluded from the control group. The other exclusion criteria for both the PCOS and control groups were as follows: hyperprolactinemia, thyroid dysfunction, Cushing's syndrome, androgen-secreting tumors, late-onset congenital adrenal hyperplasia, cognitive disability, and presence of any other coexisting chronic illness. Participants who were using any medication that may affect the psychological evaluation, such as antidepressants, melatonin, or stimulant drugs, were also excluded from the study. Participants who were born small for gestational age or premature were also excluded because they may have several other accompanying problems.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	No, the control participants were not BMI-matched to the patients with PCOS.
Summary Result/s		Adolescent girls diagnosed with PCOS demonstrated higher depressive and anxiety symptoms and lower psychosocial quality of life scores than their healthy counterparts. A relationship was found between the fT level and all psychological measures.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes

COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Drosdzol 2007
Study Citation	Drosdzol, A., Skrzypulec, V., Mazur, B., & Pawlińska-Chmara, R. (2007). Quality of life and marital sexual satisfaction in women with polycystic ovary syndrome. Folia Histochem Cytobiol, 45(Suppl 1), S93-7.
Study Country	Poland
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	PCOS group: Age: 28.9±5.6 BMI: 24.6±3.8 Marital status: single (38%); married (52%); divorced (10%) Education: vocational (14%); secondary (42%); higher (44%) Previous pregnancy and children delivery: 24% Miscarriage experience: 6% Diagnosed and treated for infertility: 50%

Control population	Control group: Age: 30.5±5.3 BMI: 22.1±2.9 Marital status: single (22.5%); married (67.5%); divorced (10.0%) Education: vocational (15%); secondary (52.5%); higher (32.5%) Previous pregnancy and children delivery: 82.5% Miscarriage experience: 0% Diagnosed and treated for infertility: 0%		
PCOS diagnostic criteria	Validated guidelines of the Polish Society of Endocrinology (PSE) and European Society of Human Reproduction (ESHRE)		
N per group	PCOS group: Screened: 100 Enrolled: 73 (27 lack of consent for participation) Completed: 50 (23 incomplete filling out of the questionnaire) Control group: 40 healthy women aged 19-40 who reported to Outpatient Gynaecological Clinics.		
Setting	Same questionnaires were given to participants to fill in voluntarily and anonymously.		
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Relevant: SF-36 Not relevant: Index of Sexual Satisfaction (evaluate marital sexual satisfaction)		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes	
Inclusion criteria	Yes Partial No Not reported	Yes Aged between 19 and 40 diagnosed with PCOS	
Exclusion criteria	Yes Partial No Not reported	Yes Incomplete filling out of the questionnaire	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial Unknown reason of why questionnaire incomplete. Selection bias: might be different demographic between participants	
		who completed questionnaire and who did not?	
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes	
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this study measuring their quality of life	
Was matching performed?	Yes Partial No Not reported	Not reported	
Summary Result/s	Quality of life parameters for women with PCOS were lower than for the controls in the aspect of: general health, limitations due to physical health, limitations due to emotional problems, social functioning, energy/fatigue and emotional wellbeing. Studied women showed worse marital sexual functioning. PCOS decreases quality of life and marital sexual functioning among women. A negative effect of hirsutism severity on general well-being and marital sexual life is also observed		
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes Both case and control groups were recruited from the same clinics
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes PCOS cases were defined according to validated guidelines of Polish Society of Endocrinology and European Society of Human Reproduction.
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes PCOS diagnosis criteria performed on everyone
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes Validated questionnaire used.
	Were outcome assessors	Yes Partial No	Not reported

	blind to case and control status?	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial because of nature of study
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial because of nature of study
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not relevant to the study design
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	PCOS group: 50% (27 women lack of consent for participation; 23 women incomplete filling out of the questionnaire) Control group: not reported
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported No protocol or PROSPERO
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Not reported Only mentioned 'NS' in table without stating exact figure
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial Some did not provide results of statistical test, only stated 'NS' in the table.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Elsenbruch 2003
Study Citation	Elsenbruch, S., Hahn, S., Kowalsky, D., Offner, A. H., Schedlowski, M., Mann, K. and Janssen, O. E. 2003 Quality of life, psychosocial well-being, and sexual satisfaction in women with polycystic ovary syndrome. Journal of Clinical Endocrinology & Metabolism. 88 [12]: 5801-7.
Study Country	Germany
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Women with PCOS Age: 28.4 ± 5.0 BMI: 30.1 ± 9.8
Control population	Healthy aged matched women Age: 29.9 ± 5.7 BMI: 24.4 ± 5.3
PCOS diagnostic criteria	National Institutes of Health
N per group	50 PCOS and 50 controls
Setting	"..outpatient clinics of the Division of Endocrinology, Department of Medicine at the University of Essen, based on referrals from gynecologists in the surrounding area or patients attracted by the clinic's home page." "Age-matched healthy controls were recruited from a health screening program for employees instituted at the University of Essen" Germany

Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		German version of the 36-item short-form health survey (SF-36) Not relevant: Psychological disturbances using the German version of the symptom checklist revised (SCL-90-R); Sexuality using a 100-mm visual analog scale (VAS)	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes
Exclusion criteria		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	N/A
Was matching performed?		Yes Partial No Not reported	
Summary Result/s		Health related quality of life measured with the 36- revealed significantly decreased scores for physical role function, bodily pain, vitality, social function, emotional role function, and mental health in patients with PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	NIH
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	N/A
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes Measurements and questionnaires were performed on all participants.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes “personal interview, physical examination, and measurement of hormone parameters”
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Not reported
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial Some outcomes rely on others.
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	N/A
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported No protocol

CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Partial BMI and unfulfilled wish to conceive higher in PCOS group. "This difference was very likely to be related to a selection bias/self-selection for specialized medical treatment because 30% of patients were referred specifically because of infertility problems, and almost all patients had previously been diagnosed with PCOS and thus aware of potential infertility problems."
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate Most of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?			

Study ID	**Hahn 2005**	
Study Citation	Hahn, S., Janssen OE, Tan S, Pleger K, Mann K, Schedlowski M, Kimmig R, Benson S, Balamitsa E and Elsenbruch S(2005). "Clinical and psychological correlates of quality-of-life in polycystic ovary syndrome." European Journal of Endocrinology 153(6): 853-860.	
Study Country	Germany	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	PCOS women with a mean (SD) age of 29 (5.4) yrs and BMI of 31 (9.3) kg/m	
Control population	Healthy women with a mean (SD) age of 30 (5.7) yrs and BMI of 24 (5.3) kg/m2	
PCOS diagnostic criteria	NIH Criteria	
N per group	120 women with PCOS and 50 healthy women	
Setting	Cases were recruited from the outpatient clinics of the Department of Medicine whereas controls (historical) were from a health screening program and by public advertisement, University of Duisburg-Essen, Germany.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Health related quality of life (SF-36) Non relevant outcomes psychological distress sexual satisfaction clinical parameters	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes Women with PCOS (cases), diagnosed based on the 1990 NIH criteria. - Healthy women from a previously studied control group (historical control), not diagnosed with PCOS by the NIH- PCOS criteria
Exclusion criteria	Yes Partial No Not reported	Yes Taking any prescription medication or any known medical condition
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial No information reported whether study participants were included/excluded based on their age, BMI and ethnicity

Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes as the main aim of the study was to explore the correlation of major PCOS symptoms with quality-of-life, psychosocial well-being and sexual satisfaction
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	Not applicable
Summary Result/s		In PCOS, changes in appearance, particularly obesity and hirsutism, reduce physical dimensions of quality-of-life	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	No Cases were recruited from the outpatient clinics whereas controls were from the previous study.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Cases were diagnosed by the 1990 PCOS-NIH criteria
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Similar criteria was applied to exclude PCOS in controls
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes Validated tools and laboratory tests were used to measure the the exposures and outcomes.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes Previously validated tools were used to measure subjective outcomes in addition to the laboratory tests
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Established case definition and validated tools were used.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not reported
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Not reported Women with PCOS had significantly higher BMI and HOMA-IR than the controls
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Partial Sample size determination was not reported, however, a difference in statistical significance was observed in QoL and other outcomes between the groups.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes V
COMMENTS			

What is the overall risk of bias?	Low Moderate High Insufficient information	Moderate - Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	No

Asian Journal of Pharmaceutical and Clinical Research. Conference: 3rd International Conference on Academic and Industrial Innovations: Transitions in Pharmaceutical, Medical and Biosciences, INNOPHARM 2018;11(11): 2018 Doi: 10.22159/ajpcr.2019.v12i11.34426	
Study Country	India	
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	A total of 173 subjects were recruited for the study, average age of study participants was 23.9±4.5 years. Patients were recruited based on inclusion criteria from the outpatient clinics of the department of endocrinology based on referrals from gynecologists and dermatologists Age range 10 to 40 years	
PCOS diagnostic criteria	1990 National Institutes of Health conference for diagnosis of the PCOS	
N per group	The number of participants that were: Screened Enrolled n = 173 Allocated/randomised: PCOS= 83, controls= 90 Assessed (at 3 month examination): PCOS=83, controls=90 Followed up	
Setting	Hospital-based prospective observational study was carried out for a period of 6 months at a tertiary care hospital in Bengaluru.	
Intervention/ indicator	Patients were recruited based on inclusion criteria from the outpatient clinics of the department of endocrinology based on referrals from gynecologists and dermatologists	
Comparison/ Control	Healthy Controls	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcomes: The World Health Organization BREF, a validated, reliable tool to assess QOL was administered in two phases of the study, pre-interventional, and post-interventional phase. Outcomes Not relevant:	
Inclusion criteria reported?	Yes	While patients in the test group were included, if they presented with either oligomenorrhea (cycles lasting longer than 35 days) or amenorrhea (absence of menstrual cycles in the past 6 months) or clinical signs of hyperandrogenism (hirsutism with a Ferriman/Gallwey score of more than 7 or obvious acne) or an elevated total testosterone (normal range – 2.0 nmol/l).
Exclusion criteria reported?	Yes Partial No Not reported	Patients with pituitary, adrenal, or ovarian diseases were excluded as they mimic the symptoms of PCOS
Does the study have a clearly focused question?	Yes Partial No Not reported	To study the present QOL status in woman with PCOS in our setup.
Is a cohort study the appropriate design to answer this question?	Yes Partial No Not reported	Yes
Does the study have specified inclusion/ exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes

Were the outcomes measured appropriate?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		Women suffering from PCOS exhibit varied symptoms which affect both physical and psychological health. The key factor in management is to create awareness on the complications of the disease and the lifestyle modification to minimize severity and progression. The study findings reveal that women with PCOS showed an improved QOL post participation in awareness programs imparted by the clinical pharmacists.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Yes
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	No
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Partial
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	PCOS= Controls=	0%
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	0%
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	The authors declare that they have no conflicts of interest.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported

COMMENTS			
What is the overall risk of bias?		Low Moderate High	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	**Kahal 2019**	
Study Citation	Kahal, H.; Kilpatrick, E.; Rigby, A.; Coady, A.; Atkin, S. The effects of treatment with liraglutide on quality of life and depression in young obese women with PCOS and controls. Gynecological Endocrinology Feb 2019;35(2):142-145 2019 Feb Doi: 10.1080/09513590.2018.1505848	
Study Country	United Kingdom	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Interventional case-control study of women with PCOS and obesity, and age- and weight-matched controls.	
Control population	36 women were recruited (19 PCOS, 17 controls), age 33.9 ± 6.7 vs. 33.5 ± 7.1 yr, and weight 102.1 ± 17.1 vs. 100.4 ± 15.1 kg, respectively	
PCOS diagnostic criteria	Rotterdam criteria	
N per group	19 PCOS, 17 controls	
Setting	Women with PCOS were recruited from the endocrine clinic and controls were recruited through an advertisement in the local newspaper.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: **Quality of life** QoL was measured using the short version of the World Health Organization QoL questionnaire (WHOQOL-BREF), which includes 26 questions to assess four major domains (subscales): physical, psychological, social and environment Outcomes Not relevant: Anthropometric measurements Biochemical investigations Depression	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To determine the effect of six months treatment of liraglutide on weight loss in PCOS compared to weight matched controls, including an assessment of QoL.
Inclusion criteria	Yes Partial No Not reported	Body mass index (BMI) between 30–45 kg/m2, and were between 18 and 45 years of age.
Exclusion criteria	Yes Partial No Not reported	Previous history of hypothyroidism, pancreatitis, heart failure, renal failure, type 2 diabetes, alcohol consumption of >14 units/week, and pregnant or breast feeding women.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes

Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	Yes
Summary Result/s		PCOS was not independently associated with reduced QoL, and/or depression, in the presence of obesity. Six months treatment with liraglutide resulted in significant reduction in weight and improvement in QoL in young women with PCOS and obesity.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Twenty five women, 69%, completed the study (13 PCOS, and 12 controls).
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	25 participants completed the study; intention-to-treat analysis was performed, including all 36 study participants, with the last observation carried forward.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No potential conflict of interest was reported by the authors.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported No prior power calculation was undertaken the data presented represents secondary outcomes to another study
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low

Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	No

Study ID	**Kaluzna 2021**	
Study Citation	Kaluzna, M.; Nomejko, A.; Slowinska, A.; Wachowiak-Ochmanska, K.; Pikosz, K.; Ziemnicka, K.; Ruchala, M. Lower sexual satisfaction in women with polycystic ovary syndrome and metabolic syndrome. Endocrine connections September 2021;10(9)():1035-1044 2021 September Doi: 10.1530/EC-21-0257	
Study Country	Poland	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	n =190 patients with PCOS (mean age 26.34 ± 5.47 years)	
Control population	n=197 age-matched CON (mean age 27.12 ± 4.97 years)	
PCOS diagnostic criteria	Rotterdam criteria and the latest international evidence-based guidelines for the assessment and management of PCOS	
N per group	n=190 PCOS n=197 Controls	
Setting	Not reported	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: WHO Quality of Life-BREF (WHOQOL-BREF) Outcomes Not relevant: Polish version of the Sexual Satisfaction Questionnaire (SSQ), and the Center for Epidemiologic Studies Depression Scale-Revised (CESD-R) questionnaire. Fasting blood samples were collected to assess hormonal, lipid, and glucose profiles. Anthropometric measures were collected. Metabolic syndrome (MS) was evaluated according to the IDF-AHA/NHLBI criteria.	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	This study aimed to assess sexual satisfaction (SS) in PCOS patients and eumenorrheic controls (CON). The relationships between SS, depressive symptoms, health-related quality of life (HRQoL), and hormonal and metabolic profiles were evaluated.
Inclusion criteria	Yes Partial No Not reported	PCOS diagnosis. Eumenorrheic healthy individuals without reported problems concerning endocrine disorders, sexual development, and maturation.
Exclusion criteria	Yes Partial No Not reported	Excluded if they had severe psychiatric disorders (schizophrenia, bipolar disorder, severe depression), diabetes, severe liver or kidney disease, the use of oral contraceptive or anti-androgen therapy in the last 3 months or current pregnancy or diagnosed and/ or treated infertility.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Yes
Was matching performed?	Yes Partial No Not reported	Yes: age-matched
Summary Result/s	There were no significant differences in the level of SS, presence of depressive symptoms, or HRQoL between PCOS and CON. Sexual Satisfaction in PCOS women appears to be undisturbed. However, Metabolic Syndrome in PCOS patients could negatively influence Sexual Satisfaction. The level of Sexual Satisfaction should be assessed in PCOS women, especially if Metabolic Syndrome is present.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes

	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	No – self report for questionnaires
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	O%
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	PCOS 8/190 = 4% CON 3/197 = 2%
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes all outcomes reported
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	The authors declare that there is no conflict of interest that could be perceived as prejudicing the impartiality of the research reported.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	**Karjula 2020**
Study Citation	Karjula, S.; Morin-Papunen, L.; Franks, S.; Auvinen, J.; Jarvelin, M. R.; Tapanainen, J. S.; Jokelainen, J.; Miettunen, J.; Piltonen, T. T. Population-based Data at Ages 31 and 46 Show Decreased HRQoL and Life Satisfaction in Women with PCOS Symptoms. Journal of Clinical Endocrinology & Metabolism 06 01 2020;105(6):01 2020 06 01 doi:10.1210/clinem/dgz256
Study Country	Finland
EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	

Patient/population/ participants		Women aged 31-46 years. BMI: Controls (at age 31 years) = 23.8±4.3kg/m^2 PCOS (at age 31 years) = 27.1±6.9kg/m^2	
PCOS diagnostic criteria		Self-report of having both oligomenorrhea and hirsutism	
N per group		The number of participants that were: Screened: n= 5,889 Enrolled: n=2,306 Allocated/randomised: PCOS=125, controls=2181 Assessed (at year 1996-1997 examination): PCOS=74, controls=1,382 Followed up: 2013 (46 years old) PCOS=75, controls=1,412	
Setting		Clinical	
Intervention/ indicator		Completed 15D Quality of Life Questionnaire	
Comparison/ Control		PCOS/control	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		Primary outcomes: 15 Quality of Life Questionnaire Score and clinical examination completed Outcomes Not relevant:	
Inclusion criteria reported?		Yes	Yes
Exclusion criteria reported?		Yes Partial No Not reported	Yes
Does the study have a clearly focused question?		Yes Partial No Not reported	Yes – Does the health burden experienced by women with PCOS differ to that experienced by women with other chronic conditions e.g. asthma, migraine, rheumatoid arthritis, depression?
Is a cohort study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Does the study have specified inclusion/ exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Were the outcomes measured appropriate?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	No
Summary of Result/s		HRQoL was lower at ages 31 and 46 in women with PCOS or H than in the controls. PCOS was an independent risk factor for low HRQoL, and the decrease in HRQoL in PCOS was similar to that of women with other chronic conditions, such as asthma, migraine, rheumatoid arthritis, and depression. The risk for low HRQoL in PCOS remained significant after adjusting for body mass index, hyperandrogenism, and socioeconomic status.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Other than the exposure under investigation, were the groups selected from similar populations?**	Yes	Yes
	Was the exposed cohort truly representative?	Yes Partial No Not reported	Partial - minimal ethnic, geographic, and age variations, and socioeconomic diversity is low, largely as a result of the availability of free health care and education in Finland.
	Is it clear that the outcome of interest was not present at the start of study?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Was exposure measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Partial – further examinations to truly meet Rotterdam criteria for PCOS could have been completed. Self- report of hirsutism and oligomenorrhea and testosterone measured

	Were outcome assessors blind to the exposure?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	PCOS= Controls=	PCOS = 20/75= 27% Controls= 430/1382= 31%
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	As above- 15D scored of drop-outs compared to follow ups overall.
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		High	low
Did risk of bias differ by outcome (e.g. primary outcome was low risk but rest were high)?		No	

Study ID	**Kumarapeli 2011**	
Study Citation	Kumarapeli, V., Seneviratne R de A, Wijeyaratnec CN. (2011). "Health-related quality of life and psychological distress in polycystic ovary syndrome: a hidden facet in South Asian women." BJOG: An International Journal of Obstetrics & Gynaecology 118(3): 319-328.	
Study Country	Sri Lanka.	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Newly diagnosed women with PCOS aged between 15-39 years	
Control population	Healthy women aged between 15 -39 years (age matched controls)	
PCOS diagnostic criteria	Cases were diagnosed by the revised Rotterdam criteria	
N per group	146 women with PCOS and 170 controls	
Setting	Both cases and controls were selected from the same cluster (district of Gampaha)	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Health related quality of life were measured by the World Health Organization Quality of Life questionnaire (WHOQOL-BREF) and General Health Questionnaire (GHQ30) Non relevant outcomes - psychological distress	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes

Inclusion criteria		Yes Partial No Not reported	Yes - Cases were diagnosed based on the revised Rotterdam criteria. - Age-matched controls were not diagnosed with PCOS by the above criteria.
Exclusion criteria		Yes Partial No Not reported	Yes Any known medical condition
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial No information reported whether study participants were included/excluded based other criteria such as BMI and family income.
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	Not applicable
Summary Result/s		PCOS occurring in South Asians adversely affects their psychological wellbeing and HRQoL. Their psychological distress is related to hirsutism rather than to obesity, which affects white Europeans with PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Cases were diagnosed by the revised Rotterdam criteria
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Similar criteria was applied to exclude PCOS in controls
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	yes previously validated tools in that community were used to assess the outcomes.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes Previously validated tools were used.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Established case definition and validated tools were used
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not applicable

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	no
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low All of the criteria have been fulfilled or where criteria have not been fulfilled it is very unlikely the conclusions of the study would be affected.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?			

Study ID	**Kutlu 2020**	
Study Citation	Kutlu, O. Evaluation of quality of life of patients with hirsutism among Turkish women: A single-center cross-sectional study. Journal of Cosmetic Dermatology Nov 2020;19(11):3053-3057 2020 Nov Doi: 10.1111/jocd.13563	
Study Country	Turkey	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Patients with hirsutism BMI: PCOS = 23.71±5.71 kg/m^2 ; Controls =25.30±5.16 kg/m^2	
Control population	Women with hirsutism according to the Modified Ferriman-Gallwey	
PCOS diagnostic criteria	2003 Rotterdam criteria diagnosed by an onstretician-gynecologist	
N per group	PCOS= 16 Controls= 41	
Setting	Unknown	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: Dermatological Life Quality Index – 10 questions designed specifically for dermatological diseases. Unknown if self-reported or completed with clinician. Outcomes Not relevant:	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Partial
Inclusion criteria	Yes Partial No Not reported	Partial
Exclusion criteria	Yes Partial No Not reported	Partial – those who presented with hirsutism but with mFG score less than eight, hypertrichosis, who performed procedures such as epilation or depilation at the time of admission, or who had mental retardation were excluded from the study.
If there were specified inclusion/ exclusion criteria,	Yes Partial	Yes

were these appropriate?		No Not reported	
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	NA – cross-sectional
Was matching performed?		Yes Partial No Not reported	Not reported
Summary Result/s		There was no statistically significant difference for patients with PCOS in terms of mean DLQI score for those with acne, seborrhea, androgenetic alopecia, menstrual irregularity, and acanthosis nigricans and those without acne, seborrhea, androgenetic alopecia, menstrual irregularity, and acanthosis nigricans (P values were .760, .913, .455, .456, and .957, respectively).

Study Country		Latvia	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?			
Patient/population/ participants		Not reported	
Control population		Adolescent patients aged 13-18 years at least 1- year post menarche without PCOS	
PCOS diagnostic criteria		PCOM and hirsutism according to ESHRE 2018 guidelines.	
N per group		PCOS= 63 Control= 66	
Setting		Out patient paediatric gynaecology clinic at the Children's University Hospital	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		Primary outcomes: Quality of life using the PCOSQ – 26 item questionnaires Self-reported Outcomes Not relevant:	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes – How does PCOS and its associated factors, including binge eating, affect the HRQoL of adolescent girls?
Inclusion criteria		Yes Partial No Not reported	Partial – attending in-patient clinic
Exclusion criteria		Yes Partial No Not reported	Partial - patients who did not fulfil the new diagnostic criteria for PCOS were excluded from the study. None other described.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	NA
Was matching performed?		Yes Partial No Not reported	Yes – age matched
Summary Result/s		HRQoL was significantly lower in adolescents with PCOS than controls (4.9 (interquartile range (IQR) 1.5) vs. 5.8 (IQR 0.9) points).

Study ID	**Ozcan Dag 2015** (the same study as Ozcan dag 2016 except the small sample size)	
Study Citation	Ozcan Dag, Z., Oguzturk O, Isik Y, Turkel Y & Bulcun E (2015). "Personality profile in patients with polycystic ovary syndrome." Gynecological Endocrinology 31(7): 540-542.	
Study Country	Turkey.	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Adult women with PCOS	
Control population	Healthy women	
PCOS diagnostic criteria	Rotterdam criteria.	
N per group	Enrolled = 49 women with PCOS and 34 controls Assessed = 45 women with PCOS and 32 controls	
Setting	Both cases and controls were referred from the Kirikale University Gynecology Clinic, Turkey.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Health related quality of life (SF-36 version 1.0) Non relevant outcomes Psychometric evaluation Anxiety and depression levels	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes

Inclusion criteria		Yes Partial No Not reported	Yes- Cases were diagnosed based on the Rotterdam criteria. Age-matched controls were not diagnosed with PCOS by the above criteria.
Exclusion criteria		Yes Partial No Not reported	Yes Any known medical condition, taking any medications, pregnancy and lactation
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial No information reported whether study participants were included/excluded based other criteria such as family income and ethnicity.
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	yes - as the aim of the study was to investigate to investigate the effect of PCOS on personality using Minnesota Multiphasic Personality Inventory
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not applicable
Was matching performed?		Yes Partial No Not reported	Yes
Summary Result/s		Patients with PCOS had lower SF-36 physical and mental health summary scores	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes Both cases and aged-matched controls were selected from the hospital.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Cases were diagnosed by the revised Rotterdam criteria
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Similar criteria was applied to exclude PCOS in controls
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes Validated tools were used to assess the outcomes.
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes Previously validated tools were used.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes Established case definition and validated tools were used.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	PArtial
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not applicable
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Cases = 4/49 = 8% Controls = 2/34 = 5%
REPORT	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Partial The PCOS group had higher mean BMI score than the control group. And no data reported on participants' economic status
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Partial No report on sample size determination however statistical significance was observed in key outcomes such as QoL.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes Adjustment for BMI was done.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID		**Ozcan Dag 2016** (the same study as Ozcan dag 2015 except the larger sample size)	
Study Citation		Ozcan Dag, Z., Alpua M, Isik Y, S. Buturak V, Ozlem B., Tulmac & Yakup Turkel (2016). "The evaluation of temperament and quality of life in patients with polycystic ovary syndrome." Gynecological Endocrinology: 1-4.	
Study Country		Turkey	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?			
Patient/population/ participants		Adult women with PCOS with a BMI of 23.26 (4.44) kg/m2	
Control population		Age-matched healthy women with a BMI of 20.83(3.16) kg/m2	
PCOS diagnostic criteria		Rotterdam	
N per group		Assessed = 53 women with PCOS and 38 controls	
Setting		Both cases and controls were referred from the Kirikale University Gynecology Clinic, Turkey.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		Health related quality of life (SF-36 version 1.0) Non relevant outcomes Temperament evaluation Anxiety and depression levels	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes - Cases were diagnosed based on the Rotterdam criteria. Age-matched controls were not diagnosed with PCOS by the above criteria.
Exclusion criteria		Yes Partial No Not reported	Yes Any known medical condition, taking any medications, pregnancy and lactation
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial No information reported whether study participants were included/excluded based other criteria such as family income and ethnicity.
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	No - as the aim of the study was to investigate the affective temperaments of PCOS patients and the **effects of those temperament** characteristics on the QoL.
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not applicable
Was matching performed?		Yes Partial No Not reported	Yes
Summary Result/s		Patients with PCOS had lower SF-36 physical and mental health summary scores	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes Both cases and aged-matched controls were selected from the hospital.

Study Citation	Panico A, Messina G, Lupoli GA, et al. Quality of life in overweight (obese) and normal-weight women with polycystic ovary syndrome. Patient Prefer Adherence. 2017; 11:423–429	
Study Country	Italy	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	PCOS and controls – not reported	
Control population	Do not meet Rotterdam criteria for PCOS	
PCOS diagnostic criteria	Rotterdam criteria	
N per group	PCOS = 100 Controls = 40	
Setting	Not reported	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Quality of Life – PCOSQ and SF-36	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Partial
Inclusion criteria	Yes Partial No Not reported	Partial: 100 Mediterranean women with PCOS aged 17.2–29 years. Controls = no PCOS of healthy weight.
Exclusion criteria	Yes Partial No Not reported	No reported
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Partial
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Partial
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not reported
Was matching performed?	Yes Partial	Yes – age matched and similar socioeconomic background
	No Not reported	

Summary Result/s		A considerable worsening of HRQoL in PCOS patients (A) compared with controls (B). In addition, patients with PCOS and BMI <25 (A1) showed a significant and more marked reduction in scores, suggesting a lower quality of life, compared with controls (B) and with normal-weight PCOS patients (A2).

Study Country	Poland
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Women using healthcare services (primary care, specialist outpatient care, and inpatient/hospital care) in four regions of Poland: Lublin, Podkarpacie, Pomerania, and Greater Poland.
Control population	Do not meet PCOS criteria
PCOS diagnostic criteria	Rotterdam criteria

N per group		PCOS= 250 Control=254	
Setting		Clinical	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		Primary outcomes: Outcomes Not relevant: World Health Organization Quality of Life-BREF (WHOQOL-BREF) questionnaire scores	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes - age over 18 years, PCOS diagnosis made based on the Rotterdam criteria, and use of health care services in Poland.
Exclusion criteria		Yes Partial No Not reported	Yes - cancer diagnosis and psychiatric disorders.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	NA – cross sectional
Was matching performed?		Yes Partial No Not reported	Not reported
Summary Result/s		Patients with PCOS had a lower overall QoL (p = 0.000), worse perceived health (p = 0.000), and lower QoL in all specific domains: physical (p = 0.023), psychological (p = 0.000), environmental (p = 0.000), and social (p = 0.000), compared with controls.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes - All tests used in the study had high statistical power: 98–100% for regression analysis, 99–100% for WHOQOL- BREF score comparisons
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	**Yes**
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	**Sanchez-Ferrer 2020**	
Study Citation	Sanchez-Ferrer, M. L.; Adoamnei, E.; Prieto-Sanchez, M. T.; Mendiola, J.; Corbalan-Biyang, S.; Monino-Garcia, M.; Palomar-Rodriguez, J. A.; Torres- Cantero, A. M. Health-related quality of life in women with polycystic ovary syndrome attending to a tertiary hospital in Southeastern Spain: a case-control study. Health & Quality of Life Outcomes Jul 16 2020;18(1):232. 2020 Jul 16 DOI: 10.1186/s12955-020-01484-z	
Study Country	Spain	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Age: PCOS=27.4±5.0 Controls= 30.6±5.9 BMI: PCOS=25.5±5.9 Controls=23.3±4.3	
Control population	Women attending the gynaecological outpatient clinic for routine examination at the University Clinical Hospital.	
PCOS diagnostic criteria	Rotterdam criteria which included a complete medical history with a modified Ferriman-Galwey (mF-G) score, transvaginal ultrasound (TVUS) and serum sexual hormones.	
N per group	PCOS=117 Control=153	
Setting	Clinical – outpatient gynaecological clinic	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: SF-36 score Outcomes Not relevant:	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes - Women with PCOS (n = 117) were women attending the gynaecology unit of the hospital, and included newly diagnosed cases as well as prevalent ones.
Exclusion criteria	Yes Partial No Not reported	Yes - Women were excluded if they: were < 18 and > 40 years old, had endocrine disorders (e.g. Cushing's syndrome, congenital adrenal hyperplasia, androgen-secreting tumours, hyperprolactinemia and hyper and hypothyroidism) or were taking any hormonal medication
		(including contraception) during the 3 months prior to the study; were pregnant or lactating; had been exposed to oncological treatment; or had genitourinary prolapse.

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes- case control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	Not reported
Summary Result/s		Quality of life of women with PCOS, especially, anovulatory PCOS- was significantly decreased compared to controls. In adjusted analyses, five scales showed significantly lower scores for all PCOS versus controls (role physical, bodily pain, general health, vitality and role emotional, having this last one the lowest score 44.0 vs.47.0; p = 0.02). The physical score was also significantly lower in all PCOS women versus controls (53.7 vs. 55.8; p = 0.01).	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Partial - PCOS women were younger, had higher BMI, more infertility problems, and showed lower educational and current occupation level than controls. Regarding marital status and other lifestyle factors both groups were comparable.
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported

Study Citation	Shafti, V. and S. Shahbazi (2016). "Comparing Sexual Function and Quality of Life in Polycystic Ovary Syndrome and Healthy Women." Journal of Family & Reproductive Health 10(2): 92-98	
Study Country	Iran	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Married women with polycystic ovary syndrome aged between 18-45 years	
Control population	Healthy married women aged between 18-45 years	
PCOS diagnostic criteria	Rotterdam	
N per group	Assessed = 129 women with PCOS and 125 healthy women	
Setting	Cases were selected from Shahid Rajaee Hospital and infertility clinics while controls were from clinic's employees and patients' companions, Tonekabon, Iran	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	WHO quality of life (26-question brief form)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes Inclusion of the cases were decided by specialist's diagnosis, medical records and individual's self-report. For control group, it was done based on individual's self- report
Exclusion criteria	Yes Partial No Not reported	Yes Any known chronic diseases including psychological disorders, intake of treatments
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	No - similar method of diagnosing PCOS was not used in both groups
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes as the aim of this study was to compare sexual function and quality of life of women with PCOS with normal women
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not applicable
Was matching performed?	Yes Partial No Not reported	
Summary Result/s	All of quality of life subscales except environment domain were significantly lower in PCOS than healthy group. Women with PCOS in term of some quality of life parameters have lower performance than healthy women**.**	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	No Hospital cases were compared with both hospital and special controls
SELECTION BIAS **Was the case definition adequate and established in a standard, valid and reliable way?**	Yes Partial No Not reported	Partial Specialist's diagnosis was used in addition to the individuals medical record and self-report

	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	No Only individuals' self-report was used to rule out PCOS in controls

DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes A validated tool was used
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes A validated tool was used
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Partial
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not reported
REPORT	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Not reported Unable to judge as the participants' sociodemographic variables were not reported.
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Partial Statistical significance was observed between the groups, but no information reported on sample size determination.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Not reported Unable to judge as there were no reported data on participants' sociodemographic characteristics, missing values, normality assumptions
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	High
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?			

Study ID	**Shishehgar 2016**
Study Citation	Shishehgar F, Tehrani FR, Mirmiran P, Hajian S, Baghestani AR (2016). "Comparison of the Association of Excess Weight on Health Related Quality of Life of Women with Polycystic Ovary Syndrome: An Age- and BMI-Matched Case Control Study." PLoS ONE [Electronic Resource] 11(10): e0162911.
Study Country	Iran
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Women with PCOS aged 18–40 years
Control population	Age- and BMI-matched healthy women
PCOS diagnostic criteria	AE PCOS riteria

N per group		Screened = 300 women (1:1 case-control ratio) Enrolled = 282 women (142 cases and 140 controls) Assessed = 282 women (142 cases and 140 controls)	
Setting		Cases were recruited from the Reproductive Endocrinology Research Centre of Shahid Beheshti University of Medical Sciences while controls were from among women attending gynaecologic centres affiliated to Shahid Beheshti University of Medical Sciences in Tehran	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		Health related quality of life SF-36	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Not applicable
Inclusion criteria		Yes Partial No Not reported	Yes Criteria of the Androgen Excess Society (AES) was used to diagnose PCOS. None of the women in the control group had any specific complaint.
Exclusion criteria		Yes Partial No Not reported	Yes Any medical illness, intake of contraceptives and medications, pregnancy, lactating
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial - Not clear as to whether the same criteria was applied in the control group
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes as the aim of the study was to compare the effects of excess body weight on HRQOL between women with PCOS and their age and BMI matched counterparts
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not applicable
Was matching performed?		Yes Partial No Not reported	No
Summary Result/s			
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes Both cases and controls were selected from the hospital
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes the Androgen Excess Society (AES) criteria was used to diagnose cases
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Not reported Not clear as to whether the same criteria was applied in the control group
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Partial
DETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes A previously validated tool was used in both cases and controls
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Zero for both groups

	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	2 (1.3%) participants each in cases and controls
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes Groups were comparable with respect to sociodemographic characteristics such as age, BMI, educational level, marital status, etc.
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes - Sample size was appropriately determined using adequate power (95%)
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?			

Study ID	**Stevanovic 2019**	
Study Citation	Stevanovic, D.; Bozic-Antic, I.; Stanojlovic, O.; Vojnovic Milutinovic, D.; Bjekic-Macut, J.; Jancic, J.; Macut, D. Health-related quality of life questionnaire for polycystic ovary syndrome (PCOSQ-50): a psychometric study with the Serbian version. Women & Health 10 2019;59(9):1015-1025 2019 10 DOI: 10.1080/03630242.2019.1587664	
Study Country	Serbia	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Women aged 18 years and above referred to the daily hospital of the Clinic of Endocrinology, Diabetes and Metabolic Disorders between October 2016 and March 2017 who were investigated for irregular menstrual bleeding, hirsutism or acne.	
Control population	Women aged 18 years and above who were referred to the clinic for different health conditions requiring endocrinologic evaluation, such as irregular menstrual bleeding, hirsutism, specific endocrinologic conditions and others.	
PCOS diagnostic criteria	Rotterdam consensus criteria	
N per group	PCOS=76 Control=28	
Setting	Gynaecology clinic	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: Quality of life: PCOSQ-50 and WHOQOL-BREF scores. Only PCOSQ-50 scores compared to controls. Outcomes Not relevant:	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes - women with diagnosed PCOS who had not initiated therapy.

Exclusion criteria		Yes Partial No Not reported	Yes - exclusion criteria: adolescent age below 18 years, pregnancy, Cushing's syndrome, hyperprolactinemia, thyroid dysfunction and other endocrine disorders, psychiatric, and/or neurological disorder and inability to read and write Serbian. Patients with non-classical 21-hydroxylase deficiency, hyperprolactinemia, Cushing's disease, untreated hypothyroidism, and androgen secreting tumours were excluded.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Yes
Was matching performed?		Yes Partial No Not reported	Not reported
Summary Result/s		Women with PCOS had significantly lower PCOSQ-50 scores than healthy control women in the hirsutism (Mean (SD) controls = 4.49 (0.08); t (df) = −3.62 (102), p < .001), obesity and menstrual disorder (Mean (SD) controls = 3.99 (0.73); t (df) = −3.41 (102), p = .001), and total PCOSQ-50 scores (Mean (SD) controls = 4.01 (0.54); t (df) = −3.09 (102), p = .03), but not for the psychosocial and emotional (Mean (SD) controls = 4.03 (0.78); t (df) = −1.69 (102), p = .09), fertility (Mean (SD) controls = 4.15 (0.65); t (df) = −1.49 (102), p = .14), sexual function (Mean (SD) controls = 3.83 (0.71); t (df) = 0.05 (70), p = .96), and coping scores (Mean (SD) controls = 3.48 (0.92); t (df) = −0.51 (102), p = .61).	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Partial – age differences only
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes – met criteria from the clinic database with no hyperandrogenism.
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	No
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	PCOS=6.2% Controls= 44%

	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	PCOS=0% Control=0%
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes

COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID		Trent 2002	
Study Citation		Trent, M. E Rich M, Austin B, Gordon C (2002). "Quality of life in adolescent girls with polycystic ovary syndrome." Archives of Pediatrics & Adolescent Medicine 156(6): 556-560.	
Study Country		USA	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?			
Patient/population/ participants		Adolescent girls with PCOS (aged 13 to 22 years)	
Control population		Healthy adolescent girls (aged 13 to 22 years)	
PCOS diagnostic criteria		Adolescent – hyperandrogenism and menstrual irregularity	
N per group		Screened = 413 adolescents Enrolled = 293 adolescents (101 cases and 192 controls) Assessed = 283 adolescents (97 cases and 186 controls)	
Setting		Cases were recruited from the primary care practice and referral base. Healthy female adolescents presenting for routine or sports physicals, routine gynaecologic care, contraceptive management, or follow-up of a minor medical issue were selected as controls.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		The Child Health Questionnaire–Child Self-Report Form (CHQ-CF87)	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes Diagnosis of PCOS was decided by hyperandrogenism (clinical or laboratory diagnosis) and menstrual irregularity
Exclusion criteria		Yes Partial No Not reported	Yes Any medical illness, pregnancy and language difficulties
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Partial - not clearly reported as to whether the same diagnostic criteria was applied to exclude PCOS in controls
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes - as the aims of this study were to examine HRQL in adolescents with PCOS, compared with healthy adolescents, and to determine whether clinically assessed or self-perceived severity of illness affects HRQL
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not applicable
Was matching performed?		Yes Partial No Not reported	
Summary Result/s		Adolescents with PCOS scored lower on subscales measuring general health perceptions, physical functioning, general behavior, and limitations in family activities because of illness. Patients scored higher on the change in health in the last year subscale, and most had been diagnosed and initiated treatment for PCOS in the last year. Patients who had higher self-perceived severity of illness also scored lower on the general health perceptions subscale, but clinical severity was not associated with differences in HRQL.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes Both cases and controls were selected from the hospital
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes a previously validated criteria was used to diagnose cases
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Not reported - not clearly reported as to whether the same diagnostic criteria was applied to exclude PCOS in controls
PERFORMANCE	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes

DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Yes
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes - a previously validated criteria was used
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Partial
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not applicable
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	3.9% (n=4) among cases and 3.1% (n=6) in controls
REPORT	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes Both groups were comparable in key prognostic variables such as age, BMI, ethnicity and insurance status
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported. Although significant difference was observed between the groups, there was no report on sample size determination
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS

PART 2

RECOMMENDATIONS

Compiled by the key contact(s)

GDG 2

Question 2.1.

1) In women with PCOS, what is the prevalence and severity of reduced QoL?

2) In women with PCOS, what dimensions of QoL are most affected?

BACKGROUND:

Health-related quality of life (HRQoL), a multidimensional construct, encompassing impacts of health, illness, and treatment on an individual's quality of life (1). QoL has consistently been shown to be poorer in women with PCOS when compared to women without PCOS (2, 3, 4). Global variation in the manifestations (5), suggests impacts are strongly underpinned by socio-cultural influences.

Women with PCOS consistently report higher prevalence and severity of reduced QoL compared to women without PCOS. Dimensional variability reported according to measurement tools used and between populations studied.

QoL tools are generally divided into generic measures that have broad application across different types and severity of diseases, and, disease-specific measures designed to assess particular diseases or patient populations (6).

Both generic and PCOS specific tools are used to measure HRQoL in the women with PCOS. Generic tools include the Short Form -36 (SF-36) (8) and, the WHO- BREF (9). Designed for use in the general population, these tools primarily focus on issues such as mobility, impact on work, pain, environment and vulnerability illnesses. An important limitation of generic tools is the lack of sensitivity to PCOS specific features such as infertility and hirsutism; however, they do enable QoL comparisons across affected and non-affected populations of women.

Commonly used PCOS specific tools include PCOSQ (9) and the modified PCOSQ (MPCOSQ) (4) and the PCOSQ-50 (10). The PCOSQ has 26 items, measuring emotions (8 items), body hair (5 items), weight (5 items), infertility difficulties (4 items) and menstrual problems (4 items) and graded on a seven-point scale. The MPCOSQ is similar to the PCOSQ with an additional four more items on acne. The PCOSQ-50 was developed to overcome the measurement shortcomings and measures PCOS-related HRQOL aspects and well-being and includes two domains important for these women, but overlooked in the previous measures, namely sexual functioning and hirsutism.

The main criticisms of these tools are that they are do not capture QoL impacts beyond the physical manifestations, with calls for the development of tools based on a broader conceptual model of QoL. Commonly used tools are limited by a narrow conceptual model of QoL. Further work is needed to strengthen HRQoL tools, to enable a comprehensive determination on the HRQoL in women with PCOS.

GRADE EVIDENCE CERTAINTY	
Comparison	GRADE for critical outcomes
Comparison 1. Women with PCOS versus controls	QoL -Physical (hirsutism, weight, menstrual irregularities, infertility) Mental health Emotional/psychological Bodily pain Vitality Environment Social functioning Sexual health General health

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Comparison 1. Adult women with PCOS vs controls
o Intervention 1.1 Short-Form Health Survey 36 (SF 36)
o Intervention 1.2 WHO Quality of Life-BREF (WHOQOL-BREF)
o Intervention 1.3 PCOS Health related Quality of Life Questionnaire (PCOSQ)

Comparison 2. Adolescent females with PCOS vs controls
o Intervention 2.1 Paediatric Quality of Life Inventory

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Health professionals and women should recognise the adverse impact of PCOS and/or PCOS features on quality of life in adults.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT

- Women with PCOS should be asked about their perception of PCOS-related symptoms, impact on quality of life, key concerns and priorities for management.

GRADE CONSIDERATIONS

Justifications:
Despite significant limitations with current tools, there is consistent evidence of lower quality of life in PCOS.
The GDG 2 panel did not consider that population level differences in dimension scores are important to the individual woman.

Subgroup considerations:
Adolescents with PCOS may have different quality of life concerns and there is limited evidence in this population.

Implementation considerations:
Need for education and awareness about quality of life for women with PCOS, and health professionals.

Monitoring and evaluation considerations:
No monitoring and evaluation in clinical settings.

Research priorities:
Further research is required in adolescents and adults to develop a PCOS specific HRQoL tool that addresses the limitations of current tools. Current screening tools are too generic or too focused on symptoms to identify QoL impacts.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
-What is the purpose of measuring QoL in women with PCOS?
It is acknowledged that understanding QoL can potentially inform policy-makers, direct treatment and requires the use of generic and PCOS specific tools.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
Certainty of evidence is low based on observational data but evidence is consistent across disease specific and generic tools.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:
No research evidence was identified

Panel discussion:

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:
It is considered imperative for health professionals to ask and to understand the impact of features on quality of life for shared decision making and to inform treatment priorities.

● COSTS

How large are the resource requirements (costs)?

Judgement:

☒ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:
No research evidence was identified

Panel discussion:

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:
No research evidence was identified

Panel discussion:

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
No research evidence was identified

Panel discussion:

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☒ Increased

Research evidence:
No research evidence was identified

Panel discussion:

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:
No research evidence was identified

Panel discussion:

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:
No research evidence was identified

Panel discussion:

GDG 2

Question 2.2.

In women with PCOS, what is the prevalence and severity of depression and anxiety?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	2.2 In women with PCOS, what is the prevalence and severity of depression and anxiety? CLINICAL PRACTICE POINTS: - Should anxiety and depression be assessed as part of standard care? - In women with PCOS, what tools/methods can be used to assess depression and/or anxiety?
Clinical leads (key contacts)	Anuja Dokras, Melanie Gibson-Helm
Allocation ranking	Level 2 - systematic review update

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women with PCOS. PCOS diagnosed by Rotterdam criteria/ National Institutes of Health/ Androgen Excess and PCOS society criteria	Validated screening tool for anxiety or depression. Note down tools. Diagnosis of depression.	Women without PCOS.	Prevalence or incidence of anxiety or depression. Scores on anxiety or depression tools.	Systematic reviews. Observational studies.	English language. Full text publication. Human studies.
Exclusion	Unrelated to PCOS. PCOS induced by valproate use PCOS in combination with other diseases. Idiopathic hyperandrogenism. Hyperandrogenism caused by other diseases	None	None	Health related quality of life Quality of life Mental health Psychological distress	Full text not available Abstracts Posters PhD theses Narrative reviews, letter to editor, editorials etc.	

2. SEARCH STRATEGY

Search details	
Search strategy source: update from Cooney LG, Lee I, Sammel MD, Dokras A. High prevalence of moderate and severe depressive and anxiety symptoms in polycystic ovary syndrome: a systematic review and meta-analysis. Hum Reprod. 2017 May 1;32(5):1075-1091. doi: 10.1093/humrep/dex044. PMID: 28333286.

Evidence processing: Studies were selected and appraised by 2 reviewers using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by 2 reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. **A total of 80 studies met inclusion criteria for this review.**

7. FINDINGS

Outcomes included:

- Outcome 1. Prevalence of depression – All studies
- Outcome 2. Prevalence of depression – Adult studies
- Outcome 3. Prevalence of depression – Adolescent studies
- Outcome 4. Prevalence of depression – studies that used clinical interviews
- Outcome 5. Depression scores – All studies
- Outcome 6. Depression scores – Adult studies
- Outcome 7. Depression scores – Adolescent studies
- Outcome 8. Depression scores by screening tools used – All studies
- Outcome 9. Depression scores by screening tools used – Adults
- Outcome 10. Depression scores by screening tools used – Adolescents
- Outcome 11. Prevalence of anxiety – All studies
- Outcome12. Prevalence of anxiety – Adult studies
- Outcome13. Prevalence of anxiety – Adolescent studies
- Outcome 14. Prevalence of anxiety – studies that used clinical interviews
- Outcome 15. Anxiety scores – All studies
- Outcome 16. Anxiety scores – Adult studies
- Outcome 17. Anxiety scores – Adolescent studies
- Outcome 18. Anxiety scores by screening tool used – All studies
- Outcome 19. Anxiety scores by screening tools used – Adults
- Outcome 20. Anxiety scores by screening tools used – Adolescents

▪ EVIDENCE SUMMARY:

Forty-seven studies compared prevalence of depression between women with PCOS versus women without PCOS. Only seven studies were of low risk of bias (Akdag Cirik 2016, Altinkaya 2014, Benson 2020, Bhattacharya 2010, Moran 2010, Moran 2012 and Sulaiman 2017) and the rest were either moderate or high risk of bias. All 47 studies were included in the meta-analysis.

Seventy-three studies reported depression scores between women with PCOS versus women without PCOS. However, only 45 contained sufficient data to be included in the meta-analysis and one study (Mansson 2011) was later excluded from the meta-analysis due to the direction of the effect. Four of those included in the meta-analysis were of low risk of bias (Akdag Cirik 2016, Deniz 2020, Harmanci 2013 and Kirmizi 2020) and the rest were either moderate or high risk of bias.

Twenty-seven studies compared prevalence of anxiety between women with PCOS versus women without PCOS. Only six studies were of low risk of bias (Akdag Cirik 2016, Altinkaya 2014, Harnod 2020, Moran 2010, Moran 2012 and Sulaiman 2014) and the rest were either moderate or high risk of bias. All 27 studies were included in the meta-analysis. One study (Harnod 2020) potentially included both adults and adolescents and therefore only included in the analysis that included all studies.

Fifty studies reported anxiety scores between women with PCOS versus women without PCOS. However, only 28 contained sufficient data to be included in the meta-analysis. Nine of those included in the meta-analysis were of low risk of bias (Akdag Cirik 2016, Aksu 2020, Altinkaya 2014, Besenek 2021, Harmanci 2013, Harnod 2020, Moran 2010, Moran 2012 and Sulaiman 2014) and the rest were either moderate or high risk of bias.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

All the studies pointed toward statistically significant high prevalence of depression in PCOS patients compared to women without PCOS. Sub group analysis of adult only and adolescent only studies showed the same trend for depression. Majority of studies were either high or moderate risk of bias.

All the studies pointed toward statistically significant high prevalence of anxiety in PCOS patients compared to women without PCOS. Sub group analysis of adult only and adolescent only studies showed the same trend for anxiety. Majority of studies were either high or moderate risk of bias.

Question 2.2.

In women with PCOS, what is the prevalence and severity of depression and anxiety?

BACKGROUND:

Prevalence and problem

Depression and anxiety are exceptionally common throughout the world with a higher prevalence in women and represent a major public health problem. It is established that women with PCOS are more likely to have depressive symptoms or clinical depression and anxiety symptoms than their healthy counterparts (1). The underlying aetiology and pathophysiology of psychiatric disorders in women with PCOS remain unclear, and the comorbidities are likely a mixture of genetic and environmental factors (2). Twin and familial studies indicate that psychiatric disorders show substantial heritability (3). However, a recent study found no genetic correlation between PCOS and psychiatric disorders implying that genetic factors are secondary phenomena rather than directly triggered in the pathogenesis of PCOS (4). A weak association for depression with PCOS attenuated to null when BMI was considered, indicating a critical role of obesity in both conditions. Non-genetic factors, such as an adverse maternal-fetal environment due to elevated androgens, with or without obesity, negatively affect the growing fetus and are critical for the development of anxiety-like behaviour in the mice offspring (5,6). These data are further supported by epidemiological studies (7-9).

Clinical practice gap – need for guidance

Previous surveys of women with PCOS in North America, Europe and Australia show that less than 10% were satisfied with information regarding long term complications associated with PCOS and less than 5% were satisfied with emotional support and counselling offered [10]. Given the high prevalence of depressive and anxiety symptoms, especially moderate to severe symptoms [11], the 2018 International PCOS Guideline recommended screen women with PCOS routinely and at the time of diagnosis. There is limited information on the prevalence of these symptoms in adolescents and the long-term risk of depressive and anxiety symptoms in adults. Further, there is limited information on perinatal mental health.

Summary of key information

Depression

The most commonly reported symptoms of depression were daily fatigue, sleep disturbances and diminished interest [12]. A meta-analysis of 10 studies including 522 women with PCOS and 475 women without PCOS from 8 countries reported increased depression scores in 44% women in the PCOS group (14-67%) versus 17% in women without PCOS (2-35%) (OR: 4.03, 95% CI: 2.96-5.5, $p<0.01$) [13]. Interestingly, the risk of having an abnormal depression score was still 4-fold increased when PCOS and non-PCOS groups were matched for BMI (number of studies = 5) suggesting that this risk is independent of and exacerbated by higher weight. This meta-analysis reported no evidence of heterogeneity between the included studies. Another meta-analysis with several overlapping studies included 910 women with PCOS and 1347 women without PCOS and reported a standardized mean difference (SMD) of depression scores between the two groups of 0.82 (95% CI: 0.73-0.92), suggesting a higher risk of depression in PCOS [14]. Included studies did not show a significant heterogeneity in this meta-analysis however, it was not clear if the depression scores were clinically significant. A meta-analysis of 26 studies including 4716 participants from 14 different countries was published in 2012 [6]. This paper reported SMD of 0.60 for depression scores between PCOS and non-PCOS groups (95% CI: 0.47-0.73) however, the authors emphasized that scores for women with PCOS were not in a clinically significant range in half of the studies whereas mild

depression was reported in the remaining studies. Further, there was significant heterogeneity between studies (I2-73%, p<0.001). The most recent meta-analysis including 23 studies was conducted with rigorous inclusion criteria including diagnosis of PCOS by a physician and not self-reported, and inclusion of studies that provided prevalence of abnormal depression scores in the study population [16]. This meta-analysis showed the odds ratio of moderate/severe depressive symptoms was 4.18 in women with PCOS (95% CI:2.68-6.52). The median prevalence of depression was 36.6% (IQR: 22.3, 50.0%) in women with PCOS and 14.2% (IQR: 10.7, 22.2%) in women without PCOS. This meta-analysis also confirmed that the increased risk of depressive symptoms was independent of higher weight. Sensitivity analyses showed that both clinic and community recruits had higher depressive scores compared to matched controls. There are some limitations to most studies included in the above meta-analyses including relatively small sample sizes of individual studies and limited confirmation of the diagnosis of depression. For example, in only 3 studies, depression was confirmed with further clinical assessment in individuals who had abnormal screening test scores. Nevertheless, two out of those 3 studies reported increased rates of clinically diagnosed depression in women with PCOS.

A new systematic review and meta-analysis was conducted for the 2023 update of the International PCOS Guideline. The meta-analysis included 47 studies comparing the prevalence of moderate to severe scores or diagnosed depression between women with PCOS and women without PCOS, and showed statistically significant higher prevalence of depression in PCOS (n=54,388 OR 2.6 [95% CI 2.12 – 3.18] <0.001). Only seven studies were of low risk of bias and the rest were either moderate or high risk of bias. Six studies included diagnostic assessment by clinical interviews. A subgroup analysis of adult only studies (n=42 studies) showed a higher prevalence of depression (n=53728, OR 2.58 (95%CI 2.08-3.2). A subgroup analysis of adolescent studies (n=5 studies of low or moderate risk of bias) also showed a higher prevalence (n= 660, OR 2.71 [95% CI 1.75 – 4.19].

A large population-based study using national health registries in Sweden, examined the association between PCOS and psychiatric disorders, as well as risks for psychiatric disorders in female and male siblings of women with PCOS [17]. This study reported a significantly increased adjusted risk of depression in women with PCOS of 1.25 (1.1.9-1.31) than women without PCOS. In another large hospital database in Western Australia, the incidence of depression in women with PCOS (9.8%) was significantly higher compared to women who did not have a diagnosis of PCOS (4.6%) [18]. Overall, these studies confirm that women with PCOS have a higher prevalence of clinically significant depressive symptoms indicating a chronic condition and not episodic events.

Anxiety

Symptoms of anxiety and anxiety disorders are more common in women with PCOS. One meta-analysis published in 2011 including 6 studies and another including 11 studies reported that women with PCOS had significantly higher anxiety scores compared to women without PCOS [14, 15]. Another meta-analysis in the same time period including 4 studies reported a sevenfold increase in the risk of abnormal anxiety scores among women with PCOS [19]. However, there was significant heterogeneity amongst included studies in all three meta-analyses. A recent rigorous meta-analysis identified 10 studies that included prevalence of anxiety symptoms in women with well-defined PCOS diagnosed by physicians using validated screening tools [16]. This study shows an increased odds of high anxiety symptoms compared to women without PCOS (OR: 5.62; 95% CI: 3.22, 9.80) and also an increased odds of moderate and severe anxiety symptoms (OR: 5.38; 95% CI: 2.28, 12.67).

The median prevalence of anxiety was 41.9% (IQR: 13.6, 52.0%) in the PCOS group and 8.5% (IQR: 3.3, 12.0%) in the non-PCOS group. There was however, increased heterogeneity amongst studies.

A new systematic review and meta-analysis was conducted for the 2023 update of the International PCOS Guideline. The meta-analysis included 27 studies comparing the prevalence of anxiety between women with PCOS and women without PCOS and showed a statistically significant higher prevalence of anxiety in women with PCOS (n=50,135, OR 2.67 [2.08 – 3.44]). Only six studies were of low risk of bias and the rest were either moderate or high risk of bias. A subgroup analysis of adults (n=23 studies,) showed statistically significantly higher odds of anxiety in women with PCOS (n= 14,527, OR 2.94 [95% CI 2.31 – 3.75]. In three studies of adolescents, the prevalence of anxiety was not increased (n= 455 OR 0.92 [95% CI 0.11 – 7.96].

In a large population-based study in Sweden, including 24,385 women diagnosed with PCOS matched for sex, year of birth, and county of residence to ten individuals randomly selected from the general population showed an increased adjusted OR for anxiety disorder (1.37, CI: 1.32, 1.43) [17]. Further, sisters of women with PCOS also had higher adjusted OR for anxiety disorder (1.15, CI: 1.07, 1.25). In another large hospital database in Western Australia mentioned in the depression section, the incidence of anxiety in women with PCOS (14%) was significantly higher compared to women who did not have a diagnosis of PCOS (5.9%) [18]. Collectively these studies indicate increased anxiety symptoms and anxiety disorders in women with PCOS, across diverse ethnic groups.

Perinatal anxiety or depression

The current evidence review only included populations with defined PCOS diagnostic criteria and therefore only identified a single study examining postpartum depression in women with PCOS. No meta-analysis could be performed. However, a recent meta-analysis has been conducted of six studies (n=934,922 women) that less rigorously defined PCOS status, e.g. self-report. One study was rated as good quality [20], two as fair [21, 22], and the remainder as low quality [23, 24, 25]. The meta-analysis reported that women with PCOS have a greater likelihood of postpartum depression (OR= 1.45, 95% CI=1.18 to 1.79, p<0.001) compared to women without PCOS (https://doi.org/10.1016/j.jad.2021.12.044). An awareness of these findings is important, but also need to be confirmed in well-characterised PCOS populations.

A range of mental health screening guidelines for the general population, were referred to in considering this question [26, 27, 28,29, 30, 31, 32, 33, 34, 35, 36, 37].

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Women with PCOS versus controls	⨁⨁◯◯ LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

PCOS vs non-PCOS

- Prevalence of depression in all patients - yes/no
- Prevalence of depression in Adults
- Prevalence of depression in adolescents

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Health professionals should be aware of the high prevalence of moderate to severe depressive symptoms and depression in adolescents and adults with PCOS and should screen for depression in all adults and adolescents with PCOS, using regionally validated screening tools.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **EBR:** Health professionals should be aware of the high prevalence of moderate to severe anxiety symptoms and anxiety disorders in adults and should screenfor anxiety in all adults with PCOS, using regionally validated screening tools.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

Consensus RECOMMENDATION

If moderate or severe depressive or anxiety symptoms are detected, practitioners should further assess, refer appropriately or offer treatment.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

- Severity of symptoms and clinical diagnosis of depression or anxiety should guide management. The optimal interval for anxiety and depression screening is not known. A pragmatic approach could include screening at diagnosis with repeat screening based on clinical judgement, risk factors, comorbidities and life events, including the perinatal period.
- Screening for mental health disorders comprises assessment of risk factors, symptoms, and risk of self-harm and suicidal intent.

GRADE CONSIDERATIONS

Justifications:

Systematic reviews, meta-analyses, registries and health service datasets collectively indicate that women with PCOS have a higher prevalence of clinically significant symptoms of depression and anxiety.

Identification of mental health disorders is important for supporting women's overall health, wellbeing and quality of life by facilitating appropriate referral and care. In the context of PCOS, identification of mental health disorders is also crucial for optimising women's ability to engage with lifestyle management and other preventive strategies at the core of PCOS care. Therefore, we recommend routine mental health screening for women with PCOS.

In adolescents, early identification of mental health disorders is crucial to supporting lifelong health. Although there are fewer studies in adolescents, they all indicate an increased prevalence of depression. The evidence for a difference in the prevalence of anxiety is inconclusive. We therefore recommend general mental health screening at diagnosis.

Evidence is based on studies using screening tools and clinical interviews and is inclusive of broad regions.

Subgroup considerations:

Perinatal depression was considered in the literature search but only one study was identified and no meta-analysis is possible.

Adolescents – Depression prevalence summarised above. Only three studies on anxiety with no significant difference.

Implementation considerations:

In many countries it is not usual practice to screen adolescents or adults with PCOS for depression and/or anxiety symptoms and doing so may identify affected patients who would otherwise be missed. Screening may have resource implications such as an impact on length of consultation, however this can be reduced by the use of the screening tools recommended here. If depression and/or anxiety symptoms are detected, intervention may require referral to other health practitioners. Additional time with the patient may also be required to complete an appropriate care plan. Access to appropriate information and appropriately trained and experienced health professionals is important but may be limited. It is the responsibility of all health professionals to understand the impact of PCOS on psychological health and to screen for and manage these disorders.

Feasibility - A pragmatic approach may be to screen all women and adolescents at the time of PCOS diagnosis and where appropriate, at the time of their regular physical health checks for PCOS. Use clinical judgment considering an individual woman's risk factors to inform if additional screening is warranted. Align timing and interval of screening during the antenatal and postnatal periods with the regional general population guidelines.

Partner with mental health professionals to improve feasibility related to referral for further care

The life stage of a woman should also be considered when screening for mental health disorders as risk factors and life events may differ. Consider issues around culture and sexual orientation.
The cultural identity and preferred language of a woman are also important considerations. Be aware of possible variations in presentation of mental health disorders and conduct screening in a culturally sensitive manner.

Translation tools should include:

- Screening can be separated into two levels depending on the competence of the practitioner.
  Step 1: The following questions could be asked [10]:
  Over the last 2 weeks, how often have you been bothered by the following problems?
  1) Feeling down, depressed, or hopeless?
  2) Little interest or pleasure in doing things?
  3) Feeling nervous, anxious or on edge?
  4) Not being able to stop or control worrying?

  Step 2: If any of the responses are positive, further screening should involve:
  Assessment of risk factors and symptoms using tools appropriate for age, culture and region (e.g. the Patient Health Questionnaire (PHQ) or the Generalised Anxiety Disorder Scale (GAD7)) and/or refer to an appropriate professional for further assessment.

Monitoring and evaluation considerations:
The optimal interval for anxiety and depressive symptom screening is not known. A pragmatic approach could include repeat screening using clinical judgement, considering risk factors, comorbidities and life events including the perinatal period.
Ongoing monitoring of women with depressive and anxiety symptoms is important. Change in symptoms with initiation of PCOS related therapies should be monitored.
Monitoring of these recommendations is needed in routine care.

Research priorities:

- Where regions, ethnic, population subgroups and life stages (including perinatal period) have not been adequately included, prevalence studies could be justified. Otherwise, further prevalence studies are not warranted.
- Longitudinal follow up to determine frequency of screening for depressive and anxiety symptoms.
- Examination of the impact of depression or anxiety on the process and outcome of PCOS treatment and management, and the impact of PCOS treatment and management on depression or anxiety.
- Examination of the effectiveness of treatment for depression or anxiety in women with PCOS, including the impact this has on the process and outcome of PCOS treatment and management
- The aetiology and pathophysiology of mental health disorders in PCOS which may inform more targeted therapy.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
The difference between depression or anxiety symptoms to actual clinical diagnosis requiring treatment needs to be appreciated.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☐ Moderate	☒ High

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
Anxiety in adolescents and perinatal depression/anxiety are still gaps.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☒ No important uncertainty or variability

Research evidence:
No research evidence was identified

Panel discussion:

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:
No research evidence was identified

Panel discussion:
The GDG did have different perspectives on this issue.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:
No research evidence was identified

Panel discussion:
As above in cost.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
No research evidence was identified

Panel discussion:
Cannot be rated due to no evidence.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:
No research evidence was identified

Panel discussion:
Equitable access to appropriately trained health professionals for mental health varies considerably. The cultural identity and preferred language of a woman are also important considerations. Be aware of possible variations in presentation of mental health disorders and conduct screening in a culturally sensitive manner.

- **ACCEPTABILITY**

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:
No research evidence was identified

Panel discussion:
Workforce training, health system, stigma and resources are all considerations.

- **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:
No research evidence was identified

Panel discussion:
See above in feasibility.

Question 2.3.

In women with PCOS what is the prevalence and severity of psychosexual dysfunction?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	**2.3 In women with PCOS what is the prevalence and severity of psychosexual dysfunction?** **CLINICAL PRACTICE POINTS:** **- Should psychosexual dysunfction be assessed as part of standard care?** **- In women with PCOS, what tools/methods can be used to assess psychosexual dysfunction?**
Clinical leads (key contacts)	**Tania Burgert**
Allocation ranking	**Level 1 - new systematic review**

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	• Women with PCOS. • PCOS diagnosed by Rotterdam criteria/ National Institutes of Health/ Androgen Excess and PCOS society criteria • 14 years and older	None.	Women without PCOS. Less than 14-year-old.	Adequate definition of sexual function, operationalized as: desire, arousal, lubrication, orgasm, frequency of intercourse, masturbation frequency, sexual dysfunction, sexual satisfaction, sexual self-image, sexual debut, sexual distress. Validated sexuality questionnaire or VAS scales	Any original study. E.g. case-control, RCT, cross-sectional	English language. Full text publication.
Exclusion	Unrelated to PCOS. PCOS induced by valproate use PCOS in combination with other diseases. Idiopathic hyperandrogenism. Hyperandrogenism caused by other diseases	None	Women without PCOS but with other diseases (endocrine, somatic or psychological) that influence sexual function	Health related quality of life Quality of life Mental health	Reviews	Full text not available Abstracts Posters PhD theses

5. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Outcomes	Summary of findings	Other notes
Elsenbruch et al. 2003	Outpatient endocrine clinic, Website clinic; Health screening program university	Cross- sectional	PCOS 50 Controls 50	VAS sexual function	PCOS: less satisfied with sexual life, less attractive, sex life is as important as for controls, body hair impacts sexuality negatively	Elsenbruch, Tan, Hahn and Caruso used the same control group
Hahn et al. 2005	Outpatient endocrine Clinic, Website clinic Health screening program university	Cross-sectional	PCOS 120 Controls 50	VAS sexual function	PCOS: less satisfied with sexual life, less attractive, sex life is as important as for controls, body hair impacts sexuality negatively	Elsenbruch, Tan, Hahn and Caruso used the same control group
Drosdzol et al. 2007	University Hospital Outpatient Gynecological Clinics	Cross-sectional	PCOS 50 Controls 40	ISS questionnaire sexual function	PCOS lower marital sexual function, more marital sexual dysfunction, hirsutism affects sexual function negatively than controls	
Tan et al. 2008	Outpatient endocrine clinic Health screening program university	Cross-sectional	PCOS 115 Controls 50	VAS sexual function	PCOS reduced sexual satisfaction and sexual self-worth compared to controls	Elsenbruch, Tan, Hahn and Caruso used the same control group
Caruso et al. 2009	Family planning center Health screening program university	Prospective intervention	PCOS 94 Controls 50	VAS sexual function	Women with PCOS find themselves less sexual attractive. Body hair impacted sexual function and PCOS had an impact on social relations.	Elsenbruch, Tan, Hahn and Caruso used the same control group Intervention study, we used baseline scores only for this meta-analysis
Mansson et al. 2011	Linne Infertlity Clinic in Uppsale Department of Obstetrics & gynecology and Medicine at Sahlgrenska University Hospital Gothenburg For each woman with PCOS a woman born on the same day, identified from the population registry served as a control.	Case control	PCOS 49 Controls 49	McCoy-FSQ	Despite having the same number of partners and about the same frequency of sexual intercourse, women with PCOS were generally less satisfied with their sex lives compared to the population-based controls. PCOS women scored numerically lower than controls on the McCoy total score, but this difference was not statistically significant.	Not included in MA for outliers see Pastoor et al. 2018

Gateva et al. 2012	Hospitalized patients endocrine clinic Other hospital population	Cross- sectional	PCOS 57 Controls 22	FSFI	PCOS lower sexual function scores then obese controls. Obese PCOS women score better in FSFI than lean PCOS women.	Intervention study, we used baseline scores only for this meta-analysis We only used data for obese women.
Stovall et al. 2012	Convenient, hospital Waiting room university gyn department	Cross- sectional	PCOS 92 Controls 82	CSFQ	PCOS lower orgasm score than controls, higher BMI related to worse orgasm scores, testosterone >1SD above mean better sexual function	
Ercan et al. 2013	Not specified, hospital University hospital, routine check up	Cross-sectional	PCOS 32 Controls 32	FSFI	No differences in sexual function, higher testosterone associated with higher total FSFI score	
Ferraresi et al. 2013	Consecutive sample, tertiary hospital, rr 83/87 total population Primary care same hospital, Regular menses	Cross- sectional	PCOS 48 Controls 35	FSFI	PCOS 50% below cut off FSFI, no significant differences in FSFI total score between PCOS and control	We used both the lean and obese data.
Zueff et al. 2014	Outpatient gyn, contraception program	Case control	PCOS 43 Controls 44	SQ-F	No significant differences in total SQ-F scores	
Benetti-Pinto et al. 2015	Gynecology department university hospital, rr 100%	Cross- sectional	PCOS 56 Controls 102	FSFI	PCOS lower score on FSFI scales except for desire and orgasm	
Elkhiat et al. 2015	Gynecology & Obstetrics Clinic	Cross-sectional	PCOS 85 Controls 63	FSDQ	PCOS lower scores on FSDQ scales except for solitary desire. Normal testosterone levels in PCOS associated with better sexual function.	
Kowalczyk et al. 2015	University hospital: department of Gynecologic Endocrinology	Cross-sectional	PCOS 73 Controls 45	MSQ	Both groups find sexuality equally important. PCOS rates themselves negatively as sexual partner.	
Lara et al. 2015	Endocrine gynecology outpatient clinic, academic medical center	Case control	PCOS 43 Controls 51	FSFI	PCOS more sexual dysfunction at baseline, other scales similar scores between PCOS and controls	Intervention study, we used baseline scores only for this meta-analysis
Noroozzadeh et al. 2016	Stratified-cluster sampling method in four provinces of various geographic regions of Iran	Cross-sectional population based	PCOS 63 Controls 216	FSFI	No significant differences between controls and PCOS on FSFI scores.	

Shafti et al. 2016	Hospital and women infertility clinics Convenient sample	Casual comparative study	PCOS 129 Controls 125	FSFI	No significant differences on FSFI scores between PCOS and controls	
Diamond et al. 2017	Trial PCOS II Trial AMIGOS Women seeking infertility care	Cross sectional secondary data analysis with data from clinical trial	PCOS 733 Controls 865	FSFI	Sexual function scores, as assessed by the Female Sexual Function Inventory, were nearly identical. The Female Sexual Distress Scale total score was higher in women with polycystic ovary syndrome. The mean Female Sexual Function Inventory total score increased slightly as the free androgen index increased, mainly as a result of the desire subscore. This association was more pronounced in the women with unexplained infertility	We only used baseline data for this study. Excluded from MA for being an outlier (see Pastoor et al. 2018)
Basirat et al. 2019	Infertility clinic Fatemeh Azahra Infertility and Reproductive Health Research Center, Babol, Iran	Case control	PCOS 120 Controls 120	FSFI	No significant differences on FSFI scores between PCOS and controls	
Glowinska et al. 2020	Gynecology Clinic at Posnan University Of Medical Sciences Internet advertisements	Cross sectional case control study	PCOS 94 Controls 47	Sexual Satisfaction Scales (physical satisfaction)	No significant difference on this scale between PCOS and controls	We only used scores on the Physical satisfactions scale since we thought these were most comparable with FSFI satisfaction
Deniz et al. 2020	Private Manavgat Obstettrics and Gynecology Center, Antalya, Turkey	Case control	PCOS 50 Controls 50	FSFI	Controls have a significantly higher FSFI total score than women with PCOS	We only used data from PCOS fertile group
Aydogan et al. 2020	A tertiary center	Case control	PCOS 20 Controls 30	FSFI	FSFI lubrication score was significantly higher in the PCOS group. Other scores were not significantly different.	We only used data from PCOS fertile group
Akbari Sene et al. 2021	Two infertility centers in Tehran, Iran	Case control	PCOS 116 Controls 93	FSFI	No significant differences were found between PCOS and controls	
Mantzou et al. 2021	Division of endocrinology of the Universitu Hospital of Patras, Greece	Case control	PCOS 76	FSFI	Women with PCOS scored significantly lower on FSFI domains arousal, lubrication, orgasm and	

	Two workshops on female sexuality conducted in the Universities of Athens and Patras, Greece		Controls 133		satisfaction and on the FSFI total score	
Thagavi et al. 2021	Infertility clinic in Omelila Hospital in Hormozgan province Iran Convenience sampling, patients companions	Case control	PCOS 90 Controls 90	FSFI	Women with PCOS scored significantly lower on all FSFI domains and the FSFI total score	
Kaluzna et al. 2021	Not reported, most likely Poznan University of Medical Sciences	Case control	PCOS 190 Controls 197	Sexual Satisfaction Questionnaire (SSQ)	No significant difference between the groups in SSQ total score	
Naumova et al. 2021	reproductive medicine unit of the Hospital Clinic, Barcelona, Spain	Case control	PCOS 37 Controls 31 (male factor infertility)	FSFI	Women with PCOS scored significantly lower compared to the MFI control group on all FSFI domains except pain and on the FSFI total score	We only used data from the male factor infertility control group
Karsten et al. 2021	Follow up of an RCT (women with obesity and infertility randomized to lifestyle intervention followed by infertility treatment or to prompt infertility treatment)	Cross sectional analysis of data from a follow up study after a multicentre RCT	PCOS 64 (orgasm, lubrication, total) PCOS 73 (sexual interest) PCOS 70 (sexual satisfaction) Controls 79 (orgasm, lubrication, total) Controls 100 (sexual interest) Controls 97 (sexual satisfaction)	MFSQ	No significant differences between PCOS and controls were found on MFSQ scores.	
Ashrafi et al. 2022	Royal Institute and health care centers in Tehran, Iran	Cross sectional	PCOS 80 Controls 80 (male factor infertility)	FSFI	Infertile women with PCOS showed lower scores on all FSFI domains and the FSFI total score compared to women with male factor infertility.	We only used data from the male factor infertility control group

6. FINDINGS

Comparisons included:

- **Comparison 1:** Women with PCOS versus controls

Outcomes included:

- **Outcome 1.** Total sexual function
- **Outcome 2.** Sexual desire
- **Outcome 3.** Sexual arousal
- **Outcome 4.** Lubrication
- **Outcome 5.** Orgasm
- **Outcome 6.** Satisfaction
- **Outcome 7.** Pain
- **Outcome 8.** VAS How many sexual thoughts and fantasies did you have?
- **Outcome 9.** VAS How satisfied were you with your sex life?
- **Outcome 10.** VAS How important is a satisfying sex life for you?
- **Outcome 11.** VAS How often do you experience pain during intercourse?
- **Outcome 12.** VAS how much does excessive body hair impact your sexuality?
- **Outcome 13.** VAS Does your appearance make it difficult to engage in social contact?
- **Outcome 14.** VAS Do you find yourself sexually attractive?

COMPARISON 1: Women with PCOS versus Controls

- **EVIDENCE SUMMARY:**

Twenty-seven studies compared psychosexual dysfunction in women with PCOS versus control. Only six studies were of low risk of bias (Basirat et al. 2019, Benetti Pinto et al. 2015, Ercan et al. 2013, Kowalczyk et al. 2015, Mantzou et al. 2021, Noroozzadeh et al. 2017) and the rest were of moderate risk of bias.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Pooled analysis showed that there were no differences in sexual desire or pain between women with and without PCOS, but women with PCOS had lower total sexual function, sexual arousal, lubrication, orgasm and satisfaction. The four studies using the VAS tool could not be pooled due to using the same control group, but comparisons within each study showed that women with PCOS had reduced sex life satisfaction and perceptions of sexual attractiveness, while reporting a higher impact of excessive body hair on sexuality and greater difficulties in engaging in social contact due to appearance. No differences were found in the reported frequency of sexual thoughts and fantasies, importance of sexual satisfaction or pain during intercourse between women with PCOS and controls. Evidence for all outcomes was low, due to downgrading for risk of bias (most studies had a moderate risk), inconsistency due to heterogeneity and varying estimates in some pooled analyses, and imprecision due to the small sample size of the control group across the four VAS studies.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI]	P	Favours	Certainty
Total sexual function	17	2143	-2.42 [-3.26, -1.58]	<0.00001	**Controls** (lower in PCOS)	⊕⊕◯◯ LOW
Sexual desire	16	2498	-0.22 [-0.47, 0.03]	0.08	No difference	⊕⊕◯◯ LOW
Sexual arousal	14	2177	-0.36 [-0.59, -0.13]	0.002	**Controls** (lower in PCOS)	⊕⊕◯◯ LOW
Lubrication	14	2136	-0.47 [-0.75, -0.20]	0.0007	**Controls** (lower in PCOS)	⊕⊕◯◯ LOW
Orgasm	15	2207	-0.35 [-0.52, -0.17]	0.0001	**Controls** (lower in PCOS)	⊕⊕◯◯ LOW
Satisfaction	19	2994	-1.48 [-2.21, -0.75]	<0.0001	**Controls** (lower in PCOS)	⊕⊕◯◯ LOW
Pain	13	2003	-0.27 [-0.57, 0.03]	0.08	No difference	⊕⊕◯◯ LOW
VAS sexual thoughts and fantasies	3	375	NA	NA	No difference	⊕⊕⊕◯ MODERATE
VAS sex life satisfaction	3	377	NA	NA	**Controls** (lower in PCOS)*	⊕⊕◯◯ LOW
VAS importance of sexual satisfaction	3	377	NA	NA	No difference	⊕⊕◯◯ LOW
VAS pain during intercourse	2	282	NA	NA	No difference	⊕⊕⊕◯ MODERATE
VAS body hair impact	4	554	NA	NA	**Controls** (higher in PCOS)*	⊕⊕◯◯ LOW
VAS social contact impact	4	554	NA	NA	**Controls** (higher in PCOS)*	⊕⊕◯◯ LOW
VAS sexual attractiveness	4	554	NA	NA	**Controls** (lower in PCOS)*	⊕⊕⊕◯ MODERATE

*based on statistically significant difference in scores when PCOS was compared with controls within each individual study (since all studies used the same control groups, this effect was not pooled to avoid duplication of the control group in the same analysis).

Study Country	*Brazil*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Department of Gynecology and Obstetrics, School of Medicine, State University of Campinas-Unicamp* *Women with PCOS diagnosis, 18-40 years*	
Control population	*Women with regular menstrual cycles every 24-35 days without signs of clinical hyperandrogenism, assisted in the seame institution*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 56* *Control 102*	
Setting	*University hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Not relevant: WHOQOL-bref* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *This study had as objective to assess sexuality and quality of life in Brazilian women with PCOS diagnosis, with emphasis on the role of weight over such parameters.*
Inclusion criteria	Yes Partial No Not reported	*Partial* *Age 18-40* *Sexually active* *PCOS or regular menstrual cycles without clinical hyperandrogenism*
Exclusion criteria	Yes Partial No Not reported	*Yes* *women with any type of cognitive* *deficiency that could jeopardize the understanding of the study instruments were excluded. We also excluded women who with chronic diseases such as: arterial hypertension, diabetes type I or II, autoimmune disease, neoplasia, or those were taking antidepressants, anxiolytics medication and pregnant.*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial*

Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Not reported*
Summary Result/s		*Women with PCOS had a worse evaluation to arousal, lubrication, satisfaction, pain and total FSFI, and there was no difference in sexual desire and orgasm.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
Quality assessment based on assessment for Pastoor et al. 2018			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Partial*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	*No*
PERFORM ANCE	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No	*Not reported*

		Not reported	
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	*Not relevant for the included studies*
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	*PCOS 63%* *Control not reported*
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Yes*
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	*Partial*
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Partially reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Low*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	*Caruso et al. 2009*
Study Citation	Caruso, S., Rugolo, S., Agnello, C., Romano, M. and Cianci, A., (2009). Quality of sexual life in hyperandrogenic women treated with an oral contraceptive containing chlormadinone acetate. J Sex Med. 2009; 6, 3376-84. doi: 10.1111/j.1743-6109.2009.01529.x.
Study Country	*Italy*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	

Patient/population/ participants	*Women aged 18-32 attending the Family Planning Centre, and had been planning to take oral contraceptives for the treatment of their hirsutism for at least 1 year.*	
Control population	*Same as Elsenbruch et al. 2003*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 94* *Control 50*	
Setting	Research Group for Sexology, Department of Microbiological and Gynecological Science, University of Catania, School of Medicine, Catania, Italy	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary:* *VAS sexual satisfaction, impact PCOS characteristics* *Not relevant:* *SF36, SPEQ, Follow up data after starting oral contraptives* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *to investigate the psychosexual aspects of women affected by clinical signs of androgenization, such a hirsutism, seborrhea and acne, before and under monophasic combined low-dose oral contraceptive intake containing 30 mg EE and 2 mg CMA*
Inclusion criteria	Yes Partial No Not reported	*Partial, only for PCOS* *18-32 years, commited relationship* *had been planning to take oral contraceptives for the treatment of their hirsutism for at least 1 year.*
Exclusion criteria	Yes Partial No Not reported	Partially reported For PCOS: Women with hyperprolactinemia, adrenal hyperplasia, Cushing's syndrome, hypothyroidism or metabolic diseases, or with depressive disorder or other previous psychiatric diagnoses and use of psychiatric drugs, or had taken oral contraceptives or other hormonal medications in the previous 6 months for treating hirsutism or anovulatory menstrual dysfunction were excluded from the study. Moreover, women who used drugs possibly impeding sexual function as well as patients with diagnosed organic causes of sexual disorders were excluded from the study. The body mass index of each woman was _30 kg/m2.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*

Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Partial* *(since we only used baseline data for the meta-analysis it is appropriate for the meta-analysis).*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?	Yes Partial No Not reported	*Not reported*
Summary Result/s	*Frequency of sexual intercourse and of orgasm by intercourse increased, and the frequency of masturbation decreased during the 6th ($p < 0.05$) and the 9th cycle ($p < 0.001$).*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

Study Citation	*Diamond, M.P., Legro, R.S., Coutifaris, C., Alvero, R., Robinson, R.D., Casson, P.A., Christman, G.M., Huang, H., Hansen, K.R., Baker, V., Usadi, R., Seungdamrong, A., Bates, G.W., Rosen, R.M., Schlaff, W., Haisenleder, D., Krawetz, S.A., Barnhart, K., Trussell, J.C., Santoro, N., Eisenberg, E. and Zhang, H., (2017). Sexual function in infertile women with polycystic ovary syndrome and unexplained infertility. Am J Obstet Gynecol.2017. doi: 10.1016/j.ajog.2017.04.034*

Study Country	*USA*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*PPCOS II trial* *AMIGOS trial*	
Control population	*PPCOS II trial* *AMIGOS trial*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 733* *Control 865*	
Setting	*multicenter Hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary outcome:* *FSFI, FSDS* *Not relevant outcomes:* *Medical Outcomes Survey, SF-36, FertiQol* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *To elucidate sexual dysfunction in well-characterized couples with polycystic ovary syndrome (PCOS) and unexplained infertility (UI) and to assess correlations of sexual function and dysfunction in female partners of infertile couples, we undertook a secondary analysis of data from 2 studies of the Eunice Kennedy Shriver National Institutes of Child Health and Human Development Cooperative Reproductive MedicineNetwork (RMN). Additionally, we sought to test the hypothesis that circulating androgen, as assessed by free androgen index (FAI) in women, would be inversely related to the prevalence of sexual dysfunction.*
Inclusion criteria	Yes Partial No Not reported	*Partial* *All PPCOS II women were seeking infertility care and were between the ages of 18 and 39 years; had oligoovulation, defined by the modified Rotterdam criteria for this disorder; and had exclusion of other disorders that could mimic the syndrome, such as congenital adrenal hyperplasia, hyperprolactinemia, or thyroid disease. All participants were required to have a normal uterine cavity and at least 1 patent fallopian tube. Male partners were required to have at least 14 million sperm per milliliter on screening semen analysis.* *All AMIGOS women were between the ages of 18 and 40 years and had UI,*

			defined as 1 or more years of an infertility history with regular menstrual cycles; had normal results on fertility testing including evidence of normal uterine cavity and at least 1 patent fallopian tube and had a male partner with at least 5 million motile sperm on semen analysis; and were also seeking infertility care.
Exclusion criteria		Yes Partial No Not reported	*Partial* *PPCOS II* *Exclusion of other disorders that could mimic the syndrome, such as congenital adrenal hyperplasia, hyperprolactinemia, or thyroid disease.*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Not reported*
Summary Result/s		*Sexual function scores, as assessed by the Female Sexual Function Inventory, were nearly identical. The Female Sexual Distress Scale total score was higher in women with polycystic ovary syndrome. The mean Female Sexual Function Inventory total score increased slightly as the free androgen index increased, mainly as a result of the desire subscore. This association was more pronounced in the women with unexplained infertility.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
Quality assessment based on assessment for Pastoor et al. 2018

Study Country	*Poland*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women between 19 and 40 years old who reported to the Obstetrics and Gynecology and the Gynecological Endocrionology Clinics of the Medical university of Silesia in Katowice, Poland*	
Control population	*Healthy women between 19 and 40 years from the Outpatient Gynecological Clinics*	
PCOS diagnostic criteria	*PSE and ESHRE*	
N per group	*PCOS 50* *Control 40*	
Setting	*University Hosptial*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary outcome:* *ISS (index of sexual satisfaction)* *Outcomes not relevant:* *SF-36* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	YES to evaluate the effect of polycystic ovary syndrome on quality of life and marital sexual satisfaction among women with diagnosed PCOS and compared with a group of healthy controls.
Inclusion criteria	Yes Partial No Not reported	*Partial :* *PCOS diagnosis vs no PCOS diagnosis*
Exclusion criteria	Yes Partial No Not reported	*Partial* *PCOS:* *Using drugs that impede sexual function or having a organic cause of sexual disorder*

			Controsl not reported
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial* *becauselimited*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Partial* *Age-matched, otherwise not reported*
Summary Result/s		Studied women showed worse marital sexual functioning (p<0.05). Marital sexual dysfunctions were diagnosed in 28.6% of women with polycystic ovary syndrome and in 10.5% of healthy women (p<0.05). Anegative effect of hirsutism severity on general well-being and marital sexual life is also observed.

Study Country	*Turkey*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with PCOS, otherwise healthy, faithfully married with an active sexual life*	
Control population	*Age matched healthy regular menstruating non-PCOS women who were admitted to outpatient unit for a routine check up*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 32* *Controls 32*	
Setting	*University hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Not relevant: BDI* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *We aimed to evaluate the sexual function of PCOS patients in comparison with healthy controls*
Inclusion criteria	Yes Partial No Not reported	*Yes* *The inclusion criteria of the study were women who were married, sexually active and between the ages of 20 and 40 who had at least a* *secondary school education, agreed to fill out the Female Sexual Function* *Index (FSFI) and Beck's Depression Inventory (BDI) questionnaire forms,* *and gave informed consent for participation.*

Exclusion criteria		Yes Partial No Not reported	*Yes* *pregnancy, a postpartum period within the past 3 months, gynecologic disorders that might affect female sexual function (that is, pelvic floor disorders, adnexal mass or atrophy, endometriosis), a history of psychological disorders (that is, anxiety states, obsessive-compulsive disorders, vaginismus), a history of internal pathology (that is, hepatic, pulmonary, renal, hematological, or endocrine diseases such as diabetes mellitus, prolactinoma or thyroid dysfunction), menopausal symptoms (including menstrual irregularities or permanent cessation of menses), and no regular sexual intercourse, which was defined as any woman who was not with her husband during the study period. Moreover, patients who did not want to complete the questionnaire forms and patients receiving any medication up to 3 months before the study that could interfere with sexual function (that is, oral contraceptives, estrogens, anti-androgens, sedatives, antidepressants, antidiabetic medications and beta blockers) were excluded due to their possible confounding effects.*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Yes* *Age matched* *Not specified how*
Summary Result/s		*The* *prevalence of sexual dysfunction in the PCOS group was similar to controls (25% vs 19%; P¼0.54). No significant difference was* *found according to each domain score of FSFI.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
Quality assessment based on assessment for Pastoor et al. 2018			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Partial*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Was the control status established in a standard, valid and reliable way?	Yes Partial No	*Yes*

		Not reported	
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Not reported*
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	*Not relevant for the included studies*
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	*2/34 PCOS* *3/35 control*
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Yes*
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	*Partial*
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*No*

Study Country	*Brazil*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*sexually active obese and nonobese women with PCOS selected at the Outpatient Clinic of Gynecologic Endocrinology, which is part of the Sector of Human Reproduction, Department of Gynecology and Obstetrics, University Hospital, Faculty of Medicine of Ribeirão Preto (DGO/HCFMRP), University of São Paulo, Ribeirão Preto, São Paulo, Brazil.*	
Control population	*recruited from a primary care center at the same institution.*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 48* *Controls 35*	
Setting	*Tertiary hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The present study sought to evaluate the sexual function of obese and nonobese women with PCOS compared to that of obese and nonobese women with regular cycles.*
Inclusion criteria	Yes Partial No Not reported	*Partial* *PCOS; diagnosis of PCOS, sexually active* *Control: regular menstrual cycle*
Exclusion criteria	Yes Partial No Not reported	*Yes* *(not reported for which group)* *the use of metformin* *or hormone-based contraceptives in the*

			last 2 months, the use of any anti-androgenic medication (cyproterone acetate or spironolactone) in the last 12 months, or the presence of any psychiatric disorder, endocrinopathy, neuropathy, or gynecologic neoplasia. Any subject exhibiting hyperandrogenism of any other etiology (i.e., congenital adrenal hyperplasia, the presence of an androgen-secreting tumor, Cushing syndrome, or hyperprolactinemia) [17] was also excluded.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Yes* *On BMI*
Summary Result/s		*Evaluation of the total FSFI scores revealed that obese women without PCOS had below-normal sexual function scores, whereas both obese and nonobese women with PCOS had borderline scores compared to controls, who had normal FSFI findings. No association was observed between body mass index, the presence of PCOS, testosterone level, and FSFI score.*

COMMENTS			
What is the overall risk of bias?		Low Moderate	*Moderate*

	High Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No*	

Study ID	*Gateva et al. 2012*	
Study Citation	Gateva, A. and Kamenov, Z., (2012). Sexual Function in Patients with PCOS and/or Obesity before and after Metformin Treatment. Advances in Sexual Medicine. 2012. DOI: 10.4236/asm.2012.22005.	
Study Country	*Bulgaria*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*patients with PCOS and/or obesity that were recruited from the hospitalized in the Clinic of Endocrinology in Alexandrovska Univer- sity Hospital in Sofia*	
Control population	*Obese women without PCOS*	
PCOS diagnostic criteria	*ESHRE, ASRM*	
N per group	*PCOS 57* *Controls 22*	
Setting	*University Hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Not relevant:* *Follow up data after starting metformin* *All self- report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *Obese PCOS patients probably have increased rate of sexual dysfunction. These data are not confirmed in lean PCOS patients. Additional studies are necessary to determine if normalizing the androgen excess and insulin resistance would improve the sexual function in PCOS patients*
Inclusion criteria	Yes Partial No Not reported	*Yes* *premenopausal women aged 18 to 45;* *PCOS, diagnosed by ESHRE-ASRM criteria and;* *BMI > 30 kg/m2.*
Exclusion criteria	Yes Partial No Not reported	*Partial* *Pregnancy;* *Serious illnesses as cardiac, renal or liver insuffi-ciency;* *Other endocrine pathology like type 2 diabetes melli-tus, adrenal tumors, hypothyroidism, prolactinomas, hypogonadism, Cushing's disease, congenital adrenal hyperplasia;* *Insulin sensitizing medication (metformin or glita-zones) or combined oral contraceptive (COC, con-taining etinylestradiol and progestin) use less than 4 months prior to the study.*

If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Partial* *(since we only used baseline data for the meta-analysis it is appropriate for the meta-analysis).*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?	Yes Partial No Not reported	*Not reported*
Summary Result/s	Obese women without PCOS showed significantly higher scores on total FSFI and all domains except from desire compared to lean PCOS subjects. Although the differences do not reach statistical significance, lean PCOS patients have the lowest scores on all domains. FSFI score correlates negatively only with androstendione levels. Women with and without hy- perandrogenemia do not show differences in FSFI score.

Study Country	*Iran*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Women with PCOS*	
Control population	*Women without PCOS*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 63* *Control 216*	
Setting	*Iranian PCOS prevalence study, population based study, four provinces of various geographic regions in Iran using stratified cluster sampling*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *We aimed to compare the sexual function in PCOS patients with controls in a population-based study and to assess the association between hormonal profiles (especially androgens) with sexual function in women with PCOS and controls.*
Inclusion criteria	Yes Partial No Not reported	*Not reported* *Published before (Tehrani et al. 2011)*
Exclusion criteria	Yes Partial No Not reported	*Partial* *congenital adrenal hyperplasia, androgen-secreting tumors and Cushing's syndrome based on physical exam and hormonal assessment.*

			excluding women with no partners (n = 210), those with incomplete data (women who refused to fill out the FSFI questionnaire) (n = 70) and those with only oligomenorrhea/amenorrhea (n = 77), only hyperandrogenemia (n = 205) or only polycystic ovaries (n = 74),
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partially reported*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Not reported*
Summary Result/s		*A comparison of PCOS women and controls showed no statistically significant difference in total FSFI and each of its specific domain*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

Study Country	*USA*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*treatment-naive women diagnosed with PCOS (cases) who had agreed to participate in a complementary and alternative therapy randomized clinical trial.*

Control population	*Waiting room university gynaecological department*	
PCOS diagnostic criteria	*NICHD*	
N per group	*PCOS 92* *Controls 82*	
Setting	*Hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: CSFQ* *Self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *We evaluated the sexual functioning of women with untreated PCOS in comparison with controls. Furthermore, we examined specific aspects of sexual functioning that might be associated with PCOS. In addition, we evaluated the association of total serum testosterone levels, BMI, hirsutism, and acne with the components of sexual functioning in women with PCOS.*
Inclusion criteria	Yes Partial No Not reported	*PCOS:* *(i) a diagnosis of PCOS using the NICHD criteria of oligomenorrhea, nondiabetic, with self-reported hirsutism and/or acne and/or elevated free testosterone; (ii) age 18 to 43 years; (iii) weight _ 250 pounds (113 kg); and (iv) at least one menses in the past 6 months but no more than eight menstrual periods in the most recent 12 months without hormonal intervention.* *Controls:* *(i) no prior or current diagnosis of PCOS; (ii) age 18 to 45 years; (iii) nondiabetic; (iv) weight _ 250 pounds (113 kg); (v) nonhirsute; and (vi) regular monthly cyclic menses.*
Exclusion criteria	Yes Partial No Not reported	*Partial (not clear if these are for both groups)* *Exclusion criteria: (i) prior or current use of oral hypoglycemic agents or insulin; (ii) the use of hormonal contraceptives or any other hormonal intervention in the 60 days prior to enrollment; (iii) currently pregnant or breastfeeding during the prior 30 days; (iv) immune deficiency; (v) fasting blood glucose level > 125 mg/dL; and (vi) hemoglobin A1C (HgbA1C) level > 6.0%.*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial	*Not relevant for the included studies*

		No Not reported	
Was matching performed?		Yes Partial No Not reported	*Not reported*
Summary Result/s		*Based on total CSFQ scores, sexual dysfunction was present in 27.2% of cases vs. 24.4% of controls (not signifcant).Women with PCOS had a significantly lower orgasm/completion score compared with women in the control group (P < 0.001).*

Study Country	*Germany*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*University Hospital of Essen* *(same as Elsenbruch 2003, Hahn 2005)*
Control population	*Same as Elsenbruch et al. 2003*

PCOS diagnostic criteria	*NIH 1990, Rotterdam*	
N per group	*PCOS 115* *Control 50*	
Setting	*University Hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary outcome:* *VAS sexual function, sexual satisfaction, impact PCOS characteristics* *Not relevant outcomes:* *BDI, SF-36, SCL-90, FKW (desire to have a child)* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* we compared psychosocial functioning in PCOS women with and without a present unfulfilled wish to conceive in order to test the hypothesis that PCOS women with a present unfulfilled wish to conceive would experience more psychological problems, particularly increased rates of depression, lower quality-of-life, and decreased sexual satisfaction and self-worth, when compared with PCOS patients without the present desire to conceive.
Inclusion criteria	Yes Partial No Not reported	*Not reported* *(same as Elsenbruch 2003?)*
Exclusion criteria	Yes Partial No Not reported	*Not reported* *(same as Elsenbruch 2003?)*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Not reported* *(same as Elsenbruch 2003?)*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?	Yes Partial No Not reported	*Not reported*
Summary Result/s	Compared with PCOS patients without the desire for a child,PCOS patients with the present wish to conceive reported a significantly higher frequency of sexual intercourse in the past month. No differences between PCOS groups were observed regarding the amount of sexual thoughts and fantasies, the importance of a satisfying sex life, the actual satisfaction with the sex life or with the perceived	

		sexual attractiveness. However, PCOS women without the current desire for a child indicated to have experienced more pain during sexual intercourse, to experience a more negative effect of excessive body hair on sexuality and to perceive more difficulties forming social contacts due to changes in outer appearance

Study Citation	*Akbari Sene A, Tahmasbi B, Keypour F, Zamanian H, Golbabaei F, Amini-Tehrani M. (2021) Differences in and correlates of sexual function in infertile women with and without polycystic ovary syndrome. Int J Fertil Steril. 2021; 15(1): 65-72. doi: 10.22074/IJFS.2021.6206.*	
Study Country	*Iran*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Infertile PCOS women visiting a infertility centerin Tehran, Iran*	
Control population	*Infertile non-PCOS women visiting a infertility centerin Tehran, Iran, by convenience sampling*	
PCOS diagnostic criteria	*PCOS guideline 2018*	
N per group	*PCOS 116* *Non-PCOS 93*	
Setting	*Two infertility centers in Tehran, Iran*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The present study, therefore, investigated the differences between infertile Iranian women with and without PCOS in terms of sexual function. It also aimed to evaluate the degree to which hormonal, anthropomorphic, and hyperandrogenic manifestations may be correlated with the sexual function of these groups of women.*

Inclusion criteria		Yes Partial No Not reported	*Not reported*
Exclusion criteria		Yes Partial No Not reported	*Partial* *Certain disorders, including thyroid disease (based on thyroid-stimulating hormone (TSH) level), hyperprolactinemia (based on prolactin level), and non-classic congenital adrenal hyperplasia (based on 17-hydroxyprogesterone (17-OHP) level), were ruled out by clinical judgment.* *psychiatric disorders; severe emotional problems in the past six months; consumption of oral contraceptive pills, gonadotropin-releasing hormone (GnRH) agonists, or insulin sensitizers in the past six months; chronic cardiovascular diseases; primary or secondary vaginismus and dyspareunia; pelvic mass; active genital infection; external vaginal anomalies; pelvic endometriosis; and partner's sexual dysfunction.*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Not reported*
Summary Result/s		*Eighty-four (40.2%) patients including 42.2% of the PCOS patients and 37.6% of the non-PCOS cases (P>0.05), were suspected of female sexual dysfunction (FSD). The most impaired functions in both groups were desire and arousal. Sexual function was not significantly different between the groups. However, PCOS women had more orgasm problems and acne worsened their sexual function. Total FSFI was positively associated with prolactin level but negatively associated with central obesity in the non-PCOS group; it was negatively correlated with marital duration in the PCOS group. Luteinizing hormone (LH) and pain, prolactin level and lubrication, and central obesity and arousal were correlated in the non-PCOS women. Prolactin level and orgasm, marital duration and arousal, and marital duration and the total FSFI were correlated in the PCOS women.*

What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	*Ashrafi et al. 2022*
Study Citation	*Ashrafi, M., Jahangiri, N., Sadatmahalleh, S.J., Mirzaei, N., Hesari, N.G., Rostami, F., Mousavi, S.S., & Zeinaloo, M. (2022). Does prevalence of sexual dysfunction differ among the most common cause of infertility? A cross-sectional study. BMC Women's Health, 2022: 22:140. doi.org/10.1186/s12905-022-01708-y*
Study Country	*Iran*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Infertile women were those with primary or secondary infertility and were grouped based on the existence of polycystic ovary syndrome (PCOS), endometriosis and male factor, as the most common causes of infertility.*
Control population	*Fertile women were recruited from the health-care centers in Tehran and all had used a condom as a birth control method;*
PCOS diagnostic criteria	*Rotterdam*
N per group	*PCOS 80* *Control MFI 80 (we only used the MFI group as a comparison)* *Control endometriosis 80* *Control fertile 160*
Setting	*Royan Institute and health care centers in Tehran, Iran.*
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Not relevant: HADS* *All self-report*

Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *Since no study has yet compared sexual function based on the different causes of infertility, the present work compared sexual dysfunction and its prevalence among Iranian females with three most-common infertility etiologies, using a validated questionnaire.*
Inclusion criteria	Yes Partial No Not reported	*Inclusion criteria consisted of an age range of 18 to 45 years, living with the husband, and being Sexually active in the last 4 weeks.*
Exclusion criteria	Yes Partial No Not reported	*Participants who filled the questionnaire incompletely or refused to complete the study were excluded*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?	Yes Partial No Not reported	*Not reported*
Summary Result/s	*The prevalence of female sexual dysfunction was 98.8% in women with PCOS, 100.0% in those with endometriosis,and 80.0% in those with male factor infertility. Overall, 36.2% of the enrolled fertile women were suffering from sexual dysfunction.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Partial* *Control group using fertile volunteer participants from other type of healthcare centres then the ones of the PCOS cases, both in the same city.*
SELECTION BIAS – Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Not reported*
SELECTION BIAS – Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	*Not reported*

PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	*Partial*
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Not reported*
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	*Not relevant for the included studies*
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	*0*
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Yes*
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	*Partial* *Small difference in age, big difference in education level and job status. Some difference in BMI.*
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Partial*

COMMENTS		
What is the overall risk of bias?	Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No*	

Study ID	*Aydogan et al. 2020*	
Study Citation	*Aydogan Kirmizi, D, Base, E, Onat, T, Caltekin, MD, Yalvac, ES, Kara, M & Gocmen, AY. (2020). Sexual function and depression in polycystic ovary syndrome: is it associated with inflammation and neuromdulators? Neuropeptides. 2020; 84. 10.1016/j.npep.2020.102099*	
Study Country	*Turkey*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Fertile women with PCOS* *Infertile women with PCOS*	
Control population	*Healthy women with regular menstrual cycles and without evidence of hyperandrogenism or PCOS were included in the control group.*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 20 (fertile)* *Control 30*	
Setting	*Tertiary center*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Not relevant: BDI* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *This study aimed to evaluate the relationship between depression and sexual dysfunction seen in patients with PCOS and serum GABA, glutamate, BDNF, and inflammatory markers and to contribute to the determination of the etiopathogenesis of PCOS.*
Inclusion criteria	Yes Partial No Not reported	*No*
Exclusion criteria	Yes Partial No Not reported	*Yes* *we excluded all patients in whom secondary etiologies were clinically suspected, including hyperprolactinemia, thyroid*

		dysfunction, Cushing's syndrome, congenital adrenal hyperplasia, and virilizing tumors. The exclusion criteria were: (i) history of any exogenous hormonal agent use in the last 3 months; (ii) chronic systemic diseases (e.g. chronic renal failure, chronic heart failure, chronic liver disease); (iii) use of antidepressants and anti-inflammatory agents (e.g. steroids); (iv) (iv) hormonal therapies and insulin sensitizers related to PCOS, or history of antiandrogen drug use in the last 3 months; (v) any antioxidant supportive therapy (e.g. vitamin C, etc.); and (vi) smoking. Furthermore, after a general psychiatric evaluation conducted by a psychiatrist, patients with bipolar disorder, psychotic symptoms during the current major depressive episode, a history of psychosis other than the mood disorder episode, any eating disorders, post-traumatic stress disorder, or a history of substance use were excluded from the study.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?	Yes Partial No Not reported	*Not reported*
Summary Result/s	*Lubrication was significantly higher in the PCOS groups compared to those in the control group (p = 0.040). There were no statistically significant differences in other FSFI scores between the groups. Although not statistically significant, sexual dysfunction was higher (50%) in the PCOS infertile group*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Partial* *Control group using healthy volunteer participants in reproductive age, unknown where recruited.*
SELECTION BIAS – Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Partial.* *Ultrasound was abdominally performed in a number of patients (less accurate). Guideline recommends tve or measuring volume. Was not mentioned in article*
SELECTION BIAS – Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	*Not clearly reported*

PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	*Partial* *For blood samples*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Not reported*
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	*Not relevant for the included studies*
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	*Not reported*
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Yes*
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	*Partial*
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*

COMMENTS		
What is the overall risk of bias?	Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No*	

Study ID	*Basirat et al. 2019*	
Study Citation	*Basirat, Z, Faramarzi, M, Esmaelzadeh, S, Firoozjai, SA, Mahouti, T, & Geraili, Z. (2019) Stress, depression, sexual function, and alexithymia in infertile females with and without polycystic ovary syndrome: a case-control study. Int J Fert STerl. 2019;13(3):203-208. doi: 10.22074/ijfs.2019.5703.*	
Study Country	*Iran*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*240 infertile females through census sampling methods (PCOS and control)* *Infertile women with definite diagnosis of PCOS*	
Control population	*Infertile women without PCOS*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 120* *Control 120*	
Setting	*Infertility clinic Fatemeh Azahra Infertility and Reproductive Health Research Center, Babol, Iran*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Not relevant: FPI, BDI-II, TAS-20* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *As differences in psychological profiles between infertile females with PCOS and those without PCOS are not clear yet, the current study aimed at comparing the psychological profile of these two groups. To the authors' best knowledge, it was the first study that compared psychological profiles of infertile females with and with-out PCOS in terms of four domains: infertility stress, depression, female sexual dysfunction, and alexithymia (i.e. the inability to distinguish and describe feelings and the absence of fantasies).*
Inclusion criteria	Yes Partial No Not reported	*Yes* *Inclusion criteria for infertile females with and without PCOS were being 15-45 years old, completion of primary school as the minimum level of education, being married and having an active sex life, and lacking any problems in speaking or understanding the Persian language; also, a definite diagnosis of PCOS was an additional criterion for PCOS group.*

Exclusion criteria		Yes Partial No Not reported	*Yes* *Exclusion criteria for all participants (females with and without PCOS) were diagnosis of the husband with azoospermia or oligospermia, presence of other disorders that could mimic PCOS syndrome such as congenital adrenal hyperplasia, thyroid disease, or hyperprolactinemia.*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Yes* *On age, level of education, duration of infertility*
Summary Result/s		*There was no significant difference between the two groups regarding the mean scores of depression symptoms and sexual function.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Yes* *Infertile women from Infertility clinic Fatemeh Azahra Infertility and Reproductive Health Research Center, Babol, Iran*

What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	*Glowinska et al. 2020*
Study Citation	*Glowinska, A, Duleba, AJ, Zielona-Jenek, M, Siakoswka, M, Pawelczyk, L, & Banaszweska, B. (2020). Disparate Relationship of sexual satisfaction, self-esteem, anxiety, and depression with endocrine profiles of women with or without PCOS. Reproductive Sciences, 2020; 27:432-44. doi.org/10.1007/s43032-019-00061-0*
Study Country	*Poland*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Women with PCOS were recruited from the Gynecology Clinic at the Poznan University of Medical*

	Sciences.	
Control population	*Recruited via internet advertisements*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 96* *Control 47*	
Setting	*University hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: sexual satisfaction scales* *Not releveant: MSEI, STAI, BDI* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *In view of the above outlined findings and discordant reports,this study was designed to carry out a comprehensive evaluation of the relationship of sexual satisfaction and other relevant psychological functions with clinical, endocrine, and metabolic profiles of women with and without PCOS. In particular, we focused on the relationship of psychosexual characteristics with BMI and testosterone level.*
Inclusion criteria	Yes Partial No Not reported	*Partial* *3 months before the study none of the study subjects used any form of oral contraceptives, other steroid hormones, or any other medications likely to affect ovarian function, insulin sensitivity, or lipid profile.* *Controls: regular menstruation and no clinical symptoms of hyperandrogenism.*
Exclusion criteria	Yes Partial No Not reported	*Partial* *Congenital adrenal hyperplasia was excluded on the basis of morning follicular phase 17-hydroxyprogesterone below 2 ng/mL. None of the subjects had elevated prolactin,thyroid disease, Cushing disease, diabetes mellitus, or symptoms of any other endocrinopathy.*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?	Yes Partial No Not reported	*Yes* *on age and social parameters*

Summary Result/s			*Overall, sexual satisfaction scores were comparable among women with and without PCOS. However, psychosexual function of women with PCOS exhibited distinguishing characteristics. The unconscious aspect of sexuality: frequency of erotic dreams, significantly correlated with free testosterone (ρ = 0.24, P = 0.03) and DHEAS (ρ = 0.31, P = 0.004) only in the PCOS group. In contrast, in women with PCOS, the frequency of masturbation did not correlate with endocrine profiles, but correlated with trait anxiety (ρ = 0.21, P = 0.049) and depression (ρ = 0.21, P = 0.05).*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Partial* *Cases from clinic, receiving fertility treatment, Control from general population.*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	*Partial* *Seems as they also received hormonal sreening. Not clear how many of the controls where excluded because of PCOS diagnosis after evaluation.*
PERFORMANCE	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	*No* *Sexual questionnaires they used are not validated.*
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Not reported*
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	*Not relevant for the included studies*

	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	*Only report on controls: 16 out of 63 not included=25%.*
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Yes*
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	*Partial* *Because a large proportion of PCOS participants also received infertility treatment compared to the control group (big difference! P=<0.0001)*
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	*Karsten et al. 2021*
Study Citation	*Karsten, MDA, Wekker, V, Groen, H, Painter, RC, Mol, BWJ, Laan, ETM, Roseboom, TJ, & Hoek, A. (2021). The role of PCOS in mental health and sexual function in women with obesity and a history of infertility. Human Reproduction Open. 2021;1:1-11. doi.org/10.1093/hropen/hoab038*
Study Country	*The Netherlands*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Women with infertility and a BMI of 29 or higher participated in this follow-up study. PCOS was diagnosed by clinicians at entry within the initial trial, based on the Rotterdam 2003 criteria*
Control population	*women with obesity and infertility without PCOS (ovulatory and anovulatory non-PCOS women (WHO class I and II)).*

PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 73* *Control women 100*	
Setting	*University hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: MSFQ* *Not relevant: HADS, SF-36* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The aim of the current study was therefore to investigate whether mental health and sexual function differ between women with or without PCOS with a comparable BMI and fertility characteristics. We therefore compared symptoms of anxiety and depression, quality of* *life and sexual function in women with obesity and a history of infertility with and without PCOS.*
Inclusion criteria	Yes Partial No Not reported	*Yes* *18-39years, infertility, BMI 29 or higher*
Exclusion criteria	Yes Partial No Not reported	*Not reported,* *Reported elsewhere*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Not reported*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?	Yes Partial No Not reported	*Not reported*
Summary Result/s	*Symptoms of anxiety and depression, physical quality of life and sexual function did not differ significantly between obese women with and without PCOS. However, women with PCOS had a worse mental quality of life summary component score (_3.60 [95% CI _6.72 to _0.56]), mainly due to a lower score on the subscale 'role limitations due to emotional problems' (_12.41 [95% CI _22.78 to _2.28]), compared to women without PCOS. However, compared to an age-matched Dutch reference population, the obese infertile women with and without PCOS both scored lower on almost all physical and mental quality of life subscales.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Yes*

Study Citation	*Kaluzna, M, Nomejko, A, Slowinska, A, Wachowiak-Ochmanska, K, Pikosz, K, Ziemnicka, K, & Ruchala, M. (2021). Lower sexual satisfaction in women with polycystic ovary syndrome and metabolic syndrome. Endocrine connnections. 2021;10(9):1035-1044. doi.org/10.1530/EC-21-0257*
Study Country	*Poland*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*PCOS patients mean age 26.34±5.47 years*
Control population	*A CON group consisted of eumenorrheic healthy Individuals without reported problems concerning endocrine disorders, sexual development, and maturation. Mean age 27.12 ± 4.97 years*
PCOS diagnostic criteria	*Rotterdam, PCOS guideline 2018*
N per group	*PCOS 190* *Control 197*
Setting	*Not reported (probably university hospital)*
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: Sexual Satisfaction Questionnaire* *Not relevant: WHOQOL-bref, CEDS-R* *All self-report*

Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Yes* *This study aimed to screen SS and psychological conditions in PCOS women in comparison to eumenorrheic controls. The relationship of depressive symptoms, HRQoL, and clinical phenotype of PCOS (clinical and biochemical hyperandrogenism (HA), simple and central obesity, insulin resistance (IR), lipid disturbances, metabolic syndrome (MS)) with SS was evaluated.*
Inclusion criteria		Yes Partial No Not reported	*Not reported*
Exclusion criteria		Yes Partial No Not reported	*Yes* *PCOS and CON women were excluded if they had severe psychiatric disorders (schizophrenia, bipolar disorder ,severe depression), diabetes, severe liver or kidney disease, the use of oral contraceptive or anti-androgen therapy in the last 3 months or current pregnancy or diagnosed and/or treated infertility.*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Yes* *Age matched*
Summary Result/s		*Patients with PCOS and MS had lower SS vs non-MS-PCOS. There w ere no significant differences in the level of SS, presence of depressiv e symptoms, or HRQoL between PCOS and CON (P > 0.05). Negative correlations were found between the SS level and BMI, waist circumference, and waist-to-height ratio i n PCOS women. However, overweight or obese PCOS women did not differ in SS levels vs no rmal-weight PCOS patients. The social dimension of WHOQOL-BREF was the only sign ificant predictor of SS in PCOS patients.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Not reported*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*

	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	*Partial* *Only in a part of the control group*
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	*Partial* *Questionnaire was only once validated in Poland and not otherwise tested or used elsewhere.*
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	*Not relevant for the included studies*
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	*Not reported*
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Yes*
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	*Partial* *Significant difference in BMI, WC, WHtR between PCO and CON group. But is analysed in correlation analysis.*
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*SS Questionnaire only validated in Poland.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Study Country	*Greece*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*PCOS 20-30 years* *Patients with PCOS were recruited* *from the Division of Endocrinology of the University Hospital* *of Patras;*	
Control population	*Healthy controls* *Recruited among attendees of 2 workshops of female sexuality* *conducted in the universities of Athens and Patras*	
PCOS diagnostic criteria	*Androgen Excess Society*	
N per group	*PCOS 76* *Controsl 133*	
Setting	*University Hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Not relevant: HADS* *Self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The aim of this study was to examine for the first time the different aspects of female sexuality in young women of Greek origin with polycystic ovary syndrome (PCOS) who do not seek fertility and to attempt to associate hormonal changes and ovulatory status with their sexual function.*
Inclusion criteria	Yes Partial	*Partial*

		No Not reported	*Controls had normal ovulatory menstrual cycles (28−35 days) and no clinical/biochemical hyperandrogenemia.* *All women recruited were sexually active in the last 4 weeks, participated voluntarily in the study and did not seek fertility*
Exclusion criteria		Yes Partial No Not reported	*Yes* *for both the women with PCOS and the healthy controls: chronic diseases, psychiatric disorders, use of drugs that could affect the hypothalamus−pituitary−gonadal axis (eg. oral contraceptive pills, GnRH agonists, antipsychotics, antidepressants, chemotherapeutic agents). Women on such drugs were excluded due to their inhibited ovarian hormone secretion.*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?		Yes Partial No Not reported	*Not reported*
Summary Result/s		*Women with PCOS demonstrated lower scores than controls in arousal (5.04 ± 1.19 vs 4.48 ±1.44, P < .001), lubrication (5.29 ± 1.17 vs 4.69 ± 1.54, P < .001), orgasm (4.78 ± 1.40 vs 4.11 ± 1.61, P = .001), satisfaction (5.22 ± 1.10 vs 4.78 ± 1.31, P = .016), and total score of the FSFI (29.51 ± 5.83 vs 26.76 ± 6.81, P < .001), even after correction for BMI. When corrected for total testosterone, the domains of lubrication, satisfaction, and total score of FSFI remained significantly impaired in women with PCOS (P values .037, .024, &.044 respectively). In multivariate logistic regression analysis, after adjusting for the effect of BMI and hormonelevels, dysfunction in orgasm, satisfaction and the total FSFI score were still 3−4 times more common in PCOS (adjusted OR [95% CI]: 3.54, P = .020; 2.96, P = .050; 3.87, P = .027). Even though no statistically significant differences were observed between women with ovulatory PCOS and controls, we detected statistically significant differences in all domains of sexual function apart from pain between controls and PCOS women with anovulation (desire P value .04, arousal P value <.001, lubrication P value <.001, orgasm P value .001, satisfaction P value .001 and FSFI total score P value <.001).*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

Study Country	*Spain*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*46 PCOS patients aged 18 to 40 who met the Rotterdam criteria and did not receive oral contraceptive pills or medications over the past 6 months were included in the study* *Patients were recruited at the reproductive medicine unit of the Hospital Clinic Barcelona where women complained of infertility.*	
Control population	*Women with tubal factor infertility* *Healthy Women with male factor infertility*	
PCOS diagnostic criteria	*Rotterdam*	
N per group	*PCOS 46* *Women with TFI 50* *Women with MFI 31 (we only used this group as a comparison)*	
Setting	*Hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Not relevant: BDI-II, HAMA-A* *All self-report*	
Does the study have a clearly focused question and/or PICO?	Yes Partial	*Yes*

	No Not reported	*The purpose of this study was to assess the prevalence of depressive and anxiety symptoms and sexual dysfunction in infertile PCOS patients in comparison with women with other infertility causes (tubal and male infertility factors), and to identify factors predisposing PCOS subjects to emotional distress and impaired sexual function.*
Inclusion criteria	Yes Partial No Not reported	*Not reported*
Exclusion criteria	Yes Partial No Not reported	*Not reported* *None of the women of the three groups was undergoing medically assisted reproduction (MAR) while participating in the present study. None of the women had any extragenital pathology.*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Not reported*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?	Yes Partial No Not reported	*Not reported*
Summary Result/s	*Women with infertility due to PCOS showed a significantly higher prevalence of depressive (48.6 vs 19.4 and 12.9%, p < 0.01) and anxiety symptoms (21.6 vs 5.6 and 3.2%, p = 0.041) than respondents of reference groups. Sexual function in PCOS subjects was impaired in the areas orgasm and satisfaction (p < 0.01 for both) compared to patients of reference groups. Clinical, biochemical hyperandrogenism, and overweight were associated with a higher incidence of depressive and anxiety symptoms in the infertile PCOS group (p < 0.01 for all). Besides, the severity of anxiety symptoms was associated with the number of medically assisted reproduction attempts (p = 0.014). Weight gain and age (p = 0.04 and p = 0.047) were associated with impaired sexual functioning. The relation between reduced sexuality and depressive/anxiety symptoms was found (p = 0.038 and p = 0.012, respectively).*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Yes*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*

Middel East Fertilty Society Journal. 2021;26(2). doi.org/10.1186/s43043-020-00047-y*
Study Country	*Iran*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*women with PCOS referred to an infertility clinic in Omelila Hospital in Hormozgan province in Iran*
Control population	*The control group was also consistent with healthy married women within the age range of 18-45 who had no chronic disease, had a regular menstrual cycle, and they were selected from patients' companions by convenience sampling method.*
PCOS diagnostic criteria	*Rotterdam*
N per group	*PCOS 90* *Control 90*
Setting	*Infertility clinic*
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary: FSFI* *Not relevant: ENRICH, Larson questionnaire, IIEF-5* *All self-report*

Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *the aim of this study is to evaluate sexual and marital satisfaction in couples with PCOS compared with a control group.*
Inclusion criteria	Yes Partial No Not reported	*Partial* *PCOS: desire to participate in the study, being 18–45 years of age, married, Iranian, having two of the following Rotterdam diagnostic criteria [10]: (1) polycystic ovaries visualized on ultrasound scan (presence of 12 follicles or more in one or both ovaries and/or increased ovarian volume, i.e., > 10 ml), (2) clinical signs of hyperandrogenism (hirsutism score based on hirsutism score greater than 7 or obvious acne) or chemical hyperandrogenism, (3) having an interval between menstrual periods > 35 days and/or amenorrhea, defined as the absence of vaginal bleeding for at least 6 months (i.e.,* *199 days). However, it should be noted we used only clinical signs for this study as our previous studies.*
Exclusion criteria	Yes Partial No Not reported	*Yes* *Our exclusion criteria were as follows: having nonclassic adrenal hyperplasia, thyroid dysfunction, hyperprolactinemia, smoking, problems in speaking or listening, taking any prescription medication (except allergy* *medications and occasional pain medications) for at least 3 months before entering the study, severe psychological stress at least 3 months before entering the study (loss of relatives, etc.), history of taking psychiatric medications at least 3 months before entering the study, having score* *< 12 according to International index of erectile function to both groups.*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant for the included studies*
Was matching performed?	Yes Partial No Not reported	*Not reported*
Summary Result/s	*The results of this study show that the mean scores of sexual function, sexual satisfaction, and marital satisfaction were significantly lower in PCOS couples compared with the control group (P < 0.05). Infertility was reported as the strongest predictive factor for sexual function and marital satisfaction in couples with PCOS (P < 0.05). Compared to the control group, sexual and marital satisfaction was lower in patients with PCOS and their partners.*

Question 2.3.

In women with PCOS what is the prevalence and severity of psychosexual dysfunction?

BACKGROUND:

Psychosexual function in PCOS may be influenced by the condition's complex interaction of endocrine, psychological, and metabolic factors. The first reports of psychosexual dysfunction in PCOS in the early 2000's suggest that PCOS may limit sexual self-worth, feminine identity, and sexual satisfaction (1-3). In 2018 a meta-analysis of 18 studies comparing sexual function as assessed by validated sexual function questionnaires and VAS (visual analogue scales) between PCOS and non-PCOS (4). While satisfaction with sex life was deemed equally important in both groups, sexual satisfaction, sexual attractiveness and sexual function were rated lower in those with PCOS. In terms of specific function subscales, the study showed lower scores for arousal, lubrication, and orgasm in PCOS.

Since then, a small meta-analysis, reported no difference in sexual function between PCOS and non-PCOS (5). However, this meta-analysis included a secondary analysis of a large infertility trial that required sexual intercourse three times a week, which may have increased sexual function scores for these participants (6). A subsequent, slightly larger meta-analysis from 2020, noted that individuals with PCOS tend to lack sexual satisfaction and report more dyspareunia (7).

Even though low sexual function scores are more common in PCOS, the prevalence of psychosexual function remains unknown, as most studies fail to report the percentage of low sexual function scores within their examined PCOS population. Furthermore, clinically relevant psychosexual dysfunction is defined through assessment of sexual distress in the context of low psychosexual function, which is not commonly reported. One study, that did report on psychosexual dysfunction in a PCOS treatment trial, found that lifestyle and combined oral contraceptive pills lead to an overall improvement of psychosexual dysfunction (8). However, the study lacked a non-PCOS comparison group. Therefore, the current GDG informing meta-analysis update is unable to report on the prevalence of psychosexual dysfunction in PCOS. In terms of psychosexual function alone, our meta-analysis notes a small but statistically significant reduction of sexual function in all assessed domains: desire, arousal, lubrication, orgasm and pain.

While subgroup analysis, separating impact by higher weight, infertility, presence of mood disorder (anxiety/depression), hormone levels and hirsutism would have been beneficial for GDG recommendations, the subgroup numbers of the current meta-analysis were still too small to result in clinically relevant data. Therefore, the relationship between PCOS and/or varying characteristics of PCOS and psychosexual dysfunction remains unclear.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Women with PCOS versus controls	⨁⨁◯◯ LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

PCOS vs non-PCOS

CONSENSUS RECOMMENDATION

- **CR:** Health professionals could consider the multiple factors that can influence psychosexual function in PCOS including higher weight, hirsutism, mood disorders, infertility and PCOS medications.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **CR:** Permission to discuss psychosexual function should be sought noting that the diagnosis of psychosexual dysfunction requires both low psychosexual function, combined with related distress

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

GRADE CONSIDERATIONS

Justifications:
Individuals with PCOS score statistically significantly lower on psychosexual function questionnaires than those that do not carry the diagnosis of PCOS but clinical relevance is unclear. We lack the corresponding distress scores which are required to meet the criteria for psychosexual dysfunction.
The impact of infertility, higher weight and other factors also cannot be ascertained on the current evidence and the independent impact of PCOS is unclear.

Subgroup considerations:
Not enough data is available to make subgroup recommendations in terms of risk for low sexual function including populations with infertility, different life stages, higher weight and mental health status.
The current tools are not inclusive of diversity.

Implementation considerations:
Health professionals may be reluctant to discuss psychosexual dysfunction [9].

Monitoring and evaluation considerations:
None

Research priorities:
Psychosexual function in combination with sexual distress (psychosexual dysfunction) should be assessed concurrently in research.
More inclusive research of diverse populations is needed.
Intervention studies in PCOS should consider including psychosexual dysfunction as an outcome where appropriate.
Examination of the effectiveness of treatment for psychosexual dysfunction in women with PCOS, including the impact this has on the process and outcome of PCOS treatment and management
Even though the evidence points to lower psychosexual function in PCOS, the relative effect of varying PCOS associated findings such as higher weight, hirsutism, mood disorder, sub- or infertility, sleep disorder, metabolic and endocrine disturbance needs exploration. Furthermore, the effect of lifestyle or pharmacological intervention on psychosexual dysfunction should be further explored by treatment type.

GDG 2

Question 2.4.

In women with PCOS, what is the prevalence and severity of body image distress?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	**Q 2.4.1) In women with PCOS, what is the prevalence and severity of body image distress?** **Clinical Practice Points:** **- Should body image distress be screened as part of standard care?**
Clinical leads (key contacts)	**Elisabet Stener-Victorin, Leah Brennan**
Allocation ranking	**Level 1 – New systematic review**

	Participants (P)	**Intervention (I)**	**Comparison (C)**	**Outcomes (O)**	**Study type (S)**	**Limits** ***(language, year)***
Inclusion criteria	Females with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity and weight. Subgroups: • Adolescents • Ethnicity • Phenotype • Pregnancy If no evidence in PCOS, evidence related to obesity will be sought narratively by key contact (not searched by evidence team).	No restrictions (Any tools assessing body image distress) Note: tools to screen body image distress Body Image Scale, Rosenberg Self-Esteem Scale, Beck Depression, Body Image Concern Inventory (BICI), Stunkard Figure Rating Scale (FRS), Body Esteem Scale, Body Image Disturbance Body Image States Scale Situational Inventory of Body-Image Dysphoria (SIBID) (and short-form version) Body Image Acceptance and Action Questionnaire (BI-AAQ) Appearance Schemas Inventory (ASI, and revised versions) Body Esteem Scale for Adolescent and Adults Body Image Coping Strategies Inventory Body Satisfaction Scale (BSS) Body Image Ideals Questionnaire Assessment of Body-Image Cognitive Distortions Body Image Quality of Life Inventory Multidimensional Body self-relations questionnaire (MBSRQ) Body image avoidance questionnaire Body appreciation scale Body image scale Ben-Tovim Walker Body Attitudes Questionnaire Body shape questionnaire Body cathexis scale Figure rating scale Derriford Appearance Scale	People without PCOS	Outcomes relating to body image concerns dysmorphic in women with PCOS. Studies are likely to vary significantly in their methods for measurement of these outcomes and as such we will place no constraints on how outcomes are measured. Studies should use **validated questionnaires** to assess body image concerns.	Original research studies done after getting informed consent and ethics committee approval wherever applicable. Randomized controlled trials, non-randomized controlled trials, Observational studies including cohort, case-control, and cross-sectional studies will be included in the review.	No limits on publication date. English language only articles were included.
Exclusion criteria	Females with PCOS not fulfilling the criteria above.				Non-evidence based guidelines, non-systematic reviews, non-comparative cohort studies, case-control studies, case series, editorials, letters, commentaries.	

2. SEARCH STRATEGY

Table 2.1. Search details

Table 2.2. Questions addressed by this search *(add more rows as needed)*:

GDG	Q1	What is the prevalence of body image dissatisfaction/distress among women with PCOS?
	Q2	Is there a higher degree of body image concerns among women with PCOS, compared to women without PCOS?
	Q3	What is the current evidence base evaluating body image concerns among women with PCOS?

5. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

No.	Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings
1	Alur-Gupta et al. 2019. USA	Women diagnosed with PCOS	Case Control	PCOS (n=189) Non-PCOS (n=225)	Multidimensional Body-Self Relations-Appearance Subscale (MBSRQ-AS) Stunkard Figure Rating Scale (FRS)	Healthy volunteers	None	Women with PCOS had worse BID scores on all five MBSRQ-AS subscales adjusted for age, body mass index, race, pregnancy history, income, and employment, and larger differences on the FRS compared with the control women. Most MBSRQ-AS subscale scores statistically significantly correlated with depression, anxiety, and quality of life scores.	Women with PCOS have increased body image distress and depressive and anxiety symptoms.
2	Annagur et al. 2014. Turkey	Women diagnosed with PCOS	Case Control	PCOS (n=83) Non-PCOS (n=64)	Body Image Scale	Healthy volunteers	None	The mean±S.D. BMI of PCOS and control groups were 23.85±4.67 kg/m2 and 22.00±2.43 kg/m2, respectively. Body mass index values of the PCOS group were significantly higher than the controls ($p<0.05$). There was no significant difference between the PCOS group and healthy controls for Body Image Scale (BIS) scores.	No significant difference in body image concerns between women with and without PCOS.
3	Deeks et al 2011. Australia	Women diagnosed with PCOS	Case Control	PCOS (n=177) Non-PCOS (n=109)	Multidimensional Body Self Relations-Appearance Subscale (MBSRQ-AS)	Healthy volunteers	None	women with PCOS had lower appearance evaluation, fitness orientation, health evaluation, health orientation, body areas satisfaction, higher overweight preoccupation and higher self-classified weight than women without PCOS.	In women with or without PCOS, body image and self-worth are predictors of both anxiety and depression, while QOL also predicts only depression.
4	Himelein et al. 2006. USA	Women diagnosed with PCOS	Case Control	PCOS (n=40) Non-PCOS (n=60)	Multidimensional Body Self Relations-Appearance Subscale (MBSRQ-AS) Body Features Satisfaction (BFS)	None	None	Women with PCOS reported higher depression scores and greater body dissatisfaction ($p < .001$) than comparison group women. Body image was strongly associated with depression overall, even after controlling body mass.	Among women with PCOS, body dissatisfaction measures and education explained 66 percent of the variance in depression, suggesting explanations of the PCOS-depression link should consider the role of potentially mediating psychosocial variables.
5	Karacan et al. 2014. Turkey	Women diagnosed with PCOS	Case Control	PCOS (n=42) Non-PCOS (n=52)	Stunkard Figure Rating Scale (FRS) body esteem scale	None	None	Women with PCOS viewed their actual body as significantly larger (M = 4.14, SD = 1.37) than their own ideal body. Similarly, participants in control group viewed also their actual body as	body esteem was important for predicting eating attitudes in both groups and sociocultural internalization of thinness ideal and body dissatisfaction were also significant factors in PCOS group.

								significantly larger (M = 3.59, SD = 1.49) than their own ideal body.	
6	Kutenaee et al. 2020. Iran	Women diagnosed with PCOS	Case Control	PCOS (n=201) Non-PCOS (n=199)	Body Image Concern Inventory (BICI)	Healthy volunteers	None	Mean BICI Score for PCOS Group; 39.17 (+/- 32.23) and Mean Body Image Score for Non-PCOS Group; 32.61 (+/-11.11). The strongest effect from a psychological variable on sleep quality was body image which had negative impact on sleep quality of patients with PCOS.	Our study showed that body image plays an important role in the sleep quality of women with PCOS.
7	Morotti et al. 2013. Italy	Women diagnosed with PCOS	Case Control	PCOS (n=33) Non-PCOS (n=22)	Stunkard Figure Rating Scale (FRS)	Healthy volunteers	None	two-factor Italian MFSQ, the FRS, and the BDI were similar in both groups.	moderate hirsutism and hyperandrogenism do not have any important influence on body image and self-esteem and, as a consequence, on sexual function.
8	Pastore et al. 2011. USA	Women diagnosed with PCOS	Case Control	PCOS (n=94) Non-PCOS (n=96)	Body Esteem Scale	Healthy volunteers	None	Body dissatisfaction (especially perception of physical conditioning) was strongly associated with more severe depression symptoms in non-obese PCOS women (BMI < 30, P < .04) before and after controlling for age, testosterone and free testosterone.	Among non-obese PCOS women, their subjective body image was strongly associated with the severity of their depression symptoms. Most of the obese PCOS cohort had low body satisfaction and depression symptoms, therefore individual differences in the body dissatisfaction scores were not helpful in identifying depression symptom severity.
9	Scaruffi et al 2019. Italy	Women diagnosed with PCOS	Case Control	PCOS (n=59) Non-PCOS (n=38)	Body Uneasiness Test (BUT)	Healthy volunteers	None	The PCOS group showed higher body uneasiness.	physical appearance and bodily function have a central place in the minds of women with PCOS, as well as in their relationships

5. FINDINGS

▪ EVIDENCE SUMMARY

Nine studies were included, all of case-control design, from various countries including Iran, Italy, USA, Turkey and Australia. All studies were ranked as moderate risk of bias due mainly to the lack of information on whether the cases and controls were taken from comparable populations and whether outcome assessors were blinded to case and control status. While some studies did not report whether the control status was established in a standard, valid and reliable way, a few others did not report whether the study was sufficiently powered to detect any differences between the groups.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS:

Studies showed that women with PCOS had higher body image concerns compared to healthy controls. However, certainty in the evidence was low across all outcomes, downgraded due to the moderate risk of bias in the included studies.

Outcome or subgroup	Studies	n	Effect, fixed [95% CI]	P	Favours	Certainty	Importance

Study Country	Turkey	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	83 patients diagnosed with PCOS according to Rotterdam Criteria. Ethnicity breakdown was 83.9% in Caucasian/White, 6.5% in Middle Eastern, 1.6% in South Asian, 1.6% in Jamaican and 6.5% in mixed descent.	
Control population	N=64 (Non-PCOS)	
PCOS diagnostic criteria	Rotterdam	
N per group	PCOS (n=83) Non-PCOS (n=64)	
Setting	Recruited from the patients with untreated PCOS who admitted to the Outpatient Clinic of Gynecology and Obstetrics of Faculty of Medicine of Selçuk University. Age matched healthy controls (n=64) were recruited from employees at Selçuk University Hospital.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Body Image Scale (BIS) Outcomes not relevant: - Rosenberg Self-Esteem Scale (RSES) - Beck Depression Inventory (BDI)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. Patients with untreated PCOS diagnosed according to Rotterdam criteria.
Exclusion criteria	Yes Partial No Not reported	Yes. The exclusion criteria for the study were the following: a history or existence of bipolar disorder, schizophrenia or related disorders, a history of neurological disease and concomitant severe medical illnesses (e. g., cardiovascular or pulmonary diseases, severe renal or liver failure, any cancer) and those who were under hormone replacement or psychotropic medications within the last 4 weeks.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes

Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case-control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	Yes, age matched healthy controls (n=64) were recruited.
Summary Result/s	The mean±S.D. BMI of PCOS and control groups were 23.85±4.67 kg/m2 and 22.00±2.43 kg/m2, respectively. Body mass index values of the PCOS group were significantly higher than the controls ($p<0.05$). There was no significant difference between the PCOS group and healthy controls for Body Image Scale (BIS) scores.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	No
SELECTION BIAS – **Was the case definition adequate and established in a standard, valid and reliable way?**	Yes Partial No Not reported	Not reported
SELECTION BIAS – **Was the control status established in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
PERFORMANCE BIAS – **Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS – **Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS – **Were outcome assessors blind to case and control status?**	Yes Partial No Not reported	Not reported
DEDETECTION BIAS – **Were all outcomes measured in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes

	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not relevant to case-control
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not relevant to case-control
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported No protocol or PROSPERO
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Yes
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?			

Study ID	Alur-Gupta S et al. 2019
Study Citation	Alur-Gupta, S., Chemerinski, A., Dokras, A., Liu, C., Lipson, J., Allison, K., & Sammel Mary D. AO - Dokras, A. O. http://orcid. org/0000-0002-1085-3969. (2019). Body-image distress is increased in women with polycystic ovary syndrome and mediates depression and anxiety. Fertility and Sterility, 112(5), 930.
Study Country	USA

CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	189 patients diagnosed with PCOS according to Rotterdam Criteria.	
Control population	Non-PCOS (n=225)	
PCOS diagnostic criteria	Rotterdam	
N per group	PCOS (n=189 Non-PCOS (n=225)	
Setting	Secondary. University of Pennsylvania's Penn PCOS center and gynecology clinics. From January-October 2018, non-pregnant women aged 18–50 years presenting to these clinics were approached for participation in the study.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Multidimensional Body Self Relations-Appearance Subscale (MBSRQ-AS) - Stunkurd Figure Rating Scale (FRS) Outcomes not relevant: - Hospital Anxiety and Depression Scale (HADS)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. Women with PCOS met the Rotterdam criteria, defined as two out of three criteria: elevated clinical or biochemical androgens (identified in this study by chart review for Ferriman-Gallwey [FG] scores and/or serum testosterone levels), irregular menses, and polycystic-appearing ovaries (identified by chart review for ultrasound report) . No restrictions were placed based on the history of mood disorders, use of antidepressants, hormonal contraception, or presence of other medical comorbidities.
Exclusion criteria	Yes Partial No Not reported	Not reported
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case-control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	No

Summary Result/s	All assessed areas of the MBSRQ-AS showed statistically significant differences between PCOS and controls suggestive of BID. On the Stunkard FRS survey, women with PCOS had larger differences compared with controls for Stunkard Score 1 (P=.020) and Score 2 (P=.011) but not Score 3 (P=.276). For both Score 1 and Score 2, the values were noted to be 2 or greater, indicative of BID		

BID measure	PCOS (n = 189)	Controls (n = 225)	P value[a]
MBSRQ-AS			
Appearance evaluation[b]	2.6 ± 0.9	3.4 ± 0.9	<.001
Overweight preoccupation	3.4 ± 0.9	2.8 ± 1.0	<.001
Appearance orientation	3.8 ± 0.6	3.6 ± 0.7	.002
Body areas satisfaction	2.8 ±0.7	3.3 ± 0.7	<.001
Self-classified weight	4.0 ± 0.7	3.6 ± 0.9	.013

INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No risk of bias the same across all outcomes	

Study ID	Scaruffi E et al 2019
Study Citation	Scaruffi, E., Franzoi, I. G., Civilotti, C., Guglielmucci, F., la Marca, L., Tomelini, M., Veglia, F., & Granieri, A. (2019). Body image, personality profiles and alexithymia in patients with polycystic ovary syndrome (PCOS). Journal of Psychosomatic Obstetrics and Gynaecology, 40(4), 294–303.
Study Country	Italy
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	59 patients diagnosed with PCOS according to Rotterdam Criteria.
Control population	N=38 (Non-PCOS)

PCOS diagnostic criteria	Rotterdam	
N per group	PCOS (n=59) Non-PCOS (n=38)	
Setting	PCOS group recruited from outpatients at the two gynecological endocrinology services of the University Hospital Città della Scienza e della Salute in Turin. The control group of 38 healthy age-matched women was enrolled through local general practitioners	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Body Uneasiness Test (BUT) Outcomes not relevant: - Toronto Alexithymia Scale (TAS-20) - (MMPI-2)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. Inclusion criteria for PCOS patients were defined according to the revised criteria of the Rotterdam Consensus Workshop. These criteria require 2 out of 3 between oligo- and/or anovulation, clinical and/or biochemical signs of hyperandrogenism and polycystic ovaries.
Exclusion criteria	Yes Partial No Not reported	Yes. Exclusion criteria for both the PCOS and the control groups were (1) having a poor knowledge of the Italian language, (2) having a certified psychiatric diagnosis, (3) having a certified diagnosis of a neurogenerative disease (i.e. Alzheimer disease, Parkinson disease, etc.), (4) having a certified medical disease, (5) being pregnant and (6) having been in psychiatric or psychological therapy in the last 6 months.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case-control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	Yes, age matched healthy controls (n=38) were recruited.
Summary Result/s	On the BUT, PCOS patients show higher values compared to the controls in both the Positive Symptom Total Index (p = .015) and the Global Severity Index (p = .002) scales.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

Study ID	Morotti E et al. 2013
Study Citation	Morotti, E., Battaglia, B., Fabbri, R., Meriggiola, M. C., Venturoli, S., Battaglia, C., & Persico, N. (2013). Body imaging and sexual behavior in lean women with polycystic ovary syndrome. Journal of Sexual Medicine, 10(11), 2752–2760.
Study Country	Italy
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	33 patients diagnosed with PCOS according to Rotterdam Criteria.
Control population	N=22 (Non-PCOS)
PCOS diagnostic criteria	Rotterdam
N per group	PCOS (n=33) Non-PCOS (n=22)
Setting	Not reported
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Stunkard Figure Rating Scale (FRS) Outcomes not relevant - Ferriman-Gallwey score (FG) - Italian McCoy female questionnaire (MFSQ) - Beck Depression Inventory (BDI)

Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes. The study aims to examine the differences in mood, perceived body image, sexual behavior, and clitoral vascularization between lean PCOS patients and healthy eumenorrheic controls.
Inclusion criteria		Yes Partial No Not reported	Yes.
Exclusion criteria		Yes Partial No Not reported	Yes.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case-control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	No
Summary Result/s		The FG score and the androgens resulted, as expected, more elevated in PCOS patients than in controls. However, the US assessment of the clitoral body volume and the resistances registered at the level of the dorsal clitoral artery did not show any difference between Group I and Group II patients. Moreover, the two-factor Italian MFSQ, the FRS, and the BDI were similar in both groups.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

Study Citation	Pastore, L. M., Dalal, P., Bray, M. J., Patrie, J. T., & Morris, W. L. (2011). Depression symptoms and body dissatisfaction association among polycystic ovary syndrome women. Journal of Psychosomatic Research, 71(4), 270–276.	
Study Country	USA	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	94 patients diagnosed with PCOS according to NICHD Criteria.	
Control population	N=96 (Non-PCOS)	
PCOS diagnostic criteria	NICHD criteria	
N per group	PCOS (n=94) Non-PCOS (n=96)	
Setting	Community. Anonymous waiting room surveys (BES and the QIDS-SR16) were implemented at three university OB/GYN and Family Medicine clinics(80% of the sample), and the university cafeterias (20% of the sample)in the fall 2009/winter 2010 (exempt IRB study).	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Body Uneasiness Test (BUT) Outcomes not relevant: - Toronto Alexithymia Scale (TAS-20) - (MMPI-2)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. Inclusion criteria were: a) a diagnosis of PCOS, as confirmed through the study using the NICHD criteria of oligomenorrheic and non-diabetic, with self-reported hirsutism and/or acne and/or elevated free testosterone (> 6.8 pg/mL), b) aged 18 to 43 years, c) weight of 250 lb (113 kg) or less, and d) at least one menses in the past six months but no more than eight periods in the most recent 12 months without hormonal intervention.

Exclusion criteria		Yes Partial No Not reported	Yes. Exclusion criteria were: a) use of metformin or hormonal contraceptives in the 60 days prior to enrollment, b) currently pregnant or breastfeeding during the prior 30 days, and c) bleeding/coagulation conditions that would contraindicate a blood draw.
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case-control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	No
Summary Result/s		Body dissatisfaction (especially perception of physical conditioning) was strongly associated with more severe depression symptoms in non-obese PCOS women (BMI < 30, P < .04) before and after controlling for age, testosterone and free testosterone.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?			

Study ID	Himelein MJ et al. 2006	
Study Citation	Himelein, M. J., & Thatcher, S. S. (2006). Depression and body image among women with polycystic ovary syndrome. Journal of Health Psychology, 11(4), 613–625.	
Study Country	USA	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	40 patients diagnosed with PCOS	
Control population	N=60 (Non-PCOS)	
PCOS diagnostic criteria	N/A	
N per group	PCOS (n=40) Non-PCOS (n=60)	
Setting	PCOS group recruited from two separate offices of a southeastern-US clinic specializing in the treatment of reproductive and endocrine disorders. A convenience control sample of women with neither PCOS nor infertility was recruited via advertisement at the first author's university and by direct solicitation at informal community events.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Multidimensional Body Self Relations-Appearance Subscale (MBSRQ-AS) - Body Features Satisfaction (BFS) Outcomes not relevant: - Beck Depression Inventroy (BDI)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. Inclusion criteria for PCOS patients at the study was the presence of at least two of the following criteria: clinical symptoms (e.g. ovulatory dysfunction, hyperandrogenism); biochemical markers such as elevated androgen (all potential PCOS patients undergo laboratory screening consisting of endocrine, glucose and glucose tolerance testing); and ultrasound evidence (e.g. 10 or more follicle cysts).
Exclusion criteria	Yes Partial No Not reported	No
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case-control

Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	No
Summary Result/s	Women with PCOS reported higher depression scores and greater body dissatisfaction ($p < .001$) than comparison group women. Body image was strongly associated with depression overall, even after controlling body mass. Among women with PCOS, body dissatisfaction measures and education explained 66 percent of the variance in depression, suggesting explanations of the PCOS-depression link should consider the role of potentially mediating psychosocial variables.

Study Country	Australia	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	177 patients diagnosed with PCOS	
Control population	109 patients	
PCOS diagnostic criteria	PCOS status was based on a prior-established medical diagnosis, confirmation at phone screening and medical questions on PCOS features included in the survey. The in-depth phone screening was completed by an experienced researcher in PCOS (author M.G.H.) using diagnostic features based on the Rotterdam criteria.	
N per group	PCOS (n=177) Non-PCOS (n=109)	
Setting	Women were recruited throughout rural and metropolitan Austra-lia. Consistently worded advertisements stating 'We are very interested inwhat you think and feel about your health' were used across a range of community settings, including a general women's health website, a support group website for womenwith PCOS (women were not necessarily members of the support group,simply website visitors), medical clinics, newsletters, magazines and newspa-pers.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Multidimensional Body Self Relations-Appearance Subscale (MBSRQ-AS) Outcomes not relevant: - Quality of Life - Hospital Anxiety and Depression Scale (HADS) -	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. Women were required to reside in Australia, be aged 18–70 years, and be able to read and write in English. PCOS status was based on a prior-established medical diagnosis.
Exclusion criteria	Yes Partial No Not reported	Yes. Women were excluded whether pregnant or had been diagnosed with heart disease or a psychiatric illness other than depression or anxiety.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No	Yes

		Not reported	
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case-control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	No
Summary Result/s		The average age for women with PCOS was 32.8 years (±7.8) and without PCOS was 41.9 years (±15.4) years [difference (95% confidence interval (CI): 9.1 (6.4–11.8); P < 0.001]. The average BMI for women with and without PCOS was 31.5 (±7.9) and 24.5 (±5.4), respectively [difference (95% CI): 7.1 (5.4–8.8); P < 0.001]. Results from the MBSRQ found that women with PCOS had lower appearance evaluation, fitness orientation, health evaluation, health orientation, body areas satisfaction, higher overweight preoccupation and higher self-classified weight than women without PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Yes
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Not reported
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Not reported
PERFORM ANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	YEs
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported

	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not relevant to case-control
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not relevant to case-control
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported No protocol or PROSPERO
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	No. Analysis of baseling demogrpahics showed significant differences with respect to age, BMI snf infertility.
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No - risk of bias was the same across all outcomes.

The impact of depression, self-esteem, and body image on sleep quality in patients with PCOS: a cross-sectional study. Sleep and Breathing, 24(3), 1027–1034.	
Study Country	Iran	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	201 patients diagnosed with PCOS	
Control population	199 patients	
PCOS diagnostic criteria	Rotterdam Criteria	
N per group	PCOS (n=201) Non-PCOS (n=199)	
Setting	Women with referred to the infertility clinic of Omelila hospital in Hormozgan Province. The control group consisted of healthy women. The research team approached 453 women, and after explaining the purpose of the study, written informed consent was obtained from each participant who volunteered to participate and the questionnaires were distributed and completed.	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary outcomes: - Body Image Concern Inventory (BICI) Outcomes not relevant: - Hospital Anxiety and Depression Scale (HADS) - Rosenberg's Self Esteem Scale (RSES) - Pittsburgh Questionnaire (PSQI)	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. - Desire to participate in the study - Married - 15-40 years of age. - Absence of non-classic adrenal hyperplasia, thyroid dysfunction, hyperprolactinoma - Non-smoking - No problems in speaking or listening - Iranian - Not taking any prespecription medication - Rotterdam Criteria for PCOS
Exclusion criteria	Yes Partial No Not reported	Not reported
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes

Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	Yes, case-control
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?		Yes Partial No Not reported	No
Summary Result/s		Mean BICI Score for PCOS Group; 39.17 (+/- 32.23) and Mean Body Image Score for Non-PCOS Group; 32.61 (+/-11.11).	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes Partial No Not reported	Not reported
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	Not reported
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes Partial No Not reported	Yes
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not reported

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	X% treatment X% control/ comparison Not reported	Not relevant to case-control
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	Not relevant to case-control
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported No protocol or PROSPERO
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes Partial No Not reported	Partial. There was no significant difference between the two groups in the abovementioned characteristics except for acne score, hirsutism, and menstrual history (P > 0.05).
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No - risk of bias same for all outcomes.	

Study ID	Karacan 2014
Study Citation	Karacan, E., Caglar, G. S., Gursoy, A. Y., & Yilmaz, M. B. (2014). Body satisfaction and eating attitudes among girls and young women with and without polycystic ovary syndrome. Journal of Pediatric and Adolescent Gynecology, 27(2), 72–77.
Study Country	Turkey
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Women with PCOS and Non-PCOS women (controls) Age= PCOS: 19.1±2.3 years, controls: 19.7±2.1 years BMI= PCOS: 22.4±3.8kg/m², controls: 21.4±3.82

Control population	Healthy volunteers	
PCOS diagnostic criteria	Rotterdam Criteria	
N per group	PCOS (n=42) Non-PCOS (n=52)	
Setting	Participants selected from Ufuk University Obstetrics and Gynecology Department in Ankara, Turkey	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Primary: Body Image Satisfaction measured using FRS, BESSA Secondary: • Eating Attitudes Test (EAT-26) • Sociocultural Attitudes towards Appearance Questionnaire (SATAQ) -	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes. Diagnosis of PCOS according to Rotterdam criteria. All participants were lean (BMI < 25) in both groups.
Exclusion criteria	Yes Partial No Not reported	Not reported
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	Yes, case-control
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant to this systematic review
Was matching performed?	Yes Partial No Not reported	No
Summary Result/s	On average, participants with PCOS viewed their actual body as significantly larger (M = 4.14, SD = 1.37) than their own ideal body. Similarly, participants in control group viewed also their actual body as significantly larger (M = 3.59, SD = 1.49) than their own ideal body.

Question 2.4.

In women with PCOS, what is the prevalence and severity of body image distress?

BACKGROUND:

Body image is complex and is influenced by many factors. For this clinical question, body image is defined as the way a person may feel, think, and view their body including their appearance. Physical factors affecting appearance (e.g., excess weight and hirsutism), psychological factors (e.g., self-esteem) and sociocultural influences (e.g., thin ideal) all influence the way women think and feel about their bodies. Body image includes attitudes to physical appearance, understanding of health, physical fitness and body size, the mental picture that individuals form of their bodies, values, and self-esteem (1). Assessment of body image includes measures of body dissatisfaction, body size estimation, and weight perception (2).

Two third of women from the general population are dissatisfied with their bodies, yet negative body image has in some, but not all, studies been shown to be more prevalent in PCOS and impacts thoughts and feelings of health, appearance, quality of life (QoL), mood, and physical fitness. One recent study shows an increased prevalence of body image distress in a diverse population of women with PCOS (3).

Women with PCOS have a negative body image (4) and appear to feel less physically attractive, healthy or physically fit and are less satisfied with their body size and appearance than women without PCOS (5). Infertile women with PCOS have lower self-esteem and body satisfaction than non-infertile women with PCOS (6). Further, hirsute women experienced lower self-esteem than non-hirsute women, and women with menstrual irregularities and higher BMI had more body dissatisfaction (6). Thus, several PCOS features, in particular hirsutism and increased weight, appear to negatively impact body image and quality of life (QoL) (7, 8). Moreover, negative body image is strongly associated with depression (3, 9, 10), anxiety (3), and plays an important role in sleep quality (11) in women with PCOS, even after controlling for weight (9, 12).

Given that negative body image in women with PCOS is increased and associated with depression, anxiety, reduced health-related QoL (13), and likely impacts on a woman's likelihood of adhering to PCOS management strategies (14, 15), body image should be considered as part of a comprehensive assessment and management plan. Detection of negative body image provides the opportunity to address both psychological aspects such as self-esteem and self-acceptance as well as working on the physical aspects of the condition such as hirsutism, overweight and acne if appropriate. As it is not usual practice to screen and assess women with PCOS for negative body image, recommendations for screening and assessment that are easy to use and widely applicable are needed for women with PCOS. If identified, addressing negative body and associated mood disorders could assist to improve emotional well-being and QoL in PCOS, although more research in this area is needed.

Multiple methods of measuring body image were used in the literature but the psychometric analyses seem to generally tap into the same construct. Therefore, the broader body of knowledge informs recommendation over and above individual meta-analysis over single tools.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Women with PCOS versus controls	⊕⊕◯◯ LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Negative body image in women with PCOS versus controls.

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Health professionals and women should be aware that features of PCOS can have a negative impact on body image.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

GRADE CONSIDERATIONS

Justifications:

Given that negative body image in women with PCOS is increased and associated with depression, anxiety, reduced health-related QoL (13), and likely impacts on a woman's likelihood of adhering to PCOS management strategies (14, 15), body image should be considered as part of a comprehensive assessment and management plan. Detection of negative body image provides the opportunity to address both psychological aspects such as self-esteem and self-acceptance as well as working on the physical aspects of the condition such as hirsutism, overweight and acne if appropriate. As it is not usual practice to screen and assess women with PCOS for negative body image, recommendations for screening and assessment that are easy to use and widely applicable are needed for women with PCOS. If identified, addressing negative body and associated mood disorders could assist to improve emotional well-being and QoL in PCOS, although more research in this area is needed.

Subgroup considerations:

Adult women with and without PCOS
There is no evidence to extend these recommendations to adolescent groups.
The evidence is consistent across ethnicities studied.

Implementation considerations:

Respectful and empathic communication is required when discussing these sensitive issues.
Screening may have resource implications in terms of impact on length of consultation and be burdensome to women and health professionals.
Implementation may require referral to other health practitioners.

Translation tools should note that:

- When considering body image issues, the following questions could be asked:

1) Do you worry a lot about the way you look and wish you could think about it less?
2) What specific concerns do you have about your appearance?
3) What effect does it have on your life?
4) Does it make it hard to do your work or be with your friends and family?

- If an issue is identified, the practitioner could consider:

a) Identifying any focus of concern of the patient (e.g. weight, hirsutism) and responding appropriately
b) Negative body image is a risk factor for disordered eating, anxiety and depression
c) Referral to appropriate patient resources including information, psycho-education, patient support groups or psychological consults as appropriate

Monitoring and evaluation considerations:
Body image assessment with any available body image scale should be considered in all PCOS health research as appropriate.

Research priorities:
Determine clinically meaningful differences in body image scores in PCOS.
More research of body image in the adolescent population should be conducted.
Validating existing body image measurement tools in PCOS.
Preferences of women with PCOS on treatment of body image issues, considering diversity.
Examine the impact of body image distress on the outcome of PCOS treatment and management, and the impact of PCOS treatment and management on body image.
Examination of the effectiveness of treatment for body image in women with PCOS, including the impact this has on the process and outcome of PCOS treatment and management

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
EVIDENCE SUMMARY

- Nine studies were included, all of case-control design, from various countries including Iran, Italy, USA, Turkey and Australia.
- All studies were ranked as moderate risk of bias due mainly to the lack of information on whether the cases and controls were taken from comparable populations and whether outcome assessors were blinded to case and control status.
- Some studies did not report whether the control status was established in a standard, valid and reliable way, a few others did not report whether the study was sufficiently powered to detect any differences between the groups.

META-ANALYSIS/ DESCRIPTIVE ANALYSIS:

- Studies showed that women with PCOS had higher body image concerns compared to healthy controls.

- However, certainty in the evidence was low across all outcomes, downgraded due to the moderate risk of bias in the included studies.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
Not screening for body image distress can potentially increase anxiety, depression, and management and impact adherence to treatment / management of body image distress.
Screening may be problematic if effective options for treatment/support are not available.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
The overall certainty of evidence is determined by the critical outcome with moderate certainty (quality) of evidence.
The broader body of evidence is not reflected in the meta-analysis due to the selected use of tools in literature and this can only be based on observational evidence which by definition in GRADE is always low certainty, however the significance of the studies was consistent. The GDG determines that certainty of the overall evidence is moderate.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☒ No important uncertainty or variability

Research evidence:
No research evidence was identified

Panel discussion:
There is no uncertainty about how much people value the main outcomes.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:
EVIDENCE SUMMARY

- Nine studies were included, all of case-control design, from various countries including Iran, Italy, USA, Turkey and Australia.
- All studies were ranked as moderate risk of bias due mainly to the lack of information on whether the cases and controls were taken from comparable populations and whether outcome assessors were blinded to case and control status.
- Some studies did not report whether the control status was established in a standard, valid and reliable way, a few others did not report whether the study was sufficiently powered to detect any differences
  between the groups.

META-ANALYSIS/ DESCRIPTIVE ANALYSIS:

- Studies showed that women with PCOS had higher body image concerns compared to healthy controls.
- However, certainty in the evidence was low across all outcomes, downgraded due to the moderate risk of bias in the included studies.

The balance of benefits of screening for negative body image, enables referral to appropriately trained and experienced health professionals with no increase in undesirable effects with screening of body image.

- **COSTS**

How large are the resource requirements (costs)?

Judgement:

☒ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:
No research evidence was identified

Panel discussion:
- There was no evidence to inform this consideration.
- Screening may have resource implications in terms of impact on length of consultation.
- Intervention may require referral to other health practitioners.
- Where needed, access to appropriately trained and experienced health professionals is required.

- **CERTAINTY OF COST EVIDENCE**

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:
No research evidence was identified

Panel discussion:
There was no evidence to inform this consideration.

- **COST-EFFECTIVENESS**

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
No research evidence was identified

Panel discussion:
- There was no evidence to inform this consideration.
- Screening may have resource implications in terms of impact on length of consultation.
- Intervention may require referral to other health practitioners.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:
No research evidence was identified

Panel discussion:
- Responses may vary depending on social and cultural background.
- Implementation and access to resources may vary depending on local circumstances.
- Access to appropriate evidence-based resources on body image may improve equity in PCOS.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:
- No research evidence was identified

Panel discussion:
- Stronger focus on what is most relevant to the patient.
- A change in practice may be required

● **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Fully feasible in clinical research but probably reduced feasibility in standard care.

Table 2.1. Search details

Search strategy source:
Although articles were identified for possible inclusion from prior to the 2019 publication (below), a new search was performed with expanded search criteria in Table 2.3 to allow for self-report of PCOS.

Lee, I., Cooney, L., Saini, S., Sammel, M. D., Allison, K. C., Dokras, A. (2019). Increased odds of disordered eating in polycystic ovary syndrome: a systematic review and meta-analysis. Eating and weight disorders: EWD, 24(5), 787-797.

Evidence source	Date of search

Table 2.2. Questions addressed by this search *(add more rows as needed)*:

GDG	Q#	Question
2	2.5.	In women with PCOS what is the prevalence and severity of disordered eating?
		CLINICAL PRACTICE POINT: - Should disordered eating be assessed as part of standard care?

Table 2.3. Search strings used in OVID or other database/s – *please save a screenshot of search results to submit alongside this template*

Evidence processing: Studies were selected and appraised by two reviewer/s in consultation with the evidence team/ key contact using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. **A total of 14 studies met inclusion criteria for this review.**

6. FINDINGS

Comparisons included:

- **Comparison 1:** PCOS versus controls

Outcomes included:

- **Outcome 1.** Any eating disorders
- **Outcome 2.** Disordered eating
- **Outcome 3.** Bulimia nervosa
- **Outcome 4.** Binge eating disorder
- **Outcome 5.** Anorexia nervosa

OUTCOME 1. Any eating disorders

- **EVIDENCE SUMMARY:**

Eleven cross-sectional studies reported the risk of at least one eating disorder including bulimia nervosa, binge eating disorder, anorexia nervosa, or night eating syndrome in adult women with PCOS compared to controls. One study had a low risk of bias (Lidaka 2022). Ten studies had a moderate risk of bias (Hollinrake 2007, Mansson 2008, Batcheller 2013, Sirmans 2014, Larsson 2016, Cesta 2016, Lee 2016, Pirotta 2019, Tay 2019, Asdaq 2020). Studies were conducted in Australia, Saudi Arabia, Sweden and the USA. Only study (Lidaka 2022) restricted inclusion to adolescents. No studies evaluated risk of any eating disorder based on ethnicity or phenotype.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

In the meta-analysis of all studies of adult women there was an increased odds of any eating disorder in women with PCOS. In the sub-analysis of only studies where PCOS diagnosis was confirmed by Rotterdam criteria, there was also an increased odds of any eating disorder in women with PCOS. Certainty in these results is moderate and was downgraded as the majority of studies were moderate quality. One study (Lidaka 2022) reported the odds of any eating disorder in adolescents with PCOS and did not find a higher odds in adolescents with PCOS.

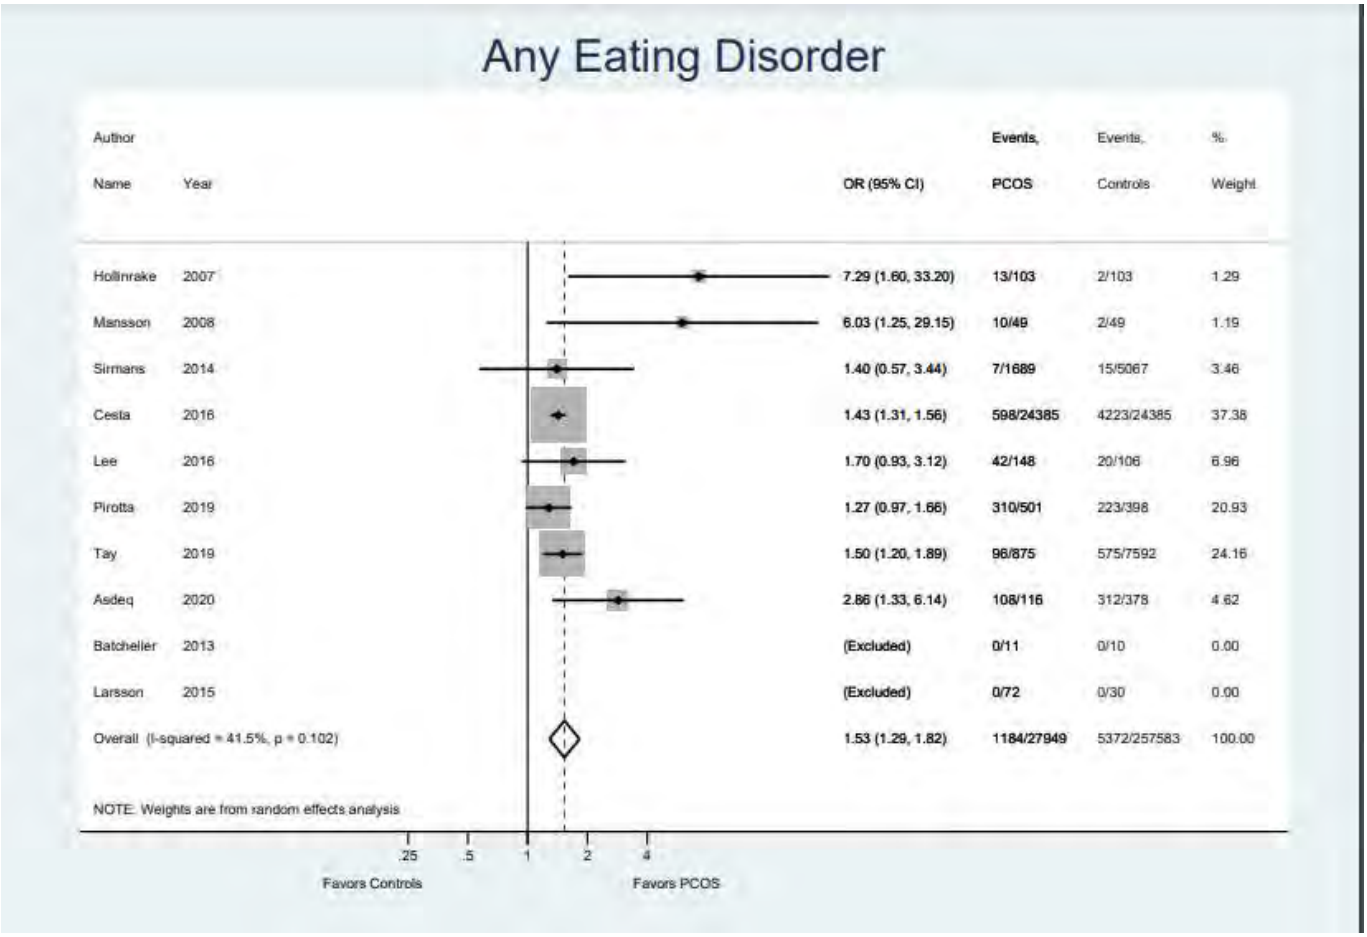
1.1. Individual Study Data Table for Any Eating Disorders

OUTCOME: Any eating disorder			OUTCOME TYPE: Dichotomous					
COMPARISON (if applicable): PCOS and control								
Author, year	Unit of outcome	Method of measurement	N events in intervention/ exposure group	N total in intervention/ exposure group	N events in control / comparison group	N total in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Hollinrake et al. 2007[a]	Count	PRIME-MG PHQ	13	103	2	103	Crude	NA
Mansson et al. 2008[a]	Count	MINI	10	49	2	49	Crude	NA
Batcheller et al. 2013[a]	Count	DSM-V based survey	0	11	0	10	Crude	NA
Sirmans et al. 2014	Count	Louisiana Medicaid claims data	7	1689	15	5067	Crude	NA
Larsson et al. 2016[a]	Count	DSM IV Survey	0	72	0	30	Crude	NA
Cesta et al. 2016	Count	ICD Codes	598	24,385	4,223	243,850	Crude	NA
Lee et al. 2016[a]	Count	DSM IV Survey	42	148	20	106	Crude	NA
Pirotta et al. 2019	Count	DSM Survey	310	501	223	398	Crude	NA
Tay et al. 2019	Count	Self-report	96	875	575	7592	Crude	NA
Asdaq et al. 2020[a]	Count	EAT-26	108	116	312	378	Crude	NA
Lidaka et al 2022[b]	Count	BITE	23	63	23	66	Crude	NA

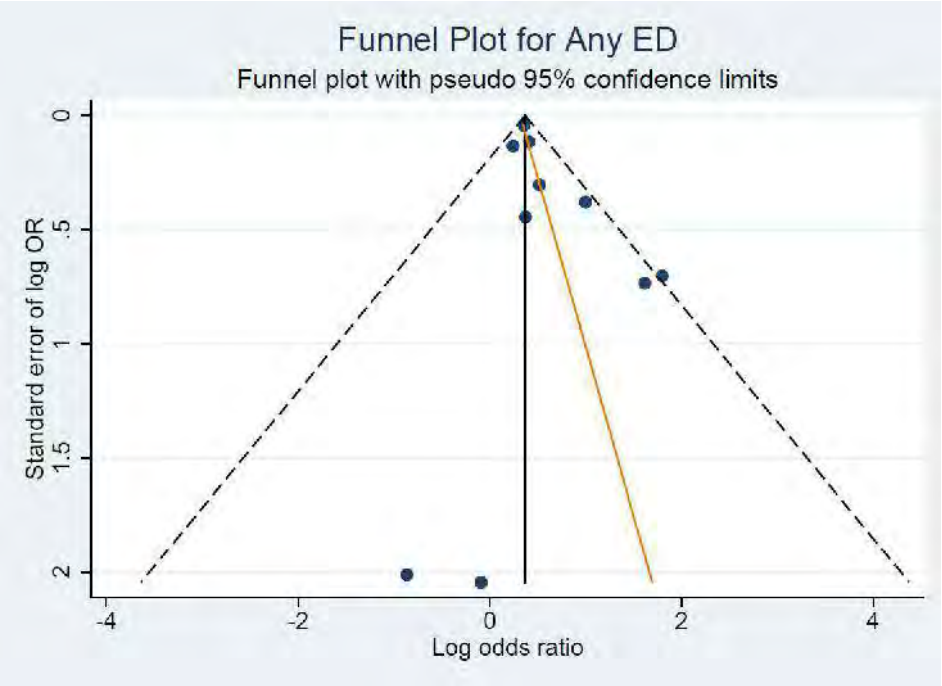
[a] Included in sensitivity analysis of studies that used confirmed Rotterdam criteria for PCOS diagnosis rather than self-report or hospital records

[b] Not included in meta-analysis as it was the only study in adolescents

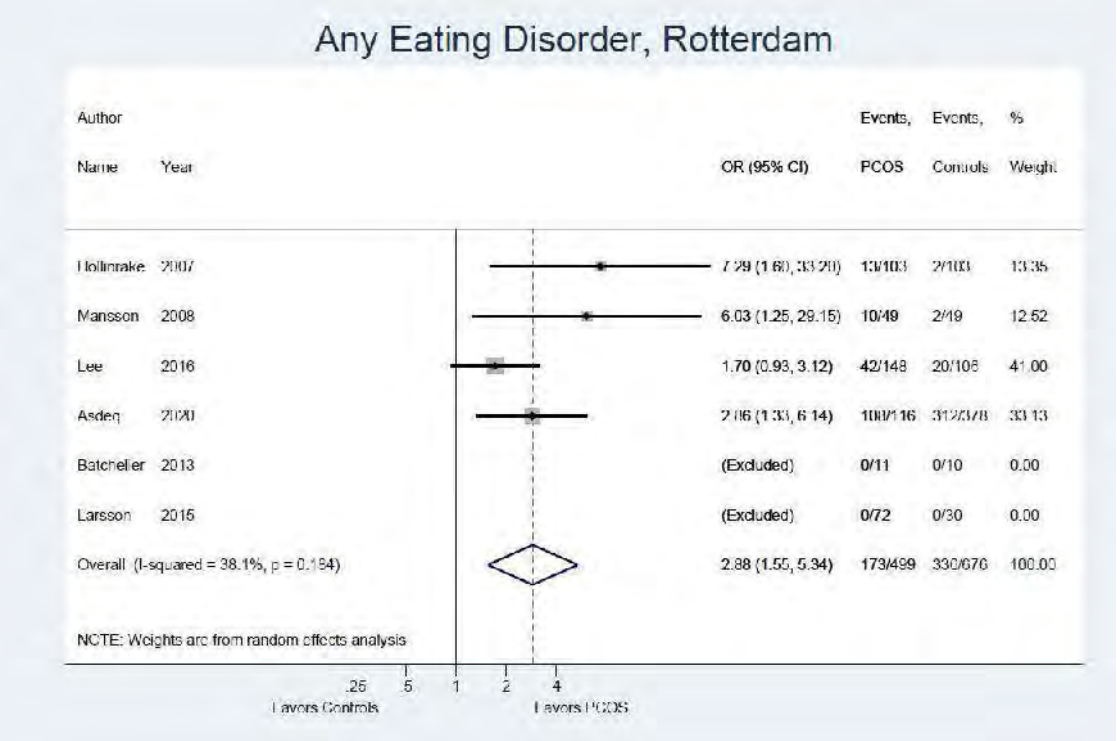
1.2 Forest plot for any eating disorder



1.3 Funnel plot for any eating disorder



1.4 Forest plot for any eating disorder, sensitivity analysis restricted to studies where PCOS diagnosis was confirmed by Rotterdam criteria



OUTCOME 2. Disordered eating

- **EVIDENCE SUMMARY:**

Six cross-sectional studies reported prevalence of disordered eating as defined as a score above the cutoff of a validated eating disorder questionnaire (Karacan 2004, Larsson 2016, Jeanes 2017, Lee 2016, Maher 2018, Pirotta 2019). All studies had a moderate risk of bias. Studies were conducted in Australia, Sweden, Turkey, the UK, and the USA. No studies evaluated risk of disordered eating in adolescents or based on ethnicity or phenotype.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

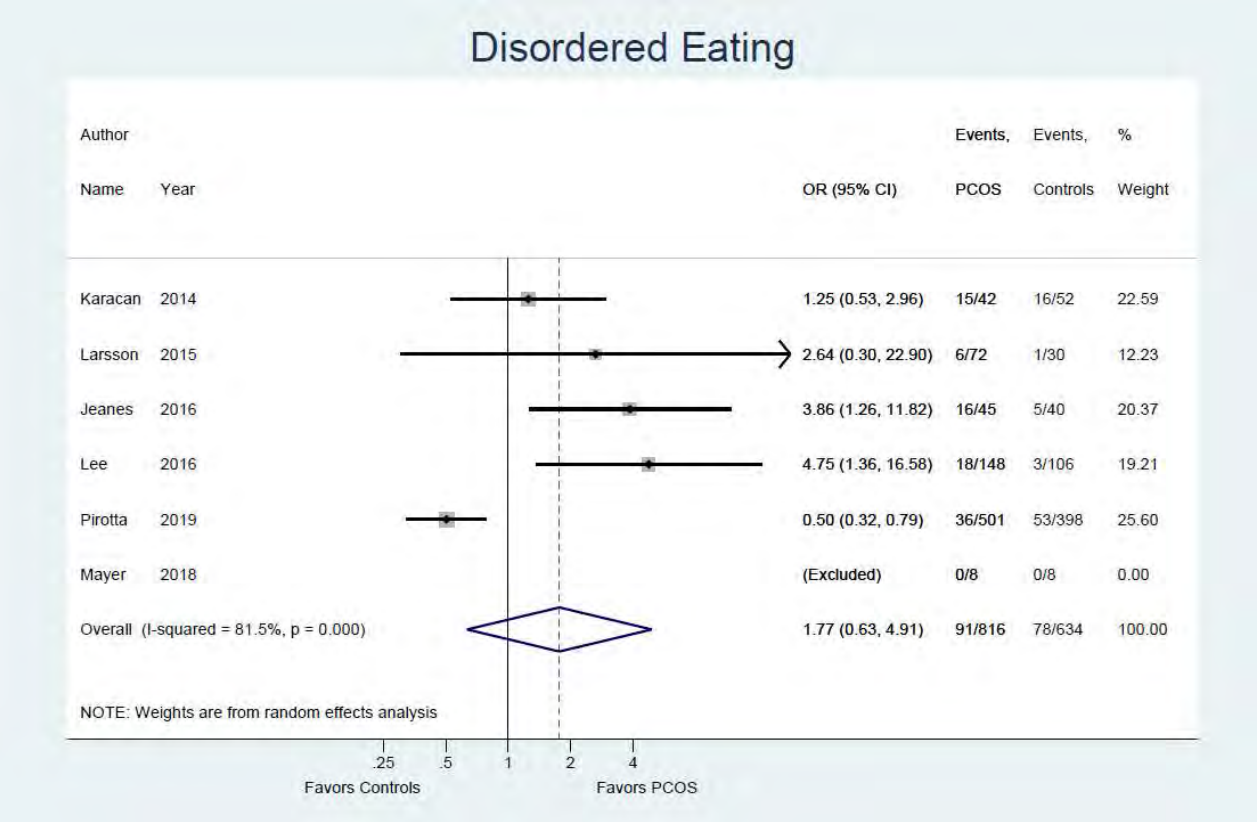
There was no increased odds of disordered eating in women with PCOS either in the meta-analysis of all adult women or the sub-analysis of only studies where PCOS diagnosis was confirmed by Rotterdam criteria. Certainty in these results is low and was downgraded once as the majority of studies were moderate quality and once because of imprecision as the confidence intervals were wide.

2.1. Individual Study Data Table for disordered eating

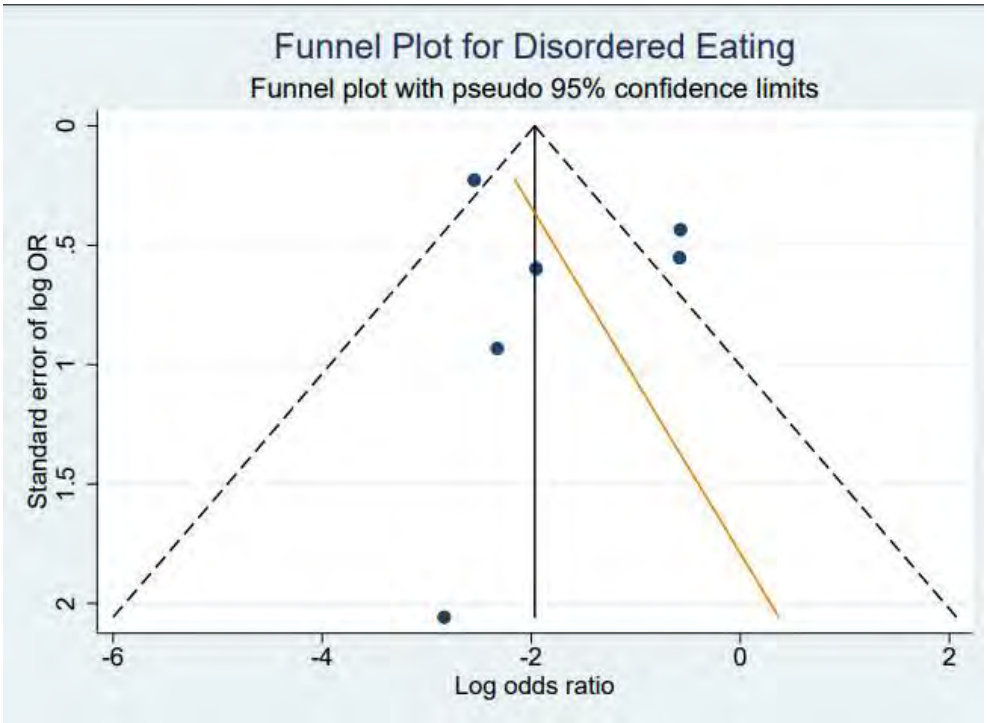
OUTCOME: Disordered eating defined as any abnormal eating disorder score				OUTCOME TYPE: Dichotomous				
COMPARISON (if applicable): PCOS and control								
Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	N events in intervention/ exposure group	N total in intervention/ exposure group	N events in control / comparison group	N total in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Karacan et al. 2014 [a]	Count	EAT-26	15	42	16	52	Crude	NA
Larsson et al. 2016 [a]	Count	EAT-40	6	72	1	30	Crude	NA
Jeanes et al. 2017	Count	BITE	16	45	5	40	Crude	NA
Lee et al. 2016[a]	Count	EDEQ	18	148	3	106	Crude	NA
Maher et al. 2018[a]	Count	EAT-26	0	8	0	8	Crude	NA
Pirotta et al. 2019	Count	EDEQ	36	501	53	398	Crude	NA

[a] Included in sensitivity analysis of studies that used confirmed Rotterdam criteria for PCOS diagnosis rather than self-report or hospital records

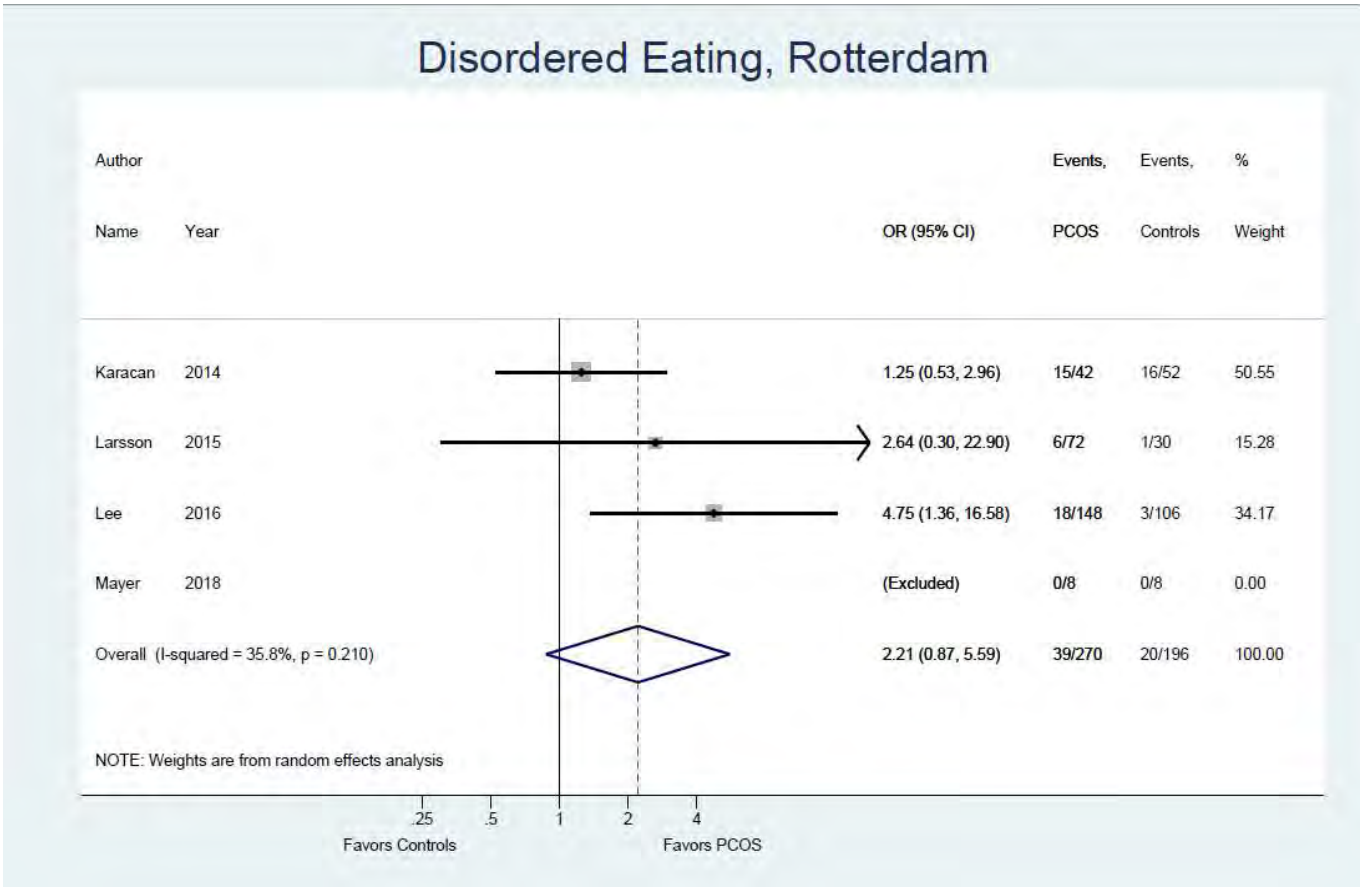
2.2. Forest plot for disordered eating



2.3. Funnel plot for disordered eating



2.4 Forest plot for disordered eating, sensitivity analysis restricted to studies where PCOS diagnosis was confirmed by Rotterdam criteria



OUTCOME 3. Bulimia Nervosa

- **EVIDENCE SUMMARY:**

Six cross-sectional studies reported prevalence of bulimia nervosa (Mansson 2008, Larsson 2016, Cesta 2016, Lee 2016, Pirotta 2019, Tay 2019). All studies had a moderate risk of bias. Studies were conducted in Australia, Sweden, and the USA. No studies evaluated risk of disordered eating in adolescents or based on ethnicity or phenotype.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

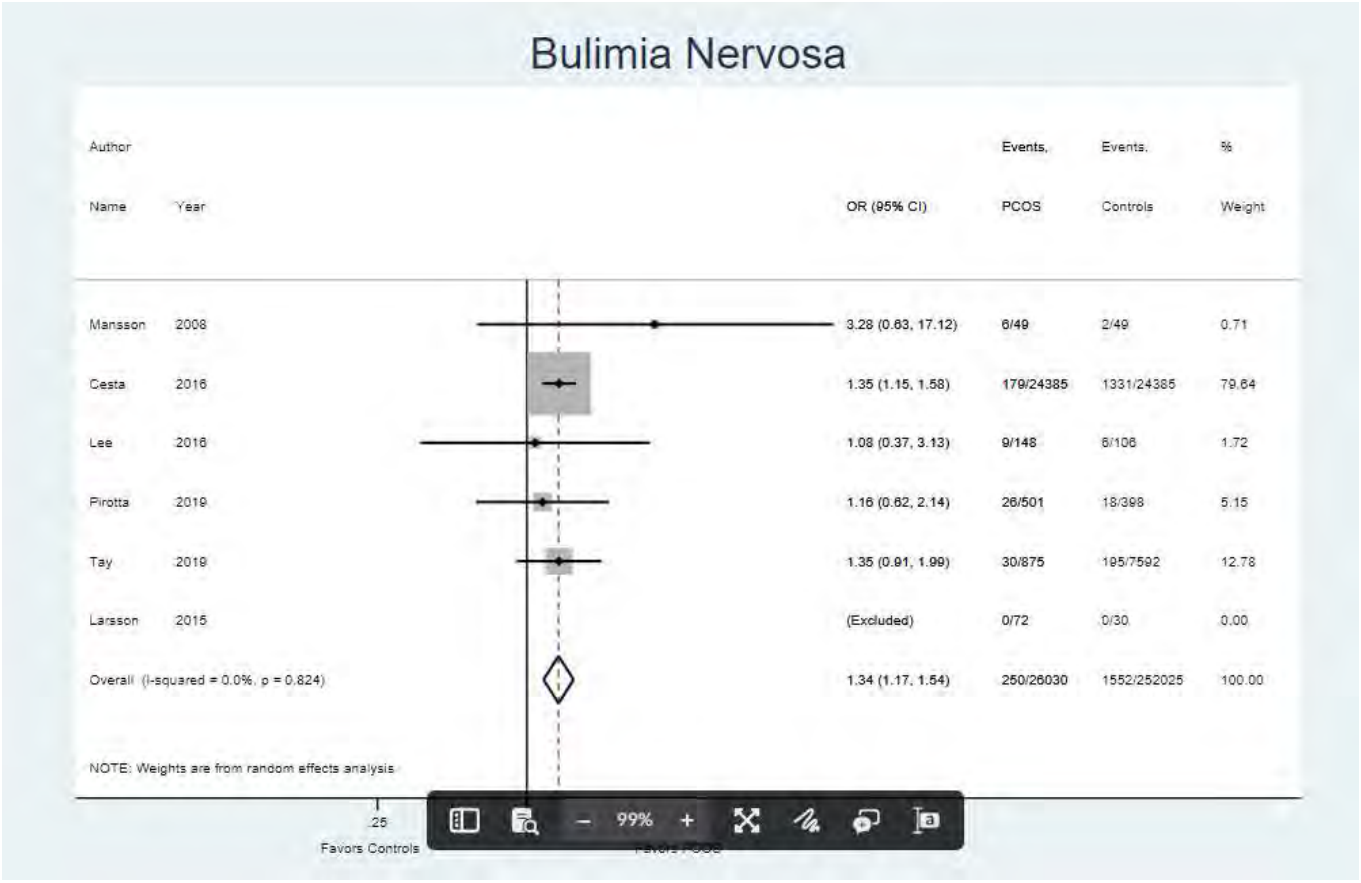
There was no increased odds of bulimia nervosa in women with PCOS in either in the meta-analysis of all adult women nor the sub-analysis of only studies where PCOS diagnosis was confirmed by Rotterdam criteria. Certainty in these results is very low and was downgraded once as the majority of studies were moderate quality, once because of imprecision as the confidence intervals were wide, and once due to risk of publication bias

3.1. Included studies for bulimia nervosa

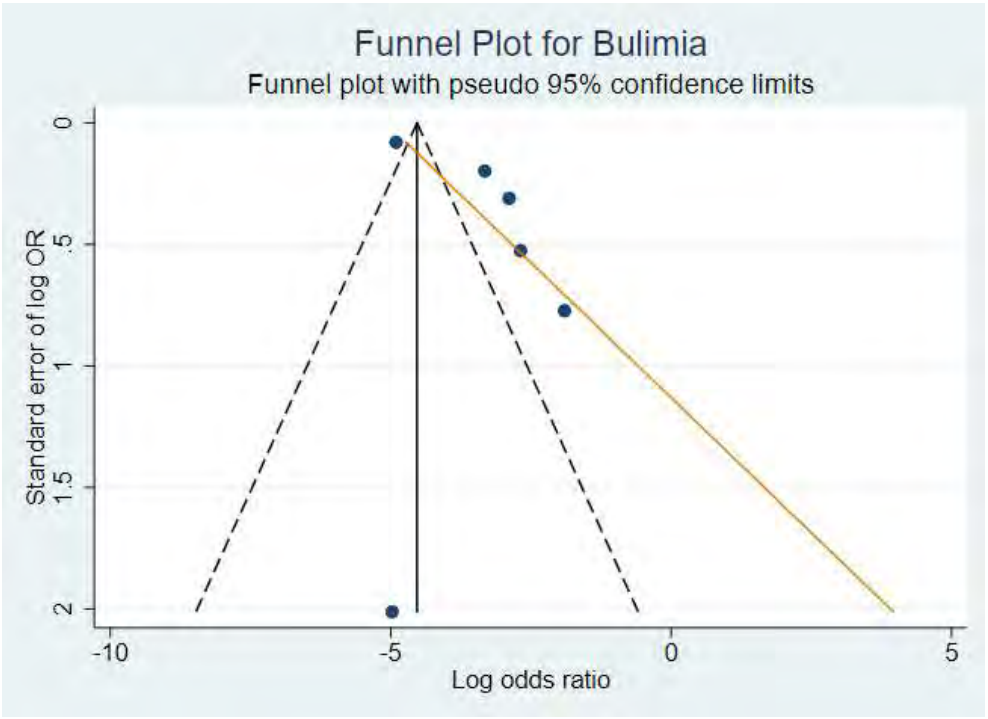
OUTCOME: Bulimia nervosa				OUTCOME TYPE: Dichotomous				
COMPARISON (if applicable): PCOS and control								
Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	N events in intervention/ exposure group	N total in intervention/ exposure group	N events in control / comparison group	N total in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Mansson et al. 2008[a]	Count	MINI	6	49	2	49	Crude	NA
Larsson et al. 2016[a]	Count	DSM IV Survey	0	72	0	30	Crude	NA
Cesta et al. 2016	Count	ICD Codes	179	24,385	1331	243,850	Crude	NA
Lee et al, 2016[a]	Count	DSM IV Survey	9	148	6	106	Crude	NA
Pirotta et al. 2019	Count	DSM Survey	26	501	18	398	Crude	NA
Tay et al. 2019	Count	Self-report	30	875	195	7592	Crude	NA

[a] Included in sensitivity analysis of studies that used confirmed Rotterdam criteria for PCOS diagnosis rather than self-report or hospital records

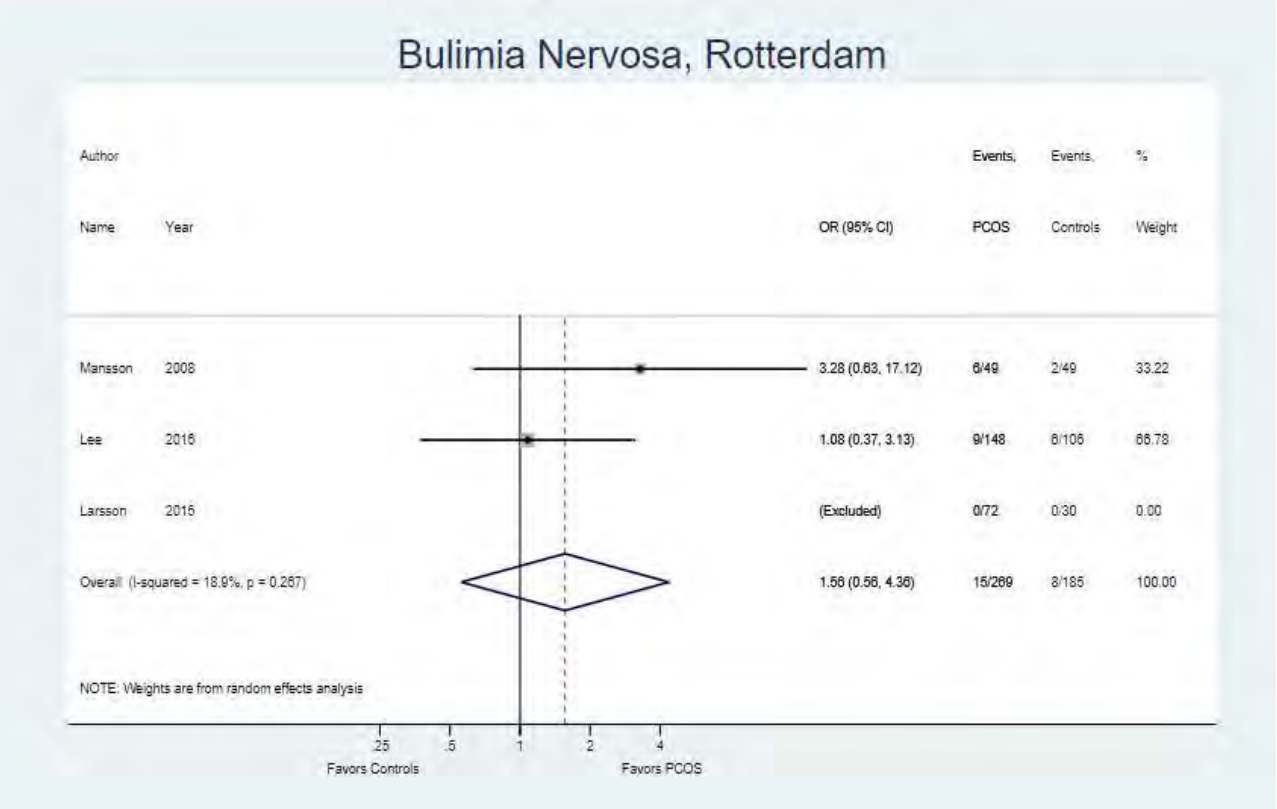
3.2. Forest plot for bulimia nervosa



3.3. Funnel plot for bulimia nervosa



3.4. Forest plot for bulimia nervosa, sensitivity analysis restricted to PCOS diagnosis with confirmed Rotterdam criteria only



OUTCOME 4. Binge eating disorder

- **EVIDENCE SUMMARY:**

Six cross-sectional studies reported prevalence of binge eating disorder. One (Lidaka 2022) had a low risk of bias and the other five had a moderate risk of bias (Hollinrake 2007, Batcheller 2013, Lee 2016, Pirotta 2019, Asdaq 2020, Lidaka 2022. Studies were conducted in Latvia, Saudi Arabia, and the USA. Only study (Lidaka 2022) restricted inclusion to adolescents. No studies evaluated risk of any eating disorder based on ethnicity or phenotype.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

There was an increased odds of binge eating disorder in women with PCOS in the meta-analysis of all adult women. Certainty in these results is low and was downgraded once as the majority of studies were moderate quality and once because of imprecision as the lower limit of the confidence interval included 1.25. There was an increased odds of binge eating disorder sub-analysis of only studies where PCOS diagnosis was confirmed by Rotterdam criteria. Certainty in these results is moderate and was downgraded once as the majority of studies were moderate quality. One study (Lidaka 2022) reported the odds of binge eating in adolescents with PCOS and did not find a higher odds in adolescents with PCOS.

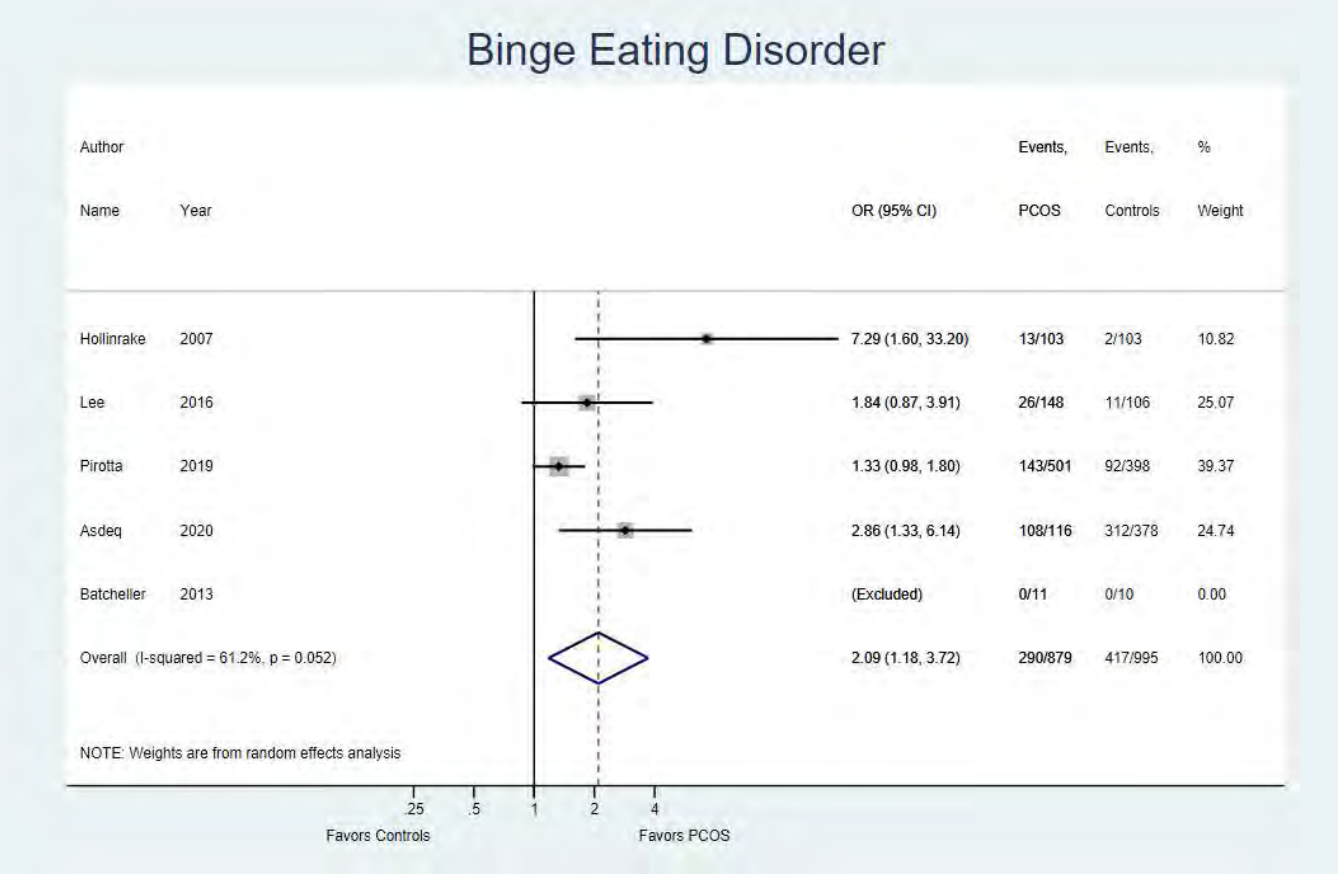
4.1. Included studies for binge eating disorder

OUTCOME: Binge Eating Disorder				OUTCOME TYPE: Dichotomous				
COMPARISON (if applicable): PCOS and control								
Author, year	Unit of outcome	Method of measurement	N events in intervention/ exposure group	N total in intervention/ exposure group	N events in control / comparison group	N total in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Hollinrake et al. 2007[a]	Count	PRIME MD PHQ	13	113	2	103	Crude	NA
Batcheller et al. 2013[a]	Count	DSM-V Based Survey	0	11	0	10	Crude	NA
Lee et al, 2016[a]	Count	DSM-IV Based Surgery	26	148	11	106	Crude	NA
Pirotta et al. 2019	Count	DSM Survey	143	501	92	398	Crude	NA
Asdaq et al. 2020[a]	Count	EAT-26	108	116	312	378	Crude	NA
Lidaka et al 2022[b]	Count	BITE	23	63	23	66	Crude	NA

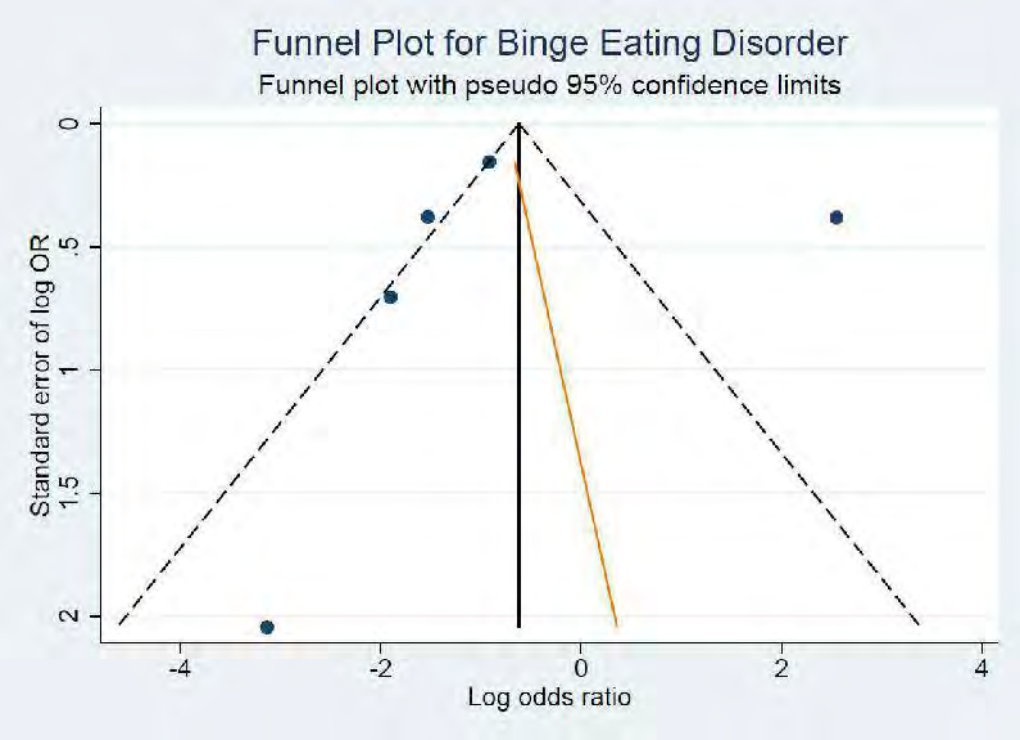
[a] Included in sensitivity analysis of studies that used confirmed Rotterdam criteria for PCOS diagnosis rather than self-report or hospital records

[b] Not included in meta-analysis as it was the only study in adolescents

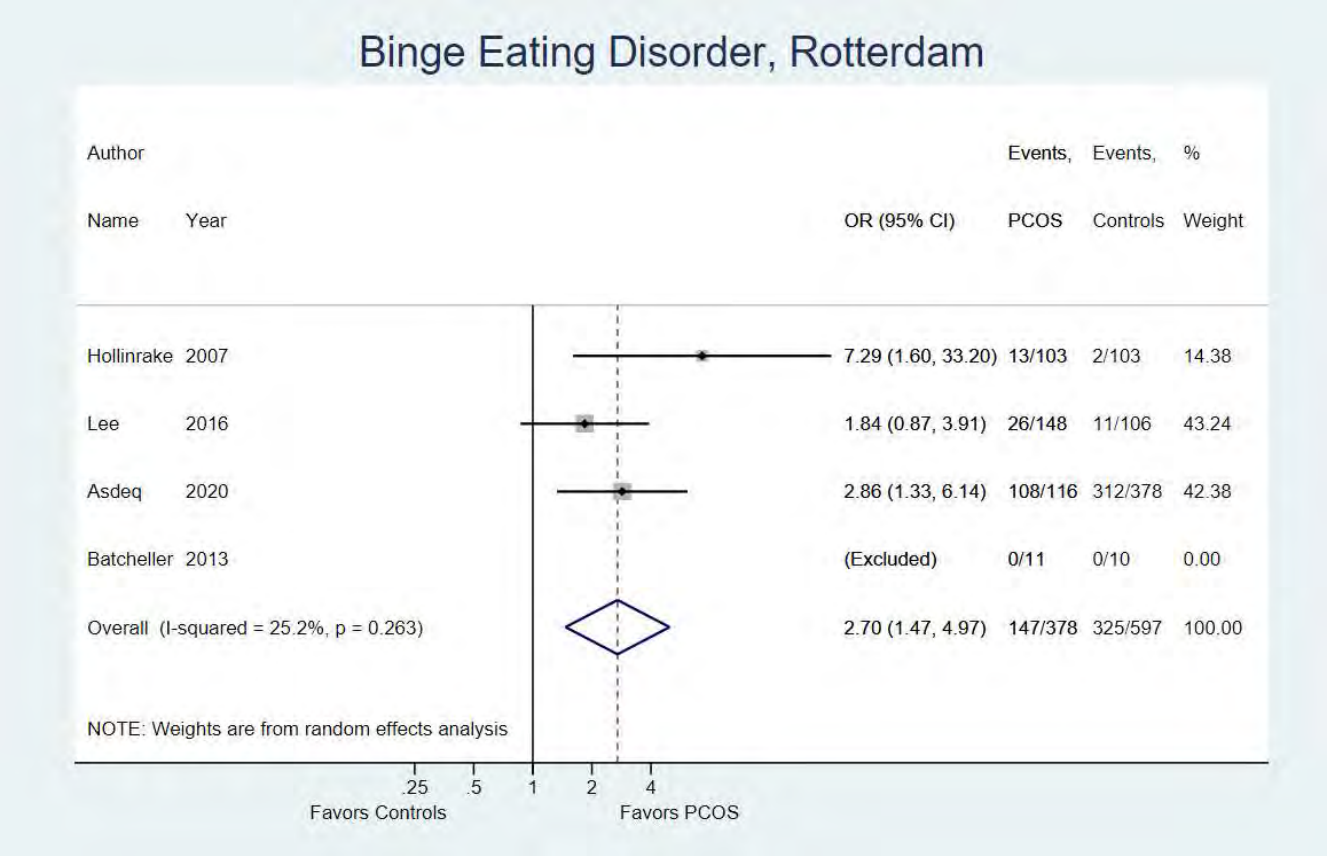
4.2 Forest plot for binge eating disorder



4.3 Funnel plot for binge eating disorder



4.4. Forest plot for binge eating disorder, sensitivity analysis restricted to PCOS diagnosis with confirmed Rotterdam criteria only



OUTCOME 5. Anorexia Nervosa

- **EVIDENCE SUMMARY:**

Four cross-sectional studies reported prevalence of anorexia nervosa (Cesta 2016, Lee 2016, Pirotta 2019 and Tay 2019). All studies had a moderate risk of bias. Studies were conducted in Australia, Sweden, and the USA. No studies evaluated risk of disordered eating in adolescents or based on ethnicity or phenotype. In none of the studies with non-zero events was PCOS diagnosis confirmed by Rotterdam criteria.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

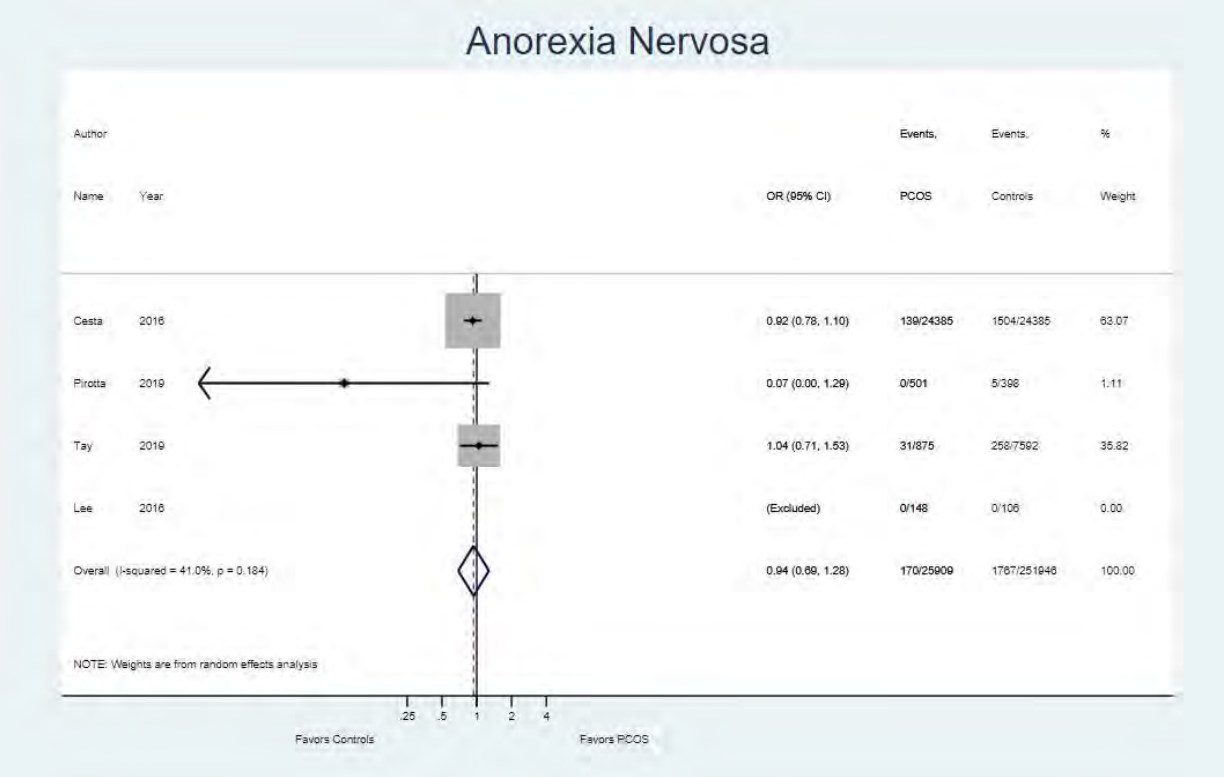
There was no increased odds of anorexia nervosa in women with PCOS in either the meta-analysis of all adult women. Certainty in these results is moderate and was downgraded once as the majority of studies were moderate quality and once because of imprecision as the confidence intervals were wide. No the sub-analysis of only studies where PCOS diagnosis was confirmed by Rotterdam criteria.

5.1. Individual Study Data Table for anorexia nervosa

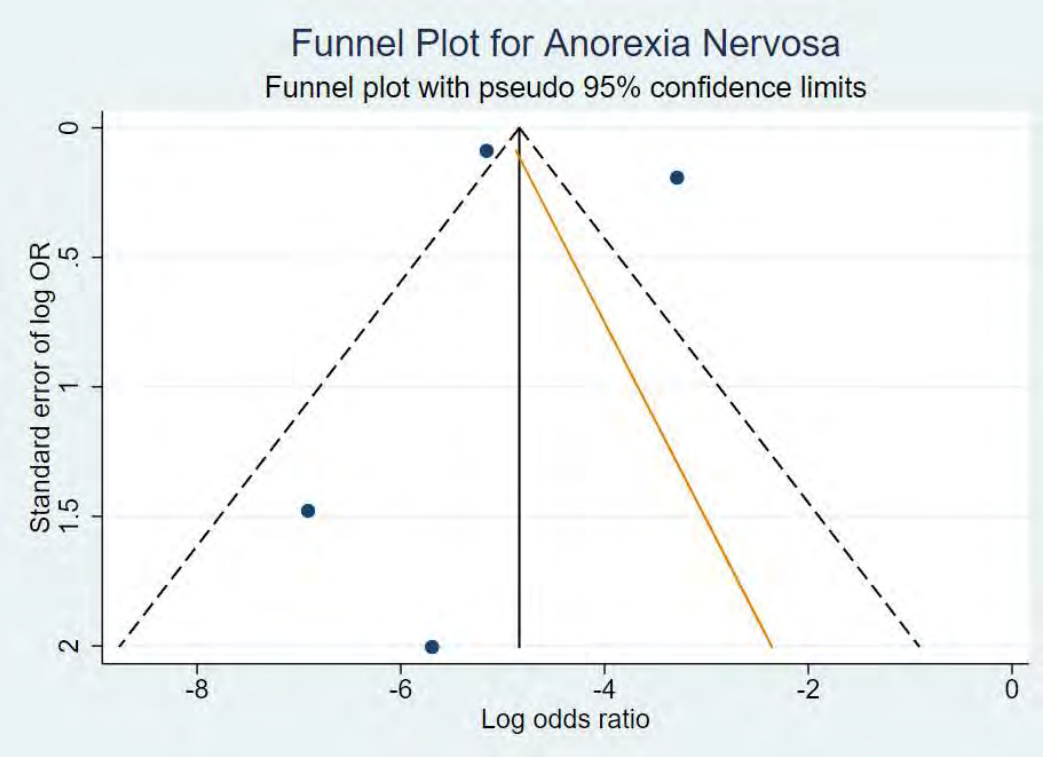
OUTCOME: Anorexia nervosa					**OUTCOME TYPE: Dichotomous**			
COMPARISON (if applicable): PCOS and control								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**N events in intervention/ exposure group**	**N total in intervention/ exposure group**	**N events in control / comparison group**	**N total in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were in the model?**
Cesta et al. 2016	**Count**	**ICD codes**	**139**	**24,385**	**1504**	**243,850**	**Crude**	**NA**
Lee et al. 2016[a]	**Count**	**DSM IV Survey**	**0**	**148**	**0**	**106**	**Crude**	**NA**
Pirotta et al. 2019	**Count**	**DSM Survey**	**0**	**501**	**5**	**398**	**Crude**	**NA**
Tay et al. 2019	**Count**	**Self-report**	**31**	**875**	**258**	**7592**	**Crude**	**NA**

[a] Included in sub-analysis of studies that used confirmed Rotterdam criteria for PCOS diagnosis rather than self-report or hospital records

5.2 Forrest plot for anorexia nervosa



5.3 Funnel plot for anorexia nervosa



5.4 Forrest plot for binge eating disorder, sensitivity analysis restricted to PCOS diagnosis with confirmed Rotterdam criteria only: Not performed as only one study (Lee et al, 2016) used Rotterdam criteria for PCOS diagnosis. This study had zero events.

APPENDIX. STUDY CHARACTERISTICS AND QUALITY APPRAISAL TEMPLATES

Study ID		Hollinrake et al, 2007	
Study Citation		Hollinrake E, Abrea A, Maifield M, Van Voorhis BJ, Dokras A. Increased risk of depressive disorders in women with polycystic ovary syndrome. Fertil Steril 2007;87:1369-76.	
Study Country		USA	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?			
Patient/population/ participants		*Cross-sectional study of women with PCOS seen at a university Reproductive Endocrinology and Infertility Clinic and women without PCOS seen at a university outpatient clinic for annual exams between* May 2004-August 2005.	
Control population		*Women without PCOS seen during the same time period for annual exams*	
PCOS diagnostic criteria		*Rotterdam criteria*	
N per group		*PCOS: N=103* *Controls: N=103*	
Setting		*University of Iowa Hospitals and Clinics between May 2004-August 2005*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		*Primary outcomes:* *- Prevalence of depression (not relevant to this analysis)* *Secondary outcomes:* *-Prevalence of other DSM IV diagnoses including binge eating disorder* *- Scales used: the Primary Care Evaluation of Mental Disorders Patient Health Questionnaire (PRIME-MD PHQ) (15) and Beck Depression Inventory (BDI)*	
Does the study have a clearly focused question and/or PICO?		Yes	
Inclusion criteria		Yes	
Exclusion criteria		Yes	*Control subjects were randomly selected from women who had regular menses and absence of hirsutism*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes	
Was there sufficient duration of follow-up for outcomes to occur?		N/A	*Not relevant for cross-sectional study*
Was matching performed?		No	
Summary Result/s		*Binge eating disorder (BED) was more common in PCOS subjects than in control subjects (12.6% vs. 1.9%; P<.01).*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Partial	*PCOS subjects were from an REI clinic and thus had higher rates of trying to conceive than controls recruited from a gyn clinic.*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes	*Rotterdam 2003*
	Was the control status established in a standard, valid and reliable way?	Yes	
PERFORM	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes	
DE DE	**Were measurements (for exposures or outcomes)**	Yes	

	carried out and calculated in a standard, valid and reliable way?		
	Were outcome assessors blind to case and control status?	No	*Unlikely to cause bias as standardized questionnaires were used*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	N/A	*In the methods, in both groups 90-94% of subjects approached agreed to participate in the study. No loss of follow-up given cross-sectional nature of the study.*
	What percentage of the individuals were not included in the analysis?	N/A	*All individuals were included*
REPORT	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUN	**Are the cohorts comparable on the basis of design or analysis?**	Partial	*Because the PCOS came from an REI clinic, they might have had higher psychiatric comorbidities then controls recruited from general gyn clinics.*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	*Power calculation was done for depression, but not eating disorders; however, significant difference was found in eating disorder outcome.*
	If statistical analysis was undertaken, was this appropriate?	Yes	*Yes*
COMMENTS		*BMI different in baseline characteristics; may confound rates of eating disorders in control vs exposure group*	
What is the overall risk of bias?		*Moderate*	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	Mansson et al, 2008
Study Citation	Månsson M, Holte J, Landin-Wilhelmsen K, Dahlgren E, Johansson A, Landén M. Women with polycystic ovary syndrome are often depressed or anxious-A case control study. *Psychoneuroendocrinology*. 2008;33(8):1132-1138. doi:10.1016/j.psyneuen.2008.06.003
Study Country	*Sweden*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Cross-sectional study of women with and without PCOS diagnosed at university outpatient units (Goteborg and Stockholm, Sweden) between 2002-2005.*

Control population		*49 age-matched controls born on the same day identified from the population registry who did not have known PCOS and did not report oligo- or amenorrhea*	
PCOS diagnostic criteria		*Rotterdam 2003*	
N per group		*PCOS: N=49* *Control: N=49*	
Setting		*University Hospital; clinical interviews*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		*Primary outcomes:* *- Current and lifetime occurrence of Axis I DSM IV diagnoses using the semi structured MINI International Neuropsychiatric Interview* *- Eating disorder outcomes: prevalence of any eating disorder and bulimia nervosa*	
Does the study have a clearly focused question and/or PICO?		Yes	
Inclusion criteria		Yes	
Exclusion criteria		Yes	*Control group: excluded if known PCOS or if report oligo- or amenorrhea*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes	
Was there sufficient duration of follow-up for outcomes to occur?		N/A	*Not relevant for cross-sectional study*
Was matching performed?		Yes	*Controls were matched to PCOS group based on birthday*
Summary Result/s		*PCOS was associated with a higher odds of any eating disorder (21% vs. 4%; OR: 6.4; 95% CI: 1.3-31), but not bulimia nervosa (12 vs. 4%; OR: 3.5; 95% CI: 0.67-18).*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Partial	*- Intervention group recruited at hospital whereas control group using population-based registry.* *- Controls were age matched*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes	*Yes, used established Rotterdam criteria*
	Was the control status established in a standard, valid and reliable way?	Yes	
PERFO RMAN	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes	
DET ECT	**Were measurements (for exposures or outcomes)**	Yes	

	carried out and calculated in a standard, valid and reliable way?		
	Were outcome assessors blind to case and control status?	No	*Although given standardized use of MINI this should not introduce bias*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	N/A	*Not relevant for cross-sectional study*
	What percentage of the individuals were not included in the analysis?	All were included	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Partial	*Because the PCOS came from hospital clinics, they might have had higher psychiatric comorbidities then controls recruited from a registry.*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	*Power calculations not reported, but they mentioned they were only powered to detect differences in psychiatric disorders that were relatively common*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Moderate	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	Batchellar et al, 2013
Study Citation	Batchellar AE, Ressler IB, Sroga JM, Martinez AM, Thomas MA, DiPaola KB. Binge eating disorder in the infertile polycystic ovary syndrome patient. Fertil Steril 2013;100(Suppl 3):S413.

Study Country		USA	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?			
Patient/population/ participants		*Cross-sectional study of patients undergoing in vitro fertilization (IVF) at University of Cincinnati, Cincinnati. Patients were divided into three groups: obese PCOS (BMI >30 kg/m2), lean PCOS, (BMI<25 kg/m2), and controls (oocyte donors or male factor infertility.*	
Control population		*Oocyte donors or male factor infertility*	
PCOS diagnostic criteria		*Rotterdam 2003*	
N per group		*Obese PCOS: N=6* *Lean PCOS: N=5* *Controls: N=10*	
Setting		*University Reproductive Endocrinology and Infertility clinic*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		*Primary outcome:* *Prevalence of binge eating disorder (BED) using DSM V criteria.*	
Does the study have a clearly focused question and/or PICO?		Yes	
Inclusion criteria		Not reported	
Exclusion criteria		Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Not reported	
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes	
Was there sufficient duration of follow-up for outcomes to occur?		N/A	*Not relevant for cross-sectional study*
Was matching performed?		No	
Summary Result/s		*No patients in either group were diagnosed with BED.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes	
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes	
	Was the control status established in a standard, valid and reliable way?	Yes	
PERFORMANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes	
DETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes	
	Were outcome assessors blind to case and control status?	No	*Unlikely to cause bias as standardized questionnaires were used*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	N/A	*Not relevant for cross-sectional study*
	What percentage of the individuals were not included in the analysis?	N/A	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Not reported	
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	*Given low numbers, unlikely to be powered to detect differences in this relatively rare outcome.*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Moderate	
Did risk of bias differ by outcome		*No*

Study Citation	Karacan E, Caglar GS, Gürsoy AY, Yilmaz MB. Body satisfaction and eating attitudes among girls and young women with and without polycystic ovary syndrome. *J Pediatr Adolesc Gynecol*. 2014;27(2):72-77. doi:10.1016/j.jpag.2013.08.003	
Study Country	*Turkey*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Cross-sectional study of adolescent/young adult females with and without PCOS conducted at Ufuk University Obstetrics and Gynecology Department in Ankara, Turkey, between January 2009 and February 2010.*	
Control population	*Adolescent/young adult females without PCOS*	
PCOS diagnostic criteria	*Rotterdam 2003*	
N per group	*PCOS: N=42* *Control: N=52*	
Setting	*University hospital, OB-Gyn department, not reported how subjects were identified*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary Outcome:* *-Eating attitudes* *--Eating Attitudes Test (EAT-26)* *-- Figure Rating Scale (FRS)* *-- The Sociocultural Attitudes towards Appearance Questionnaire (SATAQ)* *-- Body Esteem Scale for Adolescents and Adults (BESAA)*	
Does the study have a clearly focused question and/or PICO?	Yes	

Inclusion criteria		Yes	*BMI <25, young/adolescent female (age range 15-24 years)*
Exclusion criteria		Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Partial	
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes	
Was there sufficient duration of follow-up for outcomes to occur?		N/A	*Not relevant for cross-sectional study*
Was matching performed?		No	
Summary Result/s		*There were no differences between PCOS and controls for prevalence of abnormal EAT=26 scores (35.7% vs. 30.6% NS) or mean EAT-26 scores (46.6±17 vs 48.2±17.6; p= ns)*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Partial	*Unclear recruitment procedures*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes	
	Was the control status established in a standard, valid and reliable way?	Not reported	*Not reported how PCOS was excluded in control group*
PERFORMANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes	
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes	
	Were outcome assessors blind to case and control status?	Not reported	*Unlikely to impact results as standardized questionnaires used*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	Not reported	
	What percentage of the individuals were not included in the analysis?	Not reported	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Partial	*Unclear recruitment procedures*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	Not reported	*No power calculations reported*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		*Prevalence of abnormal EAT-26 scores not reported in published manuscript, but authors provided this data for the meta-analysis.*	
What is the overall risk of bias?		Moderate	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Study Country	Sweden
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Cross-sectional study of women with and without PCOS recruited between November 2005- September 2008 at the Sahlgrenska Academy University of Gothenburg, Sweden*

Control population		*Women without PCOS*	
PCOS diagnostic criteria		*Rotterdam 2003*	
N per group		*PCOS: N= 72* *Control: N= 30*	
Setting		*Participants recruited via newspapers and other community spaces*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		*Primary outcome:* *- Determine if women with PCOS have altered eating behaviours compared to controls* *Scales used:* *- 21-item Three-Factor Eating Questionnaire (TFEQ-R21)* *- Eating Attitudes Test (EAT-40), clinical cut-off for eating disturbances was score ≥ 29* *- Psychiatric illness (self-reporting questionnaire using DSM-4 criteria)*	
Does the study have a clearly focused question and/or PICO?		Yes	
Inclusion criteria		Yes	
Exclusion criteria		Yes	*Women with congenital adrenal hyperplasia, hypothyroidism, hyperprolactinemia, Cushing syndrome, androgen secreting tumors and other related disorders, pharmacologic treatment within past 12 weeks, breastfeeding, HTN/DM, in treatment for psychiatric disease were excluded. Additionally, controls were excluded if they had menstrual irregularities, polycystic ovarian morphology on ultrasound (PCOM), or signs of hyperandrogenism.*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Partial	*Exclusion of participants with hypertension/diabetes and other comorbid conditions limits generalizability of study and those often co-exist with PCOS*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes	
Was there sufficient duration of follow-up for outcomes to occur?		N/A	
Was matching performed?		No	
Summary Result/s		*There were no difference in eating behaviours (cognitive restraint, emotional eating and uncontrolled eating) between PCOS group vs controls. Women with PCOS did have higher total EAT-40 scores (PCOS 16.4 ± 10.1 vs Control 7.8 ± 6 (p= <0.001)). There were no differences in rates of abnormal EAT-40 scores or current bulimia.*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes	
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes

Study Country	*Sweden*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*Cross-sectional study of women identified from Swedish National Patient Register (NPR) between 1990 and 2013.*	
Control population	*Randomly selected individuals in general population of NPR*	
PCOS diagnostic criteria	*At least one PCOS ICD code in the NPR*	
N per group	*PCOS: N= 24,385* *Control: N= 243,850*	
Setting	*NPR*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Primary outcomes:* *Psychiatric disorders based on ICD codes in the NPR from 1973 to 2013*	
Does the study have a clearly focused question and/or PICO?	Yes	
Inclusion criteria	Yes	
Exclusion criteria	Yes	*PCOS group: PCOS excluded if they had a condition that may mimic PCOS and if a diagnosis was made before age 13 without additional diagnosis in adolescence or adulthood* *Immigration, emigration, death and diagnosis date conflicts*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Partial	*PCOS not excluded from controls*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes	
Was there sufficient duration of follow-up for outcomes to occur?	N/A	*Not relevant for cross-sectional study*
Was matching performed?	No	*A matched cohort design was used. Each PCOS patient was matched on sex, birth year, and county of residence within the decade of diagnosis to ten comparison individuals randomly selected from the general population.*
Summary Result/s	*Women with PCOS had a higher prevalence of any eating disorder (2.5% vs. 1.7%; P< 0.05) and bulimia (0.73% vs. 0.55%; P<0.05)*	

SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes	
	Was the case definition adequate and established in a standard, valid and reliable way?	Partial	*ICD codes used, not confirmed by Rotterdam*
	Was the control status established in a standard, valid and reliable way?	Partial	*PCOS not ruled out*
PERFORMANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes	
DEDETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Partial	*ICD-9 codes used*
	Were outcome assessors blind to case and control status?	No	*Unlikely to cause bias ICD 9 codes used*
	Were all outcomes measured in a standard, valid and reliable way?	Partial	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	N/A	*Cross-sectional study*
	What percentage of the individuals were not included in the analysis?	N/A	*All participants included in analysis*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	*Yes, for primary outcome*

	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		*Moderate*	
Did risk of bias differ by outcome		*No*

Study Country		England	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?			
Patient/population/ participants		*Cross-sectional study of women with PCOS and without PCOS. Healthy lean women were matched for* *weight, age and ethnicity to lean women with PCOS.* *All overweight/ obese women with PCOS were invited to participate and were not matched with controls, thus only lean women with PCOS and lean controls were included in analysis*	
Control population		*Women without PCOS*	
PCOS diagnostic criteria		*Self-report of PCOS diagnosis by a healthcare professional*	
N per group		*Controls (all lean): N=40* *PCOS (lean): 45*	
Setting		*England, social media sites and email advertisements at University of Surrey in Southern England*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		*Primary outcome:* *- Prevalence of food cravings, binge eating behaviors, emotional eating, cognitive restraint, and uncontrolled eating scores* *Scores used:* *- Bulimia Investigatory Test, Edinburgh (BITE), Food Cravings-Trait Questionnaire ((FCQeT) and the Three Factor Eating Questionnaire revised-18 ((TFEQ-R18 version 2)*	
Does the study have a clearly focused question and/or PICO?		Yes	
Inclusion criteria		Partial	*At least 18 years of age, "healthy" – not defined*
Exclusion criteria		Yes	*Patients that were pregnant or breastfeeding*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Partial	
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes	
Was there sufficient duration of follow-up for outcomes to occur?		N/A	
Was matching performed?		Yes	*Weight, age and ethnicity*
Summary Result/s		*Lean women with PCOS had higher BITE scores and a higher prevalence of abnormal BITE scores than lean controls (36% vs. 12%; p=0.02)*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION	**Was the case definition adequate?**	Yes	
	Was ascertainment of exposure adequate?	Partial	*Self-report of physician diagnosis of PCOS*

	Was the control status established in a standard, valid and reliable way?	Yes	
PERFORMANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes	
DETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes	
	Were outcome assessors blind to case and control status?	No	*Unlikely to cause bias as standardized questionnaires were used*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	N/A	Cross-sectional survey
	What percentage of the individuals were not included in the analysis?	Not reported	*21.6% of patients with PCOS not included in analysis, but it was not reported if they were lean or obese*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	No	*Not powered to report a difference in binge eating symptoms and depression.*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS

CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	*Cross-sectional study of women with and without PCOS via online survey collected between August 2017 and March 2018*
Control population	*Sampled from a cross-sectional online study that aimed to examine a range of eating-related psychosocial variables within an Australian sample. PCOS status not evaluated in controls*
PCOS diagnostic criteria	*Self-report of prior PCOS diagnosis*
N per group	*PCOS: N= 501* *Control: N= 398*
Setting	*PCOS recruited from PCOS-related Australian social media pages as well as Australian e-newsletter distribution servers.* *Controls recruited through social media and University intranet pages and groups*

Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		*Primary outcomes:* *Prevalence of disordered eating and eating disorders* *Scales Used:* *-Eating Disorder Examination Questionnaire (EDE-Q)* *-The Diagnostic and Statistical Manual of Mental Disorders Fifth Edition (DSM-5) criteria.*	
Does the study have a clearly focused question and/or PICO?		Yes	
Inclusion criteria		Yes	*Self-report as Australian, female, aged 18–45 years and had completed all of the EDE-Q, fluent in English language*
Exclusion criteria		Yes	*Pregnancy, breastfeeding, taking weight loss medication up to 6 months prior to questionnaires*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Partial	*PCOS status not evaluated in controls*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes	
Was there sufficient duration of follow-up for outcomes to occur?		N/A	*Not relevant for cross-sectional study*
Was matching performed?		No	
Summary Result/s		*Women with PCOS had a lower prevalence of disordered eating based on elevated EDE-Q scores (cut-off ≥4) (7.2% vs. 13.0%; P=0.002). There were no differences in prevalence of all eating disorders (62% vs. 56%; P=0.076), bulimia nervosa or binge eating disorder. Controls had a higher prevalence of anorexia (1.3% vs. 0%; P=0.012).*	
SELECTION BIAS	**Were the cases and controls taken from comparable populations?**	Yes	
	Was the case definition adequate and established in a standard, valid and reliable way?	Partial	*Self-report of PCOS status*
	Was the control status established in a standard, valid and reliable way?	Partial	*PCOS status not evaluated in controls*
PERFORMANCE BIAS	**Aside from the exposure/ intervention, were the groups treated the same?**	Yes	
DETECTION BIAS	**Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?**	Yes	

	Were outcome assessors blind to case and control status?	No	*Unlikely to cause bias as standardized questionnaires were used*
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study were lost to follow up?**	N/A	*Cross-sectional study*
	What percentage of the individuals were not included in the analysis?	N/A	*All participants included in analysis*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes	
CONFOUNDING	**Are the cohorts comparable on the basis of design or analysis?**	Yes	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	No	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	*Yes, for primary outcome*
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		*Moderate*	
Did risk of bias differ by outcome		*No*

Question 2.5.

In women with PCOS, what is the prevalence and severity of disordered eating?

BACKGROUND:

Diagnosable eating disorders include Anorexia Nervosa (AN); Bulimia Nervosa (BN), Binge-Eating Disorder (BED), Avoidant/Restrictive Food Intake Disorder (ARFID), Pica, Rumination Disorder, Other Specified Feeding or Eating Disorder (OSFED; atypical AN, BN of low frequency and/or duration, BED of low frequency and/or duration, purging disorder, and night eating syndrome), and Unspecified Feeding or Eating Disorders (USFED; symptoms consistent with eating disorders, including the severity of symptoms and distress and impairment, but do not meet the full criteria for any of the eating disorder diagnoses). Higher weight is not considered an eating disorder, but it is associated with increased risk of eating disorders and disordered eating (1, 2).

The 2000-2018 rate of lifetime eating disorders (EDs) worldwide was estimated to be 8.4% in women (3). The prevalence of weighted means (with ranges) for AN in women was 1.4% (0.1-3.6%), BN was 1.9% (0.3-4.6%), BED was 2.8% (0.6-5.8%), and EDNOS was 4.3% (0.6-14.6%) (3). Given the changes in DSM-5 criteria, data on OSFED is limited; however, a relatively recent study estimated OSFEDs had the highest prevalence of all EDs, above AN, BN, and BED, at ~7.4% (4).

Disordered eating refers to eating and weight related symptoms commonly associated with an eating disorder, this can include behavioural (e.g., bingeing, restriction), cognitive (e.g., dietary restraint, negative body image), and emotional (e.g., emotional eating) factors. The prevalence of disordered eating is far higher than the prevalence of eating disorders; many women who do not meet full criteria for an eating disorder experience disordered eating and associated distress. For example, Australian research (5) reports that 7.5% of women surveyed experienced binge eating, 2.1% purging, and 5.2% strict dieting or fasting. Rates are likely to be higher in women with metabolic/endocrine disorders. For example, recent Australian research (n = 2,977; Dias Santana et al., 2019 (6)), that separated participants by the absence versus presence of diabetes, found that 9.3 and 15.2% of women surveyed reported objective binge-eating, 2.5 and 7.1% subjective binge-eating, 6.1 and 6.4% strict dieting or fasting, and 0.8 and 1.7% purging, respectively.

Many women with eating disorders are undiagnosed and unaware that they have an eating disorder. Likewise, many women with disordered eating are unaware that their eating and weight related thoughts and behaviours are unusual, cause distress and/or are modifiable. Effective treatments are available for eating disorders and disordered eating. Therefore, screening, assessment and diagnosis are essential.

Eating disorders can only accurately be diagnosed via a clinical interview (e.g., the Eating Disorders Examination; Fairburn & Beglin, 1994 (7)). Unfortunately, there are no alternate standardized, widely implemented, and validated processes for screening and assessment. The variety of eating disorder diagnosis, and associated symptoms, makes it difficult to identify simple screening and assessment methods that cover all eating disorder diagnosis and symptoms (8). Additionally, the majority of available screening and assessment questionnaires were designed to assess anorexia nervosa and bulimia nervosa and do not adequately assess the full spectrum of eating disorders (e.g., atypical AN, BN of low frequency and/or duration, BED of low frequency and/or duration, purging disorder, and night eating syndrome). This is of concern given these other diagnoses are more common, and this may be particularly so in women with PCOS (because of their risk factors e.g., higher weight).

Women with PCOS are at increased risk of experiencing many of the identified risk factors for eating disorders (9). They are at increased risk of higher weight, depression, anxiety, self-esteem and poor body image. They are also more likely to be highly motivated for weight loss and to be prescribed dietary restriction. Available data suggests that, in women with PCOS, disordered eating is associated with a higher weight (9, 10), anxiety (9), depression (11, 12) and poorer quality of life (9). The presence of an eating disorder or disordered eating is likely to impact on the process and outcome of PCOS treatment and management.

There is a lack of good evidence regarding the prevalence of eating disorders and disordered eating in women with PCOS. In the only study to use a clinical interview (MINI for DSM-IV) to assess eating disorder prevalence in women with PCOS (n=49), Mansson and colleagues (13) reported increased prevalence of any eating disorder (21% vs. 4%) but not bulimia nervosa specifically (12% vs 4%) compared to controls. Of note, the MINI only assesses AN and BN, and this study uses the older DSM-IV diagnostic criteria which included fewer eating disorders and more stringent criteria. Therefore, DSM5 rates are likely to be higher.

A series of meta-analyses examined the prevalence of eating disorders and disordered eating in women with PCOS (determined either via self-report or clinical assessment) compared to controls across 14 studies. The majority of studies were conducted in the USA, Western Europe, and Australia. All but one study (14) examined adults (>18yrs). Of concern, all but one study (13) assessed eating disorders/disordered eating via self-report rather than clinical interview. Older studies reported based on DSM-IV criteria while newer studies used DSM5 criteria. Samples were recruited in a variety of ways including community advertising, large scale surveys, tertiary clinics, and national registries.

Results are summarized below

- Any eating disorder (including bulimia nervosa, binge eating disorder, anorexia nervosa, night eating syndrome) [NOTE: these are the disorders assessed across studies, not all studies examined the prevalence of all these eating disorders]: Increased odds in women with PCOS, for all studies (OR 1.53 (1.29, 1.82); K=10), and in the sub-group of studies with PCOS diagnosis confirmed by the Rotterdam criteria (2.88 (1.55, 5.34);K=6). Rates ranged from 0.5% to 62% for women with PCOS, and 0.3% to 56% for women without PCOS.
- Disordered eating (defined as a score above the cut-off of a validated eating disorder questionnaire): No increased odds of disordered eating in women with PCOS, for all studies (OR 1.77 (0.63, 4.91); K=6), or in the sub-group of studies with PCOS diagnosis confirmed by the Rotterdam criteria (2.21 (0.87, 5.59); K=4). Rates ranged from 0% to 36% for women with PCOS, and 0% to 31% for women without PCOS. Rates of disordered eating symptoms (e.g., binge eating, purging, fasting) in the absence of an eating disorder were not reported.
- Bulimia nervosa: No increased odds of bulimia nervosa in women with PCOS, for all studies (OR 1.34 (1.17, 1.54); K=6), or in the sub-group of studies with PCOS diagnosis confirmed by the Rotterdam criteria (1.56 (0.56, 4.36); K=3). Rates ranged from 0.7% to 12% in women with PCOS, and 0.6% to 6% in women without PCOS.
- Binge eating disorder: Increased odds in women with PCOS, for all studies (OR 2.09 (1.18, 3.72); K=5), and in the sub-group of studies with PCOS diagnosis confirmed by the Rotterdam criteria (2.70 (1.47, 5.97); K=3). Rates ranged from 0% to 93.1% in women with PCOS, and 0% to 83% in women without PCOS.
- Anorexia nervosa: No increased odds of anorexia nervosa in women with PCOS, for all studies (OR 0.94 (0.60, 1.28); K=4). Rates ranged from 0% to 93.1% in women with PCOS, and 0% to 83% in women without PCOS.
- Prevalence rates were not reported for other feeding and eating disorders.

The one study (14) assessing eating disorders and disordered eating in adolescents did not report higher odds of any eating disorder or of binge eating disorder (this study did not assess/report disordered eating, bulimia nervosa, or anorexia nervosa) in adolescents with PCOS. In women with PCOS it is not known whether: the prevalence of eating disorders or disordered eating changes over time; ethnic and cultural impacts on PCOS prevalence and severity; or PCOS treatments impact on the prevalence of eating disorders or disordered eating.

The importance of screening for eating disorders and disordered eating is noted in the previous International Evidence-based Guideline for the assessment and management of polycystic ovary syndrome (PCOS). Screening is also recommended for women with PCOS and/or PCOS symptoms in a number of eating disorder guidelines. For example, the Australian National Eating Disorders Collaboration list women with PCOS as one of the high-risk groups who may benefit from screening (https://nedc.com.au/eating-disorders/eating-disorders-explained/the-facts/eating-disorders-in-australia/). Likewise, the National Institute for Health and Care Excellence Guidelines for Eating Disorders: Recognition and Treatment (www.nice.org.uk/guidance/indevelopment/gid-cgwave0703/documents) suggest that clinicians think about the possibility of an eating disorder in individuals with a range of symptoms relevant to PCOS. The *Management of Eating Disorders for People with Higher Weight: Clinical Practice Guidelines* (15) provide guidance regarding assessment of eating disorders and disordered eating in people with higher weight.

	o Outcome 5. Anorexia nervosa	⊕⊕⊕◯ Moderate

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Eating disorders and disordered eating in women with PCOS vs control

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Eating disorders and disordered eating should be considered in PCOS, regardless of BMI and especially in the context of weight management and lifestyle interventions. (see 2.4 and 3.6).

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

- If disordered eating or eating disorders are suspected, appropriately qualified practitioners should further assess via a full diagnostic interview.
- If an eating disorder or disordered eating is detected, appropriate management and support should be offered.

GRADE CONSIDERATIONS

Justifications:

- Based on the meta-analyses conducted for this study, there were increased odds of women with PCOS experiencing any eating disorder (all studies (OR 1.53 (1.29, 1.82); K=10); confirmed by the Rotterdam criteria (2.88 (1.55, 5.34);K=6)) and binge eating disorder (all studies OR 2.09 (1.18, 3.72); K=5; confirmed by the Rotterdam criteria (2.70 (1.47, 5.97);K=3)), but not bulimia nervosa, anorexia nervosa or disordered eating.
- Ten studies had a moderate risk of bias. Studies were conducted in Australia, Saudi Arabia, Sweden and the USA. Only one study (14) restricted inclusion to adolescents. No studies evaluated risk of any eating disorder based on ethnicity or phenotype.
- Eating disorders can only be diagnosed via clinical interview. In the only study to use a clinical interview (MINI for DSM-IV) to assess eating disorder prevalence in women with PCOS (n=49), Mansson and colleagues (13) reported increased prevalence of any eating disorder (21% vs 4%) but not bulimia nervosa specifically (12% vs 4%) compared to controls. Of note, the MINI only assesses AN and BN, and this study uses the older DSM-IV diagnostic criteria.
- These studies did not assess all eating disorders (Avoidant/Restrictive Food Intake Disorder (ARFID), Pica, Rumination Disorder, Other Specified Feeding or Eating Disorder (OSFED; atypical AN, BN of low frequency and/or duration, BED of low frequency and/or duration, purging disorder, and night eating syndrome), and Unspecified Feeding or Eating Disorders (USFED; symptoms consistent with eating disorders, including the severity of symptoms and distress and impairment, but do not meet the full criteria for any of the eating disorder diagnoses)
- Women with PCOS are at increased risk of experiencing many of the identified risk factors for eating disorders (16, 17). They are at increased risk of higher weight, depression, anxiety, self-esteem and poor body image. They are also more likely to be highly motivated for weight loss and to be prescribed dietary restriction. Potential endocrine mechanisms have also been proposed (18). Available data suggests that, in women with PCOS, disordered eating is associated with a higher weight (9, 10), anxiety (9), depression (11, 12) and poorer quality of life (9).

Subgroup considerations:

The following subgroups needs to be considered (but are not considered in existing research)

- Adult/Adolescent (only one study considered adolescents)
- Cultural and ethnic subgroups

Implementation considerations:

Respectful and empathic communication is required when discussing these sensitive issues.
The cultural identity and preferred language of a woman are also important considerations. Be aware of possible variations in presentation of eating disorders and disordered eating and conduct screening in a culturally sensitive manner.
Screening may have resource implications such as an impact on length of consultation.
If eating disorders or disordered eating are detected, intervention may require referral to other health practitioners. Additional time with the patient may also be required to complete an appropriate care plan.
Access to appropriately trained and experienced health professionals will be required.

Translation tools should include:

- The following two questions may be helpful in screening
    - Does your weight affect the way you feel about yourself?
    - Are you satisfied with your eating patterns?
- The EDE-Q may be a helpful assessment tool

Monitoring and evaluation considerations:

Ongoing monitoring of eating disorders and disordered eating should be considered particularly in response to significant changes in weight, eating, exercise and/or body image or with lifestyle intervention.

Research priorities:
Prevalence of eating disorder/disordered eating in women with PCOS, including different subgroups (e.g., adolescents, ethnicity/culture), using a structured clinical interview (e.g., EDE, EDA5) and considering all types of eating disorders.
Validating existing screening and assessment tools in women with PCOS, including diverse groups, and adapting tools specifically for women with PCOS.
Examination of the impact of eating disorders/disordered eating on the process and outcome of PCOS treatment and management, and the impact of PCOS treatment and management on eating disorders/disordered eating.
Examination of the effectiveness of treatment for eating disorders/disordered eating in women with PCOS, including the impact this has on the process and outcome of PCOS treatment and management.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
Evidence is limited but clinical significance is important.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
Screening, assessment and diagnosis of eating disorders, disordered treatment can temporarily elevate distress. This may be particularly problematic if treatment options are not available.

Screening, assessment and diagnosis is essential for identification, referral and treatment. Access and engagement to effective treatment is likely to result in improved outcomes in terms of eating disorders/disordered eating specifically and wellbeing more generally.
Failing to detect and treat eating disorders/disordered eating leaves the individual experiencing negative consequences. It may also negatively impact on the process and outcome of PCOS treatment and management.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☒ No important uncertainty or variability

Research evidence:
No research evidence was identified

Panel discussion:

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☒ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:
No research evidence was identified

Panel discussion:
The costs of clinical interviews for diagnosis would be considerable given the time taken to conduct these interviews, and the clinical expertise required of the interviewer.
If eating disorders/disordered eating interventions are required costs for would be considerable, however there is evidence that eating disorders/disordered eating treatment is cost-effective in the general population. Treatment costs can be reduced via use of a stepped care approach.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:
No research evidence was identified

Panel discussion:

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
No research evidence was identified

Panel discussion:
See above in cost.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☒ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:
No research evidence was identified

Panel discussion:
Some settings may not have the resources/capability to screen, assess, diagnose and/or treat eating disorders/disordered eating**.**

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:
No research evidence was identified

Panel discussion:
Respectful and empathic communication is required when discussing these sensitive issues.
Health professionals and women may have some sensitivity around screening, assessment, diagnosis and/or treatment of eating disorders/disordered eating.
Some of the recommendations for eating disorder/disordered eating treatment are inconsistent with restrictive dieting/weight loss commonly prescribed in women with PCOS.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:
No research evidence was identified

Panel discussion:

Question 2.6.1.

What are the information, resource and education needs of women, adolescents, CALD groups and healthcare providers regarding PCOS?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	**2.6.1. What are the information, resource and education needs of women, adolescents, CALD groups and healthcare providers regarding PCOS?**
Clinical leads (key contacts)	**Tania Burgert, Jacky Boivin**
Allocation ranking	**Level 1 – New systematic review**

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women with PCOS (any definition) Subgroups: • Adolescents • Phenotypes • Ethnicity • Geographical and any healthcare provider who identify themselves as working with PCOS (e.g. Dietitians, physiotherapists, psychologists) etc.	Various sources of information Women with PCOS: (from family/peers health professions/internet/app/support groups/social media (FB, Instagram, tiktok/twitter), decision-support tools (e.g. question prompt lists) mainstream media (news, newspaper, magazine, TV, documentaries) Health professionals: (textbook, society, conferences, guidelines, care plans. algorithms, websites, apps, translation activities particularly associated with last guideline) medical education/training programmes	None, usual care, or others	Information or resource needs, knowledge gaps (by reproductive/metabolic/hormonal/psychologic/dermatological outcomes, by life stages, by gender identity, by cultural/ethnic background, by professional specialty) Include satisfaction, dissatisfaction, what they feel most important,	Quantitative observational studies, systematic reviews evidence based guidelines Qualitative studies.	English language
Exclusion	Females without diagnosed PCOS.		Not applicable	Not applicable	Non-evidence-based guidelines. Abstracts, protocol, clinical trial registration. Comparative intervention studies, clinical trials

Evidence processing: The search was performed for both topic 2.6.1 and 2.6.4. Studies were selected and appraised by two reviewers in consultation with the evidence team/ key contact using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. In total, 54 studies met inclusion criteria for both 2.6.1 and 2.6.4. **41 studies met inclusion criteria for the review of 2.6.1.**

GDG 2

Question 2.6.1.

What are the information, resource and education needs of women, adolescents, CALD groups and healthcare providers regarding PCOS?

BACKGROUND:

Prevalence and problem

PCOS is a chronic disease characterized by varied expression from adolescence to menopause. Therefore, informational needs are greatest at time of diagnosis. An international online questionnaire study found that one third of those affected consulted 3 or more healthcare professionals prior to establishment of the PCOS diagnosis and generally expressed dissatisfaction with health information received (1). In this study and in others, healthcare professional communication lacked recommendations for lifestyle modifications/weight management (2), discussion of long-term complications, extension of emotional support/counselling (3) and empathy (4). Comprehensive and supportive information furthermore may benefit quality of life in PCOS (5) and satisfy the desire for agency in the self-management of health issues related to PCOS (6).

Clinical practice gap

Understanding the needs of those affected by PCOS in terms of communication/recommendation from their health care professionals and discerning knowledge gaps among health care professionals that are contributing to unmet informational needs in PCOS care.

Individual's experiences of PCOS care

Due to the lack of comprehensive PCOS information at the time of diagnosis, those affected often search online to enhance understanding. In a Google Trends analysis, the frequency of PCOS related online searches was higher when compared to web interrogations for fibroids, another equally prevalent gynaecological condition (7). Overall, online searches as well as communication with online PCOS support groups enhance the effectiveness of health care visits as patients can ask more targeted questions (8, 9). A survey from Australia also found that a comprehensive question prompt list, if readily available (online or in an App), can further serve as a useful tool to enhance communication with healthcare professionals (10). Joining online discussion forums and sharing experiences also seem to reduce the psychological burden of PCOS (11). In a qualitative study that was conducted over a Skype platform video interview, participants remarked that PCOS impacted their sense of identity as a woman and challenged their perception of themselves (12). Over 50% of participants in this study discussed suicide-ideation and self-harm during their interview.

A recent, post-2018 International PCOS Guideline survey study from the United Kingdom noted that lag time to diagnosis of PCOS was only 6-12 months (13) as opposed to previous reports of > 2 years (1). However, patients continue to miss comprehensive discussion of comorbidities (13), healthy lifestyle and weight (11, 13) and enquiry about their mental health (11, 13). In a semi-structured interview study out of Canada, patients felt PCOS to be stigmatizing as weight gain, acne, and hirsutism were deemed undesirable by society (14). Furthermore, a lack of empathy and weight bias from health professionals seemed to enhance the feeling of stigmatization in patients from Canada (15). A recent study out of India looked at treatment seeking pathways in patients diagnosed with PCOS and observed that recurrent lack of clear treatment explanations led to 51 % of patients consulting 2-3 healthcare agencies for treatment (16). Even though similar treatment plans may have been provided by different clinicians, a lack of understanding treatment decisions in the context of PCOS, left patients dissatisfied.

While the 2018 International PCOS Guideline recommended lifestyle management as first-line treatment of PCOS, specific implementation models still need to be explored. A recent online PCOS survey study out of Australia reported that 95% of those surveyed would attend a lifestyle program if affordable, long-term and offer PCOS specific recommendations that addressed barriers to behaviour change (17). A subset of study participants who underwent structured interviews perceived PCOS comorbidities such as anxiety, depression, disordered eating, and poor body image as an impedance to successful lifestyle management (18).

Culturally and linguistically diverse groups

Information and resources should be framed and provided in a culturally appropriate way. An Australian study evaluating service for Aboriginal and Torres Strait Islanders with PCOS noted that group rather than individual consultations were sometimes preferred (19). Barriers to accessible and culturally appropriate information provision were identified, such as information not matched to health literacy, and unavailability of women physicians. Tribal attitude also shaped the impact of PCOS in American Indians in recent qualitative accounts (20). Menstrual dysfunction prevented American Indians from attending some tribal ceremonies, which led to social marginalization and stigmatization. PCOS furthermore affected status/identity within the tribe, where procreating was greatly valued. This sense of inadequacy was enhanced by a lack of access to fertility services in the rural contexts of tribal life. Attitudes of fatalistic acceptance additionally led to shame and unsought medical care. Like the Aboriginal and Torres Strait Islanders in Australia, American Indians often preferred to include friends and family when diagnostic and treatment information was provided (20).

Adolescents

In a quality-of-life cross-sectional examination, adolescents with PCOS were less sexually active and more worried about their ability to conceive later in life than their peers (21). In a qualitative study of young adults (age 18-23 years old) concerns about future fertility were “ever present” and on the mind of the participants (22).

Since the publication of the 2018 International PCOS Guideline, a recent cross-sectional analysis of the adolescent experience in Australia and the United Kingdom reported that time to diagnosis has shortened to < 1 year for most adolescents (23). While adolescents in this study were overall pleased with the diagnosis experience, there was dissatisfaction with information on lifestyle, psychological aspects and long term complications, although this varied by location/setting of care (23).

The 2018 International PCOS Guideline, while in support of Rotterdam criteria for diagnosis, recommends NIH criteria (menstrual dysregulation AND clinical or biochemical hyperandrogenism) for diagnosing adolescents. In a recent cross-sectional report of adolescents attending a comprehensive multi-specialty adolescent PCOS program, 247 teens who met NIH criteria for PCOS were compared to 243 teens who did not meet criteria at the time of assessment (24). During psycho-social assessment, teens that met diagnostic NIH criteria were more likely to report their gender identity as diverse (trans, fluid or non-binary). Among those diagnosed with PCOS, gender diversity was associated with higher hirsutism scores but not biochemical hyperandrogenism, suggesting that gender diverse teens might more likely embrace manifestations of hirsutism and choose to forgo common cosmetic treatments. Therefore, unawareness of a teen’s gender identity may inadvertently subject the adolescent to cis-normative treatments, potentially worsening psychological distress (24).

Healthcare providers' knowledge and practices

Aligning with patients' experience, surveys of health professionals in Europe/Asia and North America (25) and Nordic European countries (26) confirmed that clinician awareness of psycho-social morbidities associated with PCOS is low.

In terms of PCOS diagnostic criteria, a survey of physicians from North America found that only 68% of reproductive endocrinologists (REI-ObGyn) and less than half (41%) of general obstetrician-gynaecologists (ObGyn) knew to apply Rotterdam criteria for diagnosing PCOS (27). In this report REI-ObGyn specialists were more likely to prescribe lifestyle modification for both fertility and non-fertility related concerns than OBGyn physicians. In general, older physicians (age >46 years old) were less aware of Rotterdam criteria (27) and less frequently prescribed lifestyle modification (26). When ObGyn residents in training were surveyed, most residents (85%) knew that Rotterdam criteria are recommended to diagnose PCOS in adults (28). However, in this study, only 50% identified one component of each of the three diagnostic criteria. In another physician survey out of India clinical practice patterns of varying specialties were compared (29). Notably, in this study, laboratory examination to exclude a diagnosis of non-classical-congenital adrenal hyperplasia was rarely performed in any of the specialties and depression screening was most often performed by paediatricians when seeing adolescents with PCOS (29). Furthermore, hormone pills were more commonly prescribed by endocrinologists and gynaecologists, whereas metabolic complications were more likely screened for by endocrinologists and general physicians. In a small survey study in Saudi Arabia examining the practice patterns in application of the Rotterdam criteria, endocrinologists reported greater reliance on hyperandrogenism and gynaecologists more frequently used ultrasound to make the diagnosis (30). An examination of rural nurse practitioners in the United States observed that only about 40% of the practitioners recognized PCOS as a risk factor for type 2 diabetes mellitus (31). Given their customary clinical setting in family practice, women's health and internal medicine, nurse practitioners continuing education on the diagnosis and comorbidities of PCOS might greatly reduce diagnostic delays and prevent comorbidities of PCOS (31). In a qualitative study on clinician perspective in Australia, clinicians voiced concern about the diagnostic accuracy of the Rotterdam Criteria and felt that there was a risk for overdiagnosis PCOS (32). Most desired PCOS discussions with patients to be comprehensive while dispelling misconceptions about infertility (32). A recent qualitative study in allied health professionals (dietitians, physical therapists, and psychologists), explored their experience with the implementation of 2018 International PCOS Guideline lifestyle recommendations (33). Those interviewed wished to be more knowledgeable about the psychological issues associated with PCOS as these could affect body image, motivation and predisposition to disordered eating (33). Overall allied health professionals felt that the 2018 International PCOS Guideline lifestyle recommendations were too general and too weight focused. They also desired more communication with the treating clinicians in terms of hand-off and collaboration (33).

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Information resources vs none

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Tailored information, education and resources that are high-quality, culturally appropriate and inclusive should be provided to all with PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **EBR:** Information, education and resources are a high priority for women with PCOS and should be provided in a timely, respectful and empathic manner.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

CONSENSUS RECOMMENDATION

- Entities responsible for health professional education should ensure that information and education on PCOS is systemically embedded at all levels of health professional training to address knowledge gaps.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

- The diversity of the population should be considered when adapting practice paradigms.
- Health professional education opportunities should be optimised at all stages of education, graduate and postgraduate training, continuing professional development and practice support resources.
- Women should be counselled on the risk of misinformation and guided to evidence-based resources.

GRADE CONSIDERATIONS

Justifications: Evidence shows knowledge gaps among health care professionals that are contributing to unmet informational needs in PCOS care. Adolescents and adults with PCOS highly prioritised information needs.
Subgroup considerations: It is important to ensure that PCOS resources are designed for those with a low health literacy level. It is also important that resources are culturally appropriate and available in languages other than English.
Implementation considerations: Continuing health professional education must be prioritised based on lack of healthcare professional knowledge and lack of patient satisfaction with education received by health professionals Use credible and high-quality resources that encompass best practice information delivery. Codesigned, accessible resources from these evidence-based guidelines should be widely disseminated and prioritised.
Monitoring and evaluation considerations: Monitoring of knowledge in healthcare professionals and those with PCOS.
Research priorities: Exploration of optimal delivery methods of health information for end users. Demonstration of satisfaction and impact of education strategies on practice and health outcomes. Avenues of integration into models of care.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

- **DESIRABLE EFFECTS**

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☒ Moderate	☐ High

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
Evidence certainty is limited by observational data only, however these study designs are appropriate for this question and there are large numbers of studies showing consistent findings.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☒ No important uncertainty or variability

Research evidence:
No research evidence was identified

Panel discussion:

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

● COSTS

How large are the resource requirements (costs)?

Judgement:

☒ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:
No research evidence was identified

Panel discussion:

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:
No research evidence was identified

Panel discussion:

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
No research evidence was identified

Panel discussion:
Unclear. Cost to implement but savings in prevention.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☒ Increased

Research evidence:
No research evidence was identified

Panel discussion:
Accessible, high quality information, education and resources increase equity.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:
No research evidence was identified

Panel discussion:
System change may be challenging in PCOS being prioritised.

● **FEASIBILITY**

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Question 2.6.2.

What are the characteristics of available models of care implemented in PCOS clinic or service?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	2.6.2 What are the characteristics of available models of care implemented in PCOS clinic or service?
Clinical leads (key contacts)	Jacky Boivin, Chau Thien Tay, Mala Thondan
Allocation ranking	Level 1 – New systematic review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Females of any age, ethnicity or weight diagnosed with PCOS (by Rotterdam, NIH, or AES). Subgroups: • Adolescents • Phenotypes • Ethnicity • Geographical	Models of [health] care (collaboration between disciplines – bio- psychosocial approach to wellbeing) Note where defined. Include: interdisciplinary, integrated primary or specialist care; transition of care; individually tailored care plans; self-management, shared decision-making, patient-centred care, decision-support, community informed care, digital first.	None, usual care, or others	Delivery of a care Model, Cost Effectiveness (long-term), Patient-defined outcomes (e.g., satisfaction with care), Improved communication (between staff and between staff and patients), Patient health outcomes (e.g., improved physical functioning, improved mental functioning), Timely access to care and treatment (efficiency of care), Quality of Life, Self-rated emotional wellbeing, Optimal self-management indicators.	Evidence based guidelines, systematic reviews, any primary study.	English language
Exclusion	Females without diagnosed PCOS.	Clinical trials that evaluate specific interventions (lifestyle management, mobile app) that are not a component of a broader disease management framework (as defined above)	Not applicable	Not applicable	Non-evidence-based guidelines. Abstracts, protocol, clinical trial registration.

5. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention details (Models of care (MoC) details)	Outcomes measured	Summary of findings	Risk of Bias (RoB)
Bekx et al. 2010	Adolescent girls with PCOS. American Family Children's Hospital in Madison, Wisconsin.	Retrospective chart review	70 adolescents	The team consists of 2 paediatric endocrinologists, a paediatric gynaecologist, a reproductive endocrinologist, a nutritionist, and a health psychologist.	Chart review of patients seen in the first 33 months for details of initial presentation, age, body mass index (BMI), menstrual pattern, clinical and laboratory features of androgen excess, insulin resistance, and dyslipidaemia.	Seventy patients (84% Caucasian) presented with an average age at referral of 16.2 years (range 11-22 y). Eighty four percent had a BMI O the 85th percentile and 70% had a BMI O 95th percentile. Menstrual pattern was quite varied, with some patients having primary amenorrhea, and over 50% experiencing hirsutism. There were 3 cases of type 2 diabetes, and over half of the patients had elevated fasting insulin levels and low HDL levels.	Mod
Geirer et al. 2012		Retrospective chart review	110 adolescents		Change in weight.	In this multidisciplinary clinic for adolescents with PCOS, nearly 70% of patients succeeded in short-term weight stabilization, with 57% demonstrating weight loss. Interactions with the health psychologist and dietitian appeared to play a key role in successful weight control, supporting the importance of psychology and nutrition expertise in the management of this disorder.	Mod
Boyle et al. 2017	Primary care clinic on Thursday Island	Mixed method comprising a medical record audit, semi-structured interviews and focus group discussions.	36 adult women with PCOS, 8 clinicians	Multidisciplinary clinic comprising a general practitioner, women's health nurse, dietitian and women's health worker	i) Fidelity to evidence-based guidelines, (ii) barriers and enablers to women using the service, (iii) the ability to meet the needs of women and the community.	The clinic was largely successful in providing evidence-based care with up to 78% of women receiving recommended cardiometabolic screening, 100% emotional screening and 89% lifestyle management despite the remoteness of the clinic and limited financial and human resources. Health care providers report sustainability of the clinic will be dependent on factors including staffing, administrative support and inclusion of Aboriginal and Torres Strait Islander health workers.	Mod
Tay et al. 2021	Public, tertiary hospital clinic	Semi structured interview and survey.	15 adults	The MoC comprises of endocrinologist clinic, dermal and laser therapy, mental health screening, lifestyle coaching and education	1) Evaluation of the service across the framework of appropriateness, effectiveness, efficiency and	Integrated, evidence-based PCOS service was well-received and women were generally satisfied with appropriateness, effectiveness, and reported	Low

				on evidence-based information.	impact. 2) Surveys on patient's satisfaction across services provided by the clinic.	positive health impact resulting from the service.	
Torres-Zegarra et al. 2021	Tertiary care hospital.	Retrospective chart review	92 adolescents	multidisciplinary clinic including endocrinology, gynaecology/adolescent medicine, dermatology, psychology, and nutrition to provide comprehensive care to adolescent girls with polycystic ovary syndrome (PCOS)	Medical history, physical examination findings, laboratory measurements and prescribed therapies.	In adolescents with PCOS and obesity, metabolic, dermatologic, and psychologic co-morbidities are common. The use of a multidisciplinary clinic model including dermatology in addition to endocrinology, gynaecology, psychology, and lifestyle experts provides care for most aspects of PCOS.	Low

6. FINDINGS

- **EVIDENCE SUMMARY:**

Five studies evaluated or examined outcomes on patients from four PCOS health services. Study designs included cross-sectional and mix-method evaluation. Two studies were rated low risk of bias (Tay 2021, Torres-Zegarra, 2021) and the rest were rated moderate risk of bias. Service evaluation was reported by two studies (Boyle 2016, Tay 2021), patient outcome evaluation was reported by four studies (Bekx 2010, Boyle 2016, Geier 2012, Tay 2021).

- **DESCRIPTIVE ANALYSIS SUMMARY:**

Of the four PCOS health services included in the review, two were adult services based in Australia and two were adolescent services based in the United States. Three of the services were within tertiary hospital settings and only one of the services was in a primary care clinic setting. All the services involved two or more disciplines. Some form of structural lifestyle management, cardiometabolic risk assessment or management, emotional well-being screening and reproductive health management were provided in all four services. Dermatological screening or management was described in three of the four services. Evaluation of the PCOS health services or patient outcomes were heterogeneous, precluding meta-analysis or GRADE assessment.

6.1 Outcome 1: PCOS models of care

Study	Bekx 2010 Geier, 2012	Boyle 2016	Tay 2021	Torres-Zegarra 2021
Service name	Adolescent polycystic ovarian syndrome (PCOS) clinic at the American Family Children's Hospital.	No specific name. Described as "pilot PCOS clinic on Thursday Island, total of 11 clinics involved.	Monash Health statewide integrated polycystic ovary syndrome (PCOS) service.	Multidisciplinary clinic for PCOS at (Children's Hospital Colorado) CHCO.
Location, country	Wisconsin, United States	Thursday Island, Queensland, Australia	Victoria, Australia	Colorado, United States
Year of establishment	2005	2012	2017	2012
Was this codesigned by clinician and patients?	Not described.	Not described.	Yes, not specified how it was codesigned.	Yes (They restructured the clinic taking into account of patients' feedback)

Setting	Tertiary. American Family Children's Hospital, Madison, Wisconsin.	Primary care clinic, private/public not described.	Public, tertiary hospital clinic	Tertiary hospital.
Patient group	Adolescent girls with PCOS (11.4-22yo) Beck 2010: In the first 33 months, among the new referrals, 84% of whom were Caucasian, 8.5% African American, 4% Hispanic, and 1.5% other.	Adult women with PCOS, women self-identified as Torres Strait Islander (75%)	Adult	Child and adolescents with PCOS, 11-24yo
Disciplines/ allied health involved	2 pediatric endocrinologists, a pediatric gynecologist, a reproductive endocrinologist, a nutritionist, and a health psychologist, reproductive endocrinologist, a nutritionist, and a heal: th psychologist	General practitioner, women's health nurse, dietitian and women's health worker.	Endocrinology, dermatology, health coach, dietician	Pediatric Endocrinologists, Gynecologists/Adolescent Medicine Specialists, Dermatologists (added 2 years later in 2014), Psychologists, Nutritionists, and Exercise Physiologists.
Description of model	Beck 2010: Thirty percent of the patients saw all 4 providers at the first visit (endocrinology, gynecology, health psychology, and nutrition). A breakdown of individual use demonstrated that 43% saw the health psychologist, 66% saw the nutritionist, 69% saw the gynecologist, and 100% saw the endocrinologist. Geier 2012: Forty-one percent (46/110) of the patients saw all 5 providers at the initial visit. A breakdown of the individual utilization demonstrated that 100% of the subjects saw an endocrinologist and endocrine nurse, 60.9% saw a health psychologist, 75.5% saw a dietitian, and 70.0% saw a gynecologist	The clinic is multidisciplinary comprising a general practitioner, women's health nurse, dietitian and women's health worker. The women's health nurse was unique in this clinic as she generated most of the PCOS clinic referrals from her work throughout the islands in the Torres Strait. Once a client was at the clinic her role was to take a detailed history and provide 30– 60 min of education on PCOS, which covered emotional health, bleeding problems, infertility, endometrial protection, lifestyle factors, etc. She arranged ultra- sounds if required. Most women (78%) saw all three (women's health nurse, GP and dietitian) on their first visit with 20% of patients missing the dietitian appointment when this was not available due to staff leave.	The MoC comprises of endocrinologist clinic, dermal and laser therapy, mental health screening, lifestyle coaching and education on evidence-based information. Endocrinologist provided comprehensive care including diagnosis confirmation, screening and management of long-term health complications. Dermal laser therapy uses medical grade laser to treat women with hirsutism at a heavily subsidised fee. Mental health screening uses modified PCOSQ and HADS on first appointment. lifestyle coaching involves 2 lifestyle group sessions facilitated by dietitian and/or health coach included discussion of healthy diet and physical activity, personal goal-setting activity and identifying techniques for potential barriers. Education on evidence-based information - education on clinical features, diagnosis, complications, and management of PCOS provided via a single group session or printed fact sheets on first appointment	8 patients per clinic. Each patient saw every specialty during the visit. Specialists and topics addressed in clinic were designed to follow the most recently published Endocrine Society PCOS guidelines. After clinic restructured, 6-7 patients and families presenting to clinic for a 90-minute group education session prior to their individual clinic visits. The first 45 minutes were taught by Endocrinology and Gynaecology and reviewed the pathophysiology of PCOS and medical treatment approaches. The remaining 45 minutes were taught by Nutrition and Exercise Physiology and reviewed lifestyle recommendations. Most updated structure: 75-minute group class for 6-7 new patients, who are then roomed for their individual appointments, and then 6-7 follow-up patients who have individual appointments with all specialists. For Spanish-speaking patients, a Spanish interpreter is present for the group class. With COVID restrictions in 2020 (initiated after data collection for this article), we had to stop providing the in-person class and recorded the content for patients to watch prior to their visit.

6.2 Outcome 2: Services or management provided

Study	Bekx 2010 Geier, 2012	Boyle 2016	Tay 2021	Torres-Zegarra 2021
Providing diagnosis	Unclear if any criteria is being used for patients attending the clinic	Unclear if any criteria is being used for patients attending the clinic. On medical audit, 89% women had confirmed diagnosis.	Not specified what criteria however endocrinologist clinic provided comprehensive care including diagnosis confirmation	All patients need clear diagnosis before attending the clinic
Education on long term risk	Not described	Not described	Via single group session or printed fact sheet on first appointment	Provided in powerpoint slides
Lifestyle management/referral	Techniques used by the health psychologist and nutritionist included motivational interviewing, with the health psychologist focusing on life-style changes that were small, but consistent, and likely to lead to more success. The health psychologist also worked with patients to identify barriers that may exist and possible solutions. The nutritionist focused on the role of insulin as an anabolic hormone and a meal plan benefiting those who are insulin resistant (3 meals with 1-2 snacks, and the avoidance of prolonged fasts, inclusion of high-fiber carbohydrates and protein and avoiding non-nutrient dense calories). The role of exercise was emphasized by all. Mentioned of prescription of metformin by endocrinologist for weight management.	Most women (83%) set their own lifestyle goals including reducing portion sizes and increasing daily walking (67%)	2 lifestyle group sessions facilitated by dietitian and/or health coach. included discussion of healthy diet and physical activity, personal goal-setting activity and identifying techniques for potential barriers	By dietitian: - Describe goals of exercise - Set activity and exercise goals at every appointment - Weight trend from baseline and follow up visits - Provide education regarding healthy eating habits
Cardiometabolic screening, management, referral	BMI centiles, lipid profile, insulin, OGTT taken for patients insulin resistance (by fasting glucose to fasting insulin ratio), OGTT, BMI, family hx of T2DM, presence of acanthosis nigricans, lipids	Cardiometabolic risk factors and biochemical variables were assessed after screening on the first visit. A diagnosis of dyslipidaemia, impaired glucose tolerance (IGT), impaired fasting glucose (IFG) and DM2 was made based on existing diagnoses or if abnormal after screening.	Endocrine clinic provided the management of long-term health complications	By endocrinologist: - Obesity: body mass index measurement. - Glucose intolerance / diabetes mellitus: glucose tolerance test, hemoglobin A1c - Dyslipidemia: lipid panel (ideally fasting) - Fatty liver: liver function test - Hypertension: measured blood pressure - Screen overweight/obese adolescents with PCOS for symptoms of obstructive sleep apnea
Emotional well being screening, management, referral	Has health psychologist focusing on life-style changes that were small, but consistent, and likely to lead to more success. However, nothing specific on emotional wellbeing screening/management or referral	Mental well-being screening was undertaken according to guideline recommendations with a Kessler Psychological Distress Scale performed by the GP if abnormal.	Mental health screening uses modified PCOSQ and HADS on first appointment.	By psychologist: - Mental health symptoms (e.g., anxiety, depression) - Appetite self-regulation - Emotional eating - Goal setting for lifestyle modification - Optimizing sleep health
Reproductive screening/family planning/infertility management or referral	Has paediatric gynaecologist however role were not clear	includes lifestyle management, metformin prescription or specialist referral	Family planning discussion provided by the endocrinologist	By gynaecologist/adolescent medicine: - Chronic anovulation:

				menstrual irregularities and diary - Clinical and/or biochemical signs of hyperandrogenism: total/free testosterone, dehydroepiandrosterone sulfate - Polycystic ovarian morphology: pelvic ultrasound - Endometrial hyperplasia: endometrial biopsy. Discussion regarding future infertility issues
Dermatological screening/management	Acne and hirsutisim evaluated	Not described	Dermal laser therapy uses medical grade laser to treat women with hirsutism at a heavily subsidised fee.	By dermatologist: - Hirsutism: Measure modified Ferriman-Gallwey (mFG score) - Presence or absence of acne by physical examination with score of severity - Presence or absence of acanthosis nigricans, androgenic alopecia, hidradenitis suppurativa by physical examination

6.3 Outcome 3: Services evaluation

Study	Bekx 2010 Geier, 2012	Boyle 2016	Tay 2021	Torres-Zegarra 2021
Patient health outcomes: Anthropometry Metabolic Reproductive Psychological Dermatological	Anthropometric: Nearly 70% of patients succeeded in short-term weight stabilization, with 57% demonstrating weight loss.	No evaluation	No evaluation	No evaluation
Patient reported outcomes	No evaluation	Semi-structured interviews: women were motivated to make positive changes to improve their health Focus groups: Women were positive about having access to the clinic and found staff were knowledgeable. collaboration with the dietitian to determine achievable lifestyle goal setting was perceived as valuable, women felt they needed more tailored information and supervised ongoing management.	Overall service 12/15 satisfied, 1/15 neutral and 2/15 unsatisfied. General education 10/15 satisfied, 1/15 neutral, 2/15 not satisfied and 2/15 N/A or DNA. Lifestyle coaching - 11/15 satisfied, 1/15 neutral, 2/15 unsatisfied, 1/15 N/A or DNA. Endocrine clinic 12/15 satisfied, 3/15 neutral. Laser hair reduction service 5/15 satisfied and 10/15 DNA or N/A. 14/15 participants would recommend the PCOS service and 1/15 maybe.	No evaluation
Health professional satisfaction	No evaluation	Semi-structured interviews: The lack of a psychologist was a particular problem. All staff described high levels of job satisfaction and professional investment. Staff perceived that women found the clinic useful, particularly the educational aspect.	No evaluation	No evaluation
Other outcomes	No evaluation	1) Fidelity check list on alignment to PCOS guideline: diagnosis 89&, cardiometabolic screening and test 78%, emotional screening 100%, lifestyle management 89%, infertility management 100% 2) semi-structured interviews: to explore barriers and enablers to clinic implementation, clinic sustainability, service delivery, health promotion and barriers to lifestyle change.	Semi-structured interview 1) Appropriateness: An integrated PCOS service is appropriate for women's multifaceted needs. 2) Effectiveness: The PCOS service was effective in providing care and communicating sensitively to women with PCOS, but more access to the service is required. 3) Impact: A specialized PCOS service had positive impacts on medical management of PCOS, PCOS symptom severity, women's understanding of PCOS, women's confidence in managing PCOS, and general emotional well-being. 4) Efficiency: The efficiency of the PCOS service requires improvement in patient communication, resource provision, infrastructure, and awareness of the service availability. 5) Future suggestions: Women desire more funding to increase and expand the existing PCOS service and be empowered with more resources that promote self management. Patient satisfaction with each clinic	No evaluation

7. GRADE ASSESSMENTS AND EVIDENCE PROFILE

Due to the broad nature of the clinical question and the inclusion of studies of heterogeneous designs, populations and/or aims, it was not feasible to generate GRADE evidence profile tables for this question.

Please see individual study risk of bias assessments to determine the quality of evidence.

APPENDIX. STUDY CHARACTERISTICS AND QUALITY APPRAISAL TEMPLATES

Study ID	Bekx, 2010	
Study Citation	Bekx MT, Connor EC, Allen DB. Characteristics of adolescents presenting to a multidisciplinary clinic for polycystic ovarian syndrome. J Pediatr Adolesc Gynecol. 2010 Feb;23(1):7-10. doi: 10.1016/j.jpag.2009.04.004. Epub 2009 Aug 3. PMID: 19648034.	
Study Country	*United States*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	Adolescent girls with PCOS. In the first 33 months, among the new referrals, 84% of whom were Caucasian, 8.5% African American, 4% Hispanic, and 1.5% other.	
Control population	*No controls*	
PCOS diagnostic criteria	*Not specified what criteria is used for diagnosis of PCOS*	
N per group	*70 patients with confirmed diagnosis of PCOS*	
Setting	*Tertiary. American Family Children's Hospital*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*To characterize patients referred to the adolescent polycystic ovarian syndrome (PCOS) clinic at the American Family Children's Hospital, University of Wisconsin, Madison, Wisconsin.*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* *"Medical records of patients seen as new referrals in the first 33 months were reviewed for details of initial presentation, age, body mass index (BMI), menstrual pattern, clinical and laboratory features of androgen excess as documented in the clinical chart, and insulin resistance. Only those testosterone levels drawn prior to oral contraceptive pill therapy were included in the analysis "*
Exclusion criteria	Yes Partial No Not reported	*Not reported*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*N/A*

Was matching performed?		Yes Partial No Not reported	*N/A*
Summary Result/s		70 patients (84% Caucasian) presented with an average age at referral of 16.2 years (range 11-22y). 84% had a BMI> 85th percentile and 70% had a BMI>95th percentile. Menstrual pattern was quite varied, with some patients having primary amenorrhea, and over 50% experiencing hirsutism. There were 3 cases of type 2 diabetes, and over half of the patients had elevated fasting insulin levels and low HDL levels.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*N/A*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*No* *Included adolescents with PCOS but not specified what criteria used*
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	*N/A*
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	*N/A (only one group)*
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	*No* *"As many of the laboratory eval- uations were performed at various outside laboratory facilities, with significant differences in normal refer- ence rages, sensitive assays for free and total testos- terone, as well as fasting insulin, were noted as above reference level and not given as absolute values"*
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	*N/A (only one group)*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Partial. See above.*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	*N/A (only one group)*

	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	*Not reported*
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Yes*
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	*N/A (only one group)*
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*N/A (only one group)*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes. Descriptive data were used*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	Geirer, 2012
Study Citation	Geier LM, Bekx MT, Connor EL. Factors contributing to initial weight loss among adolescents with polycystic ovary syndrome. J Pediatr Adolesc Gynecol. 2012 Dec;25(6):367-70. doi: 10.1016/j.jpag.2012.06.008. Epub 2012 Oct 22. PMID: 23089571.
Study Country	*United States*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	
Patient/population/ participants	Adolescent girls with PCOS.
Control population	*No controls*
PCOS diagnostic criteria	*Rotterdam 2003*
N per group	*110 patients with confirmed diagnosis of PCOS*
Setting	*Tertiary. American Family Children's Hospital*

Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)		*Change in weight since joining clinic*	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	*Yes* *Patients seen at the multidisciplinary PCOS clinic…110 were given the diagnosis of PCOS based on the Rotterdam criteria.*
Exclusion criteria		Yes Partial No Not reported	*Not reported*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Is a cross sectional or case-control study the appropriate design to answer this question?		Yes Partial No Not reported	*Partial*
Was there sufficient duration of follow-up for outcomes to occur?		Yes Partial No Not reported	Partial Seventy-one percent (78/110) of patients returned for a follow-up visit, with an average interval of 4.5 months (1.5-12 months) between visits.
Was matching performed?		Yes Partial No Not reported	N/A
Summary Result/s		The average age at first visit was 15.9 years. The average BMI was 34.7 kg/m2 (range 18.1-55.5). Seventy-six percent had an initial BMI above the 95th percentile. Interactions with providers at the initial visit included a paediatric endocrinologist (100%), health psychologist (60.9%), dietitian (75.5%) and gynaecologist (70.9%). Seventy one percent returned for a follow-up visit, (average time of 4.5 months between visits) with 57% achieving weight loss (average 3.5 kg) and an additional 12.6% demonstrating no significant weight gain (! 1.5 kg). Thus, 69.6% demonstrated weight loss/stabilization.

Study ID	*Boyle, 2017*	
Study Citation	Boyle J, Hollands G, Beck S, Hampel G, Wapau H, Arnot M, Browne L, Teede HJ, Moran LJ. Process evaluation of a pilot evidence-based Polycystic Ovary Syndrome clinic in the Torres Strait. Aust J Rural Health. 2017 Jun;25(3):175-181. doi: 10.1111/ajr.12288. Epub 2016 Apr 18. PMID: 27086940.	
Study Country	*Australia*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	GP, women's health nurse, dietitian involved with the clinic development or implementation, Torres Strait Islander health worker and n = 1 nurse working in sexual health who were not directly involved in the clinic) and focus group discussions with women with PCOS who attended the clinic	
Control population	*N/A*	
PCOS diagnostic criteria	*Rotterdam 2003*	
N per group	Total n = 6: n = 2 GP, n = 1 women's health nurse, n = 1 dietitian involved with the clinic development or implementation, n = 1 Torres Strait Islander health worker and n = 1 nurse working in sexual health who were not directly involved in the clinic) and focus group discussions with women with PCOS who attended the clinic (n = 8)	
Setting	Primary care clinic, private/public not described	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	Process evaluation to assess: (i) Fidelity to evidence-based guidelines, (ii) barriers and enablers to women using the service, (iii) the ability to meet the needs of women and the community.	
Was there a clear statement of the aims of the research?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	Partial. All women who attended the clinic for the first twelve months were eligible for the study but criteria for key informants were not stated.
Exclusion criteria	Yes Partial	No reported

		No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Insufficient information
Summary Result/s		The clinic was largely successful in providing evidence-based care with up to 78% of women receiving recommended cardiometabolic screening, 100% emotional screening and 89% lifestyle management despite the remoteness of the clinic and limited financial and human resources. Health care providers report sustainability of the clinic will be dependent on factors including staffing, administrative support and inclusion of Aboriginal and Torres Strait Islander health workers.	
VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
VALIDITY	Is a qualitative methodology appropriate?	Yes Partial No Not reported	*Yes*
	Was the research design appropriate to address the aims of the research?	Yes Partial No Not reported	*Yes*
	Was the recruitment strategy appropriate to the aims of the research?	Yes Partial No Not reported	Yes, all women (consumers) were included and appropriate staff were included in focus *group*
	Was the data collected in a way that addressed the issue?	Yes Partial No Not reported	Yes Quantitative data were collected to assess for the fidelity to evidence-based guidelines. Interviews and group discussion ranged from 25–45 min to 1–1.5 h respectively and were guided by themes emerging from quantitative data and literature review. This included community acceptance, clinic sustainability and barriers and enablers to the clinic.
	Has the relationship between researcher and participants been adequately considered?	Yes Partial No Not reported	Not reported.
RESULTS	Have ethical issues been taken into consideration?	Yes Partial No Not reported	Yes Ethics approval was received from Cairns and Hinterland, Cape York, Torres Strait and Northern Peninsula Hospital and Health Services Human Research Ethics Committee HREC/12/QCH/116-823 and Monash University Human Research Ethics Committee. Signed consent was obtained for qualitative interviews and focus groups.
	Was the data analysis sufficiently rigorous?	Yes Partial No Not reported	Yes Data were analysed in STATA version 12.1 with calculation of proportions and frequencies. Qualitative data were categorised manually into categories based on predetermined categories identified in the literature and topics covered in the interviews by one author for the semi–structured interviews (GH) and for the FGD (HW) (deductive analysis). Additional categories

			were then created based on new topics which arose in the interviews. GH and HW with JB then considered each category independently and identified major themes with relevant quotes summarised around each theme and how these related to the research questions.
	Is there a clear statement of findings?	Yes Partial No Not reported	Yes Data triangulation was used to capture complex issues surrounding developing culturally sensitive programmes. Findings were discussed in relation to the original research question
	Is there an indication of drop outs or non-respondents and was this appropriately dealt with?	Yes Partial No Not reported Not applicable	Not reported
VALUE	How valuable is the research?	Yes Partial No Not reported	Yes No other clinics for women with PCOS in Aboriginal and Torres Strait Islander communities. This study demonstrates it is feasible to implement an evidence-based clinic for PCOS in a geographically isolated context with limited human and financial resources. Some system barriers to service delivery and sustainability of the clinic exist, and whether the women's health needs are fully met is yet to be determined. These recommendations should be considered for future improvement of the clinic, and prior to upscaling this model to a national level.
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	Yes All outcomes were reported as per method section
OTHER	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	Not reported
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*15 Adult women with PCOS, Women residing in Victoria can attend the integrated PCOS service for free with a medical referral from a doctor*	
Control population	*N/A*	
PCOS diagnostic criteria	*Not specified what criteria however endocrinologist clinic provided comprehensive care including diagnosis confirmation*	
N per group	*15 Adult women with PCOS*	
Setting	*Public, tertiary hospital clinic*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Semi structured interview* *1) Appropriateness: An integrated PCOS service is appropriate for women's multifaceted needs. 2) Effectiveness: The PCOS service was effective in providing care and communicating sensitively to women with PCOS, but more access to the service is required. 3) Impact: A specialized PCOS service had positive impacts on medical management of PCOS, PCOS symptom severity, women's understanding of PCOS, women's confidence in managing PCOS, and general emotional well-being. 4) Efficiency: The efficiency of the PCOS service requires improvement in patient communication, resource provision, infrastructure, and awareness of the service availability. 5) Future suggestions: Women desire more funding to increase and expand the existing PCOS service and be empowered with more resources that promote self-management. Patient satisfaction with each clinic*	
Was there a clear statement of the aims of the research?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes.* All women attending the integrated PCOS service were eligible to participate
Exclusion criteria	Yes Partial No Not reported	*No exclusion criteria*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Summary Result/s	Our study showed that a codesigned, integrated PCOS service which aligns with evidence-based practice and patients' priorities was reported by women as appropriate, beneficial, and effective to meet their needs. Integrated care and tailored treatments that combine general education on PCOS, lifestyle support, and laser therapy were highly valued. Clinic infrastructure, delays, and inconsistencies in service access and the tension between evidence-based treatment and patient preference for alternative therapies were among the negative experiences reported. Our study provides insights into key service elements that women value to guide the implementation of other much needed PCOS-dedicated services. The negative experiences that women encountered provide lessons to others regarding potential areas needing improvement to achieve optimal PCOS care. Publication and dissemination of evaluation incorporating both quantitative and qualitative	

		research methodologies, following a comprehensive framework, presents an important opportunity to guide the planning, implementation, and scale-up of evidence-based MoC to improve healthcare services, optimize patient experience, and ultimately deliver health benefits to the community.	
VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
VALIDITY	Is a qualitative methodology appropriate?	Yes Partial No Not reported	*Yes*
	Was the research design appropriate to address the aims of the research?	Yes Partial No Not reported	*Yes, mixed methods were used appropriately*
	Was the recruitment strategy appropriate to the aims of the research?	Yes Partial No Not reported	*Yes, all women were eligible for the study and data saturation was met for the qualitative interviews*
	Was the data collected in a way that addressed the issue?	Yes Partial No Not reported	*Yes, semi-structured interview were used, methods explained clearly*
	Has the relationship between researcher and participants been adequately considered?	Yes Partial No Not reported	*Yes, researchers have no relationship with recruited participants*
RESULTS	Have ethical issues been taken into consideration?	Yes Partial No Not reported	*Yes* *Ethics approval was obtained from the Monash Health Ethics Committee*
	Was the data analysis sufficiently rigorous?	Yes Partial No Not reported	*Yes.* *Coding and thematic analyses were used* Codes were organized into subthemes and mapped to the Markiewicz and Patrick's evaluation framework domains of appropriateness, effectiveness, efficiency, and impact, and an additional category of future suggestions. Coded all the interview transcripts, with 10% subset being double coded by S.P. Coding differences were discussed until consensus was reached. Codes were then discussed in depth between C.T.T., S.P., and S.S.L. (female dietitian) to synthesize subthemes and themes. Finally, research findings were cross-checked independently by T. R., H.S. (female psychologist), and H.J.T. (female endocrinologist and unit director) to explore alternative explanation of relationships between codes and to reduce researcher bias. Results of the qualitative component of the study were reported according to the Consolidated Criteria for Reporting Qualitative Research (COREQ) checklist.25 Quantitative data were analyzed using Excel for Mac version 15.4 (Microsoft Corporation) and presented asmean and standard deviations or frequencies and proportions

	Is there a clear statement of findings?	Yes Partial No Not reported	*Yes. All the research questions were answered in the manuscript with discussions around the comparisons with available evidence in the literature*
	Is there an indication of drop outs or non-respondents and was this appropriately dealt with?	Yes Partial No Not reported Not applicable	*No. No drop outs from this study*
VALUE	How valuable is the research?	Yes Partial No Not reported	Yes This study provides insights into key service elements that women value to guide the implementation of other much needed PCOS-dedicated services. The negative experiences that women encountered provide lessons to others regarding potential areas needing improvement to achieve optimal PCOS care. Publication and dissemination of evaluation incorporating both quantitative and qualitative research methodologies, following a comprehensive framework, presents an important opportunity to guide the planning, implementation, and scale-up of evidence-based MoC to improve healthcare services, optimize patient experience
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Yes* *Results sections were divided clearly to answer all the research questions*
OTHER	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*None declared*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Low*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Study Country	*United States*
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?	

Patient/population/ participants	Child and adolescents with PCOS, 11-24yo	
Control population	*No controls*	
PCOS diagnostic criteria	*Not specified. Patients are required to have a confirmed diagnosis of PCOS*	
N per group	*92 patients with confirmed diagnosis of PCOS*	
Setting	*Tertiary care*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	The purpose of this study is to come up with description, to illustrate the need for such a clinic (MDT PCOS clinic), to provide details needed to create similar clinics at other sites, and to describe the type of medical treatment prescribed within 1 visit when a multi-disciplinary approach is used. Main outcomes: Medical history, physical examination findings, laboratory measurements and prescribed therapies.	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* *Patient with confirmed PCOS diagnosis who attended the clinic between 2014 and 2018*
Exclusion criteria	Yes Partial No Not reported	*None*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	Not relevant
Was matching performed?	Yes Partial No Not reported	Not relevant
Summary Result/s	A total of 92 patients seen from 2014 to 2018 are described (age 15.9 years, range 11-24 years, body mass index 35.6 kg/m^2, range 19.9-53.5). Metabolic syndrome features were common: 26% had a prediabetes haemoglobin A1c (>5.6%), 83% had a high-density lipoprotein (HDL) < 50 mg/dL, 40% had a systolic blood pressure > 120 mm Hg, and 43% had an alanine aminotransferase level of > 30 U/L. Dermatologic findings included acne 93%, hirsutism 38%, acanthosis nigricans 85%, hidradenitis suppurativa 16%, and androgenic alopecia 2%. Of the patients, 33% had a diagnosis of depression or anxiety, 16% of patients had a diagnosis of obstructive sleep apnoea, and an additional 59% had symptoms	

		warranting a sleep study The most commonly prescribed medications were topical acne preparations (62%), followed by estrogen-containing hormonal therapy (56%) and metformin (40%). In adolescents with PCOS and obesity, metabolic, dermatologic, and psychologic co-morbidities are common. The use of a multidisciplinary clinic model including dermatology in addition to endocrinology, gynaecology, psychology, and lifestyle experts provides care for most aspects of PCOS.	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*N/A*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes* *Patients included any adolescents and young adults attending the clinic. Not definite diagnosis of PCOS needed*
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	*N/A*

Question 2.6.2.

What are the characteristics of available models of care implemented in PCOS clinic or service?

BACKGROUND:

Healthcare for women with PCOS is challenged by inconsistent diagnostic criteria, heterogeneous clinical phenotypes and evolving clinical features across the lifespan. Qualitative and quantitative research have consistently shown that women with PCOS were unsatisfied with their healthcare experiences (1-4). It is well acknowledged that PCOS affects a woman's biopsychosocial aspects of life and conventional siloed healthcare services based on a single medical specialty are failing to meet the multifaceted needs of women with PCOS (5, 6).

Part of the consumer engagement process of the International Evidence-based PCOS Guideline update includes an international consumer survey to determine the aspects of PCOS which were of most importance to women. Unpublished results from over 1500 women with PCOS showed that building a model of care for PCOS women is of utmost priority to support their care. There is no single definition of model of care, nor is there a standardised model of care as variation and adaptation needs to be based on local health systems, settings, resources and women's needs (6, 7). Most literature agreed that stakeholder engagement and evidence-based practice are the fundamental features of a model of care. Other important elements include improving patient selfcare, patient-centred care or shared-decision making, supporting integrated care, embedded evaluation with service refinement process and adaptability (5-9).

Several chronic disease models of care (e.g. diabetes, inflammatory bowel disease) have been described in the literature showing improvement in quality of care for patients (10-11). Patient self-care is crucial in all types of chronic disease management. Healthcare providers need to move from the traditional role of decision makers for patient disease management to the role of being a facilitator. Educating and providing information to the patient to improve the patient's disease or treatment knowledge, practising patient-centred care and encouraging shared-decision making, so that patients can take an active role in the management of their chronic condition. The nature of chronic diseases means community primary care providers play a central role in chronic disease model of care. However, smooth pathways to access specialist input for treatment escalation is essential for management of chronic diseases, and transparent interdisciplinary communication will support the continuity of care across different disciplines.

Extensive research for the 2018 International Evidence-based PCOS Guideline failed to identify any studies addressing the effectiveness of any type of model of care compared to standard care. A clinical consensus recommendation was made then to offer interdisciplinary care to women with PCOS, with an interdisciplinary care model defined as "the collaboration between a woman with PCOS and a care team who have shared goals for her total wellbeing". With careful consideration, the evidence research of the current International Evidence-based PCOS Guideline update on model of care of PCOS is focused on identifying the key elements of PCOS-dedicated healthcare services published in literature. Identifying these key elements will inform and assist with building a best practice framework for the PCOS model of care that is appropriate for women's needs and adaptable for any healthcare services that is feasible to implement. The International Osteoporosis Foundation Capture the Fracture Campaign is an excellent example that an internationally endorsed best practice framework can be very successful. Their best practice framework defines clearly both critical elements of service delivery, and aspirational elements of service delivery if resources allow 12-13). To date, more than 700 Fracture Liaison Services have been established globally in 50 countries (12-13).

To further facilitate implementation and upscaling of the model of care, it is also important to co-develop with stakeholders a set of implementation and evaluation toolkits, along with comprehensive benchmarking and key performance indicators. Healthcare benchmarking allows the continual assessment of key work processes, helps identifying gaps in care, promotes learning and can guide further refinement of the healthcare service (14).

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Not applicable. Information of key elements of any PCOS-dedicated healthcare services are drawn to make recommendations.

CONSENSUS RECOMMENDATION

- **CR:** Models of care should prioritise equitable access to evidence-based primary care with pathways for escalation to integrated specialist and multidisciplinary services as required.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT

- Strategies to deliver optimal models of care could include health professional education, care pathways, virtual care, broader health professional engagement (e.g. nurse practitioners) and coordination tools.

GRADE CONSIDERATIONS

Justifications:
There is evidence of inadequate knowledge and dissatisfaction with care mandating new approaches to education and care. Whilst there is no direct evidence that any model of care is superior to make an evidence-based recommendation, clinical consensus recommendations are made based on indirect evidence showing that women were unsatisfied with conventional healthcare services and that published PCOS-dedicated healthcare services had reported improved women's satisfaction and health outcomes. Also, other models of care for chronic diseases have been shown to improve quality of care, patient health outcomes and satisfaction.

Subgroup considerations:
The PCOS-dedicated services identified were specific for either adolescents or adults. Transition from adolescent to adult care is still unclear.
Equitable access must consider the needs of underserved populations.

Implementation considerations:
Time and resource constraints are important implementation considerations. Also important are staffing issues, especially in areas with low health resources.
Regarding patient education or information provision, health professionals can refer women to free evidence-based resources published by the 2023 PCOS Guideline translation outputs.
Improvement in care coordination will be required.

Monitoring and evaluation considerations:
Internally, an evaluation plan should be embedded for any healthcare service implementation. Evaluation and monitoring indicators should be co-developed by stakeholders.

Research priorities:
- Developing a set of benchmarking and performance indicators that address all aspects of multidisciplinary service
- Developing and implement a best practice framework outlining critical and aspirational elements of a PCOS model of care

Question 2.6.3.

How can we best support women to navigate the impact of PCOS on family and interpersonal relationships?

(Narrative Review)

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	Is psychological therapy effective for management and support of depression and/or anxiety, disordered eating, body image distress, self-esteem, feminine identity or psychosexual dysfunction in women with PCOS?
Clinical leads (key contacts)	Leah Brennan
Allocation ranking	Level 4 Narrative Review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Females of any age, ethnicity or weight diagnosed with PCOS (by Rotterdam, NIH, or AES). Subgroups: • Adolescents • Phenotypes • Ethnicity • Geographical	Models of [health] care (collaboration between disciplines – bio- psychosocial approach to wellbeing) Note where defined. Include: interdisciplinary, integrated primary or specialist care; transition of care; individually tailored care plans; self-management, shared decision-making, patient-centred care, decision-support, community informed care, digital first.	None, usual care, or others	Delivery of a care Model, Cost Effectiveness (long-term), Patient- defined outcomes (e.g., satisfaction with care), Improved communication (between staff and between staff and patients), Patient health outcomes (e.g., improved physical functioning, improved mental functioning), Timely access to care and treatment (efficiency of care), Quality of Life, Self-rated emotional wellbeing, Optimal self-management indicators.	Evidence based guidelines, systematic reviews, any primary study.	English language
Exclusion	Females without diagnosed PCOS.	Clinical trials that evaluate specific interventions (lifestyle management, mobile app) that are not a component of a broader disease management framework (as defined above)	Not applicable	Not applicable	Non-evidence-based guidelines. Abstracts, protocol, clinical trial registration.	

2. SEARCH STRATEGY

Evidence processing: This question was allocated as a narrative review. Hence, no search or screening was undertaken and recommendations will be consensus based. Below is a narrative review in response to the clinical question.

3. FINDINGS

▪ CLINICAL NEED FOR THE QUESTION

Few well-controlled studies examine the effects of PCOS in the social domain or optimal choice of interventions for managing effects on family and interpersonal relationships.

PROBLEM CONTEXT

It is well established that PCOS has an impact on physical and psychological health. PCOS is associated with increased rates of anxiety, depression and a lower health related quality of life [1]. While PCOS does not appear to cause severe social phobias or panic disorders it can disrupt social, family and interpersonal relationships in the social domain [2]. PCOS can affect interactions and relationships with partners, family, friends, colleagues, and others with whom people with PCOS have social relations. These can create challenges in personal and social interaction which, in turn, can impact interpersonal relationships in a way that varies across the lifespan and cultures [3][4]. Currently, there is a paucity of reliable data on the impact of PCOS in the social domain. Some evidence suggests a positive effect of social and family support on healthy eating and participation in exercise. Family and peer support has also been found to reduce stress, increased confidence and provide a sense of security but results vary according to marital status with increased stress being experienced by married women experiencing pressure to have children. Immediate family tend to be more supportive in comparison to extended family members [5]. Better data could generate more understanding of the impact of PCOS on social, family, and interpersonal relationships including life-stage and cultural variations. Larger well-designed studies may also help clarify the nature of complex associations. This research could inform development and evaluation of support interventions to manage negative impacts on social domains [3].

▪ NARRATIVE SUMMARY

How can we best support women and people to navigate the impact of PCOS on family and interpersonal relationships?

Social & peer support

Awareness of PCOS in the social domain can have a positive impact on those living with PCOS, including a reduction of stigma and increased support. A multi-methods study (n=296) with 25 follow up interviews found that increased awareness of PCOS in the social domain was suggested to lead to help-seeking sooner due to recognition of symptoms among friends and peers [6]. Further qualitative investigation of PCOS experiences (n=25) found that understanding allows women with PCOS to be open about their condition and helps them cope with their feelings [7]. Community awareness and understanding was perceived to facilitate adherence to treatments but could also be a hindrance in lower literacy contexts if peers described treatment options as ineffective or painful [8].

Studies of social networking sites and face-to-face PCOS peer groups have shown some positive

effects concerning support for relationships and experiential knowledge sharing [9][10][11]. A thematic analysis of nine women with PCOS using social networking sites found positive perceptions of self and others and demonstrated support gained from

relationships with peers and an increase in support from relationships, improved navigation of the health system and knowledge about PCOS[9]. A qualitative study (n=13) of a nurse-led support group that provided socio-emotional and informational social support to women with PCOS found participants experienced a reduction in isolation and a gain in personally relevant information via social comparison within the group setting [10]. A qualitative analysis (n=211) of 7 online PCOS discussion forums found them to be beneficial in terms of social support and knowledge sharing [11]. Furthermore, studies examining psychological support and online forums have found it promotes psychological wellbeing. A quantitative study (n=331) found increased self-esteem and decreased risk of depression and benefits for social relationships [12]. Examination of online breast cancer communities have been found to enable more flexible access to support and knowledge exchange regardless of time or location [13].

In contrast, thematic analysis of a survey of people with PCOS (n=50) found both empowering and disempowering consequences of online peer support groups. Participants experienced both improvements in self-management and increased feelings of isolation due to reading the negative experiences of others, perhaps due to life-stage differences or the various phenotypes [14]. This concurs with more recent findings (n=20) that exposure to negative experiences of others with PCOS can instil fear and may inhibit help-seeking behaviours and treatment adherence [8]. In one study it was also found that attendance to peer support groups could be inhibiting if groups were not diverse or did not reflect cultural background of new members [30].

Despite those with PCOS being connected through social networks, online or face-to-face support,what works, for whom, under what circumstances and how is yet to be determined for effective support provision to be established [15].

Family & relationship satisfaction

Family impacts of PCOS include the impact on siblings and parent-child relationships. The family as a site of intervention and support has been proposed because PCOS is largely self-managed at home in the everyday setting. A qualitative investigation (17) studied the context and processes of self- management among adolescents (n=7) and their parents (n=8) using focus groups. Study findings showed improvements in self-management of PCOS, psychological health and well-being in a family setting with increased levels of engagement in optimal self-management of the condition. Larger studies of such interventions may help inform further development of this or similar interventions [17]. Family could be supportive through comforting, minimising [8], helping with managing medical appointments [29] and doing research on their behalf [9]. A multi-method study surveying women with PCOS (n=296) and follow up interviews (n=25) found that the lack of awareness of PCOS symptoms among parents was a barrier to diagnosis [8]. A qualitative analysis (n=62) highlighted too that lack of knowledge of family histories (e.g., of diabetes, heart disease) are an area of concern for those with PCOS due to potential exacerbation of PCOS symptomology[16]. Similarly, a mixed methods study, involving a survey (n=275) with 62 follow-up interviews found that in uninformed families symptoms and experiences were not taken seriously and affected adherence to treatment as people were discouraged to medicate [18]. In contrast, better family support led to increased adherence to treatments [8, 29].

Marital satisfaction and social support in people with PCOS and infertility has been specifically studied due to prevalence of infertility in PCOS groups. Systematic reviews suggest it is the infertility and the unfulfilled child wish that affects the marital relationship rather than PCOS per se[19][20]. Indeed, systematic review shows that infertility has negative impacts on sexual relationships and long-term wellbeing when the child-wish is unfulfilled [21]. However, the presence of this association should not be assumed for people with PCOS. A cross-sectional quantitative study of 31 women with PCOS and their partners found that lower parity and unfulfilled child-wish was associated with higher sexual and relationship satisfaction especially for the women in the relationships [19]. The findings were thought to be due to partners having increased time for each other compared to couples with children and in the case of unwanted childlessness, couples tend to have more stable relationships [22] [19]. It should note that despite women with PCOS having a higher ovarian reserve than women without PCOS, clinical pregnancy and live-birth rates in assisted reproductive technology were not higher in women with PCOS [34]. A large population-based study in Australia which followed up women across their reproductive lifespan also showed that significantly less women with PCOS achieved their ideal family size or child-wish than women without PCOS [35].

Marginalisation of people with PCOS

Women and people with PCOS have reported feelings of marginalization and stigmatization as a result of the symptoms that may be perceived as non-traditional social constructs of beauty, femininity and womanhood [23]. Qualitative analysis of women with PCOS (n=30) found them to feel less feminine describing themselves as “abnormal” and “not proper women”, which affected their ability to disclose their suffering to others due to shame and embarrassment [24]. In qualitative studies there are mixed views on discussing family menstruation [7, 29, 30] and some reported being told to be secretive about their PCOS because it could shame the family or affect future marital prospects (e.g., India) [9, 29]. People with PCOS often experience lack of culturally and gender-sensitive standards of care, underrepresentation in research and stigma because they do not conform to social constructs of beauty. Obesity and hirsutism appear to negatively impact self-esteem, sensitivity to social criticism, social activity and interpersonal relationships [25][26]. It has been suggested that people with PCOS may benefit from integrated behavioural health care that integrates management of the medical conditions and its related behavioural health effects that affect the health and wellbeing of those with PCOS. [27][28].

Primary socialisation instils perceptions of PCOS as taboo from an early age. Women and people with PCOS are socially constructed based on patriarchal social norms of women being defined by motherhood and femininity. Investigating the taboo of PCOS in Indian society, a qualitative study (n=35) found that PCOS was often not talked about even within close family members due to the social stigma associated with menstruation and reproduction [29]. Culture and socio-religious reasoning and teaching reinforced this stigma making PCOS a taboo illness from an early age. Second, the societal taboo then results in a general lack of awareness of PCOS that can mean people avoid help-seeking or treatment. This lost opportunity for prevention of long-term sequelae of PCOS is compounded by the fact that occurrence a regular period or birth leads to the mistaken belief there is no need to consider the condition further despite established long term

risks. For those without a birth, there is a negative socio-psychological impact of childlessness for example taunts by other family members for an inability to live up to stereotypical expectations.

Taboos surrounding PCOS are experienced differentially depending on culture. In a qualitative study (n=12) of a UK ethnically diverse sample marginalisation was experienced more in relation to childlessness than to hirsutism which is more widely accepted in some African cultures [30]. Additionally, a mixed methods study which surveyed 323 women with follow-up qualitative interviews (n=11) found that those of a British Asian background experienced more stigma related to the secrecy of discussing menstruation [31]. Similarly options offered could be perceived as taboo in some groups, for example Asian adolescents using contraceptive pills [30].

In addition, the lack of understanding of PCOS and its link to subfertility leads to some women not disclosing their condition with other family members for fear of judgement [29, 30]. Often internalised, stereotypical expectations lead to self-stigmatisation because peers often reinforce these ideas and it can lead to people with PCOS becoming socially aloof by minimising interaction to avoid confrontation. This further contributes to their marginalisation and feelings of isolation.

Further directions

In terms of the wider social domain, social competence with relation to PCOS tend to be less problematic during adolescence which may be explained by a lower level of symptom severity during adolescence [4] Further research is needed to examine the impact on wider family and interpersonal relationships across the lifespan and cultures [4]. In particular, there is a need for more research on the impact of social and peer support in PCOS [32].

Family relationships including siblings and parents may require further investigation with a view to informing future interventions [17]. Additionally, given the conflicting evidence surrounding the impact of infertility and unfulfilled child wish, more research on this could be beneficial in terms of guiding future intervention [19]. Available systematic review evidence suggests that patients with fertility problems could be helped with cognitive behaviour therapy (versus routine care) but whether this approach could help with challenges in the social domain is not known [33].

Examination of people with PCOS as a marginalised social group is greatly under-researched. Increasing societal awareness of PCOS through education could help to reduce social stigma and taboo. Tackling social stigma may reduce the socio-religious impact of the condition on those with PCOS but again more research is required [27].

<u>Summary of key information</u>

Support needs and experiences of family and interpersonal relationships of women and people with PCOS varies and needs more research. Social and cultural expectations may impact interpersonal relationships due to the physical symptoms of PCOS that may not meet socio-cultural constructs of attractiveness, motherhood or femininity. The family may provide a site of effective intervention in supporting better interpersonal relationships in adolescence.

Suggestions for how we can best support women and people to navigate the impact of PCOS on family and interpersonal relationships.

- Some but not everyone with PCOS experience problems in the social domain, often due to stigma related to features of their condition. Social support has been found to have both positive and negative effects for people living with PCOS. Increased societal awareness and education on PCOS is needed to help alleviate marginalisation of anyone with PCOS. Pathways to dissemination should be investigated as part of national public health agendas.

- Women and people with PCOS may have varying support needs at different times across the lifespan. Key moments could be adolescence (support needs related to self-management) and reproductive years (support needs for unfulfilled child-wish). Both family members and healthcare practitioners must be aware of these needs and signpost to appropriate support services. The value of a stepped approach from psychoeducation about individual effects to specialised psychological services should be examined as part of the PCOS pathway.

- Family interventions have shown promising results for self-management so further research and support of family initiatives is warranted.

Question 2.6.3.

How can we best support women to navigate the impact of PCOS on family and interpersonal relationships?

(Narrative Review)

BACKGROUND:

PROBLEM CONTEXT

It is well established that PCOS has an impact on physical and psychological health. PCOS is associated with increased rates of anxiety, depression and a lower health related quality of life (1) . While PCOS does not appear to cause severe social phobias or panic disorders it can disrupt social, family and interpersonal relationships in the social domain (2). PCOS can affect interactions and relationships with partners, family, friends, colleagues, and others with whom people with PCOS have social relations. These can create challenges in personal and social interaction which, in turn, can impact interpersonal relationships in a way that varies across the lifespan and cultures (3, 4) . Currently, there is a paucity of reliable data on the impact of PCOS in the social domain. Some evidence suggests a positive effect of social and family support on healthy eating and participation in exercise. Family and peer support has also been found to reduce stress, increase confidence and provide a sense of security but results vary according to marital status with increased stress being experienced by married women experiencing pressure to have children. Immediate family tend to be more supportive in comparison to extended family members (5). Better data could generate more understanding of the impact of PCOS on social, family, and interpersonal relationships including life-stage and cultural variations. Larger well-designed studies may also help clarify the nature of complex associations. This research could inform development and evaluation of support interventions to manage negative impacts on social domains (3). In some cultures, PCOS is constructed as a tabooed disease. This negatively impacts on the experiences of those with PCOS and their families. Often, PCOS is not discussed, even among people within the same family. Pressure to conform to social norms of womanhood are magnified by the internalisation of this idea of PCOS as a tabooed disease. It is important to recognise issues of cultural appropriateness including language, taboo and stigma in the delivery of PCOS care (6).

Recommendations Framework

CONSENSUS RECOMMENDATION

- **CR:** Public health actors should consider increase societal awareness and education on PCOS to reduce stigma and marginalisation.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **PP:** Culturally appropriate resources and education on PCOS across the life span for families of those with the condition, should be considered.

CONSIDERATIONS

Justifications:
Some but not everyone with PCOS experience problems in the social domain, often due to stigma related to features of their condition. Social support has been found to have both positive and negative effects for people living with PCOS.

Subgroup considerations:
Women and people with PCOS may have varying support needs at different times across the lifespan. Key moments could be adolescence (support needs related to self-management) and reproductive years (support needs for unfulfilled child-wish).

Implementation considerations:
Women and people with PCOS may have varying support needs at different times across the lifespan. Key moments could be adolescence (support needs related to self-management) and reproductive years (support needs for unfulfilled child-wish).
Family members and healthcare practitioners must be aware of these needs and signpost to appropriate support services.

Monitoring and evaluation considerations:
None

Research priorities:
Pathways to dissemination should be investigated as part of national public health agendas.
Need research on impact on wider family and interpersonal relationships.
Role of family in psychological support.
Impact of social and peer support.
Investigate stigma and explore strategies to reduce stigma in PCOS.

Equity: Likely will increase equity.
Acceptability Acceptability may vary depending on family beliefs. The diverse nature of families is an important consideration. Consider issues around cultural appropriateness such as preferred language, taboo and stigma to ensure best practice delivery.
FEASIBILITY Probably feasible but may require a change in practice.

Question 2.6.4.

What are the key challenges for those with PCOS when interacting with healthcare professionals about polycystic ovary syndrome and related features?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	2.6.4 What are the key challenges for those with PCOS when interacting with healthcare professionals about polycystic ovary syndrome and related features?
Clinical leads (key contacts)	Jacky Boivin, Maureen Busby
Allocation ranking	Level 1 – New systematic review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Females with PCOS (diagnosed by Rotterdam, NIH, AES or self reported) of any age, ethnicity and weight. Subgroups: • Adolescents • Ethnicity • Phenotype	Any healthcare interactions in any healthcare setting. Include interactions with specialist doctors, general practitioners, nurses and allied health professionals (dietitians, physiotherapists, psychologists, mental health, dermatologist etc.)	None	Patients' perspectives on interacting with health professionals. (adjacent to terms such as perspectives, views, perceptions, experience) Note: different types of topics discussed (reproductive, metabolic, dermatological, psychological concerns) Include challenges, barriers and enablers. Include positive and negative experiences. Include culture, satisfaction/dissatisfaction etc.	Qualitative studies (e.g. interviews, focused groups, ethnography) Mixed method studies Quantitative study - satisfaction survey on any type of PCOS/Sx/Mx discussion	English language
Exclusion	Females without diagnosed PCOS.	interactions with non-healthcare professionals. Doctors' perspectives of interacting with patients	None	experiences or feelings related to receiving the diagnosis for PCOS	Abstracts, letters to editors, clinical trials	None

Evidence processing: The search was performed for both topic 2.6.1 and 2.6.4. Studies were selected and appraised by two reviewers in consultation with the evidence team/ key contact using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved**. In total, 54 studies met inclusion criteria for both 2.6.1 and 2.6.4. Of these, 28 studies met inclusion criteria for the review of 2.6.4.**

- **EVIDENCE SUMMARY:**

A total of 28 studies were identified that provided data on key challenges for those with PCOS when interacting with healthcare professionals. Of these studies three were mixed methods designs, one a systematic review, and one a comparative design of people with and without PCOS. Only data describing patient perspectives on key challenges was sought and extracted which by design an almost exclusive focus on problematic areas of care.

Qualitative data synthesised comprised participant narrative and author interpretation which were used for the descriptive analysis summary. Most studies were carried out in the UK (8 studies), Australia (6 studies) or North America (USA 5 studies, Canada 5 studies). Four studies were from India or Iran. Most studies required participants to have received a medical diagnosis of PCOS. Age range was within 20 to 50 years of age (11 studies), only one study sampled adolescent girls but several studies with larger age ranges reported on the experiences of young women 18 to 20 years of age. The predominant data collection method was interview alone or in combination with other methods. Three studies acquired data through internet forums, citizen panels or photovoice. The most common analytic approach was unspecified or generic thematic analysis, with other approaches being framework analysis or phenomenological. Two studies were judged to have high quality, four moderate quality and the remaining low quality.

Summary of Findings:
Three main themes emerged from synthesis of qualitative and mixed-methods studies on challenges for patients interacting with healthcare professionals.

First, interactions were challenging when bad news (PCOS disease, its management, or long-term risks) was shared in a way that was not empathic and that did not safeguard patient wellbeing. PCOS bad news was shared in a suboptimal way due to lack of appropriate setting or preparation (by healthcare professional, of the patient) or by use of unhelpful strategies (normalising, minimising). Importantly interactions sharing bad news did not always provide necessary knowledge and resources, end with a well-formulated strategy for management or check that patients understood the bad news or the planned management strategy. The effect of sharing bad news poorly was that patients were alarmed, felt uninformed or poorly informed, and worried about their future. Healthcare professionals that owned up to lack of disease expertise and who took the time to research and support patients with a new diagnosis were perceived positively.

Second, interactions were challenging when they did not provide opportunities to facilitate shared decision-making about outcomes that matter to people. Interactions were often too abbreviated to meaningfully engage in shared decision-making because only a subset of information, options and attributes was presented (often due to bias), patient preferences were not elicited, and too little time was available for deliberating the options with a knowledgeable doctor. The main consequent effect of the suboptimal shared decision-making context was that patients felt excluded from the decision process and decision quality about disease management perceived to be poor (shared, uninformed, not value-based). Interactions that set-up shared decision-making were positively regarded though time consuming for healthcare professionals.

Third, interactions were challenging when healthcare professionals did not support patient agency that is, patient's ability to take independent actions to manage their health and care. Patients reported they were not valued as expert witnesses of their own health and their efforts for self-management (agency) not valued or supported. Lack of valuing meant patients felt dismissed and had to be very insistent to obtain resources or achieve outcomes that mattered to them which was challenging for many reasons. Healthcare professionals that were validating, supported patients in their

research and had consultations that were patient led and informed were viewed positively.

- **DESCRIPTIVE ANALYSIS SUMMARY:**

Studies identified THREE ways in which interactions between healthcare professionals (HCPs) and patients were challenging (see Table OF SUMMARY FINDINGS):

Finding 1: Interactions were challenging when bad news was shared in a way that did not safeguard wellbeing

Interactions were challenging when the setting for sharing bad news was not set-up to minimise distress or to receive dignified care, especially in lower middle income countries where other patients could be in examining room or could overhear [4] or where patients experienced waited many hours for potentially bad news [4].

Interactions of sharing bad news were challenging when perceptions and understanding of symptoms were not elicited prior to sharing bad news. These interactions were perceived to lead to rejection of healthcare professionals recommendations [4] or to patients receiving recommendations misaligned with their causal understanding (e.g., recommending pregnancy test to account for irregular periods [8]). Also challenging was healthcare professionals omitting to first seek the invitation to share bad news from patients to avoid giving bad news unexpectedly about the diagnosis [16] but especially about the risks for future fertility and disease [1,2].

Interactions involving sharing bad news were challenging when healthcare professionals were not prepared to share bad news with appropriate knowledge and information. Healthcare professionals did not always ascertain or justify the validity of a PCOS diagnosis [3, 4, 22]. Healthcare professionals were perceived as insufficiently prepared with the necessary PCOS disease knowledge to have informed discussions with patients [14,16,26], to avoid poor explanations (e.g., “ovaries filled with water” [14]) or incorrect explanations (e.g., “you’ll grow out of it” [26], due to poor diet [21], “probably puberty” [27], “you should not be concerned”[28]) that could lead to misunderstanding of disease or management. Explanations of disease were perceived to have important gaps (e.g., omission of risk factors [6]) and lacked checking of patients understanding of the explanations [6]. Missing important information about disease meant patients felt “left in the dark”[6]. If other healthcare professionals later diagnosed PCOS, trust in initial healthcare professionals (usually general practitioner) was reduced [6]. Healthcare professionals that owned up to lack of PCOS expertise and who took the time to research and support patients in understanding it were viewed positively [11, 17].

Interactions were challenging when sharing bad news was not done empathically (e.g., was impersonal[1], abrasive, rude insensitive[21], curt instructions[3]). Efforts to alleviate patient distress were not always appropriate or helpful for example normalising symptoms ([3], “nothing to worry about”[14]) or minimising symptoms

("have lots of sex"[10], "it's just one of those things" [24]) or could cause patients to feel brushed off. Normalising was especially common with young people[3, 21, 25,27]. Other efforts to minimise were perceived as insensitive and trivialising of the condition (e.g., facial hair: "you must have Spanish ancestry"[10]). Sharing bad news about risks of future disease (infertility, cancer, cardiovascular) often gave insufficient information for people to understand the risks[24] or was delivered in a way that was upsetting or alarming (["terrified"[1], "in tears" [2]) especially to young people[20]. Reassurance from healthcare professionals [5] or de-catastrophising [23] about disease or future risks was appreciated. Bad news was at times shared through non-medical staff (e.g., receptionist [25] which was perceived as inappropriate. Healthcare professionals that added good news to bad news were perceived favourably (e.g., have PCOS, but will accelerate fertility referral)[10].

Sharing bad news that did not end with a strategy for next steps in care was perceived as challenging. In particular, when consultation did not end with a treatment plan [6, 25], strategy of follow-up[5, 21] or know-how to access future care for high risk outcomes such as infertility [1]. Strategy was perceived to be especially important for those diagnosed at a young age [1, 5]. A lack of justification for follow-up testing was perceived to cause uncertainties[6] or patients to feel "passed-off"[6]. Insufficient support to implement treatment plans or planned strategy was challenging (e.g., connecting with specialists[17]. Participants perceived the lack of a well-formulated management/follow-up plan to be due to a lack of healthcare professional knowledge [6].

Finding 2: Interactions were challenging when they did not provide opportunities to facilitate shared decision-making about outcomes that matter to people.

Interactions with HCPs were perceived to offer some options (e.g., typically hormonal control or fertility referral) but not all options (e.g., lifestyle management, complementary alternatives) [1,4,5,14], or patients felt forced to choose which options informed about (e.g., endocrinology or fertility services [24,26]). Interactions were perceived to be too abbreviated to inform on options and attributes and often described as offered with "nothing more" [1,3,4,5,12,14,21,23]. The options offered were perceived to be constrained by HCP bias about patient age[12], patient knowledge[6], marital status [8,12], weight status[5, 12], patient ethnicity[10], or HCP causal understanding of PCOS, (e.g., genetics "nothing you can do about it" [5] or health system restrictions about referral[24,26]). Options offered were perceived to be misaligned to patient circumstances (e.g., cycle based testing when irregular[2], prior history of weight loss attempts[5], cultural beliefs about unmarried women using hormonal contraceptives [8,12], personal safety in neighbourhood[16], distance to services, instability of military life[26]). Healthcare professionals were often perceived not to have sufficient disease knowledge, to inform on the option set and attributes [3, 11,24,26]. The consequent effect of these interactions was that patients lacked confidence in the healthcare professional's knowledge of options and their attributes [18] or ability to understand patient's personal circumstances [17]. Interactions set-up to generate sufficient knowledge gain about options and attributes were positively regarded though could be time consuming for healthcare professionals (i.e., two hours, [25]).

Interactions were perceived not to be set-up to elicit preferences and therefore preferences for some options were perceived not to be addressed or integrated in care plans, for example, options that avoided long-term risks [5,6, 10] or specific risks affecting the patient (e.g., migraines)[6], about weight-management [5,16,25] or psychological outcomes such as mental health[23] or restoring personal agency [25]. Healthcare professionals were perceived to act on their own preferences especially in prioritising fertility [6,8,10,12,14,21,26]. Study participants perceived that preferences for information formats (e.g., written[6]) or content of information (e.g., baseline risks[3], practical information[17]) were not elicited. Interactions that aligned with patient preferences were positively viewed for example aligned to amount and type of information[3] or referral to fertility care for childwish[10]. Interactions that were validating, patient informed and led [21] or that elicited personal preferences due to integrated care in multidisciplinary care teams [17, 23] were positively regarded.

Interactions were perceived to have insufficient time or methods to help patients deliberate the options and attributes, and or reach decisions with their healthcare professionals [1,3,4,16, 21,23,24,25]. The consequent effect was that patients felt left out of decision-making process. None of the included studies referred to healthcare professionals evaluating decision-quality despite patients reporting they felt decisions about treatment were not shared, informed [1,3,4,5, 12,14,21,23] or value-based [5,6, 10,16, 23, 25].

Finding 3: Interactions were challenging when healthcare professionals did not support patient agency (their ability to take independent actions to manage their health and care).

Interactions were perceived to be challenging when healthcare professionals did not value patients as expert witnesses to their own health by not eliciting or listening to patient's story or explanations[1,2], especially about prior mis-diagnosis, repeated testing, or ineffective treatment [2,6], by dismissing or not taking seriously patient worries[1, 9, 15,17,24,25] or showing a "condescending "attitude [11]. Young people especially perceived their voice not to be valued [9, 21,24,25]. Lack of valuing was associated with patients feeling a lack of care (e.g., "waved on" [11], "brushed off"[12], "not giving a hoot"[13], "pushed me out the door"[24]) or feeling that the reproductive conditions of girls and women were not important[12].

Interactions were challenging when patients perceived healthcare professionals did not value or support patient efforts at agency. Lack of valuing was ascertained when patients needed to be very persistent to be heard or meet their needs ("super insistent", "finally they relented"[24], "right pain in the butt"[26], "had to push to get a diagnosis"[27]], when healthcare professionals were disinterested ("seemed bored"[9]), did not acknowledge or discuss patients' own PCOS research [13, 21], did not actively provide knowledge and resources for self-management [13, 17,27] or become sufficiently involved in their care (especially follow-up[13,17]). Also challenging and undermining of self-agency were interactions proposing burdensome or difficult to execute strategies, for example, to use a an inaccessible service[1, 17], to act without appropriate data exchange between primary and secondary care[3] or follow instructions that were insufficiently motivating on their own (e.g., "just lose

weight" [16, 19,23]). Lack of support for agency was perceived to cause a loss of trust in healthcare professionals[1], reduced willingness to follow recommendations[9], and the perception in patients that they needed to be their "own doctor"[13, 17]. Patients also reported these interactions made them think healthcare professionals thought ill of them (e.g., "healthcare professionals think I'm crazy"[6], "got fed up with me"[24]). In contrast, interactions that stimulated agency and provided encouragement and support to young people (from nutritionist, [9]), answered questions reassuringly (nurse, [8])] or where healthcare professionals discussed patient research positively [13] were viewed favourably.

7. GRADE ASSESSMENTS AND EVIDENCE PROFILE

Due to the broad nature of the clinical question and the inclusion of studies of heterogeneous designs, populations and/or aims, it was not feasible to generate GRADE evidence profile tables for this question.

Please see individual study risk of bias assessments to determine the quality of evidence.

Question 2.6.4.

What are the key challenges for those with PCOS when interacting with healthcare professionals about polycystic ovary syndrome and related features?

BACKGROUND:

Prevalence and problem

Interactions between patients, their doctors and the wider healthcare team about PCOS (hereafter "interactions") are important for patients to learn about their health, make decisions about their health, and be supported to achieve health outcomes that matter to them. Therefore, it is important to address challenges in interactions that could undermine positive outcomes that could be achieved from these interactions (e.g., acceptance and adjustment to bad news, decision quality, self-management).

Clinical practice gap: need for guidance

Challenges of interactions involving sharing news in PCOS care

A common definition of bad news in health is "any information that produces a negative alteration to a person's expectations about their present or future" (1). Receiving news about PCOS whether a diagnosis, treatment or care, or risk for future disease is likely to meet this definition, even if patients feel relief at receiving a diagnosis (2-4). Receiving information that produces a negative alteration to a person's expectations is typically understood as a process (versus single event) with the lead up, the news and the aftermath of disclosure all being important (5). Voluminous empirical research exists about best ways of sharing information that produces a negative alteration to a person's expectations and many frameworks have been developed to guide how to share this news.

SPIKES framework proposes six steps which proposes six steps in delivering bad news to patients: **S**etting up the interview, assessing the patient's **P**erception of the situation, obtaining the patient's **I**nvitation to deliver the news, giving **K**nowledge and information to the patient, addressing the patient's **E**motions empathically, and (6) providing a **S**ummary and discussing prognosis and treatment options. Survey research indicates that SPIKES is aligned to patient preferences for receiving bad news in many areas of health (7), which is corroborated in fertility care using a focus group design (8). Patients have preferences for how this news should be delivered (e.g., amount of detail, who should be present), and variation across ethnicity, religiosity, and country (5). Nevertheless, systematic review and meta-analysis (17 studies) have shown that use of SPIKES for training doctors out-performs other approaches in demonstrating significant improvements in observer-rated news delivery skills and doctor confidence in delivering such news in many countries (e.g., Belgium Germany, Israel, Japan, Hong Kong, UK, USA) (9).

According to the evidence reviewed in PCOS, interactions are challenging when PCOS information that produces a negative alteration to a person's expectations (PCOS disease, its management, or long-term risks) is shared in a way that does not safeguard patient wellbeing. PCOS news is often shared suboptimally due to lack of appropriate setting (10, 11) or advanced preparation of the patient for receiving it [e.g., being forewarned, (10-13)] especially when delivered to young people. Healthcare professionals can also be unprepared due to lack of knowledge relevant for informed and accurate discussions about PCOS not being acquired in advance of delivering PCOS news (10, 14-20). Interactions are sometimes not empathic (2, 17, 21) and efforts to alleviate patient distress at such news, based on unhelpful strategies (normalising, minimising) (13-15, 22) especially with young people (4, 14, 17, 19). Importantly, interactions sharing bad news do not always end with a well-formulated strategy for future management or include a check that patients understood the news or the planned management strategy (if any) (4, 17, 23, 24).

The effect of sharing such news sub-optimally was that patients were alarmed, felt uninformed or poorly informed, and worried about their future, especially young people (2, 21, 24, 25) . Three studies reported that patients felt relief at receiving a diagnosis because of having a name and recognition (and validation) of their symptoms after many years of searching (3, 14, 17) and because of now having a care team (3). Despite relief, women also reported the diagnosis made them feel "upset" (2) and "desolate" (3) and uncertain about their future because diagnosis was not shared optimally, leaving people feeling uncertain about the nature of their condition, and its future

risks and management strategy (3, 11, 17). Healthcare professionals that owned up to lack of disease expertise and who took the time to research and support patients with a new diagnosis were perceived positively (3, 26).

Challenges of shared decision-making in PCOS care

The complexity of PCOS as a disease, its features and correlates, and future risks (e.g., hirsutism, acne, higher weight, infertility, diabetes, cardiovascular disease) make it highly likely that people with PCOS will have to make decisions considered suitable for shared decision-making, namely decisions where more than one course of action is reasonable and where the consequences of actions are significant (26). An internationally adopted definition of shared decision-making: "... is an approach where clinicians and patients make decisions together using the best available evidence. Patients are encouraged to think about the available screening, treatment, or management options and the likely benefits and harms of each so that they can communicate their preferences and help select the best course of action for them. Shared decision-making respects patient autonomy and promotes patient engagement" (27, 28, 29). Shared decision-making is often supported using patient decision aids (supporting patients) and decision support tools (supporting healthcare professionals). There is a vast international corpus of shared decision-making research (including systematic review, meta-analysis), guidelines and training. In areas of relevance to PCOS results are positive. For example, in reproductive health when compared to usual care the use of shared decision making (decision aids) reduces decisional conflict, improves patient knowledge but has no effect on anxiety or satisfaction (30, 35 studies). The benefits are replicated in diabetes care, with additional benefits reported for higher decision quality and patient risk perception and understanding (31, 16 studies) reported internationally. Prospective systematic evaluation (exposed, unexposed cohorts) suggests that additional time for shared decision making could be much less, even in difficult clinical contexts (2 mins 11 s, and 3 mins 57s, for lung cancer and breast cancer, respectively) (32).

According to the evidence reviewed in PCOS, interactions are challenging when they do not provide opportunities to facilitate shared decision-making about outcomes that matter to people. Interactions in PCOS are often too abbreviated (10, 14, 15, 17, 21, 23, 33, 34) to meaningfully engage in shared decision-making. Only a subset of options available for management are offered to patients (10, 13, 15, 18, 21, 23) often due to bias related to characteristics of the patient (e.g., age, marital status, knowledge level) (11, 13, 18, 22-24, 33). According to patients, interactions often lack time for deliberating the options and their attributes with a knowledgeable doctor (3, 13, 14, 18). In these interactions, patient preferences are often not elicited (4, 22-24, 34) 20,21, 22,23, 34) or not aligned with options offered (2, 18, 23, 33, 35, 36) (11,17, 22,33, 35,36) or doctor preferences take precedence (e.g., prioritising fertility (15, 17, 18, 22, 24, 33, 35)). The main consequent effect of a suboptimal shared decision-making context is that patients feel excluded from the decision process and decision quality about disease management perceived to be poor (shared, uninformed, not value-based) (4, 10, 14, 15, 17, 21-24, 33, 34, 36). Interactions that set-up shared decision-making were positively regarded though time consuming for healthcare professionals (17, 26, 34). In the studies reviewed patients indicated that time was an issue in consultations. One patient described a consultation perceived to have had sufficient time as being 2 hours in duration (4), suggesting that most doctors could not meet time demands. Indeed, lack of time is a consistent barrier for adopting shared decision-making as proposed in many areas of health (37).

Challenges of interactions for patient agency in PCOS

PCOS requires patients to actively participate in their own care (self-management). Patient activation is about patients' confidence in achieving this goal (38) and includes modifiable knowledge, skills, ability, and willingness to manage one's own health and care (39). Although patient activation could be affected by disease characteristics (e.g., cognitive impairment, fatigue, anxiety) it is viewed as critical to overall health and health-related quality of life. According to the patient activation framework people work through different levels of activation from low (disengaged

and overwhelmed) to high (maintaining behaviours conducive to health and quality of life) as measured using the patient activation measure (38). A narrative review indicates that greater levels of patient activation is associated with uptake of preventive behaviours (e.g., check-ups, screening), healthy behaviours (healthy diet, regular exercise), health literacy (e.g., disease knowledge, use question prompts at consultation) whereas lower activations levels are associated with greater delay in medical care (40) and increased risk of hospitalisation and emergency care (41). In a recent innovative 20-week longitudinal study patients with diabetes mellitus targeted for low activation (in 10 primary care practices c in the Netherlands) walked with their healthcare team once per week for increasingly longer periods of time. Patient activation significantly increased over time and was associated with an increase in well-being, exercise behaviour, general diet behaviour, and a reduction in body mass index, weight, and HbA1c (42).

According to the evidence reviewed in PCOS, interactions were challenging when healthcare professionals did not support patient activation and agency, that is, patients' ability to take independent actions to manage their health and care. Patients reported that they are not valued as expert witnesses of their own health (2, 3, 21, 24) especially young people (4, 13, 17, 43). Lack of valuing means patients often feel their concerns and worries are dismissed (3, 4, 13, 21, 26, 33, 43-45) and they need to be very insistent to obtain resources or achieve outcomes that matter to them (13, 18, 19), which can be challenging. Interactions with healthcare professionals were not always supportive of patients' efforts for self-management for example doctors seemed disinterested (43), did not acknowledge or discuss patients own PCOS research (17, 44), did not actively provide resources for self-management or become sufficiently involved in management (19, 26, 44). Healthcare professionals that were validating, supported patients in their research and that had consultations that were patient led and informed were viewed positively (35, 43, 44).

System and organisational level issues

Many organisational and system level factors could undermine implementation of practices such as shared decision making, for example a scoping review identified culture of health care delivery (i.e., policies and guidelines, incentives, healthcare professional education and licensing) as well as organisational characteristics (i.e., culture, leadership, priorities, teamwork, resources, and workflows) [46]. These issues could impact healthcare professional choice with knock-on effects on patients.

According to the studies reviewed in PCOS, at least some of the challenges patients perceived with doctors could have been due to challenges related to the healthcare system or organisation. Patients reported having trouble navigating the health system, or finding or accessing the recommended services (2, 21, 26), disliked automated messaging (21), found frustrating the lack of (prompt) communication between levels of care [e.g., primary and secondary (10, 14)], found crowded facilities inappropriate (10) , were disappointed by restrictions on what topics could be discussed due to system imposed limited consultation time (24, 43) or on allowable referrals(3, 13, 22) . Doctors perceived to go beyond system restrictions "pushed for referral" (22) or with integrated care models [34] were perceived more favourably.

Summary of key information

A systematic search of peer-reviewed literature was conducted to identify articles investigating challenges for those with PCOS when interacting with healthcare professionals about polycystic ovary syndrome and related features.

Women with suspected or confirmed PCOS will receive news, must make decisions about PCOS and will need to self-manage their health condition over time. To facilitate sharing news, shared decision-making and patient self-management (agency), general practitioners, endocrinologists, gynaecologists, dermatologists, nurses and allied health practitioners should all become more knowledgeable of PCOS and shared decision-making, sharing news that has potential for profound impact for the patient and supporting patient agency.

Healthcare professionals should be prepared with knowledge relevant for informed and accurate discussions about PCOS when sharing news of this diagnosis (10, 14-20). Ineffective strategies aimed at alleviating distress (normalising, minimising) should not be used because they have the opposite effect on patients (13-15, 22) especially with young people (4, 14, 17, 19). Interactions of sharing news that has potential for profound impact for the patient, should end with a strategy for next steps in care (4, 17, 23, 24).

Systems and organisations should ensure sufficient time be allocated for interactions that involve decision-making (10, 14, 15, 17, 21, 23, 33, 34) and for time to have meaningful discussion and deliberation about relevant options without assumptions related to age, fertility, weight or other person characteristic affecting options presented (10, 13, 15, 18, 21-24, 33, 35). Patient preferences should be elicited to ensure decisions aligned with these (3, 12, 16, 17, 26, 33-36).

Patients should be supported in efforts for self-agency by eliciting their personal stories and causal understanding of their health condition (2, 3, 21, 24) especially in interactions with young people (4, 13, 17, 43). Worries and concerns should be heard and not automatically dismissed as irrelevant or unimportant (3, 4, 13, 21, 26, 33, 43-45). Healthcare professionals could support patient agency by acknowledging and discussing patient's own PCOS research (17, 44), and providing evidence-based resources (including follow-up) aligned to patient preferences for self-management (19, 26, 44).

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

None

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Health professionals should employ shared decision-making and support patient agency or ability to take independent actions to manage their health and care.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **EBR:** The importance of being knowledgeable about PCOS, and applying evidence-based practices when sharing news on diagnosis, treatment and health implications, ascertaining and focusing on patient priorities should be recognised.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

CONSENSUS RECOMMENDATION

Health system actors should enable system wide changes to support health professional training, knowledge and practice in sharing news optimally, shared decision making and patient agency, including ensuring adequate consultation time and accessible resources.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

Evidence-based strategies for shared decision making and for sharing news (such as the SPIKES framework) are readily available and should be used to inform PCOS care

All health professionals partnering with women with PCOS should be knowledgeable in sharing news, in shared decision-making and in supporting patient self-management.

Evidence-based care strategies can be used to support patient activation, which refers to modifiable knowledge, skills, ability, confidence and willingness to self-manage one's own health and care.

GRADE CONSIDERATIONS

Justifications:
(see Evidence summary)

Subgroup considerations:
Subgroups may include young people who may be particularly affected by news regarding PCOS, need additional decision-support and who may especially benefit from longer-term strategies for supporting self-management (.
Cultural, religious and resource issues and biases can impact on challenges that women with PCOS experience in care (10, 33, 35) .

Implementation considerations:
Most doctors have training in sharing news but variable training in shared decision-making and supporting patient agency.
Time for provision of information and deliberation for shared decision-making is not feasible (4) without shared decision-making tools that save time on presentation of options (e.g., option grids).
Common strategies like normalising and minimising (4, 13-15, 17, 19, 22) are intended to alleviate distress and may be difficult to avoid unless other strategies for managing patient distress are provided.
Cultural, religious and resource issues can impact on challenges that women with PCOS experiences of care (10, 33, 35).

General practitioners, endocrinologists, gynaecologists, dermatologists, nurses, and allied health practitioners should all become more knowledgeable of PCOS sharing news that has potential for profound impact for the patient, shared decision-making and supporting patient self-management.

The SPIKES model (6)] could be used to share news that have the potential to negatively alter expectations of the future. Resources from national health systems exist to facilitate using this model (e.g., UK, Australia (47, 48).

Trustworthy sources for learning about shared decision-making have been developed and are free to use for individual healthcare providers and organisations, individual healthcare providers (49) and organisations (50).

In patient activation, trustworthy sources to learn how to use and implement this strategy exist (51).

Monitoring and evaluation considerations:
Monitor quality of care.

Research priorities:
Examine whether and how to implement well-established and effective frameworks for sharing news and shared decision-making in PCOS care and evaluate their effectiveness for outcomes that matter to patients (e.g., decision quality, causal understanding, agency, good health).
Examine whether and how biases manifesting in interactions around sharing news and shared decision-making can be addressed.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
Most doctors have training in sharing news, shared decision-making and supporting patient agency. As such recommendations should yield desirable effects that patients' value.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
Time for provision of information and deliberation for shared decision-making is not feasible in most primary care settings. This means that limited information and opportunity for deliberation would be provided to patients not referred to secondary care/specialist care/integrated care. How to approach shared decision-making to reduce undesirable effects.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☒ Moderate	☐ High

Research evidence:
See Part 1- Evidence Summary and GRADE document.

Panel discussion:
The certainty level was assigned based on lowest quality assessment (no or very minor considerations) for the evidence base. However, all research examined was qualitative, and many of the patients were sourced from patient support groups. Weighting of this should be discussed.
There is clear evidence of need, but there is lack of efficacy evidence specifically in PCOS.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:
No research evidence was identified

Panel discussion:
Research clearly shows that patients want news to be shared in an empathic way, that decisions be informed and value-based and that patients be seen as credible witnesses and agents in their own care.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:
No research evidence was identified

Panel discussion:
Costs to invest time and developing resources for patients.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:
No research evidence was identified

Panel discussion:

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:
No research evidence was identified

Panel discussion:
Implementation will cost but may generate savings in prevention.

● EQUITY

What would be the impact on health equity?

Judgement:

☒ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:
No research evidence was identified

Panel discussion:
There seems to be unaccountable bias in the options provided to patients. Shared decision frameworks might be able to increase equity, but only if options are accessible.
It should increase equity if uniformly adopted.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:
No research evidence was identified

Panel discussion:
Women and health professionals are likely to accept this but funders may be challenged.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:
No research evidence was identified

Panel discussion:
Most doctors have training in sharing news, but variable in shared decision-making and supporting patient agency. Feasibility is likely to be affected by lack of specific in-depth knowledge of the condition (10, 14-20). Time for provision of information and deliberation for shared decision-making is not feasible (4) (without shared decision-making tools that save time on presentation of options (e.g., option grids).

Question 2.7.

Is psychological therapy effective for management and support of depression and/or anxiety, disordered eating, body image distress, self-esteem, feminine identity or psychosexual dysfunction in women with PCOS?

(Narrative Review)

BACKGROUND:

Mental Health Disorders

Women with PCOS have a higher prevalence of clinically significant self-reported symptoms of depression, anxiety and eating disorders. Available research also suggests that women with PCOS have higher prevalence of depressive disorders, anxiety disorders and eating disorders as diagnosed by a psychiatrist using a structured clinical interview. Despite this, there is a lack of research examining the psychological treatment of clinical diagnosed anxiety, depression or eating disorders in women with PCOS.

Numerous empirically supported treatments (e.g., cognitive behaviour therapy, behaviour therapy, interpersonal therapy) are available for the treatment of depression, anxiety, eating disorders/disordered eating in the general population. These treatments result in clinically significant improvements in the condition and associated distress and impairment, as well as broader improvements including quality of life and psychosocial wellbeing. Of note, there is increasing evidence of the effectiveness of treatment delivered via telehealth (videoconference and telephone), as well as online programs (1), particularly if they are delivered with the assistance of a therapist or guide/coach (2). The choice of treatment is dependent on participant characteristics (e.g., age), diagnosis and symptoms severity, and available resources.

Regional general population guidelines typically provide guidance regarding identification, assessment and treatment for these disorders. They typically include information about treatment sequencing when multiple mental health disorders (or comorbid symptoms) are present, matching treatment intensity to symptoms severity including using stepped care treatment models, and consideration of physical health conditions when treating mental health disorders.

Links to some relevant general population guidelines are provided below.

  https://www.clinicalguidelines.gov.au/

The *Management of Eating Disorders for People with Higher Weight: Clinical Practice Guidelines* (3) provide guidance regarding treatment of eating disorders and disordered eating in people with higher weight.

Mental Health Symptoms

Women with PCOS also have higher levels of body image distress, lower levels of self-esteem, loss of feminine identity and higher levels of psychosexual dysfunction. Of note, these symptoms are core features and/or common comorbidities of depressive, anxiety and eating disorders. Therefore, they may be expected to improve if depressive, anxiety or eating disorders are successfully treated.

There are no broadly accepted general population guidelines for the treatment of body image distress, self-esteem, feminine identity or psychosexual dysfunction. Therefore, psychological treatment of these mental health symptoms should be guided by the results of systematic reviews and meta-analyses where available, or where they are not available high quality randomised controlled trials.

Available research suggests that psychological treatment, particularly cognitive behaviour therapy, is effective in improving body image distress (4, 5, 6) and low self-esteem (7). These treatments have been shown to improve the condition and associated distress and impairment. A recent RCT demonstrated that women with PCOS who received Acceptance and Commitment Therapy (ACT)-based therapy, had significantly lower levels of self-esteem and body image concern at 1-month follow-up, compared to a control group (8). This suggests CBT-based interventions (such as ACT) may be effective in improving self-esteem and body image in women with PCOS.

We are not aware of any studies examining interventions targeting the impacts of loss of feminine identity. While there are no studies examining the treatment of psychosexual dysfunction in women with PCOS specifically, a number of studies have examined treatments for psychosexual dysfunction in women with related conditions such as higher weight, infertility, metabolic syndrome and pregnancy. Lifestyle interventions (9), yoga-based interventions (10), and cognitive behavioural interventions (11) have demonstrated improvements in psychosexual functioning compared to control groups.

Psychosocial Interventions in Women with PCOS

A recent systematic review assessed the efficacy of psychosocial interventions for women with PCOS in seven RCTs (12). This review included two types of psychosocial interventions: (1) two studies examined psychological interventions (ACT and Mindfulness-Based Stress Reduction (MBSR) primarily targeting mental health outcomes, and (2) five studies examined lifestyle interventions (i.e., diet, exercise) with behavioural/cognitive behavioural components, primarily targeting lifestyle change and including mental health measure as secondary outcomes, all evaluated in an RCT design. While significant pre-post intervention effects were evident across studies for most mental health outcomes, between group effects were inconsistent. Short-term (immediate to 8 weeks post-intervention) effects for depression, QOL, self-esteem, body image, stress and negative affect were found for some studies. Only two studies found long term effects for body image and stress. There were no significant effects for anxiety (at any time point), and no significant long-term effects for anxiety, depression or QoL. Of note, only one study (13) specifically included participants with mental health concerns (elevated depression scores), and most of the remaining studies excluded participants with mental health diagnoses and/or elevated scores on self-report measures of mental health. A second systematic review and meta-analyses examined the impact of psychological interventions on depression symptoms on women with PCOS (Jiskoot et.al., under review (14)). This review was not limited to RCTs so included some additional papers. All studies compared cognitive behaviour therapy, delivered in group or individual format, to control/comparison. The meta-analyses demonstrated a large effect in favour of CBT (Cohen's d = 1.16; 0.31-2.01). Again, most of these studies were not targeting women with mental health problems. Only one case study included a participant with diagnosed depression and anxiety (and disordered eating), and two randomised controlled trials (13, 15) specifically included participants with elevated depression scores. These reviews highlight the potential benefits of psychosocial interventions for women with PCOS, and the need for research examining more targeted interventions for those with mental health diagnoses or elevated mental health symptoms.

Recommendations Framework

CONSENSUS RECOMMENDATION(S)

- Women with PCOS diagnosed with depression, anxiety, and/or eating disorders should be offered psychological therapy guided by regional general population guidelines and the preference of the woman with PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- Women with PCOS with disordered eating, body image distress, low self-esteem, problems with feminine identity, or psychosexual dysfunction should be offered evidence-based treatments (e.g., cognitive behaviour therapy) where appropriate.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

CONSIDERATIONS

Given the limited evidence, this question was allocated as a narrative review and therefore a systematic literature review was not conducted. A more general review revealed few studies typically of low quality. Given the insufficient evidence about effectiveness of psychological therapy in women with PCOS, the literature about psychological therapy in the general population has been used to inform this consensus recommendation.

Treatment of depression, anxiety, eating disorders/disordered eating should be guided by regional general population guidelines. These guidelines typically provide guidance regarding identification, assessment and treatment (including treatment sequencing) for these disorders.

Of note, negative body image, low self-esteem and psychosexual dysfunction are core features and/or common comorbidities of these disorders. Therefore, these symptoms are likely to improve if depression, anxiety or eating disorders are successfully treated.

There are no broadly accepted general population guidelines for the treatment of body image distress, self-esteem, feminine identity or psychosexual dysfunction. Limited available research suggests that cognitive behaviour therapy is effective in the treatment of body image distress, self-esteem, feminine identity or psychosexual dysfunction.

Subgroup considerations:

There is evidence that similar treatments are effective across adolescence and adulthood, however there are some minor differences in treatments.

There is evidence that evidence-based psychological interventions (e.g., cognitive behaviour therapy) are effective across cultures, however some adaptation may be required.

Implementation considerations:
Acceptability – Evidence-based psychological treatments tend to be well accepted
Availability – This has been improved with the availability of telehealth, as well as online interventions.
Cost – Costs are reduced by the use of stepped care interventions, online programs can be effective for some, particularly when used with a guide/coach.
Cost-effectiveness – Implementation of evidence-based programs, within a stepped care framework, improves cost-effectiveness.
Time consuming – Longer treatments tend to be more effective. Time demands can be reduced by the use of stepped-care approaches, and telehealth delivered interventions.
Feasibility – Evidence suggests that psychological services are poorly integrated into models of care of PCOS.

Monitoring and evaluation considerations:
Access to and use of different psychological treatment approaches would be valuable.

Research priorities:
Research is needed examining the role and efficacy of psychological intervention for depression and/or anxiety, disordered eating, body image distress, self-esteem, feminine identity or psychosexual dysfunction in adults and adolescents with PCOS.
Research examining stepped care models incorporating evidence-based interventions and delivery modes (e.g. telehealth, mobile health apps).

Equity:
Traditional, 1:1, face-to-face psychological interventions are expensive (albeit cost-effective) and often not covered by public health services. Consequently, they are more available to those of higher incomes.
The availability of telehealth (and the evidence indicating that it is similarly effective) improves access particularly for those in rural/remote areas.
The effectiveness of online materials, particularly when delivered with the assistance of a guide/coach, improves equity.
The use of stepped care models incorporating evidence-based interventions and technology solutions would improve equity.

Acceptability:
These treatments result in clinically significant improvements in the condition and associated distress and impairment, as well as broader improvements including quality of life and social functioning.
There is little evidence of negative effects of empirically supported psychosocial treatments for these conditions. Attrition from treatment can be high (up to 30%). Attrition rates are significantly higher for interventions delivered without in-person support (e.g., online interventions without a guide/coach). Therefore, there is a risk that women will not receive a full dose of treatment.
Other undesirable effects might include women with PCOS receiving non-empirically supported treatments which may be ineffective or harmful.

FEASIBILITY
Feasibility will be influenced by the availability of mental health care in the individual's local area.
