5. FINDINGS

Comparisons included:

1. Metformin versus placebo
2. Metformin+lifestyle versus placebo+lifestyle
3. Metformin versus lifestyle
4. Metformin vers OCP (also in Q4.2 – not identical)
5. Metformin vers metformin+OCP (also in Q4.2 – not identical)
6. Metformin versus anti-androgen (also in Q4.6 – identical)
7. Metformin+anti-androgen versus anti-androgen (also in Q4.6 – identical)
8. Metformin+anti-androgen versus metformin (also in Q4.6 – identical)
9. SPIOMET versus OCP (also in Q4.6 – identical)
10. Metformin versus anti-androgen+OCP (also in Q4.6 – not identical since timeline different)
11. Metformin+lifestyle versus metformin+anti-androgen+lifestyle (also in Q4.6 – not identical since timeline different)
12. Metformin+Lifestyle versus anti-androgen+lifestyle (also in Q4.6 – not identical since timeline different)
13. Metformin+anti-androgen+lifestyle versus anti-androgen+lifestyle (also in Q4.6 – not identical since timeline different)
14. Metformin+anti-androgen+lifestyle versus placebo+lifestyle (also in Q4.6 – identical)
15. Metformin versus rosiglitazone
16. Metformin versus pioglitazone
17. Metformin versus saxagliptin
18. Metformin+saxagliptin versus metformin
19. Metformin+saxagliptin versus saxagliptin
20. Metformin versus SGLT2-inhibitors
21. Metformin+liraglutide versus liraglutide
22. Metformin+myo-inositol versus myo-inositol
23. Metformin versus orlistat
24. Metformin+pioglitazone versus pioglitazone
25. Metformin+pioglitazone versus metformin
26. Metformin versus metformin+rosiglitazone
27. Metformin+rosiglitazone versus rosiglitazone
28. Metformin versus metformin (different dose)
29. Metformin versus metformin+MPA

Comparisons included in other reviews:

1. OCP versus metformin+OCP (reviewed in Q4.2)
2. OCP+metformin versus OCP+anti-obesity (reviewed in Q4.2)
3. OCP versus OCP+metformin+anti-obesity (reviewed in Q4.2)
4. Metformin+anti-androgen versus OCP (adolescents) (reviewed in Q4.2)
5. Metformin+anti-androgen+OCP versus OCP (reviewed in Q4.2)
6. Metformin+OCP versus OCP+anti-androgen (reviewed in Q4.2)

Comparison 1: Metformin versus placebo

Evidence Summary

23 randomised controlled trials (RCTs) were identified by our search. Of these RCT, 22 were included in the meta-analysis.
Of our included articles three had a low ROB, 16 had a moderate ROB and 4 had a high ROB.

Rows highlighted grey indicate studies with participants described as obese. Rows shaded green indicate that participants had BMI in the normal weight and overweight categories. We performed subgroup analyses based on BMI. As for age, there was only one study on adolescents (Hoeger et al. 2008) which is also reported separately. A major limitation in the evidence for this comparison is the lack of confidence in author reporting of units and conversions.

Meta-analysis/descriptive analysis summary

Overall:
In the meta-analysis, metformin was superior in lowering WHR (certainty very low), BMI (certainty moderate), testosterone (certainty very low), fasting glucose (certainty moderate), total cholesterol (certainty low), triglycerides (certainty low), CRP (certainty very low), PAI (certainty very low) and HOMA-IR (certainty moderate) compared to placebo.

Subanalyses according to BMI:
For PCOS-women with normal weight (BMI<25), metformin was superior in lowering FAI (certainty moderate) and fasting insulin (certainty low).
For obese PCOS women (BMI>25) metformin was superior in lowering BMI (certainty moderate), fasting glucose (certainty moderate), total cholesterol (certainty moderate) and LDL (certainty low).
Regarding individual studies, not included in the meta-analysis, Bridger et al. found that metformin was superior in improving testosterone and HDL in PCOS-women compared to placebo. The amount of girls with restored menses was also larger after metformin use compared to placebo. Certainty in the evidence for this study was low (low risk of bias but a single study with only a small amount of participants).
There was one study comparing metformin to placebo in adolescents (Hoeger et al. 2008), which found no differences in observed outcomes in metformin compared to placebo. Certainty for this study was very low (being a single, small study).
The reports suggest more gastrointestinal side effects with metformin (see table at the end of this document). Very few studies reported on side effects in specific details.

Author, year, country	Population	Sample Size per group	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Type of analysis and subgroup	ROB

[1] Downgraded once for mod ROB and downgraded once for small number of participants

[2]

Metformin versus placebo adolescents

There was one study comparing metformin to placebo in adolescents (Hoeger et al. 2008). No statistically significant differences were found for: BMI (kg/m2); Waist (cm); Total testosterone (ng/dl); SHBG (nmol/liter); FAI; Hirsutism (FG score); Total cholesterol (mg/dl); HDL (mg/dl), LDL (mg/dl); Triglycerides (mg/dl); Fasting insulin (IU/ml); Fasting blood sugar (mg/dl); CRP (mg/l); PAI-1.

Study ID	Hoeger 2008	Certainty in effect estimates (Quality of evidence)	Very low

Outcome	Time point	N	Metformin Mean	SD	Placebo Mean	SD	P value	Favours
BMI (kg/m2)	6 months	16	35.0	8.6	35.5	6.8	NR	No difference
Waist (cm)	6 months	16	105.3	13.9	105.3	18.6	NR	No difference
Testosterone (ng/dl)	6 months	16	49.7	31.1	71.6	33.8	NR	No difference
SHBG (nmol/l)	6 months	16	21.1	8.4	19.1	9.4	NR	No difference
FAI	6 months	16	10.9	7.9	16.8	11.2	NR	No difference
Hirsutism (FGS)	6 months	16	8.2	3.4	11.6	4.9	NR	No difference
Total cholesterol (mg/dl)	6 months	16	145.3	25	157	53.2	NR	No difference
HDL (mg/dl)	6 months	16	43.5	19	43.6	8.9	NR	No difference
LDL (mg/dl)	6 months	16	92.0	15.5	114	27.1	NR	No difference
Triglycerides (mg/dl)	6 months	16	71.3	21.1	87.1	25.1	NR	No difference
Fasting insulin (IU/ml)	6 months	16	19.8	10.4	29.1	24.5	NR	No difference
Fasting glucose (mg/dl)	6 months	16	84.9	12.7	86.5	5.4	NR	No difference
CRP (mg/l)	6 months	16	2.8	2.0	4.2	2.8	NR	No difference
PAI-1	6 months	16	45.4	32.2	48.0	45.9	NR	No difference

NR; not reported; A, serious risk of bias; B, serious risk of imprecision; C, serious risk of inconsistency; D, very serious imprecision; E, indirectness

Adverse outcomes

	Study	metformin	Placebo
Gastrointestinal side effects	Karimzadeh 2007	Nausea 30% Diarhhea 10% Vomiting 15%	0%
	Fleming 2002	15/26=57.69%	5/39=12.82%
	Ng 2001	3/8=37.5% (vomiting)	1/7=14.3% (vomiting)

Comparison 2: Metformin+lifestyle versus placebo+lifestyle

Evidence Summary

Eight randomised controlled trials (RCTs) were identified by our search. Of these RCT, all were included in the meta-analysis.
Of these studies four had a low ROB and five a moderate ROB.

Rows highlighted grey indicate studies with participants described as obese. We performed subgroup analyses based on BMI. As for age, there was only one study on adolescents (Ladson et al. 2011).

Meta-analysis/descriptive analysis summary

In the meta-analysis, metformin+lifestyle was superior in lowering testosterone for the overall group (moderate certainty). Among PCOS women without a specified BMI, WHR was significantly lower in participants with metformin+lifestyle compared to placebo and lifestyle. For other outcomes, no difference was observed. Certainty in the evidence is moderate to very low.

Regarding individual studies, not included in the meta-analysis, Tiwari et al. found that participants treated with metformin and lifestyle had less oligomenorrhea compared to placebo and lifestyle (certainty moderate). Hoeger et al. found that testosterone and FAI was significantly lower in participants treated with metformin+lifestyle compared to those who received placebo+lifestyle. Fux Otta et al. found HOMA-IR to be lower in participants treated with metformin and lifestyle. Certainty for these findings was very low.

Gastrointestinal side-effects seems to be more common in the metformin+lifestyle group (see table at the end).

Author, year, country	Population	Study Design	Sample Size per group	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Type of analysis and subgroup	ROB
Tiwari et al 2018 India	Females diagnosed as PCOS	RCT	1.Lifestyle+metformin 33 2.Lifestyle+placebo 33	6 months	1.25.2 ±4.6 2.26.3 ±3.7	1.24.3 ±3.9 2.24.5 ±4.8	Weight, whr, BMI, hirsutism	META	**ROB low**

Comparison 3: Metformin versus lifestyle

Evidence Summary

Three randomised controlled trials (RCTs) were identified by our search. Of these RCT, all were included in the meta-analysis.
Of these studies two had a moderate ROB and one a high ROB. All studies were on obese PCOS patients, one (Hoeger et al. 2008) on adolescents.

Meta-analysis/descriptive analysis summary

According to the meta-analysis, metformin was superior in lowering testosterone and participants with lifestyle only had an improved SHBG. For other outcomes, no difference was observed. However, certainty in the evidence is very low for all outcomes.
Regarding individual studies, not included in the meta-analysis, Esfahania et al. found that DHEAS seemed to be lower in participants using metformin compared to those with lifestyle only and WHR seemed to be lower among participants with lifestyle only. Certainty in the evidence was, however, very low for all outcomes.
Regarding adverse effects, Esfahanian et al. reported that the metformin only group had a higher amount of participants with GI related adverse effects (2/17 compared to 0/13)

Note
No new studies compared to the previous TR were identified.

Author, year, country	Population	Sample Size per group	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Type of analysis and subgroup	ROB
Esfahanian et al. 2013 Iran	Women with bmi>=27 and PCOS	1.Metformin=17 2.HC diet=13	3 months	1: 31.1±3.3 2: 34.1±5.4	1: 21.9±9.3 2: 20±4.6	BMI, WHR, T, DHEAS, f-insulin, f-gluc, lipids, HOMA, crp, adverse effects	META BMI>=27	**ROB high**
Hoeger et al. 2008 USA	Women, aged of 12-18 yr with BMI above the 95th percentile and evidence of menstrual irregularity	1.Metformin=6 2.placebo=10 3.OCP=10 4.LS=8	6 months	1: 34.3±6.5 2: 36.1±7.5	1: 16±1.7 2: 15.4±1.7	BMI, hirsutism, SHBG, FAI, T, f-insulin, f-gluc, lipids, crp, PAI	META BMI above the 95th percentile Adolescents	**ROB Moderate**

Hoeger et al. 2004 USA	Overweight or obese women with PCOS	1.Metformin=6 2.LS+placebo=8 3.LS+metformin=5 4.Placebo=7	6 months	1: 37.1±4.9 2: 40±7.4 3: 41.7±6.2 4: 37.1±4.6	1: 29.5±6.4 2: 27.1±4.3 3: 30.4±5.4 4: 27.1±4.5	BMI, SHBG, FAI, T, f-insulin, f-gluc	META BMI=>25 Adults	**ROB Moderate**

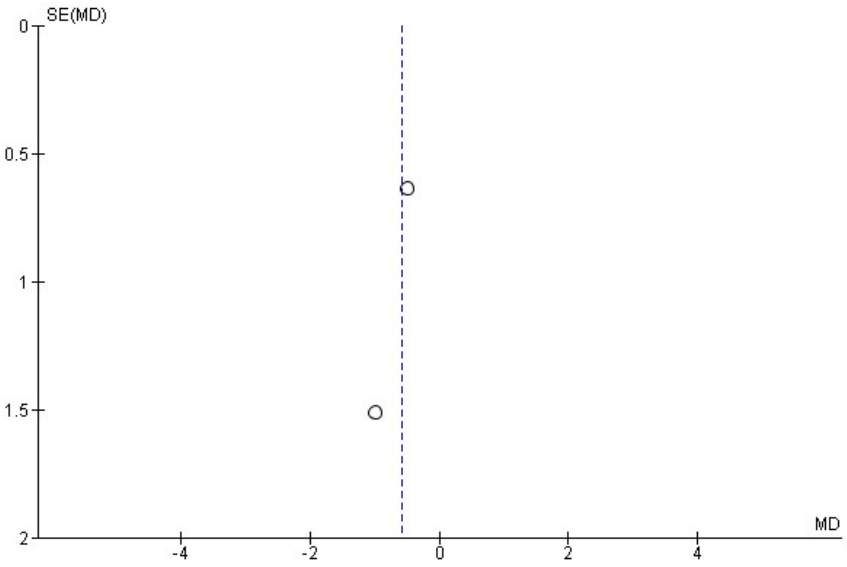
3.10.3. Funnel plot for assessment of publication bias



Comparison 4: Metformin versus OCP

Evidence Summary

24 randomised controlled trials (RCTs) were identified by our search (resulting in 33 included articles). Of these RCT, 22 were included in the meta-analysis.
Of our included articles two had a low ROB, 14 had a moderate ROB and 17 had a high ROB.

We used data from original articles and performed our own conversions (in terms of units and variation) wherever means and SDs or SEs were reported.
A major limitation in the evidence for this comparison is the lack of confidence in author reporting of units and conversions.

In Panidis et al. and Christakou et al. metformin is compared to an OCP, either containing cyproterone acetate (CPA) or drospirenon (DRP). In these cases, I have included the comparison between metformin and OCPs containing CPA since this combination is more frequently used in the other studies. Note that in Q4.2 (OCP-Metformin comparison) DRP was used, explaining slightly different results and sometimes grading.

Rows highlighted grey indicate studies with participants described as obese (BMI over 25). Rows shaded green indicate that participants had BMI in the normal weight category (BMI under 25). Studies using the same data are coloured in the “author-column”. We performed subgroup analyses based on BMI (<=25, >25 or BMI not specified) and age (adults and adolescents).

Meta-analysis/descriptive analysis summary

Overall:

In the meta-analysis, metformin was superior in improving fasting insulin, total cholesterol, triglycerides, CRP and HOMA-IR (certainty low or very low).
OCP was superior in improving hyperandrogenism (SHBG, FAI, Testosterone, free testosterone, DHEAS and androstenedione) and restoring regularity in menstrual cycle (certainty moderate to very low).

Subanalyses according to BMI:

For PCOS-women with normal weight (BMI<25), metformin was superior in lowering WHR (certainty low), total cholesterol (certainty very low) and HOMA-IR (certainty moderate). OCP was better in improving hirsutism (certainty low) and androstenedione (certainty low) in PCOS-women with normal weight (BMI<25).
For obese PCOS women (BMI>25) metformin was superior in improving HDL (certainty moderate).
Metformin was superior in improving fasting insulin (certainty very low to moderate), triglycerides (certainty low) and CRP (certainty low to moderate) compared to OCP regardless of BMI. OCP was superior to metformin in improving hyperandrogenism (SHBG, FAI and Testosterone) in PCOS-women regardless of BMI (certainty low to high).

Subanalyses according to age:

For adult PCOS-women metformin was superior in improving fasting insulin (certainty moderate), whereas OCP was superior in improving hyperandrogenism (SHBG, FAI, testosterone, free testosterone) (certainty high to very low).
We found four studies on adolescents (Allen et al., Al-Zubeidi et al, El Maghraby et al. and Hoeger et al. 2008). For adolescents, metformin was superior in lowering LDL (certainty low),

whereas OCP was superior in improving SHBG and FAI (note that only one study included these outcomes).
Metformin was superior in lowering CRP and total cholesterol (certainty very low to moderate) regardless of age.

Regarding individual studies, not included in the meta-analysis, Glintborg et al. and Dardzinska et al. found that BMI, weight and CRP was significantly lower after using metformin, whereas some studies (Glintborg et al., Burchall et al., Meyer et al.) found that hyperandrogenism (SHBG, FAI, PAI and DHEAS) was better improved by using OCP.
Certainty in the evidence for the individual studies are low or very low since the studies were moderate or high risk of bias and all studies had only a small amount of participants.
Due to the lack of systematic reporting, where many studies do not report adverse effects at all, and the ones that do, not report in a similar manner, it is difficult to draw strong conclusions, but the reports suggest more gastrointestinal side effects with metformin (see table at the end of this document).
Dorgham et al. found that OCP with laser hair removal could achieve greater hair reduction and significant improvements in patients' QOL compared to metformin+laser hair removal (see table at the end of this document).

*Have reported baseline age and BMI separated by obese and non-obese groups; and both interventions were administered to each obese and non-obese group
separately, however the results are presented per intervention for all participants and not presented for each obese and non-obese group/intervention.

Results of meta-analysis

Results were subgrouped based on BMI (<=25, >25 or not specified) and age (adults and adolescents)

Outcome	Time point	RCTs	N	Effect, random, MD	P-value	I2 (%)	Favours	Certainty

Comparison 5: Metformin versus metformin+OCP (also in Q4.2 – not identical)

Evidence Summary

Six randomised controlled trials (RCTs) were identified by our search. Of these RCT, 5 were included in the meta-analysis.
Of these studies three had a moderate ROB and two a high ROB.

Rows highlighted grey indicate studies with participants described as obese (BMI over 25). Rows shaded green indicate that participants had BMI in the normal weight category (BMI under 25). Studies using the same data are coloured in the “author-column”. We performed subgroup analyses based on BMI (<=25, >25 or BMI not specified). All studies in this category were on adult women.

Meta-analysis/descriptive analysis summary

In the meta-analysis, metformin only was superior in lowering WHR, fasting glucose, total cholesterol and triglycerides (certainty low to very low), whereas a combination of metformin and ocp was superior in lowering testosterone (certainty low) and DHEAS (certainty very low). For other outcomes, no difference was observed. Certainty in the evidence is low or very low since the studies were moderate or high risk of bias and many studies had only a small amount of participants.

Regarding individual studies, not included in the meta-analysis, Glintborg et al. found that BMI was significantly lower after using metformin only compared to combination therapy, whereas SHBG was higher among those using combination therapy. Kumar et al. found that the metformin+OCP combination was superior when treating hirsutism. Kebapcilar et al. found that free testosterone was lower among those using combination therapy compared to those using metformin only. Glintborg et al. and Moro et al found that FAI was significantly lower after treatment with Metformin+OCP compared to metformin only. Certainty in the evidence for the individual studies are low or very low since the studies were moderate or high risk of bias and all studies had only a small amount of participants.
Only a few studies reported adverse effects separately for both groups. According to these, the risk of adverse effects appears to be fairly similar in both groups (see table at the end of this document).

Author, year, country	Population	Sample Size per group	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Type of analysis and subgroup	ROB

Comparison 6: Metformin versus anti-androgen (also in Q4.6 – identical)

Evidence Summary

Only one RCTs compared metformin to an anti-androgen (Diri et al. 2017). This study was rated as high risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. Diri et al. found that the anti-androgen finasteride reduced both androgen levels (DHEAS and SHBG) and parameters of insulin resistance (AUC-Insulin) better than metformin. For the other outcomes measured, no difference was observed.
No side effects were observed with finasteride or metformin.
Certainty in the evidence for this comparison is very low (downgraded twice for very serious risk of bias and twice for very serious risk imprecision, being a single, small study).

Comparison 7: Metformin+anti-androgen versus anti-androgen (also in Q4.6 – identical)

Evidence Summary

Only one RCTs compared metformin and anti-androgen to anti-androgen only (Diri et al. 2017). This study was rated as high risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. Diri et al. found that anti-androgen alone was more effective in lowering HOMA-IR and AUC-insulin compared to metformin and anti-androgen in combination. For the other outcomes measured, no difference was observed.
No side effects were observed with finasteride and/or metformin.
Certainty in the evidence for this comparison is very low (downgraded twice for very serious risk of bias and twice for very serious risk imprecision, being a single, small study).

Comparison 9: SPIOMET versus OCP (also in Q4.6 – identical)

Evidence Summary

Five RCTs compared SPIOMET (spironolactone 50mgx1, pioglitazone 7.5mgx1 and metformin 850mgx1) to OCP but all studies used the same data. Outcomes from Ibanez et al. 2020 and De Zegher et al. 2019 were used, since these were the studies with the largest amount of participants. These studies were rated as moderate risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one set of data used. Ibanez et al. found that the SPIOMET reduced hirsutism, LDL-cholesterol, CRP, HOMA-IR and fasting insulin better than metformin. OCP was superior in increasing SHBG.
None of the articles reported any side effects.
Certainty in the evidence for this comparison is low (downgraded once for serious risk of bias and once for serious risk imprecision, being a single, small study).

Author, year, country	Population	Sample Size per group	Intervention/ exposure details	PCOS criteria	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Summary of findings	Other
De Zegher et al 2019 Spain	Adolescent girls with PCOS (gynaecological age>2.0 years)	SPIOMET=29 OCP=29	1.SPIOMET-group: spironolactone 50 mgx1 daily, pioglitazone 7.5 mgx1 daily and metformin 850 mgx1 daily, taken together at dinner time 2.OCP-group: 20 µg ethinyloestradiol plus 100 mg levonorgestrel (21/28 days), and placebo (7/28 days)	hirsutism, oligomenorrhea, gynaecological age>2.0 years,	12 months	NR	1.15.8 ±0.3 2.15.6 ±0.3	FAI (the rest in Ibanez et al 2020)	OCP and SPIOMET treatment were accompanied, respectively, by 1.7- and 3.4-fold rises of circulating GDF15. Post-OCP, GDF15, CRP and insulin returned towards baseline levels; post-SPIOMET, GDF15 returned also to baseline levels but CRP, insulin and liver fat remained normal	**ROB Moderate** Same outcomes in Ibanez et al. (Toward a Treatment Normalizing Ovulation Rate in Adolescent Girls with Polycystic Ovary Syndrome)?
Ibanez et al 2020 Spain	Adolescent girls with PCOS two RCT pooled (gynaecological age>2.0 years)	SPIOMET=**31** OCP=**31**	1.SPIOMET-group: spironolactone 50 mgx1 daily, pioglitazone 7.5 mgx1 daily and metformin 850 mgx1 daily, taken together at dinner time 2.OCP-group: 20 µg ethinyloestradiol plus 100 mg levonorgestrel (21/28 days), and placebo (7/28 days)	hirsutism, oligomenorrhea, gynaecological age>2.0 years,	12 months	1.24.2 ±0.7 2.24.2 ±0.7	1.15.7 ±0.2 2.15.9 ±0.2	BMI, mFGS, SHBG, T, A, free-T, f-insulin, HOMA, OGTT, triglycerides	OCP and SPIOMET treatment reduced the androgen excess comparably and had no differential effects on total-body lean or fat mass. However, SPIOMET was accompanied by more broadly normalizing effects, including on hepato-visceral fat and on circulating insulin	**ROB Moderate**
Ibanez et al 2017 Spain	Adolescent girls with PCOS	SPIOMET=**17** OCP=**17**	1.SPIOMET-group: spironolactone 50 mgx1 daily, pioglitazone 7.5 mgx1 daily and metformin 850 mgx1 daily, taken together at dinner time 2.OCP-group: 20 µg ethinyloestradiol plus 100 mg levonorgestrel (21/28 days), and placebo (7/28 days)	hirsutism, oligomenorrhea, gynaecological age>2.0 years,	12 months	1.23.4 ±0.7 2.24.0 ±0.8	1.15.8 ±0.3 2.15.9 ±0.3	No outcomes (all are in Ibanez et al 2020)	SPIOMET was followed by a 2.5-fold higher ovulation rate than OCP and by a 6-fold higher normovulatory fraction. Oligoanovulation risk after SPIOMET was 65% lower than after OCP	**ROB Moderate**

Comparison 10: Metformin versus anti-androgen+OCP (also in Q4.6 – not identical since timeline is different)

Evidence Summary

Four randomised controlled trials (RCTs) and five articles reporting these outcomes were identified by our search. Of these RCT, three were included in the meta-analysis.
Of these studies, one had a low ROB (Mehrabian et al. 2016), one a moderate ROB (Meyer et al. 2009) and three a high ROB (Burchall et al. 2017, Kebapcilar et al 2010 and Alpanes et al. 2017). Rows highlighted grey below indicate studies with participants described as obese.

Meta-analysis/descriptive analysis summary

In the meta-analysis (measuring BMI, HDL and triglycerides) no differences between the two groups were observed. Certainty in the evidence is moderate to very low.
Regarding individual studies, not included in the meta-analysis, Alpanes et al observed that a combination of anti-androgen and OCP was superior in improving hyperandrogenism (hirsutism, testosterone, free testosterone, androstenedione and DHEAS). Another study found that anti-androgens combined with OCP was superior in increasing SHBG (Meyer et al. 2007) and lowering CRP (Mehrabian et al. 2016) compared to metformin only. Mehrabian et al. found that those treated with metformin had a lower fasting glucose compared to the anti-androgen+OCP-group. Certainty in the evidence for the individual studies were low or very low.
Patients using metformin reported more GI adverse effects (see table at the end).

Adverse effects

	Study	Metformin	Anti-androgen+OCP
Gastrointestinal side effects (diarrhea,vomiting etc)	Alpanes 2017	2/22	0/24
	Kebapcilar	8/24	0
Other	Alpanes 2017	-	1/24 allergic reaction
	Meyer 2007	-	1/38 Mood swings

Comparison 11: Metformin+lifestyle versus metformin+anti-androgen+lifestyle (also in Q4.6 – not identical since timeline is different)

Evidence Summary

Five randomised controlled trials (RCTs) were identified by our search. Of these RCT, all were included in the meta-analysis.
Of these studies three had a low ROB and two a moderate ROB. All studies reported outcomes on adults. One study reported outcomes on obese PCOS-women (Gambineri et al. 2006).

Rows highlighted grey indicate studies with participants described as obese. Unfortunately, we were not able to perform any subanalyses due to a limit number of studies. A major limitation in the evidence for this comparison is the lack of confidence in author reporting of units and conversions (especially for Amiri et al., which we often had to leave out).

Meta-analysis/descriptive analysis summary

In the meta-analysis, metformin+anti-androgen+lifestyle was superior compared to metformin+lifestyle in improving hyperandrogenism (FAI and testosterone), fasting insulin and fasting glucose. For other outcomes, no difference was observed. Certainty in the evidence is low or very low.
Regarding individual studies, not included in the meta-analysis, no differences was observed. Certainty in the evidence for the individual studies were high or low.
Adverse effects seemed to be similar in both groups (see table at the end).

Note
Only one new study added, compared to the previous TR (Long et al 2022).

Author, year, country	Population	Sample Size per group	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Type of analysis and subgroup	ROB

Adverse effects

	Study	Metformin+LS	Metformin+anti-androgen+LS
Gastrointestinal side effects (diarrhea,vomiting etc)	Long 2022	4/54	4/51
	Ganie 2013	9/56 (diarrhea)	7/62 (diarrhea) 2/62 (nausea)
Nausea	Long 2022	6/54	5/54

Comparison 12: Metformin+lifestyle versus anti-androgen+lifestyle (also in Q4.6 – not identical since timeline is different)

Evidence Summary

Five randomised controlled trials (RCTs) were identified by our search. Of these RCT, all were included in the meta-analysis.
Of these studies two had a low ROB and three a moderate ROB. All studies reported outcomes on adults. One study reported outcomes on obese PCOS-women (Gambineri et al. 2006).

Rows highlighted grey indicate studies with participants described as obese. Unfortunately, we were not able to perform any subanalyses due to a limit number of studies. A major limitation in the evidence for this comparison is the lack of confidence in author reporting of units and conversions (especially for Amiri et al., which we often had to leave out).

Meta-analysis/descriptive analysis summary

In the meta-analysis, anti-androgen+lifestyle was superior compared to metformin+lifestyle in improving hirsutism and increasing SHBG. In this meta-analysis also number of menstrual cycles/year increased with anti-androgen+lifestyle combination compared to metformin+lifestyle. For other outcomes, no difference was observed. Certainty in the evidence is low or very low.
Regarding individual studies, not included in the meta-analysis, Gambineri et al. found that participants using anti-androgen+lifestyle had a higher, more favourable HDL compared to those with metformin and lifestyle (certainty low).
Patients using metformin reported more GI adverse effects, whereas those using anti-androgens reported more polyuria and dryness of mouth (please see table at the end).

Author, year, country	Population	Sample Size per group	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Type of analysis and subgroup	ROB

Adverse effects

	Study	Metformin+LS	Anti-androgen+LS
Gastrointestinal side effects (diarrhea,vomiting etc)	Long 2022	4/54	2/53
	Ganie 2013	9/56 (diarrhea)	0/51
Nausea	Long 2022	5/54	3/53
	Ganie 2013	3/56	
Other	Long 2022	0/54 (polyuria) 0/54 (dry mouth)	1/53 (polyuria) 2/53 (dry mouth)
	Ganie 2013	-	4/51 polyuria 2/51 (dry mouth) 11/51 (menstrual irregularity)

Comparison 13: Metformin+anti-androgen+lifestyle versus anti-androgen+lifestyle (also in Q4.6 – not identical since timeline is different)

Evidence Summary

Four randomised controlled trials (RCTs) were identified by our search. Of these RCT, all were included in the meta-analysis.
Of these studies two had a low ROB and two a moderate ROB.

Rows highlighted grey indicate studies with participants described as obese. Unfortunately, we were not able to perform any subanalyses due to a limit number of studies.

Meta-analysis/descriptive analysis summary

In the meta-analysis, metformin+anti-androgen+lifestyle was superior in lowering fasting glucose compared to only anti-androgen and lifestyle. For other outcomes, no difference was observed. Certainty in the evidence is low or very low.

Regarding individual studies, not included in the meta-analysis, Ganie et al. and Gambineri et al. found that HOMA-IR and menstrual cycle/6 months was significantly lower after using metformin+anti-androgen+lifestyle compared anti-androgen and lifestyle. Certainty in the evidence for the individual studies are high for HOMA-IR and low for menstrual cycles/6 months.

Author, year, country	Population	Sample Size per group	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Type of analysis and subgroup	ROB

Comparison 14: Metformin+anti-androgen+lifestyle versus placebo+lifestyle (also in Q4.6 – identical)

Evidence Summary

Two randomised controlled trials (RCTs) were identified by our search. Of these RCT, both were included in the meta-analysis.
One study (Gambineri et al. 2006) had a low ROB, whereas the other one (Amiri et al. 2014) had a moderate ROB.

Rows highlighted grey indicate studies with participants described as obese.

Meta-analysis/descriptive analysis summary

In the meta-analysis, metformin+anti-androgen+lifestyle was superior in lowering fasting glucose and testosterone. For other outcomes, no difference was observed. Certainty in the evidence is very low.
Regarding individual studies, not included in the meta-analysis, Gambineri et al. found that metformin+anti-androgen+lifestyle compared anti-androgen and lifestyle was superior when it comes to lowering weight and improving the menstrual cycle. WHR was lower for those participants using placebo combined with LS. Certainty in the evidence for the individual studies are low.
None of the studies reported adverse effects.

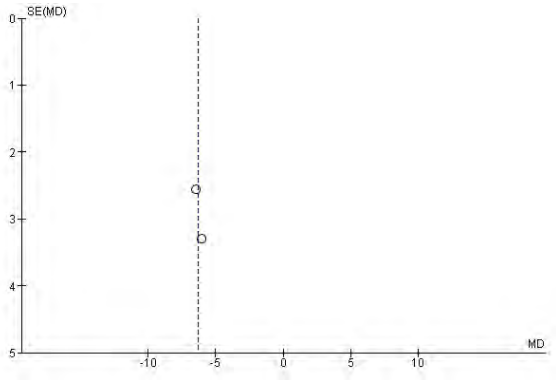
14.5.3. Funnel plot for assessment of publication bias



Comparison 15: Metformin versus rosiglitazone

Evidence Summary

Seven randomised controlled trials (RCTs), resulting in 9 articles were identified by our search. Of these RCT, all were included in the meta-analysis.
Of these articles one had a low ROB, six a moderate ROB and two a high ROB. All studies were on adult PCOS patients, one study on obese participants (BMI>=25), one on non-obese (BMI<27) and seven where the BMI was not reported. Rows highlighted grey indicate studies with participants described as obese and green indicates studies with participants described as non-obese. Studies using the same data are coloured in the “author-column”.
A major limitation in the evidence for this comparison is the lack of confidence in author reporting of units and conversions (Cetinkalp et al. 2009 and Ahmad et al. 2008).

Meta-analysis/descriptive analysis summary

Overall:
In the meta-analysis, metformin was superior in lowering weight (certainty very low) and BMI (certainty moderate), as well as improving hyperandrogenism (androstenedione and total testosterone) (certainty moderate).
Rosiglitazone was superior in improving LDL (certainty moderate).

Subanalyses according to BMI:
For PCOS-women with normal weight (BMI<27), metformin was superior in lowering testosterone (certainty very low), whereas rosiglitazone was superior in lowering fasting glucose (certainty very low). Metformin was superior in lowering weight and BMI regardless of BMI.
Note that for many outcomes subgroup analysis contained only one study and certainty is very low.

Regarding individual studies, not included in the meta-analysis, Ahmad et al found that metformin was superior in improving hirsutism (low certainty) compared to rosiglitazone. According to the study by Jensterle et al. it appears that metformin was superior in lowering triglycerides and rosiglitazone at lowering CRP (very low certainty). Menstrual cycles seemed to become more regular for participants using metformin (low certainty, Ahmad et al.).

Regarding adverse effects, Jensterle et al. and Kilicdag et al. reported participants in the metformin group to have more gastrointestinal adverse effects, whereas Jensterle found that some participants in the rosiglitazone group suffered from headache (see table at the end).

Gastrointestinal side effects (diarrhea,vomiting etc)	Jensterle 2008 (1)	4/18	0/17
	Kilicdag	3/15	0/15
Headache	Jensterle 2008 (1)	0/18	3/17

Comparison 16: Metformin versus pioglitazone

Evidence Summary

Six randomised controlled trials (RCTs) were identified by our search. Of these RCT, all were included in the meta-analysis.
Of these studies two had a moderate ROB and four a high ROB. All studies were on adult PCOS patients, two studies on obese participants (BMI>=25) and four where the BMI was not reported. Rows highlighted grey indicate studies with participants described as obese.
A major limitation in the evidence for this comparison is the lack of confidence in author reporting of units and conversions (Shahebrahimi et al).

Meta-analysis/descriptive analysis summary

In the meta-analysis, metformin was superior in lowering WHR in obese women (certainty very low) whereas pioglitazone was superior in improving FAI (certainty moderate).
Regarding individual studies, not included in the meta-analysis, Ortega-Gonzales et al found that metformin was superior in improving free testosterone and androstenedione (very low certainty).
We did not find any reports on adverse effects.

Author, year, country	Population	Sample Size per group	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Type of analysis and subgroup	ROB
Naka et al 2011 Greece	Young women with PCOS (mean age 23.3 years)	1.Metformin=15 2.Placebo=14 3.Pioglitazone=14	6 months	1.29.4 ±6.5 2.28.3 ±4.9 3.28.5±5.4	1.22.2±3.6 2.24.3 ±6.0 3.23.6±5.1	Weight, bmi, WHR, f-gluc, f-insulin, lipids, hirsutism, T, SHBG, FAI	META	**ROB Moderate**

Comparison 17: Metformin versus saxagliptin

Evidence Summary

Only one RCTs compared metformin to saxagliptin (Elkind-Hirsch et al. 2016). This study was rated as low risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. Elkind-Hirsch et al. found that saxagliptin was more effective than metformin in lowering triglycerides and increasing SHBG, whereas metformin was superior in decreasing testosterone and LDL among PCOS women with prediabetic hyperglycemia. For the other outcomes measured, no difference was observed. The article states that “saxagliptin was well tolerated in this trial. The addition of SAXA to MET therapy did not lead to an increase in the incidence of gastrointestinal side effects, which are typically associated with metformin treatment alone. No clinically meaningful differences between treatment groups in the overall incidence of clinical adverse experiences, serious clinical adverse experiences, or laboratory adverse experiences were observed. The incidence of study discontinuation due to adverse events over 16 weeks was similar across arms.”
Certainty in the evidence for this comparison is low (downgraded twice for very serious risk of imprecision, being a small, single study).

Comparison 18: Metformin+saxagliptin versus metformin

Evidence Summary

Only one RCTs compared metformin and saxagliptin to metformin (Elkind-Hirsch et al. 2016). This study was rated as low risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. Elkind-Hirsch et al. found that metformin and saxagliptin was more effective than metformin only in lowering triglycerides, increasing SHBG and shortening menstrual cycle among PCOS women with prediabetic hyperglycemia. For the other outcomes measured, no difference was observed.
The article states that “saxagliptin was well tolerated in this trial. The addition of SAXA to MET therapy did not lead to an increase in the incidence of gastrointestinal side effects, which are typically associated with metformin treatment alone. No clinically meaningful differences between treatment groups in the overall incidence of clinical adverse experiences, serious clinical adverse experiences, or laboratory adverse experiences were observed. The incidence of study discontinuation due to adverse events over 16 weeks was similar across arms.”
Certainty in the evidence for this comparison is low (downgraded twice for very serious risk of imprecision, being a small, single study).

Comparison 19: Metformin+saxagliptin versus saxagliptin

Evidence Summary

Only one RCTs compared metformin and saxagliptin to saxagliptin (Elkind-Hirsch et al. 2016). This study was rated as low risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. Elkind-Hirsh found that a combination treatment with metformin and saxagliptin is superior compared to saxagliptin when it comes to shortening menstrual cycle among PCOS women with prediabetic hyperglycemia.
The article states that “saxagliptin was well tolerated in this trial. The addition of SAXA to MET therapy did not lead to an increase in the incidence of gastrointestinal side effects, which are typically associated with metformin treatment alone. No clinically meaningful differences between treatment groups in the overall incidence of clinical adverse experiences, serious clinical adverse experiences, or laboratory adverse experiences were observed. The incidence of study discontinuation due to adverse events over 16 weeks was similar across arms.”
Certainty in the evidence for this comparison is low (downgraded twice for very serious risk of imprecision, being a small, single study).

Comparison 20: Metformin versus SGLT2-inhibitors

Evidence Summary

Two RCTs compared metformin to SGLT2inhibitors. One compared metformin to empagliflozin (Javed et al. 2019), whereas the other one compared metformin to canagliflozin (Cai et al. 2022). Both studies were rated as moderate risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study comparing metformin to empagliflozin. Javed et al. found that empagliflozin improved weight and BMI reduction in overweight and obese women with PCOS (BMI=>25). No changes were seen in hormonal or metabolic parameters. There were no adverse events in the metformin-group. In the empagliflozin-group, two patients reported adverse events (headache and dizziness=1 and mild rash=1) which were however believed to be unrelated to the study drug. As this was a randomized open-label study, it was rates as having a moderate risk of bias. Certainty in the evidence for this comparison is very low (downgraded once for serious risk of bias and twice for very serious risk imprecision, being a small study).

Meta-analysis was also not possible with only one study comparing metformin to canagliflozin. Cai et al. found that canagliflozin lowered DHEAS in women with PCOS. Otherwise there were no differences in the outcomes compared. This study was rated as having a moderate risk of bias due to no blinding and protocol published in retrospect. Certainty in the evidence for this comparison is very low (downgraded once for serious risk of bias and twice for very serious risk imprecision, being a small study).

Author, year, country	Population	Sample Size per group	Intervention/ exposure details	PCOS criteria	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Summary of findings	Other
Javed et al. 2019 UK	Overweight and obese women (BMI>=25) with PCOS	1.Metformin=20 2.Empagliflozin=19	1.Metformin 1500mg/d 2.Empagliflozin 25mg/d	Rott	3 months	1.38.7 ±7.8 2.37.1 ±6.8	1.31.5±20 2.26.0 ±8.0	Weight, bmi, FAI, T, SHBG, A, DHEAS, f-gluc, f-insulin, homa, lipids, crp	A significant improvement in anthropometric parameters and body composition could be observed in overweight and obese women with PCOS after 12 weeks of treatment with empagliflozin compared to metformin, although no changes were seen in hormonal or metabolic parameters.	**ROB moderate**
Cai et al 2022 China	Women aged 18 to 45 years with PCOS and IR	1.Metformin=29 2.Canagliflozin=30	1.Metformin 1500/2000mg/d 2.Canagliflozin 100mg/d	Rott	3 months	1.27.95 (26.22 to 29.69) 2.27.26 (25.55 to 28.99) Mean (95% CI)	1.27.83 (25.97 to 29.68) 2.28.58 (26.72 to 30.43) Mean (95% CI)	Weight, bmi, whr, menstrual cycles, homa, f-gluc, f-insulin, lipids, T, A, DHEAS, SHBG	canagliflozin was not inferior to metformin in PCOS patients with IR, which suggests that sodium-glucose cotransporter-2 inhibitors should be considered as effective drugs in the treatment of PCOS patients with IR.	**ROB Moderate**

Comparison 21: Metformin+liraglutide versus liraglutide

Evidence Summary

Only one RCTs compared metformin and liraglutide to liraglutide only (Jensterle et al. 2017). This study was rated as high risk of bias as there was no blinding. Note that other comparisons between metformin and liraglutide are included in Q4.5.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. Jensterle et al. found that liraglutide only was more effective in lowering BMI, whereas metformin and liraglutide combined was more effective in lowering LDL-cholesterol. Note that the liraglutide dose was different in the two groups observed.
The most common side effects in the liraglutide-group were nausea (8/14) and diarrhea (5/14). Vomiting occurred in 1/14 patients and 2/14 mild headache were documented. Adverse effects reported in combination-group were nausea (6/14), mild diarrhea (6/14), and insomnia (1/14). No side effect was documented by 6/14 in the liraglutide-group and 8/14 in the combination-group. No subject withdrew because of the adverse events in either group.

Certainty in the evidence for this comparison is very low (downgraded twice for serious risk of bias and twice for very serious risk imprecision, being a single, small study).

Comparison 22: Metformin+myo-inositol versus myo-inositol

Evidence Summary

Only one RCTs compared metformin and myo-inositol to myo-inositol only (Prabhakar et al. 2021). This study was rated as moderate risk of bias as the information on whether the study is open labelled or blinded is lacking. Note that other comparisons between metformin and myo-inositol are included in Q4.7

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. This study reported standardized mean difference (SMD) and 95% CI. Prabhakar et al. did not find any differences in the study groups for outcomes observed.
The combination group reported more adverse events (84.2%) than the myo-inositol group (18.7%). One patient in the combination group discontinued due to nausea, vomiting and severe gastric pain. Liver function tests were normal in both groups.
Certainty in the evidence for this comparison is very low (downgraded once for serious risk of bias and twice for very serious risk imprecision, being a single, small study).

Comparison 24: Metformin+pioglitazone versus pioglitazone

Evidence Summary

Only one RCTs compared metformin and pioglitazone to pioglitazone (Sohrevardi et al. 2016). This study was rated as high risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. Sohrevardi et al. found that treatment with a combination of metformin and pioglitazone was superior in lowering testosterone compared to pioglitazone only, whereas pioglitazone only was better in lowering fasting glucose.
In the combination group two women withdrew from the study because of intolerable gastric discomfort. Pioglitazone was well tolerated and
no patients discontinued pioglitazone because of side-effects.
Certainty in the evidence for this comparison is very low (downgraded twice for very serious risk of bias and twice for very serious risk imprecision, being a single, small study).

Comparison 26: Metformin versus metformin+rosiglitazone

Evidence Summary

Only one RCTs compared metformin to metformin and rosiglitazone (Li et al. 2020). This study was rated as low risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. Li et al. found that metformin alone was more effective for decreasing weight and BMI. Note that the metformin-dose was higher (1500mg/d) in the metformin-only group compared to the combination group (metformin 1000mg/d). Metformin in combination with rosiglitazone was more effective for decreasing total cholesterol and triglycerides. Metformin only increased HDL better than Metformin+Rosiglitazone in combination.
When metformin was administered at a dosage of 1,500 mg/day, 51 patients experienced nausea, loss of appetite, diarrhea, and dizziness. Most of these patients gradually adapted within 1 to 5 weeks, except for one patient who could not tolerate a dosage of 1,500 mg/day and withdrew from the study with a dosage reduced to 1,000 mg/day. No side effects related to rosiglitazone were reported throughout the study.

Certainty in the evidence for this comparison is moderate (downgraded once for serious risk of imprecision, being a small, single study).

Author, year, country	Population	Sample Size per group	Intervention/ exposure details	PCOS criteria	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Summary of findings	Other

Comparison 28: Metformin versus metformin (different dose)

Evidence Summary

Only one RCTs compared metformin with different doses (Harborne et al. 2005). This study was rated as high risk of bias.

Meta-analysis/descriptive analysis summary

Meta-analysis was not possible with only one study. Harborne et al. found that there was no difference between the two interventions. Other relevant outcomes were mentioned in this study, however no useable data was reported.
Certainty in the evidence for this comparison is very low (downgraded twice for very serious risk of bias and once for serious risk imprecision, being a small study). The study didn't report adverse effects.

Author, year, country	Population	Sample Size per group	Intervention/ exposure details	PCOS criteria	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Summary of findings	Other
Harborne et al. 2005 UK	Obese women with PCOS	1.42 2.41	1.Metformin 500mgx3=1500mg/d 2.Metformin 850mgx3=2550mg/d	Author defined	8 months	All participants: 37.2 (35.9, 38.5)	NR	weight	Weight loss is a feature of protracted metformin therapy in obese women with PCOS, with greater weight reduction potentially achievable with higher doses.	**ROB high**

Individual studies

Outcome	**Time point**	**N**	**Metformin 1500mg/d Mean**	**SD**	**Metformin 2550mg/d Mean**	**SD**	**P value**	**Favours**
Weight	8 months	83	101.9	19.90	92.7	14.57	0.08	No difference

Comparison 29: Metformin versus metformin+MPA

Evidence Summary

Only one RCTs compared metformin to metformin and MPA (medroxyprogesterone acetate) (Haydardedeoglu et al. 2009). This study was rated as moderate risk of bias.

Meta-analysis/descriptive analysis summary

A meta-analysis was not possible to perform with only one study. Haydardedeoglu et al. found that metformin only was superior for lowering testosterone and free testosterone compared to metformin combined with cyclic MPA and metformin only was also superior in increasing HDL. Certainty in the evidence for this comparison is very low (downgraded once for serious risk of bias and twice for very serious risk imprecision, being a small study).
Note: in the previous TR, this study was included in the comparison of metformin versus OCP. Since MPA is a progestin and in that way different from the other OCPs, it is analysed separately.

Author, year, country	Population	Sample Size per group	Intervention/ exposure details	PCOS criteria	Duration	Mean BMI (kg/m2)	Mean Age (y)	Outcomes	Summary of findings	Other
Haydardedeoglu 2009 Turkey	Women with PCOS	1.Metformin=20 2.Metformin+MPA=20	1.Metformin 850mgx2/d 2. [1] Downgraded once as studies high to low risk of bias (3/7 high ROB)
[2] Downgraded once as all studies moderate ROB
[3] Downgraded twice as all studies high ROB
[4] Downgraded once as all studies high or moderate ROB
[5] Downgraded once as studies low, moderate and high ROB
[6] Downgraded once as 4 studies moderate, 2 low, 1 high ROB (weight 2,5%)
[7] Downgraded once as studies high to low risk of bias
[8] Downgraded once as 6 studies moderate, 1 high ROB (weight 16.4%)
[9] Downgraded once as one study high and one low ROB
[10] Downgraded once as I^2 is close to or >50% but CI partly overlapping
[11] Downgraded twice as I^2 very high and CI not overlapping
[12] Downgraded once as no information on what BMI the patients in the studies had
[13] Downgraded once as no adolescents in the overall group
[14] Downgraded twice as the CI is wide and there are few studies
[15] Downgraded once as the CI is wide

[16] Downgraded once as there are only a few participants
[17] Not downgraded since there is only one study with a large CI containing only a small amount of the participants
[18] Downgraded twice as all studies but one is high ROB
[19] Upgraded once due to large effect

QUALITY APPRAISAL. RANDOMISED CONTROLLED TRIALS

Study ID	Aghamohammadzadeh 2010
Study Citation	Aghamohammadzadeh N, Aliasgarzadeh A, Baglar L, Abdollahifard S, Bahrami A, Najafipour F, et al. Comparison of metformin and cyproteroneestrodiol compound effect on hs c-reactive protein and serum androgen levels in patients with poly cystic ovary syndrome. Pakistan journal of medical sciences. 2010;26(2):347-51.
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	NIH
Presence of infertility	*Not reported*
Presence of other condition/s	*Not reported*
Medication History	*No*
N per group	*Allocated/randomised: 35 to each group* *Assessed at end of study: 30 in each group*
Setting	*specialty and sub specialty clinics of Tabriz University (Medical Sciences).*
Intervention	*EE 35 μg + CPA 2 mg*
Comparison	*Meformin 1000 mg/d*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*CRP, androgens*
Follow up Duration	*3 + 6 months*
Summary Result/s	*No significant differences between COCP and metformin.*
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	*The aim of our study was to compare the effects of Metformin and Cyproterone-estradiol compound on CRP and androgens level in patients with PCOS.*
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	Yes **Partial** No Not reported	*patients with PCOS from specialty and sub specialty clinics of Tabriz University (Medical Sciences). We used the National Institutes of Health criteria for diagnosis of patients. Not clearly stated specific inclusion criteria.*
Exclusion criteria	**Yes** Partial No Not reported	*rheumatic disease, infective disease, therapy for hirsutism and scalp hair loss such as spironolactone and finasteride and therapy for acne such as antibi-otics.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	*Patients randomly divided in two equal groups.*
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	
PERFORMANC	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	

	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No **Not reported**	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	
	Were all outcomes measured in a standard, valid and reliable way?	Yes **Partial** No Not reported	*Yes for blood tests, not reported for anthropometry*
	Were outcomes assessed objectively and independently?	Yes **Partial** No Not reported	*Yes for blood tests, not reported for anthropometry*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	14% COCP 14% met	*COCP 5/35 = 14%* *Met 5/35 = 14%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial **No** Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	*No protocol*

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes **Partial** No Not reported	*Only BMI, andorgens and CRP at baseline reported, not other baseline criteria such as age.*
	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No **Not reported**	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	Yes **Partial** No Not reported	*T tests were used, no reports on if data was normally distributed*
COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	*Randomization not described. Lack of baseline data. No protocol,*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Ahmad 2008
Study Citation	Ahmad, Jamal; Shukla, Nidhi; Khan, Abdur Rahman; Ahmed, Faiz; Siddiqui, M. Asim Comparison of metabolic effects of metformin and rosiglitazone in the management of polycystic ovary syndrome (PCOS): A prospective, parallel, randomized, open-label study Diabetes & metabolic syndrome clinical research & reviews 2008;2(1):37-46
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	PCOS women aged 18-35 years, with complaints of menstrual irregularities, hirsutism, and/or sterility
PCOS diagnostic criteria	NIH
Presence of infertility	For some
Presence of other condition/s	Menstrual irregularities, hirsutism
Medication History	-
N per group	*Allocated/randomised:* 1.Metformin=35 2.Rosiglitazone=35 *Assessed: Metformin=31* *Rosiglitazone=30*
Setting	Seventy non-diabetic, euthyroid, normoprolactinemic women aged 18-35 years, attending the outpatient endocrinology clinic with complaints of menstrual irregularities, hirsutism, and/or sterility were recruited.
Intervention	1.Metformin 850mgx2/d
Comparison	2.Rosiglitazone 2mgx2/d
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, WHR, hirsutism, menstruation, f-gluc, f-insulin, homa, T, dheas, A

Follow up Duration	3, 6 and 12 months	
Summary Result/s	Rosiglitazone seems to improve insulin resistance relatively earlier; while metformin had an earlier and more sustained benefit on hyperandrogenemia.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*The present study was undertaken to evaluate and compare the efficacy of metformin versus rosiglitazone on insulin resistance and hyperandrogenemia in women with PCOS*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	PCOS was diagnosed by the presence of (i) chronic ovulatory dysfunction–oligomenorrhea (cycle length > 45 days) or amenorrhea (cycle length > 6 months), (ii) evidence of hyperandrogenemia, whether clinical (hirsutism with F—G score of >8) or biochemical (serum concentration of testosterone)
Exclusion criteria	Yes Partial No Not reported	other causes such as CAH, androgen secreting tumors, hyperprolactinemia and Cushing's syndrome.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS — **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*-Subjects were randomly allocated into two group using random number tables.* -prospective, parallel, randomized, open-label study
SELECTION BIAS — **Was allocation to intervention group concealed**	Yes Partial No Not reported	

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Met - 4/35=11.4% Rosi- 5/35=14.3%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis	Yes Partial No Not reported	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*However, no p-values were reported to report similarity at baseline. This was done via visual inspection.*
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*There was sufficient randomisation, but open-label design indicates no blinding so there was potentially performance and detection bias.*

Study ID	Alpanes 2017
Study Citation	Alpañés M, Álvarez-Blasco F, Fernández-Durán E, Luque-Ramírez M, Escobar-Morreale HF. Combined oral contraceptives plus spironolactone compared with metformin in women with polycystic ovary syndrome: a one-year randomized clinical trial. European journal of endocrinology / European Federation of Endocrine Societies. 2017;177(5):399-408.
Study Country	Spain
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	Rotterdam (fulfills NIH/AES criteria)
Presence of infertility	Excluded
Presence of other condition/s	
Medication History	-
N per group	*Randomised to COC + spir:* 24 assigned, 18 completed *Randomized to metformin.:* 22 assigned, 13 completed
Setting	*Androgen excess outpatient clinic, Madrid, Spain*
Intervention	30 μg EE+ 150 μg DG (Microdiol, Merck Sharp & Dohme de España, S.A. Madrid, Spain) given 21/28 days + 100 mg spironolactone (Aldactone, Pfizer, S.L., Alcobendas, Spain)
Comparison	*Metformin* (Dianben, Merck, S.L., Mollet del Vallés, Spain) 850 mg b.i.d. (total 1700 mg/day)
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Hirsutism score, BMI, waist circumference and waist-to-hip ratio after three, six, nine and 12 months of treatment.* *Androgenic profile and OGTT after overnight fasting.*
Follow up Duration	*12 months*

Summary Result/s	Compared with metformin, COC plus spironolactone caused larger decreases in hirsutism score, total and free testosterone and menstrual dysfunction.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	*The aim was to compare COC + spiro vs. met to compare treatment efficacy and safety in terms of cardiometabolic risk factors and adverse events.*
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	*Diagnosis of PCOS required the presence of clinical and/or biochemical hyperandrogenism together with evidence of oligoovulation. Specific etiologies such as nonclassic 21-hydroxylase deficiency, hyperprolactinemia, hypothyroidism, Cushing's syndrome and androgen-secreting tumors had been excluded.* *Hirsutism was defined by a modified Ferriman–Gallwey score ≥8 points. Biochemical hyperandrogenism was defined by total testosterone ≥2.3 nmol/L, calculated free testosterone ≥35 pmol/L, androstendione ≥15.7 nmol/L and/or dehydroepiandrosterone sulfate ≥9.5 µmol/L.* *Ovulatory dysfunction required the presence of menstrual dysfunction (menstrual cycle length: ≤ 26 or > 35 days) or evidence of luteal phase defect in women with normal menstrual cycles (day 20–24 serum progesterone concentrations: ≤12.7 pmol/L).*
Exclusion criteria	**Yes** Partial No Not reported	*Patients seeking fertility and those with previous surgical treatment of PCOS or medical treatment with hormonal contraceptives, antiandrogens, insulin sensitizers or drugs that might interfere with blood pressure regulation, lipid profile or carbohydrate metabolism for the previous three months, history of serious illness including hypertension, diabetes mellitus, or cardiovascular*

			events, pregnancy, contraindication for the use of metformin, COC or spironolactone and drug or alcohol abuse.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	**Yes** Partial No Not reported	*Stratified block randomization one-to-one ratio. Blocks of ten sealed opaque envelopes (five per arm of treatment) served for treatment assignment. Stratification for obesity, defined by a body mass index (BMI) ≥30 kg/m2, was accomplished by using separate blocks for non-obese and for obese women.*
	Was allocation to intervention group concealed?	Yes Partial **No** Not reported	*No masking method was used after randomization.*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial **No** Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial **No** Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes **Partial** No Not reported	*Met group started on lower dose first week, and were advised to use barrier conception.*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes **Partial** No Not reported	*Yes for blood samples. Not reported for anthropometric and hirsutism outcomes.*

	Were outcomes assessed objectively and independently?	Yes **Partial** No Not reported	*Yes for blood samples. Not reported for anthropometric and hirsutism outcomes.*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	25% treatment 41% control/ comparison	*COC + spiro: 24 assigned, 18 with ongoing treatment after 12 months = 25% dropout.* *24 included in ITT analysis = 100%.* *Met: 22 assigned, 13 with ongoing treatment after 12 months = 41% dropout. 22 included in ITT analysis = 100%.*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	**Yes** Partial No Not reported	*ITT*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	**Yes** Partial No Not reported	*Protocol published is in Spanish but seems to include the reported outcomes.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes **Partial** No Not reported	*Partial* *SHBG levels seem to be higher at baseline in COC+spiro group. Met group has higher FG score at baseline.*
	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial **No** Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	**Yes** Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes **Partial** No Not reported	*No absolute results presented, only % change from baseline for some outcomes, and not for both groups.*
COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	*High dropout rate, most results not presented as numbers with appropriate measures. Group allocation probably known to the ones who performed hirsutism assessment (not reported)*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Altinok 2018
Study Citation	Altinok, Magda Lambaa; Ravn, Pernille; Andersen, Marianne; Glintborg, Dorte Effect of 12-month treatment with metformin and/or oral contraceptives on health-related quality of life in polycystic ovary syndrome Gynecological endocrinology : the official journal of the International Society of Gynecological Endocrinology 2018;34(10):859-863
Study Country	Denmark
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	White women with PCOS, aged 18-39 years, BMI <35

PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	Eight participants had prescriptions of antidepressants at trial-start M (n = 3), M + OCP (n = 3) and OCP (n =2)
Medication History	Eight participants had prescriptions of antidepressants at trial-start M (n = 3), M + OCP (n = 3) and OCP (n =2)
N per group	*Allocated/randomised: Metformin-group 30* *OCP-group 30* *Metformin+OCP 30* *Assessed at end of study: Metformin-group 19* *OCP-group 23* *Metformin+OCP 23*
Setting	Patients were recruited from the Department of Endocrinology, Odense University Hospital, and from local fertility clinics and Departments of Gynecology.
Intervention	Metformin 1000+1000 mg/d (M was slowly up titrated with 500 mg/day/week). M was paused 4 weeks and OCP 12 weeks prior to evaluation. Barrier contraception during the study period or an intrauterine device implanted. All patients were given general advice on lifestyle intervention.
Comparison	OCP-group: 150 mg desogestrel+30 µg ethinylestradiol Metformin+OCP: Metformin 1000+1000 mg/d and 150 mg desogestrel+30 µg ethinylestradiol. All patients were given general advice on lifestyle intervention.
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, BMI (kg/m2), FG-total, Total T, FAI, SHBG (nmol/l), Health-related quality of life
Follow up Duration	12 months
Summary Result/s	HRQoL changes were comparable between 12- month randomized M and/or OCP treatment in relatively healthy and lean women with PCOS.

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To assess changes in HRQoL during a 12-month randomized treatment with M, OCP or M + OCP in PCOS.

Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	White women, aged 18–39 years and with body mass index (BMI) < 35 kg/m2. Patients who fulfilled the Rotterdam criteria for PCOS
Exclusion criteria	Yes Partial No Not reported	Pregnancy, medical diseases, untreated depression or eating disorders, diabetes or contraindications for M or OCP
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported
	Was allocation to intervention group concealed?	Yes Partial No Not reported
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported

	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Patients with Metformin only consented to use a barrier contraception during the study period or have an intrauterine device implanted.
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Metformin-group 11/30=36.7%* *OCP-group 7/30=23.3%* *Metformin+OCP 7/30=23.3%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Only remaining participants*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*SOS missing*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Oral contraceptive pills and metformin tablets were sponsored by Sandoz but they were not involved in the economy, planning of the project, or writing of the article.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	The power of the study was calculated using the area under the curve for serum insulin during two hours oral glucose tolerance test as the primary end point. No previous randomized controlled trials has examined the effect of M and/or OCP on HRQoL during 12-month treatment.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*High dropout rate, no baseline data regarding important confounders, unclear randomization and blinding process.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was*		*No – all outcomes high risk of bias*	

low risk but rest were high)?

Study Citation	*Bilgir O, Kebapcilar L, Taner C, Bilgir F, Kebapcilar A, Bozkaya G, et al. The effect of ethinylestradiol (EE)/cyproterone acetate (CA) and EE/CA plus metformin treatment on adhesion molecules in cases with polycystic ovary syndrome (PCOS). Intern Med. 2009;48(14):1193-9.*
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	
Medication History	*No*
N per group	*Allocated/randomised: 20 in each group* *Assessed at end of study: 20 in each group*
Setting	*Not reported, study performed in Turkey,*
Intervention	*EE 35 µg plus CPA 2 mg (Diane Nova, Shering, Germany; 21 days per month followed by a 7-day pill-free period*
Comparison	*EE 35 µg plus CPA 2 mg (Diane Nova, Shering, Germany; 21 days per month followed by a 7-day pill-free period + metformin (Glucophage, Merck Lipha Lab, Lyon, France; 850 mg twice daily).*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Lipid profile, androgens, insulin, and HOMA-IR values* *Adhesion molecules*
Follow up Duration	*3 months*
Summary Result/s	*EE/CA+metformin treatment reduced inflammation markers in cases with PCOS compared to EE/CA treatment.*
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	*Adhesion molecules were evaluated before and 3 months after treatment to observe the response to EE/CA and EE/CA plus metformin treatment with respect to chronic inflammation previously detected in PCOS.*
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	*All cases with PCOS were evaluated based on the Rotterdam criteria. All patients fulfilled the diagnostic criteria; that is, at least two of the three criteria: polycystic ovaries on ultrasonography, clinical and/ or biochemical signs of hyperandrogenism, and oligo- and/ or anovulation. All women had normal thyroid, renal and hepatic functions.* *Not reported if this was inclusion criteria.*
Exclusion criteria	**Yes** Partial No Not reported	*Women who had received any medication (e.g., insulin-sensitizing drugs, oral contraceptives, antiandrogens, statins, aspirin, NSAIDs, warfarin, antidepressant medication, corticosteroids, ASA, GnRH agonists or antagonists) in the preceding 3 months were excluded. Furthermore, patients with hypertension and electrocardiographic changes suggestive of coronary artery disease, a history of angina or myocardial infarction, any known vascular, diabetes mellitus, known coagulation abnormalities, hyperprolactinemia, spontaneous abortion, bulimia or anorexia, any systemic disease,* *infection or inflammatory diseases were excluded from the study.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	*randomly divided into two groups*
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% COCP 0% COCP + met	*COCP 0/20* *COCP + met 0/20*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	**Yes** Partial No Not reported	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	*Not reported* *This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	**Yes** Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No **Not reported**	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	*Randomization not described, no blinding, no protocol.*

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	

Study ID	Bodur 2018
Study Citation	Bodur S, Dundar O, Kanat-Pektas M, Kinci MF, Tutuncu L. The effects of different therapeutic modalities on cardiovascular risk factors in women with polycystıc ovary syndrome: A randomızed controlled study. Taiwan J Obstet Gynecol. 2018;57(3):411-6.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Non-obese women with PCOS aged 18-39 years
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	
Medication History	*No*
N per group	*OCP: 21* *Met:29* *Combo: 20* *Controls:17*
Setting	*Outpatient gynaecology clinic of the Haydarpasa Training Hospital,Istanbul, Turkey*
Intervention	*3 mg DRSP in combination with 30 µg EE (Yasmin™ pills, Schering AG, Germany).*
Comparison	*Met: 1700 mg metformin per day (Glucophage® 850 mg tablets, Merck Pharmaceuticals, Turkey).* *Combo: 3 mg DRSP and 30 µg EE in combination with 1700 mg metformin per day.* *Controls: No treatment*

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary not stated. Antropometry, glucose metabolism, inflammatory and hematostatic factors.*	
Follow up Duration	*6 months*	
Summary Result/s	*Six cycles of treatments with OC alone may cause metabolic variables to deteriorate in non-obese women with PCOS. The addition of metformin to OC may ameliorate some aspects of this effect.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	*This study was designed to evaluate the effects of different therapeutic modalities (3 mg DRSP/ 30 µg EE, 1700 mg metformin and in combination) on cardiovascular risk factors, including metabolic risk factors, haemostatic risk factors, and markers of low-grade inflammation in non-obese women with PCOS.*
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	*Non-obese (18-30 BMI) women with PCOS according to Rotterdam criteria receiving care at the outpatient gynaecology clinic of the Haydarpasa Training Hospital. Clinical or biochemical hyperandrogenism was detected if the modified Ferriman-Gallwey score was higher than 8, acne was present and serum concentrations of total and/ or free testosterone were increased. Oligomenorrhoea was defined when menstruation occurred six times a year at most. Polycystic ovaries were visualized by ultrasonography when increased stromal echogenicity was peripher-ally surrounded by more than 10 follicles with a diameter of 2-8 mm*
Exclusion criteria	**Yes** Partial	*Those patients who had systemic disorders and were receiving therapies that could affect*

		No Not reported	*carbohy-drate and lipid metabolism were excluded from the study. Patients reporting contraindications for oral contraceptives and metformin were also excluded from the study.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes **Partial** No Not reported	*randomized into four subgroups by a computerized method*
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No **Not reported**	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	19% treatment (OCP) Met: 41% Combo: 40% Controls: 13%	*OCP 4/21 dropouts = 19%* *Met: 12/29 dropouts = 41%* *Combo 8/20 dropouts = 40%* *Controls 2/17 dropouts = 13%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No **Not reported**	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	*Not reported* *No protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	**Yes** Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial **No** Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS		*Lack of blinding and high dropout rate not similar between groups key reason for high RoB*	
What is the overall risk of bias?		Low Moderate **High** Insufficient information	Lack of blinding and high dropout rate not similar between groups key reason for high RoB
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes high risk of bias*	

Study ID	Bridger 2006
Study Citation	Bridger, T.; MacDonald, S.; Baltzer, F.; Rodd, C. Randomized placebo-controlled trial of metformin for adolescents with polycystic ovary syndrome Arch Pediatr Adolesc Med Mar 2006;160(3):241-6
Study Country	Canada
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Adolescents, 13 to 18 years with hyperinsulinemia and PCOS
PCOS diagnostic criteria	Author defined. All subjects had chronic oligomenorrhea (<6 menses in the preceding year) and clinical or biochemical evidence of hyperandrogenism

Presence of infertility	No	
Presence of other condition/s	No	
Medication History	*No*	
N per group	*Allocated/randomised: Metformin-group 11* *placebo-group 11* *Assessed at end of study, Metformin-group 11* *placebo-group 10*	
Setting	Adolescents with PCOS and hyperinsulinemia from the Endocrinology and Adolescent Medicine clinics of the Montreal Children's Hospital (Montreal, Quebec) between 1999 and 2002. Participants were 13-18 years old and had a history of menarche at least 2 years prior to enrollment	
Intervention	Metformin 750mgx2/day	
Comparison	Placebo 1 tablx2/day	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, , T, f-gluc, HOMA, lipids, girls with restored menses	
Follow up Duration	3 months	
Summary Result/s	A significant decline in T with metformin compared with placebo The relative risk of menses was 2.50 times higher in the metformin group compared with the placebo. There were no significant changes in bmi, hirsutism, triglyceride levels, or total and low-density lipoprotein cholesterol levels.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To determine whether metformin or placebo could, in conjunction with healthy lifestyle counseling, decrease serum testosterone levels and related aberrations in adolescents with hyperandrogenism, hyperinsulinemia, and polycystic ovarian syndrome.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	
Inclusion criteria		Yes Partial No Not reported	Adolescents, 13 to 18 years with chronic oligomenorrhea (<6 menses in the preceding year) and clinical or biochemical evidence of hyperandrogenism
Exclusion criteria		Yes Partial No Not reported	Exclusion criteria included diabetes mellitus, renal or hepatic disease, pregnancy, allergies to metformin, taking oral contraceptives in the 6 months prior to enrolment, or taking medications that could influence the effects of insulin or androgens
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Patients were randomized by draw sequential sampling, without replacement
	Was allocation to intervention group concealed?	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*placebo-controlled, double- blind trial*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Metformin-group 0/11=0%* *placebo-group 1/11=9.1%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Differences in BMI*

	If confounding was present, was it controlled for?	Yes Partial No Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Aventis Phar- maceutical, Laval, Quebec, supplied metformin and an identical appearing placebo*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Sample size was based on power calculations and the pub- lished effects of metformin treatment in adult women. We ap- proached eligible candidates sequentially until this goal was achieved, and baseline demographic features did not differ be- tween participants and nonparticipants
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Burchall 2017

Study Citation	Burchall, Genia F.; Piva, Terrence J.; Ranasinha, Sanjeeva; Teede, Helena J. Differential Effects on Haemostatic Markers by Metformin and the Contraceptive Pill: A Randomized Comparative Trial in PCOS Thrombosis and haemostasis 2017;117(11):2053-2062
Study Country	Australia
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Overweight and obese women with PCOS
PCOS diagnostic criteria	NIH
Presence of infertility	No
Presence of other condition/s	BMI – metformin group = 37.79 ± 6.81 Low dose OCP+spiro=35.25 ± 5.71 Higher-dose OCP= 35.91 ± 8.11
Medication History	*No*
N per group	*Allocated/randomised: metformin-group N=37* *Low-dose OCP+spiro N=38* *High dose OCP=35* *Assessed at end of study: metformin-group N=23* *Low-dose OCP+spiro N=16* *High dose OCP=21* Not all participants had samples available for haemostatic measurements.
Setting	The women were recruited from community advertisements and studied between 2003 and 2005. The study was performed retrospectively on biobanked samples.
Intervention	Participants received standard diet and lifestyle advice at the screening visit. Three months later, women were randomly allocated. Metformin 1000mgx2/day with dose titrated up over 4 weeks starting at 500 mgx2/dday.
Comparison	Participants received standard diet and lifestyle advice at the screening visit. Low-dose OCP+Spiro: 20-µg EE/100-µg levonorgestrel combined with spironolactone 50 mgx2/day High-dose OCP: 35-µg EE/2-mg cyproterone acetate

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, oGTT, Insulin, HOMA-IR, T, PAI-1, ADMA, PF1 and 2, TG, Fibrinolytic system, Plasminogen, TAFI.	
Follow up Duration	Metabolic, hormonal and haemostatic markers were assessed at baseline and after 6 months of intervention.	
Summary Result/s	Endothelial function improved with higher dose with some improvement in low-dose OCP + S and metformin. Aberrant coagulation was noted in both OCP groups, but not with metformin. Fibrinolysis was reduced with higher-dose OCP. Study suggests an additional dimension of treatment (haemostatic system effects) that favours metformin treatment over the OCP in PCOS.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To investigate and compare haemostatic impacts of common pharmacological treatments and explore relationships with hormonal and metabolic variables in PCOS.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	PCOS was diagnosed after medical review by the study team based on the NIH criteria that includes irregular menstrual cycles (<21 or >35 days) and clinical (hirsutism, acne) or biochemical (elevation of at least one circulating ovarian androgen) hyperandrogenism.
Exclusion criteria	Yes Partial No Not reported	Exclusion criteria were secondary causes of amenorrhea and hyperandrogenism (congenital adrenal hyperplasia, androgen-secreting tumours, Cushing's syndrome, hyperprolactinaemia, thyroid dysfunction, adrenal disorders and pregnancy), smoking and diabetes.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	At randomization subjects were allocated to one of three groups based on computer-generated random numbers. Open label study
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Open label study
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Open label study
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Open label study. End-point sample collection was completed by a research nurse who was blinded to the treatment allocation.
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	End-point sample collection was completed by a research nurse who was blinded to the treatment allocation.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*metformin-group N=14/37=37.8%* *low-dose OCP+spiro N=22/38=57.9%* *high dose OCP=14/35=40%* Not all participants had samples available for haemostatic measurements.

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	There was no significant difference in age between the three interventional groups. Other variables not reported.
	If confounding was present, was it controlled for?	Yes Partial No Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Prior sample size calculation was made to ensure adequate statistical power to detect statistical significance, although the study was slightly underpowered in the low-dose OCP + S group

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		Moderate - Some of the criteria have been fulfilled and those criteria that have not been fulfilled may affect the conclusions of the study.	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High drop outrate/lost to follow up and no blinding key reason for high RoB*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	Cai 2022
Study Citation	Cai, Meili; Shao, Xiaowen; Xing, Feng; Zhang, Yuqin; Gao, Xinyu; Zeng, Qiongjing; Dilimulati, Diliqingna; Qu, Shen; Zhang, Manna Efficacy of canagliflozin versus metformin in women with polycystic ovary syndrome: A randomized, open-label, noninferiority trial Diabetes, obesity & metabolism 2022;24(2):312-320
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women aged 18 to 45 years with PCOS and IR
PCOS diagnostic criteria	Rotterdam
Presence of infertility	NR
Presence of other condition/s	Insulin resistance
Medication History	No
N per group	*Allocated/randomised:* 1. Metformin=35 2. Canagliflozin=33

	Assessed: 1. Metformin=29 2. Canagliflozin=30	
Setting	A randomized open-label study in the Department of Endocrinology, Shanghai Tenth People's Hospital between July 2019 and April 2021. 68 PCOS patients with IR who were aged 18 to 45 years were finally enrolled	
Intervention	Metformin 500mgx2 the first week, then Metformin 1500-2000mg/d	
Comparison	Canagliflozin 100mg/d	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, bmi, whr, menstrual cycles, homa, f-gluc, f-insulin, lipids, T, A, DHEAS, SHBG	
Follow up Duration	3 months	
Summary Result/s	canagliflozin was not inferior to metformin in PCOS patients with IR	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To determine the safety and efficacy of canagliflozin in comparison to metformin in polycystic ovary syndrome (PCOS) patients with insulin resistance (IR).
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	-PCOS patients with IR who were aged 18 to 45 years -Diagnosis of PCOS was based on the Rotterdam diagnosis criteria (2003)

Exclusion criteria		Yes Partial No Not reported	-younger than 18 years or older than 45 years -mental illness that rendered the individual unable to provide informed consent -severe hepatic and renal dysfunction and/or heart failure -taking/having taken traditional Chinese medicine, contraceptives, SGLT2 inhibitors, metformin, glucagon-like peptide-1 or pioglitazone in the previous 3 months -current or recent participation in another clinical trial -strong fertility needs within half a year of the study period.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	randomized, in a 1:1 ratio, to either a canagliflozin or a metformin group, using blocked randomization (block size: 6). Sequentially numbered, sealed, opaque envelopes were used for allocation concealment.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	The participants were advised to use adequate contraception while receiving canagliflozin.

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1. Metformin=6/35=17.1% 2. Canagliflozin=3/33=9.1%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*The intention to treat population was used to analyse the safety of canagliflozin versus metformin and the pre-protocol population was used to analyse the efficacy of canagliflozin versus metformin*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	clinical trial registration number was NCT04700839. *Protocol published at the end of the study period*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	

	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Funding not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*No blinding, protocol published in retrospect*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*

Study ID	*Cetinkalp 2009*
Study Citation	Cetinkalp S, Karadeniz M, Erdogan M, Ozgen G, Saygl F, Ylmaz C. The effects of rosiglitazone, metformin, and estradiol-cyproterone acetate on lean patients with polycystic ovary syndrome. The Endocrinologist (Baltimore, Md). 2009;19(3):94-7.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants	Women with PCOS	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	*Not reported*	
Presence of other condition/s		
Medication History	*No*	
N per group	*Allocated/randomised: 100 included, 94 randomized* *Assessed at end of study:* *COCP:33* *Met: 47* *Rosiglitazone:14 (not included in this systematic review)*	
Setting	*Not reported*	
Intervention	35ug EE +2 mg CPA	
Comparison	metformin 2g/day	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, weight, TG, Chol, LDL, HDL, insulin, glucose, HOMA, DHEAS, free T, TT, CRP, oligo-/amenorrhea, FG score	
Follow up Duration	*4 months*	
Summary Result/s	*ECA is more effective than insulin-sensitizing drugs such as rosiglitazone and metformin in improving menstrual pattern and reducing serum free-testosterone levels. MET, an insulin-sensitizing drug, is more effective in reducing fasting insulin levels than the ECA.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	*The present study aims to compare the clinical, biochemical, and hormonal changes in PCOS patients on MET, ROSI, and ECA therapy.*
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	

If there were specified inclusion/ exclusion criteria, were these appropriate?		**Yes** Partial No Not reported	
Inclusion criteria		**Yes** Partial No Not reported	*Young women with PCOS were included in our study. PCOS was defined by the Rotterdam PCOS consensus criteria.*
Exclusion criteria		**Yes** Partial No Not reported	Patients who had DM, hyperprolactinemia, congenital adrenal hyper-plasia (diagnosed with the adrenocorticotropic hormone stimulation test), thyroid disorders, Cushing syndrome, hypertension, hepatic or renal dysfunction were excluded from the study. Use of confounding medications, such as oral contraceptive agents, antihypertensive medications, and insulin sensitizing drugs were also excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	*Only reported that randomization was used*
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes **Partial** No Not reported	*Yes for blood tests, not reported for anthropometry.*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison **Not reported**	*Overall 6/100 dropouts, not reported for specific groups*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No **Not reported**	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	*No protocol*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes **Partial** No Not reported	*Age not reported*

	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No **Not reported**	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	Yes **Partial** No Not reported	*Only Mann-Whitney U test and Wilcoxon rank sum test were used, no reports on data distribution*
COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	*High due to not describing randomization, no Consort flow chart, no description of group allocation for dropouts, no baseline data for age.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	Cho 2009

Study Citation	Cho, L. W.; Kilpatrick, E. S.; Keevil, B. G.; Coady, A. M.; Atkin, S. L. Effect of metformin, orlistat and pioglitazone treatment on mean insulin resistance and its biological variability in polycystic ovary syndrome Clin Endocrinol (Oxf) Feb 2009;70(2):233-7
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Obese, hyperandrogenic, anovulatory Caucasian women with PCOS
PCOS diagnostic criteria	Rott
Presence of infertility	No
Presence of other condition/s	Obesity
Medication History	
N per group	*Allocated/randomised:* 1.Metformin=10 2.Orlistat=10 3.Pioglitazone=10 *Assessed:* 1.Metformin=10 2.Orlistat=10 3.Pioglitazone=10
Setting	Thirty obese hyperandrogenic, anovulatory Caucasian women with PCOS [BMI 36·0 ± 1·2 kg/m2 and age of 26·4 ± 1·5 year (mean ± SEM)] were recruited from the Hull Royal Infirmary endocrinology clinic, where they were referred by their primary care physicians for investigation of menstrual abnormalities, with or without hirsutism.
Intervention	1.Metformin 500mgx3/d
Comparison	2.Orlistat 120mgx3/d 3.Pioglitazone 45mg/d
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Homa, insulin, shbg, bmi, fai
Follow up Duration	3 months

Summary Result/s	Only orlistat reduced both IR and its variability significantly, though all three drugs were effective in reducing hyperandrogenism within the 12-week period of the study	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To compare the change in IR and its variability before and after treatment with insulin sensitization through metformin and pioglitazone, compared to that induced by weight loss with orlistat
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Exclusion criteria were vague (no specified medication)*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	all patients had oligomenorrhea or amenorrhoea, hyperandrogenaemia and polycystic ovaries on transvaginal ultrasound.
Exclusion criteria	Yes Partial No Not reported	None were on any medications that would alter their IR at the time or for the preceding 3 months of entering the trial. Diabetes was excluded by a 75-g oral glucose tolerance test.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Randomized, open labelled parallel study randomized using a computer program
SELECTION BIAS **Was allocation to intervention group concealed**	Yes Partial No Not reported	
PERFORMANC **Were patients blind to intervention group?**	Yes Partial No Not reported	

	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	0% in all groups
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Age not reported*
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Funded by Hull university but conflict of interest not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Describes power calculation, but not for what difference*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*No blinding, no protocol, conflict of interest not reported, all relevant baseline values not reported.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	

Study ID	Christakou 2014

Study Citation	Christakou C, Kollias A, Piperi C, Katsikis I, Panidis D, Diamanti-Kandarakis E. The benefit-to-risk ratio of common treatments in PCOS: effect of oral contraceptives versus metformin on atherogenic markers. Hormones (Athens). 2014;13(4):488-97.
Study Country	Greece
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	NIH
Presence of infertility	*Not reported*
Presence of other condition/s	
Medication History	*No*
N per group	*Allocated/randomised: 40 / group randomized* *Assessed at end of study:* *EE/CPA:38* *EE/DRSP: 36* *Met: 35*
Setting	Outpatient Departments of Endocrinology of the two participant University Hospitals in Thessaloniki and in Athens, between 2008 and 2010
Intervention	35ug EE +2 mg CPA
Comparison	30 35ug EE + 3mg DRSP metformin 1700 mg/day
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, HOMA, TT, SHBG, FAI, CRP
Follow up Duration	*3 + 6 months*
Summary Result/s	Metformin as well as the OCP containing cyproterone acetate were effective in reducing serum AGEs while the OCP containing drospirenone had a marginal lowering effect on this marker
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	To compare effects of COCP and metformin on atherosclerotic markers incl CRP and advanced glycated end products in lean women with PCOS
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	PCOS according to NIH criteria. All the participants were lean (BMI <25 kg/m2), in good health and nonsmokers or had quit smoking for more than a year at baseline. Not stated if this was exclusion criteria
Exclusion criteria	**Yes** Partial No Not reported	Patients were excluded from participation if they were pregnant or planning to become pregnant, were breastfeeding, had a his-tory of current or recent (within 6 months) use of oral contraceptives, antidiabetics, or antiandrogens, or had any contraindications to metformin therapy including renal or hepatic impairment.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	**Yes** Partial No Not reported	After completing baseline evaluation, patients were randomized in a 1:1:1 ratio Randomization was performed by random number tables. The patient number treatment codes were held by a third party.
	Was allocation to intervention group concealed?	Yes Partial **No** Not reported	
PERFORMANC	**Were patients blind to intervention group?**	Yes Partial **No** Not reported	

	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	**Yes** Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** **Partial** No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	***EE/CPA 5%*** ***EE/DRSP 10%*** ***Met 13%***	EE/CPA 2/40=5% EE/DRSP 4/40=10% met 5/40=13%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial **No** Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	*No protocol*

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes **Partial** No Not reported	Matched for age, BMI and WHR. HOMA differed at baseline.
	If confounding was present, was it controlled for?	Yes **Partial** No Not reported	Correlation between HOMA and primary outcomes were checked, no correlations
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial **No** Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low **Moderate** High Insufficient information	Moderate due to only partly described randomization process, no blinding
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

Study ID	De Zegher
Study Citation	de Zegher, Francis; Diaz, Marta; Villarroya, Joan; Cairo, Montserrat; Lopez-Bermejo, Abel; Villarroya, Francesc; Ibanez, Lourdes The relative deficit of GDF15 in adolescent girls with PCOS can be changed into an abundance that reduces liver fat Scientific reports 2021;11(1):7018
Study Country	Spain
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Adolescent girls with PCOS two RCT pooled (gynaecological age>2.0 years)
PCOS diagnostic criteria	Inclusion criteria were hirsutism (modifed Ferriman-Gallwey score>8), oligomenorrhea (menstrual intervals>45 day), gynaecological age>2.0 years, and absence of sexual activity.
Presence of infertility	No
Presence of other condition/s	hyperandrogenism
Medication History	No
N per group	Allocated/randomised: SPIOMET-group=36 OCP-group=35 Assessed at end of study: SPIOMET-group=29 OCP-group=29
Setting	A post-hoc study of two previous randomised studies in adolescent girls with PCOS
Intervention	Mediterranean diet and regular exercise were recommended to all study participants. SPIOMET-group: spironolactone 50 mgx1 daily, pioglitazone 7.5 mg once daily and metformin 850 mg once daily, taken together at dinner time.
Comparison	Mediterranean diet and regular exercise were recommended to all study participants; OCP-group: 20 µg ethinyloestradiol plus 100 mg levonorgestrel (21/28 days), and placebo (7/28 days)

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Birthweight, GDF15, CRP, HOMA-IR, adiponectin, abdominal fat, hepatic fat, lipids, FAI, testosterone	
Follow up Duration	12 months with medication. Results of outcomes are shown at baseline, 6 months with medication and 6 months after medication stopped (i.e. 18 months after the study begun)	
Summary Result/s	OCP and SPIOMET treatment were accompanied, respectively, by 1.7- and 3.4-fold rises of circulating GDF15. Post-OCP, the circulating concentrations of GDF15, CRP and insulin returned towards baseline levels; post-SPIOMET, there appeared to be prolonged benefts: GDF15 returned also to baseline levels but CRP, insulin and liver fat remained normal, while circulating HMW adiponectin remained elevated.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To test the hypothesis that PCOS in non-obese adolescents is characterised by low concentrations of circulating GDF15, when judged by the degree of CRP and insulin drive. To study the effects of OCP versus SPIOMET on circulating GDF15
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	a) hirsutism (modifed Ferriman-Gallwey score>8) b) oligomenorrhea (menstrual intervals>45 day), c) gynaecological age>2.0 years d) absence of sexual activity.
Exclusion criteria	Yes Partial No Not reported	Exclusion criteria were 21-hydroxylase defciency; glucose intolerance or diabetes; evidence of thyroid, liver, or kidney dysfunction; hyperprolactinemia; and any prior use of medications affecting gonadal/adrenal function, or carbohydrate/lipid metabolism
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	open-label, randomized, controlled design? On the other hand they say that the OCP group got OCP+placebo
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Open label*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Open label
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported for anthropomety, yes for blood samples*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*SPIOMET-group 7/36=19.4%* *OCP 6/35=17.1%*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial No Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*Conflicting information on randomization and drop-outs key reason for moderate RoB*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes similar*	

Study ID	Diri 2017
Study Citation	Diri, H.; Bayram, F.; Simsek, Y.; Caliskan, Z.; Kocer, D. Comparison of Finasteride, Metformin, and Finasteride Plus Metformin in Pcos. *Acta Endocrinol (Buchar)* **2017**, *13*, 84-89, doi:10.4183/aeb.2017.84.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*No*
Presence of other condition/s	*None*
Medication History	*None*
N per group	*Randomised to FIN: n = 16; Randomised to MET: n = 19; Randomised to MET + FIN: n = 17*

Setting	*Patients admitted to the outpatient Endocrinology clinic of Erciyes University medical school, Turkey*	
Intervention	5mg/day FIN (Proscar, Merck Sharp Dohme, UK);	
Comparison/s	850mg twice daily metformin (Glukofen, Sandoz, Turkey); 5mg/day FIN (Proscar, Merck Sharp Dohme, UK) + 850mg twice daily metformin (Glukofen, Sandoz, Turkey).	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, SHBG, Free T, DHEAS, Adrostenedione. HOMA-IR, AUC-Glucose, AUC-Insulin	
Follow up Duration	12 months	
Summary Result/s	Whilst each individual group showed benefit within the groups, comparisons in changes between the groups in parameters of any particular treatment modality. However, finasteride alone significantly reduced both androgen levels and parameters of insulin resistance. Metformin was not inferior to finasteride in the treatment of hyperandrogenism.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes *This study enrolled 70 patients admitted to the outpatient Endocrinology clinic of Erciyes University Medical School and either newly or previously diagnosed with PCOS.*
Exclusion criteria	Yes Partial No Not reported	Yes - *Patients with chronic systemic diseases, continuous drug use, and those who were treated for PCOS during the previous year were excluded.*

INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	No *Stated it was randomised but no protocol for randomisation provided*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	No *They were informed of the side effects, thus they were aware of which drugs they were taking.*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Partial
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Partial *During the first week of treatment, metformin was administered at a dose of 425 mg twice daily to avoid gastrointestinal side effects, and thereafter at a dose of 850 mg twice daily. Compared to other treatments that did not have this dose ramp up.*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Partial
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Yes
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	No

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Not reported
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	No
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported – no protocol
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Partial - *Some yes, but others such as SHBG and E2 were not similar at baseline*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	No
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Partial – no information on funding

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported – no power calculations made.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	**High -** *This is due to lack of blinding of participants, attrition bias, and drop-out rate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Dorgham 2021
Study Citation	Dorgham N, Sharobim A, Haggag H, El-Kalioby M, Dorgham D. Adding Combined Oral Contraceptives or Metformin to Laser Treatment in Polycystic Ovarian Syndrome Hirsute Patients. J Drugs Dermatol. 2021;20(3):302-6.
Study Country	Egypt
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS and facial hirsutism
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*

Presence of other condition/s	*Facial hirsutism*	
Medication History	*No*	
N per group	*Allocated/randomised: 50/group* *Assessed at end of study: 50/group*	
Setting	*Not stated where, but single center in Cairo, Egypt*	
Intervention	*Laser only*	
Comparison	*1: Laser + metformin* (Glucophage® 500 mg; Merck Serono, Darmstadt, Germany); 2: Laser + COCP, 35 μg EE + 2 mg CPA (Diane-35®; Bayer AG, Leverkusen, Germany).	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	HR-QoL (VAS, Dermatology Life Quality Index (DLQI) Hisutism Life Quality Index) (HLQI))	
Follow up Duration	*6 m*	
Summary Result/s	Combining hormonal treatment with laser hair removal can achieve greater hair reduction, significant improvements in patients' QOL, and better maintenance as compared with when combining metformin with laser hair removal or conducting alone.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	Assessing the impact of adding combined oral contraceptives (COCs) or metformin to laser hair removal on the quality of life of polycystic ovarian syndrome (PCOS) patients with hirsutism.
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No	*T*he inclusion criteria were an age of 18 to 40 years with a confirmed diagnosis of PCOS according to

		Not reported	the Rotterdam criteria10 and facial hirsutism as assessed by the Ferriman–Gallwey score.
Exclusion criteria		**Yes** Partial No Not reported	Hirsute patients with other dermatological and/or systemic diseases were considered ineligible for inclusion. Patients with any contraindication to receiving laser or hormonal treatments (eg, history of DVT) were also excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	**Yes** Partial No Not reported	Patients were randomly divided into three equal groups. An independent person created the allocation sequence using computer-generated random numbers. Allocation was concealed using sequentially numbered, opaque sealed envelopes kept by the attending nurse.
	Was allocation to intervention group concealed?	**Yes** Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	
DEDETECTION	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	

	Were all outcomes measured in a standard, valid and reliable way?	Yes **Partial** No Not reported	Self-reported outcome for QoL, change from start measured on VAS by treating physician
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison **Not reported**	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No **Not reported**	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No **Not reported**	Baseline data other then QoL data not reported
	If confounding was present, was it controlled for?	Yes Partial No **Not reported**	

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No **Not reported**	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	No baseline data, no reports on of dropouts, no blinding
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Elbandrawy 2022
Study Citation	Elbandrawy, A. M.; Yousef, A. M.; Morgan, E. N.; Ewais, N. F.; Eid, M. M.; Elkholi, S. M.; Abdelbasset, W. K. Effect of aerobic exercise on inflammatory markers in polycystic ovary syndrome: a randomized controlled trial European review for medical and pharmacological sciences 2022;26(10):3506-3513
Study Country	Cairo
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants	Females aged 25-35 years diagnosed with PCOS [mean age of 26.7±2.3, BMI of 23.6±3.5kg/m2
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	No
Medication History	No
N per group	Allocated/randomised: Metformin 20 Metformin+AE-group 20 Assessed at end of study: Metformin 20 Metformin+AE-group 20
Setting	Normal-weight women with PCOS were recruited from the Outpatient Clinic of Gynecology, Kasr Al-Aini University Hospital, Egypt
Intervention	Metformin 1500mg daily.
Comparison	A treadmill was used for walking aerobic exercise. All participants were allowed to hold a support bar if necessary. Participants assigned to the aerobic exercise group were invited to undertake three sessions of supervised exercise training each week for 12 consecutive weeks. Each session lasted approximately 60 min. The aerobic exercises consisted in walking on the treadmill for 30 minutes at a 0% slope, including three phases: the warming-up phase, which consisted in walking on the treadmill for 5 minutes at low intensity (30% of MHR), the actual phase, which consisted in walking on the treadmill for 20 min at moderate intensity (60-70% of MHR), and the cooling phase, which consisted in walking on the treadmill for 5 minutes at low intensity (30% of MHR). The MHR was calculated according to the equation (220-age). In addition Metformin 1500mg daily
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	IL-6, TNF-α, and CRP at baseline and after 12 weeks of intervention.
Follow up Duration	3 months
Summary Result/s	The findings showed a significant reduction in IL-6, TNF-α, and CRP values in both AEM and M groups (p=0.001, p=0.01,

	respectively) after the end of the 12 weeks of the intervention. However, the AEM-group showed a greater reduction in IL-6, TNF-α, and CRP (p=0.01, p = 0.01 and p=0.001, respectively)	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To examine the potential effects of aerobic exercise on interleukin-6 (IL6), tumor necrosis factor (TNF), and C-reactive protein (CRP) in PCOS women.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	Women with PCOS had to meet two of the following criteria: a medical history of hyperandrogenic oligo/ amenorrhea (8 menses per year) and PCO on ultrasonography of more than 10 ovarian follicles 2-9 mm in diameter, or clinical hirsutism (a modified Ferriman-Gallwey score of 8 or higher was considered diagnostic of hirsutism)
Exclusion criteria	Yes Partial No Not reported	No participation in an exercise training program in the last 3 months hyperandrogenism, such as congenital adrenal hyperplasia, thyroid dysfunction, and hyperprolactinemia. Additional exclusion criteria for this study were renal or hepatic dysfunction.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Participants who met the inclusion criteria were randomly assigned to one of the two groups. A computer-generated random table was used for randomization. At the baseline and after 12 weeks of the intervention, only one independent investigator, who was blinded to group allocation, conducted the testing procedures.

	Was allocation to intervention group concealed?	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Impossible, as only one group had aerobic activity*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	"At the baseline and after 12 weeks of the intervention, only one independent investigator, who was blinded to group allocation, conducted the testing procedures." So investigators yes, care provider no
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Participants in the AE+Met-group were given a separate familiarization session prior to the aerobic training session, during which they were introduced to the aerobic exercise protocol as well as all measurement procedures.
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Anthropometrical measurements not reported
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	One independent investigator, who was blinded to group allocation, conducted the testing procedures.
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Metformin-group 0/20=0%* *AE+Metformin-group 0/20=0%*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*No reports on hyperandrogenism or matabolic hormones*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Elkind-Hirsch 2016
Study Citation	Elkind-Hirsch, Karen E.; Paterson, Martha S.; Seidemann, Ericka L.; Gutowski, Hanh C. Short-term therapy with combination dipeptidyl peptidase-4 inhibitor saxagliptin/metformin extended release (XR) is superior to saxagliptin or metformin XR monotherapy in prediabetic women with polycystic ovary syndrome: a single-blind, randomized, pilot study Fertility & Sterility 2017;107(1):253-260.e1
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	PCOS women, aged 18–42 years with prediabetic hyperglycemia
PCOS diagnostic criteria	NIH
Presence of infertility	No
Presence of other condition/s	prediabetic hyperglycemia determined by a 75-gram oral glucose tolerance test
Medication History	NR
N per group	*Allocated/randomised:* 1. Metformin=13 2. Saxagliptin=12

	3. Metformin+Saxagliptin=13 *Assessed:* 1. Metformin=12 2. Saxagliptin=11 3. Metformin+Saxagliptin=11	
Setting	Healthy, premenopausal patients with PCOS, aged 18-42 years and with impaired glucose regulation were enrolled in the study from March 2014 to January 2016.	
Intervention	1.Metformin 2000mg/d	
Comparison	2.Saxagliptin 5mg/d 3. Metformin 2000mg/d+Saxagliptin 5mg/d	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	f-gluc, HOMA-IR, lipids, WHR, BMI, menstrual interval, T, A, SHBG, DHEAS, FAI	
Follow up Duration	4 months	
Summary Result/s	Treatment with SAXA-MET was superior to either drug alone in terms of clinical and metabolic benefits in prediabetic patients with PCOS.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To evaluate efficacy with the dipeptidyl peptidase-4 inhibitor saxagliptin (SAXA), metformin extended release (MET), and combination (SAXA-MET) in patients with polycystic ovary syndrome (PCOS) and impaired glucose regulation.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	

If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	Polycystic ovary syndrome was defined according to NIH. Eligible patients were required to have the combination of irregular periods (cycle length outside 21– 35 days or fewer than eight cycles per year) together with biochemical evidence of hyperandrogenism (total T >50 ng/dL or free androgen index [FAI] >3.87. Prediabetic hyperglycemia was determined by a 75-g oral glucose tolerance test (OGTT) and included PCOS patients with impaired fasting glucose, IGT, or both (impaired fasting glucose/IGT)
Exclusion criteria	Yes Partial No Not reported	DM, smokers, suspected pregnancy, desiring pregnancy, or injectable hormonal contraceptive use within 6 months; and use of oral contraceptives, other steroid hormones, drugs that affect gastrointestinal motility or carbohydrate metabolism, and/or antiobesity drugs within 3 months before study entry
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	All patients were allocated to 1 of these 3 groups according to computer-generated random numbers using a block randomization method. The primary investigator was blinded to all treatment arms. Prospective, randomized, single-blind drug study
SELECTION BIAS **Was allocation to intervention group concealed?**	Yes Partial No Not reported	
PERFORMANC **Were patients blind to intervention group?**	Yes Partial No Not reported	

	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	The primary investigator was blinded to all treatment arms.
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1. Metformin=1/13=7.69% 2. Saxagliptin=1/12=8.33% 3. Metformin+Saxagliptin=2/13=15.4%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Clinical Trial Registration Number: NCT02022007

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Main author served on an advisory board for AstraZeneca and has received research grant support from Novo Nordisk, Bayer, and Merck, Sharp and Dohme. Research grant from AstraZeneca Pharmaceuticals
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Power calculations were done*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported

Study Citation	Fonseka S, Wijeyaratne CN, Gawarammana IB, Kalupahana NS, Rosairo S, Ratnatunga N, et al. Effectiveness of Low-dose Ethinylestradiol/Cyproterone Acetate and Ethinylestradiol/Desogestrel with and without Metformin on Hirsutism in Polycystic Ovary Syndrome: A Randomized, Double-blind, Triple-dummy Study. J Clin Aesthet Dermatol. 2020;13(7):18-23.
Study Country	Sri Lanka
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS aged 18-40 yrs, with mFG score ≥8.
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	
Medication History	*No*
N per group	*COCP EE/CPA = 20* *COCP EE/DSG = 23* *EE/CPA + met = 26* *EE/DSG + met = 30*
Setting	*Patients attending medical and gynecology clinics at teaching hospitals in Kandy and Peradeniya, Sri Lanka*
Intervention	*EE 35 μg + CPA 2mg*
Comparison	*EE 20 μg + DSG 0.15 mg* *Met + EE 35 μg + CPA 2mg* *Met + EE 20 μg + DSG 0.15 mg*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Hirsutism: Hair density, hair diameter, and hair growth rate* *mFG score* *VAS hirsutism self assessment*
Follow up Duration	*6 + 12 months*
Summary Result/s	*EE/CPA and EE/DSG were equally effective in improving hirsutism in PCOS, with no added benefit from low-dose metformin.*
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	The objective was to determine the effectiveness of ethinylestradiol/cyproterone EE/CPA) and ethinylestradiol/desogestrel (EE/DES) both alone and in combination with low-dose metformin on hirsutism in women with PCOS.
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	Eligible subjects included those aged 18 to 40 years with PCOS diagnosed in accordance with the 2003 Rotterdam Consensus Conference criteria with a modified Ferriman-Gallway score (mFGS) of hirsutism of eight points or more.
Exclusion criteria	**Yes** Partial No Not reported	*Patients with secondary causes of hyperandrogenism, significant comorbidities such as diabetes, contraindications to the use of trial drugs, or who were taking any form of hormonal contraceptives or antiandrogens three months prior to starting the study and seeking fertility were excluded.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	**Yes** Partial No Not reported	*Simple randomization to four study arms was completed using a computer-generated random number table.*
	Was allocation to intervention group concealed?	**Yes** Partial No Not reported	According to the list generated by a random number generator, a piece of paper indicating the study arm (A, B, C, or D) was placed inside serially-numbered, sealed, opaque envelopes. When a participant was recruited, the patient's name, address, and telephone number were written on the envelope. Treatment was started according to the assigned arm (A, B, C, or D). All logistics were overseen by an administrator who was not involved in the rest of the study.

PERFORMANCE BIAS	**Were patients blind to intervention group?**	**Yes** Partial No Not reported	*Subjects of all four arms were prescribed three drugs using appropriate placebos.* *The active tablets were removed from the commercial packings and placed in adhesive polythene bags*
	Were investigators and care providers blind to intervention group?	**Yes** Partial No Not reported	*All the investigators, the statistician, and the involved patients were blinded to the treatment; the pharmacist who dispensed the drugs was not.*
	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	**Yes** Partial No Not reported	*a single examiner who was blinded to the therapy conduct the assessments and intra-observer variability was minimized by using the same photographic scale of mFGS to score the hirsutism.*
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	20% EE/CPA 8% *EE/DSG* *0% EE/CPA + met* *3% EE/DSG +met*	*COCP EE/CPA: randomized 25, dropout 5 = 20%* *COCP EE/DSG: randomized 25, dropout 2 = 8%* *EE/CPA + met: randomized 26, dropout 0 = 0%* *EE/DSG + met: randomized 31, dropout 1 = 3%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial **No** Not reported	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	**Yes** Partial No Not reported	*Protocol followed*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes **Partial** No Not reported	*Baseline characteristics did not differ significantly except for age, which was higher in met + EE/DSG group*
	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial **No** Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes **Partial** No Not reported	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	*A two-way mixed analysis of variance (ANOVA) model for repeated measures was used during the analysis. Additionally, a one-way ANOVA and categorical data analytical methods were used wherever appropriate.* *Before applying the two-way mixed ANOVA model, significant outliers in each variable were excluded. Where sphericity was not assured, the Greenhouse-Geisser or Huynh-Feldt test was used to calculate the p-values*
COMMENTS			

What is the overall risk of bias?	**Low** Moderate High Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		

Study ID	Gambineri 2004
Study Citation	Gambineri, A.; Pelusi, C.; Genghini, S.; Morselli-Labate, A. M.; Cacciari, M.; Pagotto, U.; Pasquali, R. Effect of flutamide and metformin administered alone or in combination in dieting obese women with polycystic ovary syndrome Clin Endocrinol (Oxf) Feb 2004;60(2):241-9
Study Country	Italy
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Obese (BMI>28) women with PCOS
PCOS diagnostic criteria	Rott
Presence of infertility	No
Presence of other condition/s	Obesity
Medication History	-
N per group	*Allocated/randomised:* 1. metformin N=10 2.Placebo N=10 3. FLUT N=10 4.Metformin+FLUT=10 *Assessed:* 1. metformin N=10 2.Placebo N=8 3. FLUT N=9 4.Metformin+FLUT=10

Setting	Forty obese women with PCOS were enrolled in the study. After a 1-month diet, according to single blind design, the patients were allocated to treatment with placebo, metformin (850 mg/orally, twice daily), flutamide (250 mg/orally, twice daily) or metformin (850 mg/orally, twice daily) + flutamide (250 mg/orally, twice daily) for the following 6 months, while continuing hypocaloric dieting.	
Intervention	1. metformin 850mgx2/d 2.Metformin 850mgx2/d +FLUT 250mgx2/d	
Comparison	Placebo FLUT 250mgx2/d	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, bmi, T, free-T, A, DHEAS, SHBG, f-gluc, f-insulin, HOMA, lipids	
Follow up Duration	6 months	
Summary Result/s	Metformin, flutamide or the combined metformin + flutamide treatment appears to have a more favourable outcome on body fat distribution, androgens, lipids, hirsutism and menses.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To investigate the effects of long-term metformin and flutamide, given alone or in combination and added to a hypocaloric diet, on body weight and fat distribution, androgens, metabolic and clinical status, in a group of obese women with PCOS
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	

Inclusion criteria		Yes Partial No Not reported	-BMI > 28 and abdominal fat distribution, defined - -WHR> 0·80 (WHO, 1997). The diagnosis of PCOS was made according to the presence of oligo/ amenorrhoea, hyperandrogenism [supranormal testosterone levels according to our reference values (0·39 ± 0·18 ng/ml)] and ovarian ultrasounds
Exclusion criteria		Yes Partial No Not reported	-thyroid, cardiovascular, renal or liver dysfunction, based on clinical examination and routine laboratory findings. -Cushing's syndrome and congenital adrenal hyperplasia, DM medication or significantly modified their body weight for 3 months before the study
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

Study Country	Denmark	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	*Not reported*	
Presence of other condition/s	-	
Medication History	*No*	
N per group	*Allocated/randomised: 30 to each group* *Assessed at end of study:* *COCP=23* *Met=19* *Combo=23*	
Setting	*Patients recruited from the department of Endocrinol-ogy, Odense University Hospital, and from local fertility clinics and Departments of Gynecology.*	
Intervention	*30 μg EE + 150 mg DSG*	
Comparison	*-Metformin 1000 mg b.i.d. (2000 mg/day)* *-Combo met + COCP*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*body composition, hyperandrogenism, metabolic markers*	
Follow up Duration	*12 months*	
Summary Result/s	*Met treatment alone or in combination with COCP was associated with weight loss and improved body composition compared with COCP alone, whereas free T levels decreased during met + COCP or COCP.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	*The primary aim of the present study was to evaluate whether treatment with metformin alone or combined with OCP resulted in a more advantageous body compo-sition than treatment with OCP alone*

Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	*Patients with PCOS according to Rotterdam criteria. Other inclusion criteria not stated.*
Exclusion criteria	**Yes** Partial No Not reported	*Patients with diabetes (fasting plasma glucose ≥ 7.0 mmol/L and/or HbA1c 44 mmol/mol), elevated liver enzymes, renal dysfunction, congestive heart disease, depression, and eating dis-orders were not included in the study. Obese patients [body mass index (BMI) ≥ 35 kg/m2] and patients with other contraindications for COCP (previous or family history of thrombosis or breast cancer, coagulatory defects, and heavy smokers) were not included in the study. Patients were not included if they were pregnant or expressed a wish for conception during the study period.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	
SELECTION BIAS **Was allocation to intervention group concealed?**	Yes Partial No **Not reported**	
PERFORMANC **Were patients blind to intervention group?**	Yes Partial No **Not reported**

COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	*Randomization not described, many dropouts, uneven distribution of dropouts and dropouts differed in BMI at baseline compared with completers.*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Heidari 2019
Study Citation	Heidari, Behnam; Lerman, Amir; Lalia, Antigoni Z.; Lerman, Lilach O.; Chang, Alice Y. Effect of Metformin on Microvascular Endothelial Function in Polycystic Ovary Syndrome Mayo Clinic proceedings 2019;94(12):2455-2466
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Females aged 18 to 50 years with a BMI of 25 or greater who had a diagnosis of PCOS
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	BMI of 25 or greater
Medication History	*No*
N per group	*Allocated/randomised: Metformin-group 33* *placebo-group 15* *Assessed at end of study: Metformin-group 29* *Placebo13*
Setting	An open-label study of women with PCOS randomized to metformin vs no treatment at Mayo Clinic in Rochester, Minnesota, from March 24, 2014, to November 18, 2016
Intervention	Metformin 1500mg/day
Comparison	placebo
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Bmi, weight, ogtt,f-gluc, insulin, HOMA, DHEAS, T, CRP, lipids
Follow up Duration	3 months
Summary Result/s	In metformin-treated participants, there was a significant decrease in body weight (P<.05), f-gluc (P<.01), f-insulin (P<.05), HOMA-IR (P<.05), total cholesterol (P<.05), and T(P<.001) after 3 months of treatment
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	"to determine whether specific metabolic, hormonal, or phenotypic features of PCOS might be associated with metformin's effect in PCOS on peripheral microvascular endothelial function or if metformin can improve endothelial function in women with PCOS and endothelial dysfunction."
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	Criteria of both oligoanovulation and androgen excess were required for inclusion in the study to increase the likelihood of insulin resistance. Oligoanovulation was defined as less than 9 menses per year or the absence of a progesterone increase above 10 ng/mL in the luteal phase (days 20–22 of menstrual cycle) in women with monthly menses. Androgen excess was defined as elevated testosterone or dehydroepiandrosterone sulfate, severe acne, androgenic alopecia, or clinical hirsutism (Ferriman-Gallwey score >8).
Exclusion criteria	Yes Partial No Not reported	Exclusion criteria included elevated prolactin level, untreated hypothyroidism or hyperthyroidism, Cushing syndrome, congenital adrenal hyperplasia, diabetes, creatinine level greater than 1.5 mg/dL (to convert to µmol/L, multiply by 88.4), pregnancy, breastfeeding, smoking, taking oral contraceptive pills or other medications that would affect androgen levels, insulin sensitivity, or endothelial function.

INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	an open-label randomized study. The randomization is not described
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Open label design
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Open label design
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Participants randomized to the no treatment arm had the option to continue the study for an additional 3 months, during which they received metformin and completed an additional set of study measurements after metformin treatment
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Metformin-group 4/33=12.1%* *placebo-group 2/15=13.3%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Two of the authors are consultants for medical companies*

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*Moderate*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*No blinding*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Ibanez 2020
Study Citation	Ibáñez L, Díaz M, García-Beltrán C, Malpique R, Garde E, López-Bermejo A, et al. Toward a Treatment Normalizing Ovulation Rate in Adolescent Girls With Polycystic Ovary Syndrome. J Endocr Soc. 2020;4(5):bvaa032.
Study Country	Spain
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Adolescent girls with PCOS two RCT pooled (gynaecological age>2.0 years)
PCOS diagnostic criteria	Inclusion criteria were hirsutism (modifed Ferriman-Gallwey score>8), oligomenorrhea (menstrual intervals>45 day), gynaecological age>2.0 years, and absence of sexual activity.
Presence of infertility	No

Presence of other condition/s	hyperandrogenism	
Medication History	*No*	
N per group	*Allocated/randomised: SPIOMET-group 36* *OCP-group 35* *Assessed at end of study: SPIOMET-group 31* *OCP-group 31*	
Setting	A post-hoc study of two previous randomised studies in adolescent girls with PCOS conducted in the Adolescent Endocrinology Unit of Sant Joan de Déu University Hospital, Barcelona, Spain. Mediterranean diet and regular exercise were recommended to all study participants	
Intervention	20 µg EE plus 100 mg LNG (21/28 days), and placebo (7/28 days)	
Comparison	SPIOMET-group: spironolactone 50 mgx1 daily, pioglitazone 7.5 mg once daily and metformin 850 mg once daily	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, hirsutism score, SHBG, T, androstenedione, free-testosterone, free-androstenedione, f-insulin, HOMA-IR, oGTT,, CRP lipids	
Follow up Duration	12 months	
Summary Result/s	OCP and SPIOMET treatment reduced the androgen excess comparably and had no differential effects on total-body lean or fat mass. However, SPIOMET was accompanied by more broadly normalizing effects, including on hepato-visceral fat and on circulating insulin	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	Reports on pooled results from two RCTs. The limited power of the first study (N = 34) prompted the launch of a second study with virtually identical design. The primary endpoint was posttreatment ovulation rate; secondary outcomes included hirsutism score, fasting insulin, androgens, lipids, high-molecular-weight (HMW) adiponectin, C-reactive protein (CRP), carotid intima-media thickness (cIMT), body composition, and hepato-visceral fat
Does the study have specified	**Yes** Partial No	

inclusion/exclusion criteria?	Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	a) hirsutism (modifed Ferriman-Gallwey score>8) b) oligomenorrhea (menstrual intervals>45 day), c) gynaecological age>2.0 years d) absence of sexual activity.
Exclusion criteria	**Yes** Partial No Not reported	Exclusion criteria were 21-hydroxylase defciency; glucose intolerance or diabetes; evidence of thyroid, liver, or kidney dysfunction; hyperprolactinemia; and any prior use of medications affecting gonadal/adrenal function, or carbohydrate/lipid metabolism
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Did the study have an adequate method of randomisation?**	**Yes** Partial No Not reported	Randomization (1:1) for study medication was webbased (http://www.SealedEnvelope.com), using random permuted blocks, with strata for age (<16.0 or >16.0 years) and BMI (<24.0 or ≥24.0 kg/m2).
SELECTION BIAS – **Was allocation to intervention group concealed?**	**Yes** Partial No Not reported	
PERFORMANCE BIAS – **Were patients blind to intervention group?**	Yes Partial **No** Not reported

Study Citation	Javed, Z.; Papageorgiou, M.; Deshmukh, H.; Rigby, A. S.; Qamar, U.; Abbas, J.; Khan, A. Y.; Kilpatrick, E. S.; Atkin, S. L.; Sathyapalan, T. Effects of empagliflozin on metabolic parameters in polycystic ovary syndrome: a randomized controlled study Clinical endocrinology 2019;90(6):805
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	PCOS women, aged 18–45 years and BMI>=25
PCOS diagnostic criteria	Rotterdam
Presence of infertility	No
Presence of other condition/s	Overweight, bmi>=25
Medication History	NR
N per group	*Allocated/randomised:* 1. Metformin=20 2. Empagliflozin=20 *Assessed:* 1. Metformin=20 2. Empagliflozin=19
Setting	An open-label, randomized, comparative study in women with PCOS was performed in the Academic Diabetes, Endocrinology and Metabolism research centre at Hull Royal Infirmary.
Intervention	1.Metformin 1500mg/d
Comparison	Empagliflozin 25mg/d
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, bmi, FAI, T, SHBG, A, DHEAS, f-gluc, f-insulin, homa, lipids, crp
Follow up Duration	3 months

Summary Result/s	A significant improvement in anthropometric parameters and body composition, in overweight and obese women with PCOS after 12 weeks of treatment with empagliflozin compared to metformin, although no changes were seen in hormonal or metabolic parameters.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	The aim of this study was to compare the effects of empagliflozin vs metformin on anthropometric and body composition, hormonal and metabolic parameters in women with PCOS.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	Aged 18-45 years BMI ≥25 kg/m^2 diagnosed with PCOS based on the Rotterdam criteria [biochemical hyperandrogenism, as indicated by a free androgen index (FAI) >4, and self-reported oligomenorrhea (cycle length >35 days and 9 or fewer periods per year) or amenorrhoea (absence of menses for a period ≥3 months)
Exclusion criteria	Yes Partial No Not reported	-differential diagnoses on classical 21-hydroxylase deficiency, hyperprolactinaemia, Cushing's disease and androgen-secreting tumours were excluded from participation. -pregnancy or intention to become pregnant, breastfeeding, documented use of oral hormonal contraceptives and hormone-releasing implants, metformin or other insulin-sensitizing medications, clomiphene citrate or oestrogen modulators, GnRH modulators and

			Minoxidil, DM, history or presence of malignant neoplasms within the last 5 years, pancreatitis (acute or chronic), recurrent UTI or gastrointestinal tract surgery, ongoing, inadequately controlled thyroid disorder and known hypersensitivity to the investigational medicinal products or any of their excipients.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	randomized on a 1:1 ratio using an online web-based randomization service (**https://www.sealedenvelope.com**) to receive either empagliflozin 25 mg (Jardiance) or metformin A randomized open-label study
	Was allocation to intervention group concealed?	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported

Study ID	Jensterle 2008 (1)
Study Citation	Jensterle, M.; Janez, A.; Mlinar, B.; Marc, J.; Prezelj, J.; Pfeifer, M. Impact of metformin and rosiglitazone treatment on glucose transporter 4 mRNA expression in women with polycystic ovary syndrome Eur J Endocrinol Jun 2008;158(6):793-801
Study Country	Slovenia
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	NICHD (National Institute of Child Health and Human Development)
Presence of infertility	NR
Presence of other condition/s	*NR*

Medication History	*NR*
N per group	*Allocated/randomised:* 1.Metformin=18 2.Rosiglitazone=17 *Assessed:* 1.Metformin=17 2.Rosiglitazone=16
Setting	"We recruited 35 women with PCOS as classified according to the National Institute of Child Health and Human Development (NICHD) criteria" (not reported where and in what kind of hospital)
Intervention	1.Metformin 850mgx2/d
Comparison	2.Rosiglitazone 4mg/d
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	f-gluc, f-insulin, homa, bmi, dheas, A, T, free T, periods/6months
Follow up Duration	6 months
Summary Result/s	Therapy with insulin sensitizers resulted in marked improvement in adipose tissue GLUT4 mRNA expression in PCOS patients, rosiglitazone being more effective when compared with metformin.

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To explore whether the well-known clinical, hormonal and metabolic efficacy of metformin or rosiglitazone treatment is reflected in the modulation of adipocyte GLUT4 mRNA expression in patients with PCOS.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	PCOS was classified according to the National Institute of Child Health and Human Development (NICHD) criteria

Exclusion criteria		Yes Partial No Not reported	Possible Cushing's syndrome or congenital (nonclassic) adrenal hyperplasia was excluded. Additional exclusion criteria were type 1 or type 2 diabetes mellitus, a significant cardiovascular or hepatic disease, and the use of medications known or suspected to affect reproductive or metabolic functions, within 60 days prior to study entry
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	"As a method of randomization, the RAND programme in Excel was used"

Study ID	Jensterle 2017
Study Citation	Jensterle et al., *BMC Endocrine Disorders 17 :5*, 2017
Study Country	Slovenia
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS and obesity
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	*bmi>30*
Medication History	*No*
N per group	*Lira 3 mg 14, Combo N =14*
Setting	outpatients Department for Endocrinology, Diabetes and Metabolic Diseases University Medical Center Ljubljana
Intervention	*Liraglutide 3mg qd*

Comparison	*Combo: Metformin 1000mg BID and Liraglutide 1.2 mg qd*	
Co-intervention	*none*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	The primary outcome of the study was mean change in measures of obesity. Secondary outcomes included metabolic and hormonal changes	
Follow up Duration	*12 weeks*	
Summary Result/s	Short-term interventions with COMBO and LIRA3 both led to significant improvement of measures of obesity in obese PCOS, LIRA3 being superior to COMBO. However, COMBO further improved androgen profile beyond weight reduction and was associated with better tolerability.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	compare the combination of metformin and low dose liraglutide 1.2 mg to high dose liraglutide 3 mg alone on measures of obesity in obese PCOS.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	type A phenotype of PCOS diagnosed by ASRM-ESHRE Rotterdam criteria including concomitant presence of a) hyperandrogenemia on either the biochemical or the clinical level, b) menses abnormalities and c) PCO morphology; age 18 years to menopause and obesity (body mass index: BMI ≥ 30)
Exclusion criteria	Yes Partial No Not reported	Patients with history of carcinoma, significant cardiovascular, kidney or hepatic disease and the use of medications known to affect reproductive or metabolic functions within prior to study entry

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes,* To detect a statistically significant difference between groups of approximately 2.5 kg in weight loss with 80% power, each group had to consist of 14 patients.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*yes*

COMMENTS	*Lack blinding key reason for high RoB*	
What is the overall risk of bias?	Low Moderate High Insufficient information	*High (no blinding)*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes high risk of bias*	

Study ID	Karimzadeh 2007
Study Citation	Karimzadeh, Mohamad Ali; Eftekhar, Maryam; Taheripanah, Robabeh; Tayebi, Naeimeh; Sakhavat, Leili; Zare, Fatemeh The effect of administration of metformin on lipid profile changes and insulin resistance in patients with polycystic ovary syndrome Middle East Fertility Society journal 2007;12(3):174
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women aged 20-35 years with PCOS
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Yes
Presence of other condition/s	menstrual disorder, hirsutism and infertility
Medication History	
N per group	*Allocated/randomised: Metformin-group 100* *placebo-group 100* *Assessed at end of study, not reported*
Setting	200 women with PCOS (age 20- 35 years) who were referred to clinic because of menstrual disorder, hirsutism and infertility.
Intervention	Metformin 500mg/day for one week and then 500mgx3/day

Comparison	Placebo 1 tabl/day for a week, then 3 tabl/day	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Lipids	
Follow up Duration	3 months	
Summary Result/s	Metformin increased ovulation and pregnancy rates and decreased lipids compared to placebo	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To evaluate the effects of metformin on lipid profile changes, insulin resistance, BMI, Ovulation and pregnancy rates in patients affected by PCOS
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	women (age 20- 35 years) with PCOS who were referred due to menstrual disorder, hirsutism and infertility.
Exclusion criteria	Yes Partial No Not reported	other endocrinological abnormalities such as hyperprolactinaemia, and thyroid dysfunction, Cushing syndrome, congenital adrenal hyperplasia.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Then patients were randomly (Randomization was performed using computergenerated sequences that were sealed in number opaque envelopes) divided into two groups.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Both women and the doctor were blinded to the content of tablet which had identical appearance and were packaged by the clinic pharmacist

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)	Yes Partial No Not reported	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial No Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*Attrition not reported, no protocol, no reports regarding funding or conflict of interest, no description on blood analysis*	
What is the overall risk of bias?		Low Moderate High	

	Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*

Study Citation	Kaya MG, Calapkorur B, Karaca Z, Yildirim S, Celik A, Akpek M, et al. The effects of treatment with drospirenone/ethinyl oestradiol alone or in combination with metformin on elastic properties of aorta in women with polycystic ovary syndrome. Clin Endocrinol (Oxf). 2012;77(6):885-92.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	AES
Presence of infertility	*NR*
Presence of other condition/s	
Medication History	*No*
N per group	*Allocated/randomised: COCP 19, COCP + met 18* *Assessed at end of study: COCP 19, COCP + met 18*
Setting	*women newly diagnosed with PCOS in the Department of Endocrinology of Erciyes University, Turkey*
Intervention	30 µg EE/3mg DRSP
Comparison	30 µg EE/3 mgDRSP + met

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, weight, SHBG, TT, fT, FAI, androstendione, DHEAS, insulin, HOMA, TG, LDL, HDL, CRP,	
Follow up Duration	*6 months*	
Summary Result/s	an improvement in the elastic parameters of the aorta by adding metformin to OCP treatment.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	The aim of this study was to investigate the effects of treatment with drospirenone/ethinyl oestradiol (E/E) alone or in combination with metformin on the elastic properties of the aorta in women with PCOS
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	Patients were selected from women newly diagnosed with PCOS in the Department of Endocrinology of Erciyes University according to the Androgen Excess and PCOS Society criteria
Exclusion criteria	**Yes** Partial No Not reported	Exclusion criteria included diabetes mellitus, hypertension, hy- perlipidaemia, corticosteroid use, oral contraceptive use, sys- temic disease (hepatic, renal, cardiac), use of drugs affecting insulin resistance, smoking, aortic disease (coarctation, aneu- rism, Marfan syndrome or history of aortic surgery), evidence of ongoing infection, presence of severe valve disease, pregnancy or inflammation and insufficient echocardiography view
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	Consecutively randomized into two different treatment arms
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes **Partial** No Not reported	Echocardiographic examinations were performed before and after 6 months of treatment by the same physician (BC) who was unaware of the patients' treatment group.
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0 %	*0 dropouts*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	**Yes** Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial **No** Not reported	BMI differed, 26 in combo vs 32 in COCP group. Other baseline parameters did not differ.
	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes **Partial** No Not reported	No conflict of interest, but funding not reported.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	

COMMENTS		
What is the overall risk of bias?	Low Moderate **High** Insufficient information	Randomization process not described properly, was decribed as consecutively randomized. Baseline characteristics differed between groups.
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		

Study ID	Kaya 2015
Study Citation	Kaya MG, Yildirim S, Calapkorur B, Akpek M, Unluhizarci K, Kelestimur F. Metformin improves endothelial function and carotid intima media thickness in patients with PCOS. Gynecol Endocrinol. 2015;31(5):401-5.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS, aged 17-37 years
PCOS diagnostic criteria	AES
Presence of infertility	Not reported
Presence of other condition/s	*No*
Medication History	*No*
N per group	*Allocated/randomised:* *Metformin+OCP 25* *OCP 25* *Assessed at end of study: drop-out not reported*
Setting	Women with PCOS in the Department of Endocrinology at Erciyes University Hospital, aged 17–37 years

Intervention	drospirenone 3 mg/ EE 3 mg with a 28-d cycle (21 hormone pills followed by 7 placebo pills)	
Comparison	drospirenone 3 mg/ EE 3 mg with a 28-d cycle (21 hormone pills followed by 7 placebo pills) and metformin 850 mg twice a day	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, BMI, lipids, SHBG, T, FAI, A, DHEAS, HOMA, CRP	
Follow up Duration	6 months	
Summary Result/s	adding metformin to OCP treatment may have beneficial effect on FMD and CIMT that represent vascular function in patients with PCOS. These results suggest that adding metformin to OCP treatment for PCOS could preserve the cardiovascular system and improve it.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	to investigate the effects of treatment with drospirenone/ ethinyl estradiol (EE) alone or in combination with metformin on the flow-mediated vasodilatation (FMD) and carotid intima media thickness (CIMT) in women with PCOS.
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	Newly diagnosed women with PCOS, aged 17–37 years. PCOS was defined as the presence of two of the following criteria after the exclusion of other etiologies: (i) polycystic ovaries on ultrasound examination, (ii) chronic oligomenorrhea or amenorrhea, (iii) clinical or biochemical evidence of hyperandrogenism
Exclusion criteria	**Yes** Partial No Not reported	DM, corticosteroid use, use of drugs affecting insulin resistance, hyperlipidemia, hypertension, oral contraceptive use, evidence of ongoing infection, presence of severe valve disease, pregnancy, systemic disease (hepatic, renal,

			cardiac), smoking, aortic disease (coarctation, aneurism, Marfan syndrome or history of aortic surgery).
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	After overnight fasting, blood samples were obtained from the subjects during the follicular phase of the menstrual cycle, except in those with amenorrhea.
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0 %	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)? **High**	Yes Partial No Not reported	*NA*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	**Yes** Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*NA*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes **Partial** No Not reported	No conflict of interest, funding not reported.

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS		*Randomization-process reported poorely*	
What is the overall risk of bias?		Low Moderate **High** Insufficient information	Unclear randomization, no blinding.

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	

COMMENTS		
What is the overall risk of bias?	Low Moderate **High** Insufficient information	Randomization not described, no blinding
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		

Study ID	Kebapcilar 2010
Study Citation	Kebapcilar L, Taner CE, Kebapcilar AG, Alacacioglu A, Sari I. Comparison of four different treatment regimens on coagulation parameters, hormonal and metabolic changes in women with polycystic ovary syndrome. Arch Gynecol Obstet. 2010;281(1):35-42.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	
Medication History	*No*
N per group	*Allocated/randomised: 12/group* *Assessed at end of study: 12/group*
Setting	*Not reported*
Intervention	35 µg EE/2mg CPA (Diane Nova, Shering, Germany; 21 days per month followed by a 7-day pill-free period),

Comparison	1: 35 µg EE/2mg CPA + met 1700 mg/day 2: : metformin 1700 mg/day 3: : met 1700 mg/day + spiro 100 mg/day metformin: Glucophage, Merck Lipha Lab, Lyon, France; 850 mg twice daily), spironolactone (Aldactone, ARIS, Turkey; 100 mg/daily)	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, fT, DHEAS, insulin, HOMA, TG, LDL, HDL,	
Follow up Duration	*3 months*	
Summary Result/s	In all treatment groups, reduced levels of coagulation parameters were observed, improvement of hormonal, hematological and metabolical variables by most probably reducing insulin levels. Among the treatment groups, EE/CA–metformin may be a more effective therapeutic option than the other protocols and this may be due to the benefcial effect of EE/CA–metformin on insulin resistance	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	To determine the effects of different treatment regimens on the hormonal features, metabolic parameters, and hematologic variables in women with PCOS
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	Patients with PCOS (24.0+/-5.4 years; BMI 27.9+/-5.28) were included in the study. PCOS was diagnosed according to Rotterdam. All women had normal thyroid, renal and hepatic functions.
Exclusion criteria	**Yes** Partial No Not reported	Women who had any medication (e.g., antihypertensives, oral anti-diabetics, oral contraceptives, antiandrogens, statins, warfarin, antidepressant medication, and GnRH agonists and antagonists) in the preceding 3 months were not included. Women who are current smokers and with hypertension, diabetes, histor y of coronary heart

			disease, known coagulation abnormalities were also excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	Patients were randomly assigned to one of four treatment groups and each group contained 12 participants
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**

Study ID	Kilicdag 2005
Study Citation	Kilicdag, E. B.; Bagis, T.; Zeyneloglu, H. B.; Tarim, E.; Aslan, E.; Haydardedeoglu, B.; Erkanli, S. Homocysteine levels in women with polycystic ovary syndrome treated with metformin versus rosiglitazone: a randomized study Hum Reprod Apr 2005;20(4):894-9
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	NIH
Presence of infertility	No

Presence of other condition/s	-
Medication History	-
N per group	*Allocated/randomised:* 1.Metformin=15 2.Rosiglitazone=15 *Assessed:* 1.Metformin=15 2.Rosiglitazone=15
Setting	This study was conducted in the Department of Obstetrics and Gynecology of Baskent University School of Medicine, Adana, Turkey. Between April 2002 and June 2003, 30 women with PCOS participated in this prospective randomized study
Intervention	1.Metformin 850mgx2/d
Comparison	2.Rosiglitazone 4mg/d
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, bmi, dheas, T, free-T, homa, lipids
Follow up Duration	3 months
Summary Result/s	Metformin and rosiglitazone therapy result in a significant increase in plasma Hcy concentrations, without significant changes in BMI and IR that could result in increased cardiovascular risk.

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To examine the effects of short-term metformin and rosiglitazone therapy, especially on serum levels of Hcy and other cardiovascular factors such as lipid profile and insulin resistance, in patients with PCOS.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	
Inclusion criteria		Yes Partial No Not reported	All patients with oligomenorrhoea (a cycle length of 45 days or six periods per year) or amenorrhoea, who also had evidence of hyperandrogenism [a hirsutism score >7, according to Ferriman and Gallway] and/or an elevated serum testosterone level
Exclusion criteria		Yes Partial No Not reported	-other causes of hyperandrogenism. -subjects treated with hormonal medications within 3 months
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Patients were randomized to two groups by an allocation sequence generated from a random number table and assigned through consecutively numbered opaque, sealed envelopes.
	Was allocation to intervention group concealed	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*No blinding, no protocol*	
What is the overall risk of bias?		Low Moderate High Insufficient information	

Study ID	Kumar 2018
Study Citation	Kumar Y, Kotwal N, Singh Y, Upreti V, Somani S, Hari Kumar KVS. A randomized, controlled trial comparing the metformin, oral contraceptive pills and their combination in patients with polycystic ovarian syndrome. J Family Med Prim Care. 2018;7(3):551-6.
Study Country	India
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants	Newly diagnosed PCOS (age 18–40 year, symptom duration >6 months)	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	No	
Presence of other condition/s	*No*	
Medication History	*No*	
N per group	*Allocated/randomised:* 1. Metformin=30 2. OCP=30 3.OCP+Metformin=30 *Assessed at end of study:* 1. Metformin=30 2. OCP=28 3.OCP+Metformin=29	
Setting	A randomized, controlled, prospective interventional study in a tertiary care, teaching hospital of the armed forces. The participants were recruited from the endocrinology/medicine/gynecology clinic of our hospital. Included were 90 newly diagnosed patients with PCOS (aged between 18 and 40 years, symptom duration >6 months, premenopausal, and normal thyroid function).	
Intervention	OCP-group: EE 35 mcg and cyproterone acetate 2 mg	
Comparison	Metformin: 500 mg/day, gradually increased to 2000 mg/day over 1 month Metformin+OCP-group: metformin 500 mg/day, gradually increased to 2000 mg/day over 1 month +EE 35 mcg and cyproterone acetate 2 mg	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, BMI, mFGS, lipids, f-gluc, f-insulin, HOMA-IR, TT, DHEAS	
Follow up Duration	6 months	
Summary Result/s	Met+OCP improves hyperandrogenism and body composition and reduces the inflammatory markers better than Met or OCP alone	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes **Partial** No	to determine the effect of metformin and OCP either alone or in combination in women with PCOS. (previous reports have given conflicting results

		Not reported	about the clinical, hormonal, and reproductive outcomes)
Does the study have specified inclusion/exclusion criteria?		**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?		**Yes** Partial No Not reported	
Inclusion criteria		**Yes** Partial No Not reported	Newly diagnosed patients with PCOS according to Rotterdam (aged between 18 and 40 years, symptom duration >6 months, premenopausal, and normal thyroid function)
Exclusion criteria		**Yes** Partial No Not reported	Patients with a history of using any drug therapy (insulin sensitizers, hormone therapy, calcium, and Vitamin D), use of other drugs that affect the body composition and androgen levels (insulin, glucocorticoids), and pregnancy or lactation.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	**Yes** Partial No Not reported	The patients were divided into three groups using a computer-generated random sequence numbering
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	

	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	7% COCP 0% met 3% COCP + met	1. Metformin=0/30=0% 2. OCP=2/30=6.7% 3.OCP+Metformin=1/30=3.3%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)? moderate	Yes Partial **No** Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes **Partial** No Not reported	All the three groups were comparable in the clinical presentation and the symptomatology. However, patients in Group 3 had higher BMI and IR in comparison to other groups.
	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial **No** Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial **No** Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes **Partial** No Not reported	
COMMENTS			
What is the overall risk of bias?		Low **Moderate** High Insufficient information	No blinding, groups differed partially at baseline

Study ID	Li 2020
Study Citation	Li, Y.; Tan, J.; Wang, Q.; Duan, C.; Hu, Y.; Huang, W.

	Comparing the individual effects of metformin and rosiglitazone and their combination in obese women with polycystic ovary syndrome: a randomized controlled trial Fertility and sterility 2020;113(1):197
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Obese Chinese women (BMI>=25) with PCOS and insulin resistance
PCOS diagnostic criteria	Rotterdam
Presence of infertility	NR
Presence of other condition/s	Overweight, bmi>=25
Medication History	patients exhibiting insulin resistance
N per group	*Allocated/randomised:* 1. Metformin+LS=68 2. Rosiglitazone+LS=67 3.Metformin+Rosiglitazone+LS=69 *Assessed:* 1. Metformin+LS=61 2. Rosiglitazone+LS=63 3.Metformin+Rosiglitazone+LS=61
Setting	Prospective randomized controlled trial that took place between December 2013 and September 2016 at the Reproductive Endocrinology Division, West China Second University Hospital of Sichuan University, People's Republic of China
Intervention	1.Metformin 1500mg/d+lifestyle
Comparison	2.Rosiglitazone 4mg/d+lifestyle 3.Metformin 1000mg/d +Rosiglitazone 4mg/d+lifestyle

	During the study, all participants were advised to undergo lifestyle modification, including dietary adjustments and moderate-strength physical exercises three times a week for 40 minutes per session	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Menstrual cycle, weight, bmi, whr, mFGS, T, f-gluk, f-insulin, homa, lipids	
Follow up Duration	6 months	
Summary Result/s	Metformin along with lifestyle modification should be recommended for obese, insulin-resistant women with PCOS. Rosiglitazone alone or combined with metformin plus lifestyle modification should be considered for the women with abnormal lipid profiles	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	to compare the clinical and biochemical metabolic effects of metformin, rosiglitazone, and their combination in obese, insulin-resistant Chinese women with PCOS
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	-women from 18 to 35 years of age -patients with obesity, a BMI>=25 -patients exhibiting insulin resistance, homeostatic model assessment of insulin resistance (HOMA-IR) index >=2.77
Exclusion criteria	Yes Partial No Not reported	-patients with hyperprolactinemia, hypo- or hyperthyroidism, or abnormal liver, kidney, or heart function -patients affected by hypertension, diabetes mellitus, or severe mental illness or with a personal history of cardiovascular events -patients who had taken oral contraceptives, glucocorticoids, antiandrogen agents, ovulation induction agents, diabetic drugs, or other steroid agents within 3 months

INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	A prospective, randomized, open-label study. Women were randomly allocated to the treatment group according to computer-generated random numbers, using a block randomization method (1:1:1) with random block size of 6 or 10
	Was allocation to intervention group concealed?	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1. Metformin+LS=7/68=10.3% 2. Rosiglitazone+LS=4/67=6.0% 3.Metformin+Rosiglitazone+LS=8/69=11.6%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Chinese Clinical Trial Registry Center (ChiCTR-TRC-13003642)
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Funding not reported*

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*Not blinded, but unlikely to affect outcome.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Low*

Study ID	Lingaiah 2019
Study Citation	Lingaiah, S.; Morin-Papunen, L.; Risteli, J.; Tapanainen, J. S. Metformin decreases bone turnover markers in polycystic ovary syndrome: a post hoc study Fertility and sterility 2019;112(2):362
Study Country	Finland
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Adult women with PCOS, non-obese (BMI <27) and obese (BMI>=27)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Yes
Presence of other condition/s	No
Medication History	No
N per group	*Assessed at end of study: Metformin-group BMI <27, 40* *Placebo-group, BMI<27, 34*

	Metformin-group BMI >=27, 17 *Placebo-group, BMI>=27, 27*	
Setting	*Post hoc analysis among a subset of subjects from a large cohort of subjects in a prospective multi-center, placebo-controlled randomized study on the effects of metformin on miscarriage, pregnancy, and live-birth rates. Only the subjects examined at Oulu University Hospital were included in the study.*	
Intervention	*Non-obese women (BMI < 27 kg/m2) received metformin (Diformin; Leiras) at a dose of 500 mg + 1,000 mg daily* *Obese women (BMI R 27 kg/m2) received metformin at a dose of 1,000 mgx2 daily.*	
Comparison	Placebo tablets	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	T, SHBG, FAI, DHEAS, A, f-gluk, f-ins, HOMA, BMI, WHR, weight.	
Follow up Duration	3 months	
Summary Result/s	Metformin treatment, was associated with reduced bone turnover, as suggested by reductions in markers of bone formation and resorption, leading to slower bone remodeling in premenopausal women with PCOS. Small decrease in weight and BMI in the obese group after metformin. T and f-gluc decreased, and the Matsuda index increased. Non-obese group treated with metformin, T, FAI and A decreased	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	to investigate the effects of metformin on bone turnover markers in women with PCOS
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	

Inclusion criteria		Yes Partial No Not reported	Women aged 18–39 yr at entry, with a BMI greater than 19 kg/m^2 and diagnosed with PCOS according to Rotterdam criteria
Exclusion criteria		Yes Partial No Not reported	type 2 DM, active liver disease (alanine aminotransferase >100 IU/liter), history of cardiac or renal failure, hormone medication, alcohol use, and regular smoking.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Randomization was performed by the hospital pharmacy with 1:1 allocation in random blocks of 10 using two computer-generated lists, one for the nonobese and one for the obese women. Metformin and placebo tablets were provided by Leiras (Turku, Finland) and prepacked in opaque identical containers of 100 tablets and consecutively numbered for each woman according to the randomization schedule. Each woman was assigned a number and received the tablets in the corresponding container. Randomization codes remained blinded until the database lock had taken place. The patients and all study site personnel were blinded to the study drug codes
	Was allocation to intervention group concealed?	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	

DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Blood samples were collected in a fasting state at baseline and at 3 months of treatment with metformin/placebo and were stored at 20 C until the time of analysis.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Weight and waist and hip circumferences (measured to the nearest centimetre with a soft tape at the narrowest part of the torso and at the widest part of the gluteal region) were assessed at each visit, and the waist to hip ratio (WHR) was calculated.
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	0 % in this study (only participants who completed study included in post hoc) met-group 16.9%, placebo 21.2% in original study
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	intention to treat analysis
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	

	If confounding was present, was it controlled for?	Yes Partial No Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*Moderate*	
What is the overall risk of bias?		Low Moderate High Insufficient information	Unclear attrition
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes moderate risk of bias*	

Study ID	Long 2022
Study Citation	Long, Tao; Zhang, Ying; Zeng, Chunping; Zheng, Siyuan; Zhou, Lin; Liu, Haiyan

	Effects of Low-Dose Spironolactone Combined with Metformin or Either Drug Alone on Insulin Resistance in Patients with Polycystic Ovary Syndrome: A Pilot Study International Journal of Endocrinology 2022;():1-8
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS aged >18yr
PCOS diagnostic criteria	Rott
Presence of infertility	No
Presence of other condition/s	No
Medication History	-
N per group	*Allocated/randomised:* 1. Metformin=63 2. SPL=63 3. Metformin+SPL=63 *Assessed at end of study:* 1. Metformin=54 2. SPL=53 3. Metformin+SPL=51
Setting	A single center, randomized, open-label, pilot study of patients with PCOS,aged >18 yrs at the third Affiliated Hospital of Guangzhou Medical University between 01/2014 and 01/2016
Intervention	1.Metformin 1500mg/d 2.Metformin 1500mg/d+Spironolactone 40mg/d
Comparison	3.Spironolactone 40mg/d
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, BMI, WHR, FAI, HOMA,
Follow up Duration	3 months
Summary Result/s	No differences in any parameters between the metformin and spironolactone groups (all $P > 0.05$). In the combined group, after 12 weeks of treatment, HOMA-IR was lower than in the metformin and spironolactone groups

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To compare the effects of low-dose spironolactone combined with metformin or either drug alone on IR and functional improvement in patients with PCOS, as well as compliance, safety, and incidence of adverse effects through a prospective randomized open-label study.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	(1) age >18 years; (2) history of sexual life; and (3) agreed to use barrier contraception within 12 weeks.
Exclusion criteria	Yes Partial No Not reported	(1) other endocrine diseases such as hyperprolactinemia and congenital adrenal hyperplasia (CAH), or hyperprolactinemia and other endocrine diseases that led to hyperandrogenism, such as Cushing's syndrome, CAH, and androgen-secreting tumors; (2) patients with immune diseases, cancer, type 1 diabetes, or history of type 2 diabetes; (3) medications within 12 weeks, including cortisol, antidepressants, hypoglycemic agents, hormonal contraceptives, ovulation-inducing drugs, or other drugs that affect the metabolism of glycolipids and sex hormones; (4) pregnant or lactating women within the recent 6 months or those with pregnancy plan within 3 months; (5) patients with speech impairment or those with disabilities who cannot understand the experimental requirements; (6) patients with severe organ failure such as liver or renal function, or mental disorders; (7) patients with immunodeficiency or HIV infection;

			(8) history of drug abuse and alcohol dependence in the past 5 years; (9) history of pancreatitis or pancreatectomy; or (10) participated in any clinical trials within 3 months
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	The participants were randomized 1 :1 : 1 to one of three groups according to a random number table: the metformin group, spironolactone group, and metformin + spironolactone group. This was an open-label study
	Was allocation to intervention group concealed?	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	

	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1. Metformin=9/63=14.3% 2. SPL=10/63=15.9% 3. Metformin+SPL=12/63=19.0%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*No blinding, not ITT, no protocol*	
What is the overall risk of bias?		Low Moderate High Insufficient information	

Study ID	Luque-Ramírez 2009
Study Citation	Luque-Ramírez M, Mendieta-Azcona C, Alvarez-Blasco F, Escobar-Morreale HF. Effects of metformin versus ethinyl-estradiol plus cyproterone acetate on ambulatory blood pressure monitoring and carotid intima media thickness in women with the polycystic ovary syndrome. Fertility and sterility. 2009;91(6):2527-36.
Study Country	Spain
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	
Medication History	*No*
N per group	*Allocated/randomised: COCP 15; metformin 19* *Assessed at end of study: COCP 15; metformin 12*

Setting	*Academic hospital, Madrid, Spain*	
Intervention	35 µg EE/2mg CPA	
Comparison	1700 mg met/day	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*The study was designed for ambulatory blood pressure monitoring and carotid intima media thickness Outcome of interest for this review is adverse effects*	
Follow up Duration	*24 w*	
Summary Result/s	Metformin treatment decreased daytime ABPM recordings whereas EE + CPA exerted the opposite effect. The safer blood pressure profile of metformin should be considered in PCOS patients who present with a history of hypertension or who are at risk for this disorder.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	To compare the effects of metformin versus an antiandrogenic contraceptive pill on ambulatory blood pressure monitoring (ABPM) and carotid intima media thickness (CIMT) in women with polycystic ovary syn- drome (PCOS)
Does the study have specified inclusion/exclusion criteria?	Yes **Partial** No Not reported	vague for inclusion, none for exclusion?
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	34 consecutive PCOS patients were recruited.
Exclusion criteria	**Yes** Partial No Not reported	None of the patients had a personal history of hypertension, diabetes mellitus, or cardiovascular events, or had received treatment with oral contraceptives, antiandrogens, insulin sensitizers, or drugs that might interfere with blood pressure regulation for the previous 6 months.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	**Yes** Partial No Not reported	Simple randomization was conducted using blocksof 10 sealed opaque envelopes assigning five patients to re-ceive Diane35Diario and five patients to receive metformin.Randomization allocated 15 patients to Diane35Diario and19 patients to metformin.
	Was allocation to intervention group concealed?	**Yes** Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial **No** Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0% COCP 37% met	COCP 0/15 met 7/19=37%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	**Yes** Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	**Yes** Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	**Yes** Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*NA*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No **Not reported**	

	Was the study sufficiently powered to detect any differences between the groups?	**Yes** Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low **Moderate** High Insufficient information	No blinding, high dropout rate in one arm, but intention to treat analysis
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Lv 2005
Study Citation	Lv L, Liu Y, Sun Y, Tan K. Effects of metformin combined with cyproterone acetate on clinical features, endocrine and metabolism of non-obese women with polycystic ovarian syndrome. J Huazhong Univ Sci Technolog Med Sci. 2005;25(2):194-7.
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	The presence of: (1) chronic anovulatroy disorders such as oligomenorrhea, anovulatory cycles, or secondary amenorrhea; (2) the ratio of LH/FSH was>2 and (or) the plasma testosterone (T) level was>2.6 nmol/L;

	(3) 10 or more follicles 2--8 mm in diameter) in one or both ovaries by transvaginal ultrasound examination;	
Presence of infertility	*Not reported*	
Presence of other condition/s		
Medication History	*No*	
N per group	*Allocated/randomised:* *Assessed at end of study: 25/group*	
Setting		
Intervention	35 µg EE/2mg CPA	
Comparison	35 µg EE/2mg CPA + met 500 mg/day	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, WHR, TT, A4, DHEAS, SHBG,	
Follow up Duration	*6 months*	
Summary Result/s	Combined use of EE/CPA and metformin could improve insulin sensitivity and further suppress hyperandrogenism in non-obese women with PCOS	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes **Partial** No Not reported	To explore the effects of metformin combined with cyproterone acetate (CPA) on the clinical features, endocrine and metabolism of the patients with polycystic ovarian syndrome
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No	PCOS was defined as the presence of: (1) chronic anovulatroy disorders such as oligomenorrhea, anovulatory cycles, or secondary amenorrhea; (2) the ratio of LH/FSH was>2 and (or) the plasma

		Not reported	testosterone (T) leve was>2.6 nmol/L; (3) 10 or more follicles (2--8 mm in diameter) in one or both ovaries by trans- vaginal ultrasound examination
Exclusion criteria		**Yes** Partial No Not reported	other known endocrinological disease, and those taking drugs known to affect carbohydrate or lipid metabolism and OGTT re- sults during the 6 months preceding the study were excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	The subjects were randomized to either the CPA group (n=25) or to the CPA+metformin group (n=25).
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No **Not reported**	
DEDET ECTION	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	

	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	randomization poorley described, no blinding, no info on drop outs, unclear aim
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Mhao 2016
Study Citation	Mhao NS, Al-Hilli AS, Hadi NR, Jamil DA, Al-Aubaidy HA. A comparative study to illustrate the benefits of using ethinyl estradiol-cyproterone acetate over metformin in patients with polycystic ovarian syndrome. Diabetes Metab Syndr. 2016;10(1 Suppl 1):S95-8.
Study Country	Iraq
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS

PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Some were seeking due to infertility, proportion not stated.*
Presence of other condition/s	
Medication History	*No*
N per group	*Allocated/randomised:* *Assessed at end of study: COCP 10, met 16 (dropouts not reported)*
Setting	The participants were attending the infertility clinic, the teaching hospital, seeking treatment for their infertility and/or cycle abnormalities. Iraq.
Intervention	EE 30 µg /CMA 2mg
Comparison	met 1000 mg/day
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, WHR, FG score, chol, HDL, LDL, TG, TT, OGTT
Follow up Duration	*3 months*
Summary Result/s	Metformin is beneficial in improving lipids, glucose homeostasis and BMI, but EE/CPA is superior in improving the clinical manifestations of PCOS including menstrual disturbances and hyperandrogenism.

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes **Partial** No Not reported	To illustrate the clinical and biochemical effects of ethinylestradiol-cyproteroneacetate(EE-AC) and metformin in this disease.
Does the study have specified inclusion/exclusion criteria?	Yes **Partial** No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes **Partial** No Not reported	

Inclusion criteria		Yes **Partial** No Not reported	women with PCOS (no definition) seeking for infertility and/or cycle abnormailities
Exclusion criteria		Yes Partial **No** Not reported	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	"This was a randomized control trial study, done on twenty-six female patients already diagnosed as cases of PCOS. Participants were divided into two study groups"
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No **Not reported**	
DEDET ECTION	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	

	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No **Not reported**	
	Were outcomes assessed objectively and independently?	Yes Partial No **Not reported**

	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial **No** Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	Yes **Partial** No Not reported	Baseline variables not reported, not adjusted
COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	No reports on ranomization, blinding, dropouts, age at baseline, PCOS criteria not defined
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Mohiyiddeen 2013
Study Citation	Mohiyiddeen, L.; Watson, A. J.; Apostolopoulos, N. V.; Berry, R.; Alexandraki, K. I.; Jude, E. B. Effects of low-dose metformin and rosiglitazone on biochemical, clinical, metabolic and biophysical outcomes in polycystic ovary syndrome J Obstet Gynaecol Feb 2013;33(2):165-70
Study Country	UK
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	Rotterdam

Presence of infertility	NR
Presence of other condition/s	irregular periods
Medication History	-
N per group	*Allocated/randomised:* 1. Metformin=20 2. Rosiglitazone=20 *Assessed:* 1. Metformin=17 2. Rosiglitazone=18
Setting	Women with PCOS who attended the gynaecological outpatient clinic as a result of irregular periods
Intervention	1.Metformin 500mgx2/d
Comparison	2.Rosiglitazone 4mgx1/d
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, bmi, f-insulin, f-gluc, crp, lipids, t, shbg, fai
Follow up Duration	3 months
Summary Result/s	Rosiglitazone and metformin, has comparable beneficial impacts on metabolic, hormonal and morphological features of PCOS but no obvious effect on vascular parameters in a population of predominantly mild PCOS

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To compare the effect of low-dose metformin and rosiglitazone on clinical, biochemical, ultrasound features and endothelial function in patients with polycystic ovary syndrome (PCOS)
Does the study have specified	Yes Partial No	

inclusion/exclusion criteria?	Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	The diagnosis for PCOS was based on the criteria adapted from the Rotterdam consensus. These criteria include hyperandrogenism, chronic anovulation and polycystic ovaries.
Exclusion criteria	Yes Partial No Not reported	Secondary causes such as non-classical adrenal 21-hydroxylase deficiency, hyperprolactinaemia and androgen-secreting neoplasms
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Randomisation using a computer generated system into two groups The study had an open design, as one of the investigators in the study knew the dosage for safety reasons. The rest of the research team as well as the senior sonographer who performed the ovarian scans were blinded to the randomisation
SELECTION BIAS **Was allocation to intervention group concealed**	Yes Partial No Not reported	
PERFORMANCE BIAS **Were patients blind to intervention group?**	Yes Partial No Not reported	
PERFORMANCE BIAS **Were investigators and care providers blind to intervention group?**	Yes Partial No Not reported	

	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1. Metformin=3/20=15% 2. Rosiglitazone=2/20=10%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Funding not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*No protocol, patients not blinded*	
What is the overall risk of bias?		Low Moderate High Insufficient information	

Study ID	Naka 2011

Study Citation	Naka, K. K.; Kalantaridou, S. N.; Kravariti, M.; Bechlioulis, A.; Kazakos, N.; Calis, K. A.; Makrigiannakis, A.; Katsouras, C. S.; Chrousos, G. P.; Tsatsoulis, A.; Michalis, L. K. Effect of the insulin sensitizers metformin and pioglitazone on endothelial function in young women with polycystic ovary syndrome: a prospective randomized study Fertil Steril Jan 2011;95(1):203-9
Study Country	Greece
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Young women with PCOS (mean age 23.3 years)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	NR
Presence of other condition/s	NR
Medication History	-
N per group	*Allocated/randomised:* 1. Metformin=15 2. Placebo=15 2. Pioglitazone=15 *Assessed:* 1. Metformin=15 2. Placebo=14 2. Pioglitazone=14
Setting	University Hospital endocrinology outpatient clinic
Intervention	1.Metformin 850mgx2/d
Comparison	2.Placebo 3.Pioglitazone 30mg/d

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, bmi, WHR, f-gluc, f-insulin, lipids, hirsutism, T, SHBG, FAI	
Follow up Duration	6 months	
Summary Result/s	treatment with metformin or pioglitazone for 6 months induces a similar beneficial effect on endothelial function; this may be partially attributed to an improvement in insulin resistance	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To compare the effect of two different insulin sensitizers, metformin and pioglitazone, on endothelial function in women with PCOS
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	At least two of the following three features were present: oligo-ovulation or anovulation (fewer than six menstrual cycles in the preceding year), hyperandrogenism, and polycystic ovaries
Exclusion criteria	Yes Partial No Not reported	congenital adrenal hyperplasia, hyperprolactinemia, thyroid disease, or Cushing's syndrome) [1] prior treatment (in the past 6 months) known to affect vascular endothelial function (vitamins, antioxidants, cardiovascular medications); [2] prior treatment (in the past 6 months) with oral contraceptives, antiandrogens, glucocorticoids, or infertility medications; [3] history of cardiovascular disease or diabetes; or [4] excessive alcohol use (more than two drinks a day)
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	-A prospective, randomized, open-label study - participants were assigned randomly following a computergenerated list of randomization into three groups

	Was allocation to intervention group concealed	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*The metformin group took their doses twice daily, whereas the pioglitazone group took it once daily, and the no treatment group did not receive a placebo.*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1. Metformin=0/15=0% 2. Placebo=1/15=6.7% 3. Pioglitazone=1/15=6.7%

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Funding not reported*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Based on their power calculations from previous studies*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	

COMMENTS	*Lack of blinding (open-label)*
What is the overall risk of bias?	Low Moderate High Insufficient information
Study ID	Ortega-Gonzales 2005
Study Citation	Ortega-González, C.; Luna, S.; Hernández, L.; Crespo, G.; Aguayo, P.; Arteaga-Troncoso, G.; Parra, A. Responses of serum androgen and insulin resistance to metformin and pioglitazone in obese, insulin-resistant women with polycystic ovary syndrome J Clin Endocrinol Metab Mar 2005;90(3):1360-5
Study Country	Mexico
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS, aged 18–35 yr, BMI>=25, whose chief complaints were hirsutism and/or sterility
PCOS diagnostic criteria	Rotterdam
Presence of infertility	In some
Presence of other condition/s	Obesity and hirsutism
Medication History	-
N per group	*Allocated/randomised:* 1. Metformin=25 2. Pioglitazone=27 *Assessed:* 1. Metformin=18 2. Pioglitazone=17
Setting	Women with PCOS, aged 18–35 yr, whose chief complaints were hirsutism and/or sterility, were recruited from the outpatient Endocrinology and Sterility Clinics of the Instituto Nacional de Perinatologı´a.
Intervention	1.Metformin 850mgx3/d
Comparison	2.Pioglitazone 30mg/d

Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, bmi, WHR, hirsutism, f-gluc, f-insulin, HOMA, lipids, dheas, free-T, A	
Follow up Duration	6 months	
Summary Result/s	pioglitazone is as effective as metformin in improving insulin sensitivity and hyperandrogenism, despite an increase in body weight, bmi and the WHR associated with pioglitazone	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To compare the effectiveness of pioglitazone and metformin in ameliorating IR and hyperandrogenism in obese women with PCOS and IR who were naive to previous treatment with drugs intended to improve insulin sensitivity.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	The diagnosis of PCOS was based on at least two of the three following abnormalities: oligomenorrhea or amenorrhea, a serum androstenedione concentration more than 2.9 ng/ml, or a serum free testosterone more than 2.5 pg/ml and polycystic ovaries by ultrasound. All women had a BMI >=25 kg/m2 , acanthosis nigricans, fasting hyperinsulinemia greater than 16 IU/ml and a fasting glucose to insulin ratio of less than 4.5
Exclusion criteria	Yes Partial No Not reported	impaired glucose tolerance test or type 2 DM, hyperprolactinemia, thyroid disorders, late-onset congenital adrenal hyperplasia, and Cushing's syndrome. Use of clomiphene citrate, oral contraceptives, antiandrogens, or drugs to control their appetite during the previous 6 months.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Randomization was by random number tables. The patients' number treatment codes were retained until the end of the trial in a sealed envelope by a third party who did not participate in the study; patients' names were disclosed after completion of the study. Because the drugs had different daily dose schedules (i.e. once a day for pioglitazone and three times a day for metformin), the study had an open design
	Was allocation to intervention group concealed	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1. Metformin=7/25=28% 2. Pioglitazone=10/27=37%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Trial registration number: CN-00503724
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*High drop-out number, 28-37%*

Study ID	*Ozgurtas 2008*
Study Citation	Ozgurtas T, Oktenli C, Dede M, Tapan S, Kenar L, Sanisoglu SY, et al. Metformin and oral contraceptive treatments reduced circulating asymmetric dimethylarginine (ADMA) levels in patients with polycystic ovary syndrome (PCOS). Atherosclerosis. 2008;200(2):336-44.
Study Country	Turkey
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS with a chief complaint of irregular menstrual cycles and/or clinical hyperandrogenism.
PCOS diagnostic criteria	Rotterdam
Presence of infertility	
Presence of other condition/s	

Medication History	*No*	
N per group	*Allocated/randomised: 22/group* *Assessed at end of study: COCP 21; met 20*	
Setting	obstetrics and gynecology outpatient clinic, Turkey	
Intervention	35 µg EE + 2 mg CPA	
Comparison	met 1700mg/day	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, WHR, HOMA, chol, TG, HDL, LDL, TT, fT, A4, DHEAS, SHBG	
Follow up Duration	*3 months*	
Summary Result/s	circulating (asymmetric dimethylarginine) ADMA concentrations in non-obese, non-hypertensive and young women with PCOS are significantly higher than healthy controls and they improved by a 3-month course of metformin and oral contraceptive treatments	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	(1) to determine circulating ADMA concentrations in 44 women with PCOS and 22 age- and BMI-matched healthy controls, (2) to evaluate its correlations with insulin resistance, gonadotrophins, and androgen secretion, and (3) to compare effects of metformin and ethinylestradiol–cyproterone acetate (EE/CPA) treatments on circulating ADMA concentrations
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No	PCOS was made according to the criteria proposed at the Rotterdam revised consensus meeting BMI < 25 kg/m2, aged >18 years, normal tsh and prl

		Not reported	
Exclusion criteria		**Yes** Partial No Not reported	subjects with possible ovarian tumors, congenital adrenal hyperplasia, BMI greater than 25 kg/m 2 , any chronic disease that could interfere with the absorption, distribution, metabolism or excretion of met- formin or EE/CPA, renal or liver disease,
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No **Not reported**	The subjects were randomised to receive either metformin or monophasic oral contraceptive
	Was allocation to intervention group concealed?	Yes Partial No **Not reported**	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No **Not reported**	
DEDETECTION	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	

	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	5% COCP 9% met	COCP 1/22=5% Met 2/22=9%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No **Not reported**	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	**Yes** Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*NA*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No **Not reported**	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	Randomization not described, no blinding
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	*Panidis 2011*
Study Citation	Panidis D, Georgopoulos NA, Piouka A, Katsikis I, Saltamavros AD, Decavalas G, et al. The impact of oral contraceptives and metformin on anti-Müllerian hormone serum levels in women with polycystic ovary syndrome and biochemical hyperandrogenemia. Gynecol Endocrinol. 2011;27(8):587-92.
Study Country	Greece
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS

PCOS diagnostic criteria	NIH
Presence of infertility	*Not reported*
Presence of other condition/s	
Medication History	*No*
N per group	*Allocated/randomised:* *Assessed at end of study: 15/group*
Setting	*Outpatient endocrine clinic, Greece*
Intervention	35 µg EE + 2 mg CPA
Comparison	1: 3 mg DRSP/30 mcg EE 2: metformin 1700mg/day
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcome AMH: Relevant outcomes for this review: BMI, HOMA, glucose, insulin, TT, A4, DHEAS, SHBG, FAI
Follow up Duration	*6 months*
Summary Result/s	AMH serum levels were significantly decreased under treatment with 35 microg ethinylestradiol plus 2 mg cyproterone acetate, due to decrease in androgens and suppression of gonadotropins.

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	To assess the impact of metformin and of two different oral contraceptives (OCs) containing cyproterone acetate and drospirenone, on serum anti-Müllerian hormone (AMH) levels, in a cohort of women with polycystic ovary syndrome
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	

Inclusion criteria		**Yes** Partial No Not reported	Only normal weight (BMI<25)were included in the study. Diagnosis of PCOS was based on the presence of: chronic anovulation (fewer than six spontaneous bleeding episodes per year), and biochemical hyperandrogenemia in accordance with NIH
Exclusion criteria		**Yes** Partial No Not reported	Other common causes of hyperandrogenism such as prolactino- ma, congenital adrenal hyperplasia, Cushing syndrome and virilizing ovarian or adrenal tumours were excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes **Partial** No Not reported	Randomisation was non-blind and was based on patients' chronological presence at the outpatient endocrine infirmary,
	Was allocation to intervention group concealed?	Yes Partial **No** Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial **No** Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial **No** Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No **Not reported**	
DEDET ECTION	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	

	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	0%	*0 dropouts*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	**Yes** Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	**Yes** Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*NA*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes **Partial** No Not reported	Funding not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes **Partial** No Not reported	By including a minimum of 15 patients in each study group, the probability is 90% that the study will detect a treatment difference at a two sided 5.0% significance level.
	If statistical analysis was undertaken, was this appropriate?	Yes **Partial** No Not reported	”We prefer to use non-parametric methods as fewer assumptions have to be made"
COMMENTS			
What is the overall risk of bias?		Low Moderate **High** Insufficient information	Randomization in chronological order, no blinding, no protocol,
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Prabhakar 2021
Study Citation	Prabhakar, Priyanka; Mahey, Reeta; Gupta, Monica; Khadgawat, Rajesh; Kachhawa, Garima; Sharma, Jai Bhagwan; Vanamail, Perumal; Kumari, Rajesh; Bhatla, Neerja Impact of myoinositol with metformin and myoinositol alone in infertile PCOS women undergoing ovulation induction cycles - randomized controlled trial Gynecological endocrinology : the official journal of the International Society of Gynecological Endocrinology 2021;37(4):332-336
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	PCOS women with infertility

PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Yes	
Presence of other condition/s	No	
Medication History	No	
N per group	*Allocated/randomised:* 1. Metformin+myoinositol=57 2.myoinositol =59 *Assessed:* 1. Metformin+myoinositol=50 2.myoinositol=55	
Setting	Total 130 infertile PCOS women (Rotterdam criteria) attending infertility clinic were screened for the study	
Intervention	1. Metformin 500mgx3/d+myoinositol 4g/d	
Comparison	2.Myoinositol 2gx2/d	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	BMI, WHR, T, HOMA, lipids	
Follow up Duration	3 months	
Summary Result/s	After 3 months of therapy, both study groups had comparable improvement in metabolic and hormonal parameters.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	to compare the efficacy of the combination of metformin and myoinositol with myoinositol alone in terms of clinical pregnancy rate among infertile PCOS women.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*No exclusion criteria (other diseases for example)*
Inclusion criteria		Yes Partial No Not reported	women aged 20–38 years who failed to conceive for >12 months, BMI <30 and bilateral patent tubes on hysterosalpingography/laparoscopy with mild male factor infertility and those women willing to participate and follow-up in the study
Exclusion criteria		Yes Partial No Not reported	*Not clearly stated, those who did not fullfill inclsuion?*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Patients were randomized into two groups according to computer-generated randomization table.

COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*

Study ID	Sahu 2019
Study Citation	Sahu A, Tripathy P, Mohanty J, Nagy A. Doppler analysis of ovarian stromal blood flow changes after treatment with metformin versus ethinyl estradiol-cyproterone acetate in women with polycystic ovarian syndrome: A randomized controlled trial. J Gynecol Obstet Hum Reprod. 2019;48(5):335-9.
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS, all with menstrual irregularities
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*
Presence of other condition/s	

Medication History	*No*	
N per group	*Allocated/randomised: COCP 51; metformin 50* *Assessed at end of study: COCP 44; metformin 42*	
Setting	*Department of Obstetrics and Gynecology, SCB Medical College, Cuttack, India*	
Intervention	*35 ug EE + 2 mg CPA 21/7*	
Comparison	*metformin 500 mg x 2*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary:* ovarian stromal blood flow *Relevant for this review: BMI, cycle duration, hirsutism, TT, SHBG, DHEAS, chol, HDL, LDL, TG, glucose, insulin, HOMA*	
Follow up Duration	*6 months*	
Summary Result/s	*Treatment with both OCP and metformin leads to a reduction in ovarian stromal vascularization in PCOS women perhaps through different mechanisms and this reduction is more prominent with OCP*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	To evaluate the effects of oral contraceptive pill (OCP) and metformin at the end of 6 months of treatment on ovarian stromal blood flow by using pulsed and color Doppler in women with PCOS.
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	PCOS according to Rotterdam criteria
Exclusion criteria	**Yes** Partial No	Women were excluded if they were known to have congenital adrenal hyperplasia, pituitary insufficiency, persistent hyperprolactinemia, current or previous cardiovascular, hepatic or renal

		Not reported	dysfunction, diabetes, if they had used ovulation induction drugs, oral hypoglycemic agents, OCPs, or anti-androgens within the last 3 months.

	If confounding was present, was it controlled for?	Yes Partial No Not reported	*NA*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial **No** Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	**Yes** Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low **Moderate** High Insufficient information	No blinding
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Sangeeta 2012
Study Citation	Sangeeta, S. Metformin and pioglitazone in polycystic ovarian syndrome: a comparative study J Obstet Gynaecol India Oct 2012;62(5):551-6
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women of age 18–30 years with PCOS
PCOS diagnostic criteria	Rotterdam
Presence of infertility	NR
Presence of other condition/s	NR
Medication History	

N per group	*Allocated/randomised:* 1. Metformin=50 2. Pioglitazone=50 *Assessed:* 1. Metformin=43 2. Pioglitazone=42	
Setting	A randomized, double-blinded, comparative study conducted at Gandhi Hospital—a tertiary care centre and a teaching hospital for graduation and post-graduation in medicine at Hyderabad, Andhra Pradesh, India	
Intervention	1.Metformin 500mgx2/d	
Comparison	2.Pioglitazone 15mgx1/d	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Hirsutism, lipids, f-insulin, homa, T, shbg, FAI	
Follow up Duration	6 months	
Summary Result/s	Pioglitazone may be a better treatment option as far as protection from tendency to development of diabetes is concerned. The rise in serum SHBG levels and decline in free androgen index and L/H ratio are more remarkable with pioglitazone	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To evaluate the effect of metformin and pioglitazone on insulin resistance, ovulation and hyperandrogenism in women with PCOS
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	

If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	Age 18-30 yrs the presence of two out of the following three criteria after the exclusion of other criteria: (1) oligo and/or anovulation, (2) hyperandrogenism (clinical and/or biochemical), and (3) polycystic ovaries, (12 or more follicles of 2–9 mm in diameter or ovarian volume[10 cc)
Exclusion criteria	Yes Partial No Not reported	(1) Pregnancy and nursing, (2) Significant liver impairment, (3) Significant renal impairment, (4) Neoplastic disease, (5) Cardiovascular diseases, (6) Cushing's disease, (7) Hypothyroidism, (8) Hyperprolactinemia, and (9) Any drug intake-like Anti-diabetic (or) Oestrogen and progesterone.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	"This is a randomized, double-blinded, comparative study" "randomly allocated to two groups" *Randomised but method not demonstrated*
SELECTION BIAS – **Was allocation to intervention group concealed?**	Yes Partial No Not reported	
PERFORMANCE BIAS – **Were patients blind to intervention group?**	Yes Partial No Not reported	*As randomized and double-blinded*
PERFORMANCE BIAS – **Were investigators and care providers blind to intervention group?**	Yes Partial No Not reported	

	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Different treatment regimen - MET group was b.i.d and pioglitazone was 15 OD.*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1. Metformin=7/50=14% 2. Pioglitazone=8/50=16%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Age and bmi (or weight, WHR) at baseline not reported*
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	The power of the study for different variables was found to be 79.3–100 % except F–G grading for hirsutism (5 %) and serum testosterone (5.6 %) (power calculation done with the help of standard statistical tools). Done posthoc
	If statistical analysis was undertaken, was this appropriate? Moderate	Yes Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Randomization poorley described, no info on baseline age and bmi.*

Study ID	Shahebrahimi 2016

Study Citation	Shahebrahimi, K.; Jalilian, N.; Bazgir, N.; Rezaei, M. Comparison clinical and metabolic effects of metformin and pioglitazone in polycystic ovary syndrome Indian J Endocrinol Metab Nov-Dec 2016;20(6):805-809	
Study Country	Iran	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS, aged 20–49 years	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s	-	
Medication History	-	
N per group	*Allocated/randomised:* 1. Metformin=28 2. Pioglitazone=28 *Assessed:* ?	
Setting	the Obstetrics and Gynecology Clinic of Imam Reza Hospital, Kermanshah, Iran, from May 2012 to April 2013	
Intervention	1.Metformin 500mgx3/d	
Comparison	2.Pioglitazone 30mg/d	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, bmi, f-gluc, lipids, T, f-insulin, dheas	
Follow up Duration	3 months	
Summary Result/s	Although we were not able to recommend one treatment regime over the other, pioglitazone offers a useful, alternate treatment in women with PCOS who are not able to tolerate metformin.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No	This study compares the effects of 2 types of insulin sensitizer drugs, metformin and pioglitazone, on

		Not reported	clinical, metabolic, and endocrine characteristics of women with PCOS.
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	
Inclusion criteria		Yes Partial No Not reported	the presence of at least 2 of the following 3 criteria: (1) Oligo/anovulation, (2) clinical or biochemical signs of hyperandrogenism including hirsutism, acne, or increased serum testosterone, and (3) polycystic ovaries by vaginal ultrasound
Exclusion criteria		Yes Partial No Not reported	Diabetes mellitus, abnormal liver function tests, known cardiac or renal disease, smoking, age <20 yrs, adrenal disorders including congenital adrenal hyperplasia and Cushings syndrome, thyroid disorders and hyperprolactinemia.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	"56 subjects aged 20–49 years were randomly divided into 2 treatment groups"
	Was allocation to intervention group concealed	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Not compared statistically, seems to differ in some baseline factors such as BP and acne*
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Randomization not described, no blinding, baseline factors differ*

Study ID	Sohrevardi 2016

Study Citation	Sohrevardi, S. M.; Nosouhi, F.; Hossein Khalilzade, S.; Kafaie, P.; Karimi-Zarchi, M.; Halvaei, I.; Mohsenzadeh, M. Evaluating the effect of insulin sensitizers metformin and pioglitazone alone and in combination on women with polycystic ovary syndrome: An RCT Int J Reprod Biomed Dec 2016;14(12):743-754
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS, aged 18-40 years, with irregular menses and infertility
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Yes
Presence of other condition/s	Irregular menses
Medication History	-
N per group	*Allocated/randomised:* 1.Metformin=28 2.Pioglitazone=28 3. Metformin+Pioglitazone=28 *Assessed:* 1.Metformin=22 2.Pioglitazone=21 3. Metformin+Pioglitazone=23
Setting	Eighty four women with PCOS, aged 18-40 years old, with irregular menses and infertility and/or clinical sign of hyperandrogenism (hirsutism and acne) were recruited from Department of Gynecology, Shahid Sadoughi Hospital Yazd, Iran. between April 2014 to May 2015.
Intervention	1.Metformin 500mgx3/d
Comparison	2.Pioglitazone 30mg/d 3. Metformin 500mgx3/d+Pioglitazone 30mg/d
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, bmi, WHR, f-gluc, f-insulin, homa, lipids, dheas, T
Follow up Duration	3 months

Summary Result/s	Only metformin ameliorated hyperandrogenemia in women with PCOS. Treatment with combination of metformin and pioglitazone did not show more benefit than monotherapy with each drug alone	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	to determine the effect of metformin and pioglitazone on clinical, hormonal and metabolic parameters in women with PCOS.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	The presence of at least 2 of the following 3 criteria: (1) Oligo/anovulation, (2) clinical or biochemical signs of hyperandrogenism including hirsutism, acne, or increased serum testosterone, and (3) polycystic ovaries by vaginal ultrasound
Exclusion criteria	Yes Partial No Not reported	Thyroid dysfunction, hyperprolactinemia, Cushing's syndrome, any androgen-secreting tumors, DM (fasting plasma glucose >7 mmol/L), nonclassical 21- hydroxylase deficiency, autoimmune disease, central nervous system disease, significant hypertension, past hysterectomy, abnormal liver or kidney functions or active liver disease (ALT >2.5 the upper limit of normal range), and known heart disease, pregnancy and lactation were excluded from the study.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Before initiation of the study, all patients were allocated to three different groups in sequences provided by computer program generating random number. All subjects received a sealed envelope including the number 1 or 2 or 3 which was corresponding to metformin, pioglitazone and combination therapy, respectively. In our study because commercially accessible pills were applied, there was no blinding after randomization, therefore, investigator and subjects could be aware of the actual treatment.
	Was allocation to intervention group concealed	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	
	Were outcomes assessed objectively and independently?	Yes Partial No	

		Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1.Metformin=6/28=21.4% 2.Pioglitazone=7/28=25% 3. Metformin+Pioglitazone 5/28=17.9%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Differs in HOMA-IR*
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*No blinding, no protocol, High drop-out 18-25%*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High drop-out 18-25%*

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*			

Study ID	Steiner 2007
Study Citation	Steiner, C. A.; Janez, A.; Jensterle, M.; Reisinger, K.; Forst, T.; Pfützner, A. Impact of treatment with rosiglitazone or metformin on biomarkers for insulin resistance and metabolic syndrome in patients with polycystic ovary syndrome J Diabetes Sci Technol Mar 2007;1(2):211-7
Study Country	Germany
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants	Women with PCOS	
PCOS diagnostic criteria	NIH	
Presence of infertility	No	
Presence of other condition/s	-	
Medication History	-	
N per group	*Allocated/randomised:* 1.Metformin=17 2.Rosiglitazone=18 *Assessed: 1.*Metformin=16 2.Rosiglitazone=17	
Setting	Thirty-five women with clinically confirmed PCOS diagnosis were included in the study [age (mean±SD): 24.7±4.8 years; body mass index: 27.4±6.0 kg/m2 (unclear in which country and what hospital)	
Intervention	1.Metformin 850mgx2/d	
Comparison	2.Rosiglitazone 4mg/d	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	f-gluc, f-insulin, homa, bmi, periods/month	
Follow up Duration	6 months	
Summary Result/s	An increase in insulin sensitivity was observed, especially in the rosiglitazone arm.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	To explore whether treatment of patients with PCOS with two different insulin sensitizing drugs has an impact on newly described biomarkers for metabolic syndrome A little vague
Does the study have specified	Yes Partial No	

inclusion/exclusion criteria?	Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	PCOS as classified according to National Institute of Child Health and Human Development criteria
Exclusion criteria	Yes Partial No Not reported	- Possible Cushing's syndrome or congenital (nonclassic) adrenal hyperplasia was excluded. -type 1 or type 2 diabetes mellitus, significant cardiovascular or hepatic disease, and the use of medications known or suspected to affect reproductive or metabolic functions within 60 days of study entry.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	The patients were randomly allocated to a 6-month treatment
	Was allocation to intervention group concealed	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	

	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Fasting bloodsamples? How where weight measured?*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	1.Metformin=1/17=5.9% 2.Rosiglitazone=1/18=5.6%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial Not reported No	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Andreas Pfützner and Andrej Janez are consultants to Glaxo-Smith- Kline, the manufacturer of rosiglitazone.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*Randomization not described, no protocol, possible conflict of interest*	
What is the overall risk of bias?		Low Moderate High Insufficient information	

Study ID	Tiwari 2018

Study Citation	Tiwari, Nisha; Pasrija, Shikha; Jain, Sandhya Randomised controlled trial to study the efficacy of exercise with and without metformin on women with polycystic ovary syndrome European Journal of Obstetrics & Gynecology & Reproductive Biology 2019;234():149-154
Study Country	India
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Females with PCOS (aged and bmi not specified)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	*No*
Medication History	*No*
N per group	*Allocated/randomised: Lifestyle+metformin 33* *Lifestyle+placebo 33* *Assessed at end of study: Lifestyle+metformin 31* *Lifestyle+placebo 31*
Setting	This randomised double blinded placebo controlled trial was carried out in a district hospital in Delhi over a period of one year
Intervention	All women were advised to do marching at the same place for 30 min three days a week for 3 months in the department under supervision. The exercise was monitored by the investigator to ensure a heart rate 120 beats/min. For the next 3 months all women continued the exercise at home without supervision In addition Metformin 1700mg daily
Comparison	All women were advised to do marching at the same place for 30 min three days a week for 3 months in the department under supervision. The exercise was monitored by the investigator to ensure a heart rate 120 beats/min. For the next 3 months all women continued the exercise at home without supervision In addition placebo
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Androgenic parameters (mFGS, T), antropometric parameters (BMI, WHR), biochemical parameters (OGTT, triglycerides, s-cholesterol), clinical parameters (oligomenorrhea)

Follow up Duration	6 months	
Summary Result/s	The mean difference in mFGS at 0, 3 and 6months were statistically significant in both groups. On comparing groupA (lifestyle+placebo) with groupB (lifestyle+met) at 6months, significant improvement was found in menstrual cycle symptoms (55.17% vs 83.33%), mean weight loss (1.08 kg vs 2.5 kg), waist circumference reduction (2.56 cm vs 4.75 cm) and change in mean waist hip ratio (0.02vs0.04). Significant changes were noted in OGTT and Serum testosterone level at 6months in GroupB (lifestyle+met), but not in Group A (lifestyle+placebo)	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	1. To study the efficacy of exercise in improving clinical symptoms, anthropometry, glucose tolerance and laboratory profile in women with PCOS. 2. To study the combined efficacy of exercise and metformin on above parameters in women with polycystic ovary syndrome.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	
Inclusion criteria	Yes Partial No Not reported	“Women diagnosed as PCOS on the basis of the Rotterdam criteria, willing to participate in the study, follow the exercise schedule and not on any regular exercise regime”.
Exclusion criteria	Yes Partial No Not reported	“diseases like adrenal hyperplasia, cushing syndrome etc”
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Women included in the study were divided into two groups by block randomisation with sealed envelope system. Sister-in-charge of Outpatient Department prepared eleven large envelopes each containing six smaller envelopes, three each of group A and B. All selected women were divided into groups of six, depending upon their time of selection. Each time one big envelope was opened and smaller envelopes were randomly chosen by women according to which their group was assigned. Those labelled "A" received placebo along with exercise and those labelled "B" received metformin with exercise. The sister-in-charge kept the record as to which patient belonged to which group and gave metformin/placebo as per the randomisation, such that till the end of the study neither the patients nor the investigator had any knowledge regarding who belonged to which group, thus making the study double blind. At the end of the study group distribution was collected from sister-in-charge and analysed.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported

Presence of infertility	*not reported*
Presence of other condition/s	
Medication History	*No*
N per group	*Allocated/randomised:* *Assessed at end of study:* COCP=28; COCP + met=30
Setting	
Intervention	35 µg EE + 2 mg CPA + placebo
Comparison	35 µg EE + 2 mg CPA + met 1500 mg/day (The RCT also included barbiturate, not incl here)
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, WHR, BMI, glucose, inslulin, OGTT, HOMA, chol, TG, LDL, HDL, TT, SHBG, FAI
Follow up Duration	*3 months*
Summary Result/s	Although, the 3-month treatment period led to decrease in concentrations of insulin and androgens as it was reported elsewhere, we could not confirm significant effect of MET on weight change and lipid profile as it was shown by others. Three months may be too short a time to demonstrate the effect of MET on metabolic abnormalities sufficiently. Furthermore, MET is associated with a higher incidence of nausea, vomiting, and other gastrointestinal disturbances.
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?	**Yes** Partial No Not reported	This study aimed to assess whether use of BBR, considered to be an insulin sensing agent, is effective in the treatment of endocrine characteristics of PCOS and to compare these effects with MET therapy. The outcome measures in this study included change in anthropometric measures and hormonal and metabolic indices in a group of insulin-resistant Chinese women with PCOS.
Does the study have specified inclusion/exclusion criteria?	**Yes** Partial No Not reported	
If there were specified inclusion/ exclusion criteria, were these appropriate?	**Yes** Partial No Not reported	
Inclusion criteria	**Yes** Partial No Not reported	subjects with PCOS according to Rotterdam criteria and insulin resistance (IR was assessed by HOMA-IR ≥ 3.8 or fasting glucose insulin ratio (FGIR) ≤ 4.5.
Exclusion criteria	**Yes** Partial No Not reported	Exclusion conditions included the following systemic and endocrine disorders: late-onset congenital adrenal hyperplasia, Cushing's syndrome, thyroid dysfunction, hyperprolactinemia, diabetes mellitus, coronary artery disease, and spontaneous abortion. Furthermore, subjects accepting treatment with medications known to alter insulin hemodynamics, ovulation induction, anti-obesity, or oral contraceptives (OCs) within 3 months were excluded from the study
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Did the study have an adequate method of randomisation?**	**Yes** Partial No Not reported	Randomization was based on a computer-generated code in blocks of six. A copy of the code was stored in a sealed envelope by personnel not involved in the trial.
SELECTION BIAS – **Was allocation to intervention group concealed?**	**Yes** Partial No Not reported	

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No **Not reported**	
	Were investigators and care providers blind to intervention group?	Yes Partial No **Not reported**	
	Aside from the experimental intervention, were the groups treated the same?	**Yes** Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No **Not reported**	
	Were all outcomes measured in a standard, valid and reliable way?	**Yes** Partial No Not reported	
	Were outcomes assessed objectively and independently?	**Yes** Partial No Not reported	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	10% COCP 14% met	COCP: 3/31=10% COCP + met: 5/36=14%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial **No** Not reported	

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No **Not reported**	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	**Yes** Partial No Not reported	
	If confounding was present, was it controlled for?	Yes Partial **No** Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial **No** Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No **Not reported**	
	If statistical analysis was undertaken, was this appropriate?	**Yes** Partial No Not reported	
COMMENTS			
What is the overall risk of bias?		Low **Moderate** High Insufficient information	No blinding, no protocol

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	

Study ID	Zahra 2017
Study Citation	Zahra, M.; Shah, M.; Ali, A.; Rahim, R. Effects of Metformin on Endocrine and Metabolic Parameters in Patients with Polycystic Ovary Syndrome Hormone and metabolic research = Hormon- und Stoffwechselforschung = Hormones et metabolisme 2017;49(2):103-108
Study Country	Pakistan
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Females with PCOS aged 18–35 years
PCOS diagnostic criteria	Vaguely reported see inclusion criteria
Presence of infertility	Not reported
Presence of other condition/s	No
Medication History	No
N per group	*Allocated/randomised: 30 (metformin group) and 30 (placebo)* *Assessed at end of study: 20 (metformin group) and 20 (placebo)*
Setting	This was a randomized, placebo-controlled study, conducted in 2 tertiary care hospitals (Hayatabad Medical Complex and Leady Reading Hospital, Peshawar, Pakistan)
Intervention	Metformin, according to body weight with a maximum dose of 500mg 3 times/day
Comparison	Placebo tablets 3 times/day
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, BMI, fasting glucose, insulin, HOMA-IR, LH, FSH, visfatin, INSL-3, systolic and diastolic bp.
Follow up Duration	3 months

Summary Result/s	Metformin treatment showed significant improvement in systolic and diastolic blood pressures. In addition, an improvement in the hormonal profile in the form of reduction in LH, FSH, and visfatin levels was observed.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	to evaluate the effects of metformin on insulin resistance in PCOS and to determine its relation with neo-hormones INSL-3 and visfatin
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	18-35 year old females with PCOS. The diagnosis of PCOS was based on females having disturbed ovulatory function with chronic oligomenorrhea or amenorrhea, typical appearance of polycystic ovaries by ultrasound examination (according to ESHRE, ASRM), hirsutism, or elevated serum androgens
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Those females who dropped metformin in this 3 months period (due to socioeconomic reasons) or those were not willing for follow-up vis - its were excluded from the study.*
Inclusion criteria	Yes Partial No Not reported	18-35 year old females with PCOS. The diagnosis of PCOS was based on females having disturbed ovulatory function with chronic oligomenorrhea or amenorrhea, typical appearance of polycystic ovaries by ultrasound examination (according to ESHRE, ASRM), hirsutism, or elevated serum
Exclusion criteria	Yes Partial No Not reported	-Those who quit metformin in this 3 months period (due to socioeconomic reasons) -not willing for follow-up visits -Patients on antihypertensive drugs were also excluded from the study
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	The methods section only states: “The participants were then randomly divided into 2 groups”
	Was allocation to intervention group concealed?	Yes Partial No	

		Not reported	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Venous blood sample was obtained after overnight fast, for arthropometic measures it was not reported.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	
ATTRITIO N BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	In the original study: Metformin-group 10/30=33.3% Placebo-group 10/30=33.3% Some dropouts excluded!

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Baseline weight and BMI seems to be different (higher in placebo group). Also INSL-3 and visfatin differs at baseline.*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	

	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	
COMMENTS		*High*	
What is the overall risk of bias?		Low Moderate High Insufficient information	The randomization process poorly described, many drop-outs, differences in baseline variables.
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes high risk of bias*	

PART 2

RECOMMENDATIONS

GDG 4

Question 4.4.

Is metformin alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?

BACKGROUND:

Metformin, an insulin sensitizer, has been widely used for the prevention/management of prediabetes and type 2 diabetes in general population mild side effects of nausea, vomiting, diarrhoea, and flatulence (1,2). Metformin has additional benefits on weight loss in the combined treatment with lifestyle changes (3). Metformin has also been regularly evaluated alone or combined with oral contraceptive pills (OCP) and/ or antiandrogen drugs in randomized controlled trials in adult and adolescent women with PCOS (4). Its main action is in the liver with suppression of gluconeogenesis and hepatic glucose output, but it also enhances peripheral insulin action and reduces glucose absorption from the digestive tract, with no significant direct effect on pancreatic insulin production (5). Indeed, as women with PCOS present higher prevalence of insulin resistance, and the compensatory hyperinsulinemia has been linked to ovarian androgen secretion, metformin could be acting on the interface of metabolic and reproductive features of PCOS (6,7,8,9). In recent years, randomized clinical trials have emerged also looking for evidence of possible benefits and safety of combining metformin with antidiabetic or anti-obesity drugs, with or without OCP, anti-androgens and lifestyle on clinical, metabolic, and hormonal outcomes in adult and adolescent girls with PCOS, which is summarized in the present topic.

The usual dose of metformin for PCOS is 1000 to 2500 mg per day, although doses of up to 2000 mg have been trialled in PCOS. A limitation can be mild side effects, which are predominantly gastroenterological consisting of abdominal discomfort, nausea, and diarrhea. These symptoms are usually dose dependent and time-limited and can be minimized by gradually building up the dose of metformin over a period of 1–2 months. Initial doses should be 250–500 mg/day taken just before the main meal. In the case gastrointestinal side effects recidivate, the current dose may be reduced for a period of 7–10 days, followed by a resumption of the increasing dosage schedule (10,11). Vitamin B12 levels may also be affected on longer term metformin, especially in high risk populations.

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Comparison 1: Metformin versus placebo
Comparison 2: Metformin + lifestyle versus placebo + lifestyle
Comparison 3: Metformin versus lifestyle

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Metformin alone should be considered in adults with PCOS and a BMI ≥ 25 kg/m2 for anthropometric, and metabolic outcomes including insulin resistance, glucose, and lipid profiles.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **EBR:** Metformin alone could be considered in adolescents at risk of or with PCOS for cycle regulation, acknowledging limited evidence.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **CR:** Metformin alone may be considered in adult women with PCOS and BMI < 25 kg/m^2, acknowledging limited evidence.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

Where metformin is prescribed the following need to be considered:

- Shared decision making needs to consider feasibility and effectiveness of active lifestyle intervention.

Women should be informed that metformin and active lifestyle intervention have similar efficacy.

- Mild adverse effects, including gastrointestinal side-effects that are generally dose dependent and self-limiting
- Starting at a low dose, with 500mg increments 1-2 weekly and extended-release preparations may minimise side effects and improve adherence.
- Suggested maximum daily dose is 2.5g in adults and 2g in adolescents.
-
- Use appears safe long-term, based on use in other populations, however indications for ongoing requirement needs to be considered
- Use may be associated with low vitamin B12 levels, especially in those with risk factors for low vitamin B12 (e.g. diabetes, post bariatric surgery, pernicious anaemia, vegan diet etc.), where monitoring should be considered,
-

GRADE CONSIDERATIONS

Justifications:
In adult women with PCOS, metformin alone, at doses 1000 -2000 mg/d favour BMI reduction and metabolic outcomes, such as fasting glucose, HOMA-IR (moderate certainty), total cholesterol, triglycerides (low certainty), as well as testosterone (low certainty) and possibly WHR and shortening cycles (very low certainty). In women with BMI<25 metformin is superior to placebo in decreasing FAI (moderate certainty).
Metformin in combination with lifestyle favour improvement on testosterone (moderate certainty) and menstrual cycles/6 months (very low certainty). There is no significant effect on hirsutism (low certainty).
Women using metformin had more adverse gastrointestinal effects compared to placebo (moderate certainty). Side effects are not well reported.

Subgroup considerations:
In women with PCOS and BMI>25 metformin alone versus placebo favours decreasing BMI (moderate certainty)
In women with PCOS and BMI>25 metformin in combination with active lifestyle intervention was superior in lowering testosterone vs. lifestyle only.
Only 2 studies included 55 adolescent girls and suggested this could favor improving lipid profile, testosterone and restoring cycles, with very low quality of evidence.

Implementation considerations:
Metformin is widely prescribed for the management of type 2 diabetes and has been used in many countries to treat women and adolescents with PCOS. It is of low cost and widely available but side effects are present.
Metformin should be implemented after active lifestyle intervention but significant barriers for implementation of active lifestyle intervention may be present.

Monitoring and evaluation considerations:
Ensure contraception for women on metformin only (without OCP) treatment and not planning pregnancy at short-term
Gastrointestinal side effects are common in individuals taking metformin and should be monitored as they will impact on adherence. Considerations should be made to change to extended-release preparation if metformin is not well tolerated or there are adherence issues.

Research priorities:
Vitamin B12 status should also be the subject of further research to inform frequency of monitoring unless women are vegetarian.
The need for high-quality, well-designed, and adequately powered studies in adults and mainly in adolescents, suggested in the previous TR, remains current, with detailed reports on metformin-related adherence and adverse effects.
Importantly, these studies in women and adolescents require evaluation of different doses, extended-release preparations, and longer duration of treatment.
Need for studies to examine the impact of metformin on acne, hair loss, psychosexual function?
Studies in women across the BMI range to understanding any potential differential effect of metformin associated with BMI

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

• DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Metformin versus placebo

Twenty-three RCT addressing the outcomes of interest were identified and of these, 22 were included in the meta-analysis. One of them was in adolescents.

-Metformin, when compared to placebo, was superior in lowering the following outcomes: BMI (moderate certainty), WHR (very low certainty), testosterone (very low certainty), fasting glucose (moderate certainty), HOMA-IR (certainty moderate) total cholesterol (low certainty), triglycerides (low certainty), CRP (very low certainty), PAI (very low certainty); and in shortening the menstrual cycle (very low certainty).

-In sub analyses, for BMI>25 metformin was superior in lowering BMI, fasting glucose and total cholesterol (moderate certainty for all) and LDL (low certainty). For BMI<25, metformin was superior in lowering FAI (moderate certainty) and fasting insulin (low certainty)

-There was no significant difference in hirsutism score (low certainty). There were no significant differences in the following outcomes: SHBG, DHEAS, androstenedione, HDL.

It is important to remain cautious due to low to very low certainty in effect estimates and the quality of evidence across most of the outcomes.

- Regarding adolescents, one study was analysed as an individual study and showed metformin was superior in improving testosterone and HDL and in restoring menses. Certainty in the evidence for this study was low (low risk of bias but a single study with only a small number of participants, as reported by the evidence team). The other study found no differences in observed outcomes in metformin compared to placebo (low certainty for this single, small study).

Metformin + lifestyle versus placebo + lifestyle

Eight RCTs that address this comparison were identified and included in the meta-analysis. One of them also analysed adolescents separately.

-Metformin in combination with lifestyle when compared to placebo in combination with lifestyle, was superior in lowering testosterone (moderate certainty).

-Metformin + lifestyle was superior in increasing menstrual cycles/6 months (very low certainty).

-In a sub-analysis that included 2 studies in the meta-analysis, in which the BMI was not specified, metformin + lifestyle was superior in lowering WHR (low certainty).

-There were no significant differences for the other outcomes with certainty in the evidence being moderate to very low.

Metformin versus lifestyle

Three RCTs addressing this comparison were identified and included in the meta-analysis.

All studies were in women of a higher weight and adolescents with PCOS, one of them on 22 adolescents. No new studies from the previous analysis were identified.

-Metformin in comparison to lifestyle was superior in lowering testosterone and lifestyle was superior in increasing SHBG. While not statistically significant, fasting glucose tended to favour metformin.

-No differences were observed for the other outcomes: BMI, fasting insulin, total cholesterol, HDL, LDL, triglycerides, CRP.

However, it is important to remain cautious since the certainty in effect estimates and the quality of evidence is very low for all outcomes

- Concerning individual studies, not included in the meta-analysis, in one study DHEAS seemed to be lower in the metformin group vs. lifestyle WHR seemed to be lower in the lifestyle group vs. metformin. However, certainty in the evidence was very low for these outcomes.

Panel discussion:

See justifications above.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Adverse gastrointestinal effects were more frequent in the metformin group x placebo and in the metformin + lifestyle group x placebo + lifestyle (moderate certainty).

Panel discussion:

Metformin gastrointestinal side effects versus difficulty implementing lifestyle intervention

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Very low to moderate certainty evidence depending on the comparisons and outcomes. Data on side effects are limited.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☒ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Studies are warranted to define the value that consumers or health professionals place on the outcomes especially in the context of metformin not being approved for PCOS. Some relevant outcomes seem to be weight, quality of life, cycles, hirsutism, GI side-effects.

Panel discussion:

Lack of evidence creates challenges

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

No research evidence was identified.

Panel discussion:

Challenges with lack of adequate evidence.

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☒ Negligible costs or savings	☒ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Lifestyle intervention may be expensive to women and health systems, as in healthy food, and metformin is low in cost.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

Unclear.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

No clear evidence.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Lifestyle intervention may be expensive to women and health systems, as in healthy food, and metformin is low in cost.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Health care professionals might not accept metformin as it is not approved for PCOS this might change with education.

Public health may not accept medication over lifestyle.

Women with PCOS might not accept this option due to side effects or dosing schedule.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Low cost and accessible.

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Comparison 4: Metformin versus OCP
Comparison 5: Metformin versus metformin + OCP
Comparison 9: SPIOMET versus OCP

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** COCP could be used over metformin for management of hirsutism and irregular menstrual cycles in PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **EBR:** Metformin could be used over COCP for metabolic indications in PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **EBR:** The combination of COCP and metformin could be considered to offer little additional clinical benefit over COCP or metformin alone, in adults with PCOS with a BMI $\leq$ 30 kg/m2.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

- **PP:** In combination with the COCP, metformin may be most beneficial in high metabolic risk groups including those with a BMI >30 kg/m^2, diabetes risk factors, impaired glucose tolerance or high-risk ethnic groups.
- **PP:** Where COCP is contraindicated, not accepted or not tolerated, metformin may be considered for irregular menstrual cycles. For hirsutism, other interventions may be needed.

GRADE CONSIDERATIONS

Justifications:

[COMP 4] In adult women with PCOS, metformin, at doses 1000 -2000 mg/d favours improvement on metabolic outcomes. In turn OCP is more effective in improving clinical and laboratorial hyperandrogenism and restoring regularity in menstrual cycle (moderate to very low certainty). To note, even if OCP is better for hyperandrogenism, studies confirm that metformin may decrease androgen levels and probably ameliorate cycles, depending on the effective dose and time of exposition. Among the 22 RCT included in the meta-analysis, various include adolescent girls but few studied only this population.

[COMP 5] Metformin + OCP is more effective in lowering testosterone (low certainty) and DHEAS (very low certainty) compared to metformin only. There were no studies with adolescent girls in for this comparison

[COMP 9] Evidence on SPIOMET is very limited and only available in Spain. Two RCTs, with results pooled and with, in total, five publications were identified. COCP (EE 20 µg – LNG 100 mg) was compared with spironolactone 50 mg/d + pioglitazone 7.5 mg/d + metformin 850 mg/d (SPIOMET).

The first RCT was published in 2017, with one additional publication on the same cohort, one year later. Another RCT, with the same comparison, and from the same research group, was done to increase power, with no separate publication. The pooled results were reported in three publications in the next years, one of them with the highest number of participants, being considered the main publication. FAI could be extracted from the more recent study, as an additional outcome.
Risk of bias was moderate. The study had a duration of 12 months. Only effect on hirsutism, no effect on testosterone.

Subgroup considerations:
Inadequate evidence in those with BMI ≥ 30 kg/m2 and adolescents.

Implementation considerations:
The off-label status of metformin in PCOS needs to be discussed with the patient in the context of heavily evidence-based recommendations.

Monitoring and evaluation considerations:
Metformin approval by policy regulators to enable monitoring and evaluation of guideline recommendation.

Research priorities:
Adolescents and BMI ≥30 kg/m2 groups
For metformin, COCP and combinations

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Metformin versus OCP

24 RCTs (33 articles) addressing the comparison of metformin and OCP were identified and of these, 22 were included in the meta-analysis.

-Metformin, compared to OCP, was superior in improving fasting insulin, total cholesterol, triglycerides, CRP and HOMA-IR (low or very low certainty). For women with BMI<25: metformin was also superior in lowering WHR (low certainty), total cholesterol (very low certainty) and HOMA-IR (moderate certainty). Regarding women with BMI >25, metformin was superior in improving HDL (moderate certainty).

-OCP was superior in improving hyperandrogenism (SHBG, FAI, Testosterone, free testosterone, DHEAS and androstenedione) and restoring regularity in the menstrual cycle (moderate to very low certainty). For women with BMI<25: OCP was also better in improving hirsutism (low certainty) and androstenedione (low certainty)

-Regarding adolescents, metformin was superior in lowering LDL (low certainty), whereas OCP was superior in improving SHBG and FAI (note that only one study included these outcomes).

Metformin versus metformin + OCP

Six RCTs were identified for this comparison and of these, 5 were included in the meta-analysis.

-Metformin alone, compared to the combination with OCP, was superior in lowering WHR, fasting glucose, total cholesterol (low to very low certainty for all), and triglycerides (in the sub analysis with BMI<25, low certainty)

-The combination of metformin and OCP was superior in lowering testosterone (low certainty) and DHEAS (very low certainty).

- No differences were observed for the other outcomes, but the certainty in effect estimates and the quality of evidence is low or very low.

- Regarding individual studies, not included in the meta-analysis for some outcomes, the combination metformin and OCP was superior on improving hirsutism, SHBG levels, free testosterone and FAI. In turn, metformin only was found to be superior in lowering BMI.

Again, the certainty in the evidence for the individual studies are low or very low (studies with moderate or high risk of bias and most with small sample sizes).

SPIOMET versus OCP

Five RCTs comparing SPIOMET (spironolactone 50mgx1, pioglitazone 7.5mgx1 and metformin

850mgx1) with OCP were identified. However, all studies used the same set of data and therefore, it was not possible to perform a meta-analysis. The outcomes of the two studies with the largest sample size were used .

-SPIOMET was superior in reducing hirsutism, LDL-cholesterol, CRP, HOMA-IR and fasting insulin compared to OCP.

-OCP increased SHBG more than SPIOMET. QOE for these comparisons are low

Panel discussion:

As above.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Gastrointestinal side effects seem to be more frequent with metformin

The frequency of adverse effects is similar between metformin alone or metformin +OCP groups

There were no side effects reported for SPIOMET or OCP.

Systematic effects are not systematically reported.

Panel discussion:

Favours this option for not combining metformin and COCP as it offers little additional benefit beyond monotherapy.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☒ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

This rating refers to combination treatment with metformin and COCP.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Some women with PCOS and especially those not using OCP have expectations on restoration of cycles.

Panel discussion:

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

See above

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☒ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Combination might increase costs

Panel discussion:

Metformin is low cost so omitting the combination treatment offers little cost savings.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

Unclear

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Policy regulators' approval of metformin use in PCOS will increase equity.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Policy regulators may not wish to cover the cost of metformin.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☒ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Aligns with current practice recommendations.

Evidence to Recommendations Framework

COMPARISONS (option versus other option)
Comparison 28: Metformin versus metformin (different dose) – This data is considered in the metformin versus placebo comparison

Allocation ranking	Level 1- New systematic review

1. SELECTION CRITERIA

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Females with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity and weight. Subgroups: adolescents (10-19y), adults, post-menopausal. BMI subgroups overweight and each class of obesity BMI>25-29.9, 30-34.9, 35-40, >40	Anti-obesity pharmacological agents alone (Orlistat, GLP1RA, phentermine/topiramate, lorcaserin, naltrexone/bupropion, or any other anti-obesity pharmacological agent) or in combination with lifestyle, metformin, OCP, anti-androgens. All doses Duration: min 3 months	Placebo or any other intervention (listed in intervention) or combinations of those listed in intervention. Bariatric surgery alone or in combination with listed interventions.	Androgenicity: Hirsutism- FG score (ethnicities), FAI, testosterone (free/total), SHBG, DHEAS, androstenedione, Irregular cycles Metabolic: fasting glucose, fasting insulin, HOMA-IR, QUICKI, OGTT: 120 min glucose and insulin, 30/60/90 min glucose and insulin where available, AUC glucose, AUC insulin, Matsuda index, Euglycemic hyperinsulinemic clamp. Lipids: Chol LDL, HDL TG, CRP Psychological: Qol, depression Arthropometric: weight BMI, WHR, waist circumference, % with >5% or > 10% weight loss , fat mass, fat free mass, % body fat Gastrointestinal effects Fertility: Menstrual regularity, Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, single and multiple pregnancies, miscarriage rate, adverse events (including pre term delivery, growth restriction, low birth weight, stillbirth. Pregnancy complications, pre-eclampsia, hyperglycaemia, hypertension in pregnancy, gestational diabetes, perinatal morbidity, fetal macrosomia, caesarean.) Adverse events	Evidence based guidelines, systematic reviews, randomised controlled trials. Crossover trials will be included but only the phase before the crossover will be included in outcomes.	English language. New search Limit to last 10 years - decision from 2018
Exclusion	Females without PCOS.	Metformin alone	Agent or combination used in the intervention.		Non-evidence based guidelines, non-systematic reviews, any study lower than a RCT. Quasi randomised trials.

i. Phentermine/Topiramate v Dapagliflozin

Sample sizes: PT=13, Dapa=17

OUTCOME: Gastrointestinal effects (Nausea)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs Dapa								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			2		0		Crude	NA

OUTCOME: Gastrointestinal effects (Upset stomach)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs Dapa								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**

Elkind-Hirsch et al. 2021			1		0		Crude	NA

OUTCOME: Other AE (Yeast infection)				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Phentermine/topiramate vs Dapa								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		4		Crude	NA

OUTCOME: Other AE (Urinary tract infection: burning urination)				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Phentermine/topiramate versus Dapagliflozin (DAPA)								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		2		Crude	NA

OUTCOME: Other AE (Vaginal irritation)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate versus Dapagliflozin (DAPA)								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		1		Crude	NA

OUTCOME: Other AE (Rapid heartbeat)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate versus Dapagliflozin (DAPA)								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			1		1		Crude	NA

OUTCOME: Other AE (Light headed)	**OUTCOME TYPE:** Dichotomous
COMPARISON (if applicable): Phentermine/topiramate versus Dapagliflozin (DAPA)	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Elkind-Hirsch et al. 2021			1		1		Crude	NA

OUTCOME: Other AE (Fatigue)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs Dapa								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			2		0		Crude	NA

OUTCOME: Other AE (Insomnia)	**OUTCOME TYPE:** Dichotomous
COMPARISON (if applicable): Phentermine/topiramate vs Dapa	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Elkind-Hirsch et al. 2021			3		0		Crude	NA

OUTCOME: Other AE (Headache)				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Phentermine/Topiramate versus Dapagliflozin (DAPA)								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			2		0		Crude	NA

OUTCOME: Other AE (Kidney stone)	**OUTCOME TYPE:** Dichotomous
COMPARISON (if applicable): Phentermine/Topiramate versus Dapagliflozin (DAPA)	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Elkind-Hirsch et al. 2021			1		0		Crude	NA

OUTCOME: Other AE (Prolong menstrual bleeding)				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Phentermine/Topiramate versus Dapagliflozin (DAPA)								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		1		Crude	NA

ii. Phentermine/Topiramate v Dapagliflozin + Metformin

Sample sizes: PT=13, DAPA+Met=19

OUTCOME: Gastrointestinal effects (Nausea)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs DAPA + MET								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			2		1		Crude	NA

OUTCOME: Gastrointestinal effects (Upset stomach)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs DAPA + MET								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			1		5		Crude	NA

OUTCOME: Other AE (Yeast infection)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs DAPA + MET								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		5		Crude	NA

OUTCOME: Other AE (Injection site reaction: irritation, nodule, rash, redness, itching)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs DAPA + MET								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		0		Crude	NA

OUTCOME: Other AE (Urinary tract infection: burning urination)	**OUTCOME TYPE:** Dichotomous

COMPARISON (if applicable): Phentermine/Topiramate versus DAPA + MET								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		1		Crude	NA

OUTCOME: Other AE (Frequent urination)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate versus DAPA + MET								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		1		Crude	NA

OUTCOME: Other AE (Rapid heartbeat)	**OUTCOME TYPE:** Dichotomous
COMPARISON (if applicable): Phentermine/topiramate versus DAPA + MET	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Elkind-Hirsch et al. 2021			1		0		Crude	NA

OUTCOME: Other AE (Light headed)				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Exenatide versus DAPA + MET								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			1		0		Crude	NA

OUTCOME: Other AE (Fatigue)	**OUTCOME TYPE:** Dichotomous
COMPARISON (if applicable): Phentermine/topiramate vs Dapa	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Elkind-Hirsch et al. 2021			2		0		Crude	NA

OUTCOME: Other AE (Insomnia)				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Phentermine/topiramate vs Dapa								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**

OUTCOME: Other AE (Headache)	**OUTCOME TYPE:** Dichotomous
COMPARISON (if applicable): Phentermine/topiramate versus DAPA + MET	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Elkind-Hirsch et al. 2021			2		0		Crude	NA

OUTCOME: Other AE (Kidney stone)				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Phentermine/Topiramate versus DAPA + MET								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			1		0		Crude	NA

iii. Phentermine/Topiramate v Exenatide + Dapagliflozin

Sample sizes: PT=13, EXE+DAPA=20

OUTCOME: Gastrointestinal effects (Nausea)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs EXE + DAPA								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			2		1		Crude	NA

OUTCOME: Gastrointestinal effects (Upset stomach)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs EXE + DAPA								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			1		5		Crude	NA

OUTCOME: Other AE (Yeast infection)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/topiramate vs EXE + DAPA								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		5		Crude	NA

OUTCOME: Other AE (Urinary tract infection: burning urination)					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): Phentermine/Topiramate versus EXE + DAPA								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Elkind-Hirsch et al. 2021			0		1		Crude	NA

OUTCOME: Other AE (Frequent urination)	**OUTCOME TYPE:** Dichotomous
COMPARISON (if applicable): Phentermine/topiramate versus EXE + DAPA	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Elkind-Hirsch et al. 2021			0		1		Crude	NA

OUTCOME: Other AE (Rapid heartbeat)				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): Phentermine/topiramate versus EXE + DAPA								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**

Note: Orlistat + Metformin was superior to Metformin for body fat %reduction – reported in body of manuscript.

(Numerical data is not provided in the numerical tables)

6. STUDY CHARACTERISTICS AND QUALITY APPRAISAL

1. Exenatide

i. Elkind-Hirsch 2021

Study ID	*Elkind-Hirsch 2021*
Study Citation	*Elkind-Hirsch et al., J Clin Endocrinol Metab 106:3019-3033, 2021*
Study Country	*USA*
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS age 18-45*
PCOS diagnostic criteria	*NIH 1990*
Presence of infertility	*not reported*
Presence of other condition/s	*Obese , BMI 30-45, premenopausal*
Medication History	*No*
N per group	*130 at baseline,* *11 were ineligible* *119 met criteria assigned to 1 of 5 treatment groups* *End of study:* *Exenatide n=20* *Dapagliflozin n= 17* *Exenatide and Dapa n= 20* *Dapa and metformin n = 19* *Phentermine/Topiramate n = 16* *Allocated/randomised: 119 (23 Exenatide; 22 Dapagliflozin plus Exenatide; 23 Dapagliflozin; 26 Dapagliflozin/Glucophage; 25 Phentermine-Topiramate)*

Setting	*Woman's Hospital Endocrine and Weight Loss Clinic, USA*
Intervention	*1. Exenatide once weekly (Bydureon),; 2 mg weekly,* *2. dapagliflozin (Farxiga) 10 mg daily,* *3. Exenatide and DAPA (2 mg weekly/10 mg daily),* *4. Combined dapagliflozin/metformin XR (Xigduo) were provided* *by AstraZeneca Pharmaceuticals (DAPA 10 mg/MET 2000 mg XR daily),* *5. weight loss medication, PHEN/TPM (PHEN 7.5 mg/* *TPM 46 mg ER daily)* *treated for 24 weeks.*
Comparison	***DAPA**: 10 mg daily;* ***combined DAPA/MET** (DAPA 10 mg/MET 2000 mg XR daily),* *for 24 weeks*
Co-intervention	*Counselling concerning the benefits of lifestyle modification through diet and exercise;* *Encouragement to increase daily exercise (eg, walking, using stairs)*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*FAI, total testosterone, DHEAS* *fasting glucose, HOMA-IR, Matsuda index: Sensitivity index (SI)* *Total cholesterol, LDL, HDL, TG,* *Weight, BMI, WHR, WC, body fat %, Fat mass, Fat free mass-Lean BM* *N of single pregnancies* *Gastrointestinal effects (Nausea, Upset stomach), Other AE (Yeast infection, Injection site reaction: irritation, nodule, rash, redness, itching, Urinary tract infection: burning*

	urination, Frequent urination, Vaginal irritation, Rapid heartbeat, Light headed, Stuffy nose, Fatigue, Insomnia, Headache, Kidney stone, Prolong menstrual bleeding) *after 24 weeks of treatment*	
Follow up Duration	*24 weeks*	
Summary Result/s	*Dual therapy with EQW/DAPA was superior to either alone, DAPA/MET and PHEN/TPM in terms of clinical and metabolic benefits* *EQW/DAPA and PHEN/TPM resulted in the most loss of weight and total body fat by DXA, and WC. Despite equivalent reductions in BMI and WC with PHEN/TPM, only EQW/DAPA and EQW resulted in significant improvements in MBG, SI, and IS. Reductions in fasting glucose, testosterone, FAI, and BP were seen with all drugs.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* GLP-1RA and SGLT2i, in combination and alone, SGLT2i plus MET vs a comparator weight loss medication in obese, nondiabetic women with PCOS
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No	Yes Eligible participants were required to have the combination of irregular periods (cycle length outside 21-35 days or < 8 cycles/year) together with biochemical evidence of hyperandrogenism (total

	Not reported	testosterone [TT] > 50 ng/dL, or free androgen index [FAI] > 3.87) (16) and exclusion of known disorders for bleeding irregularities and androgen excess. obese class I, II, and III (BMI > 30 < 45) and agreement to use effective contraception consistently during therapy
Exclusion criteria	Yes Partial No Not reported	Yes Diabetic individuals, current smokers, suspected pregnancy, desiring pregnancy, or injectable hormonal contraceptive use within 6 months and use of oral contraceptives, other steroid hormones, drugs that affect gastrointestinal motility or carbohydrate metabolism, and/or antiobesity drugs within 3 months prior to study entry.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* All participants were assigned to 1 of these 5 groups based on computer-generated random numbers using a block randomization method.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*yes*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*

	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Yes* "All investigators were blinded to drug treatment."
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Obese women with PCOS* *1. Exenatide once weekly (Bydureon),; 2 mg weekly,* *3/23= 13%* *(1 dropout request by patient, 2 pregnant)* *2. dapagliflozin (Farxiga) 10 mg daily: 6/23=26%* *(1 patient moved, 1 concern about meds, 2 not complaint, 1 removed from study by physician, 1 major surgery)* *3. Exenatide and DAPA (2 mg weekly/10 mg daily): 2/22= 9%* *(1 side effects, 1 non compliant)* *4. Combined dapagliflozin/metformin XR (Xigduo)* *(DAPA 10 mg/MET 2000 mg XR daily): 7/26=27%* *(4 not tolerate side effects, 1 personal reason, 1 non compliant, 1 gallstone and GI problems)* *5. weight loss medication, PHEN/TPM (PHEN 7.5 mg/* *TPM 46 mg ER daily) : 9/25=36%* *(5 side effects, 1 non compliant, 2 pregnant, 1 reaction to med)*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes (page 3024: When baseline comparisons were analyzed there were no consistent differences between the treatment groups for intent-to-treat participants as well asparticipants completing the trial (see Table 1).*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*yes.AG* *Clinicaltrials.gov NCT02635386*

CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Partial- disclosed as per:* *K.E.H reports receiving grant support from Novo* *Nordisk and Astra-Zeneca, serves on an advisory board for Astra Zeneca Pharmaceuticals, and is a consultant for EMD Serono.* *N.C. and J.S. report grant support from Ferring Pharmaceuticals.* *E.S. and D.B. have nothing to disclose.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes* *The sample size had a statistical power of 0.80 and* *2-sided P value of less than .05 and was calculated to be* *22 for each group.*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*yes*
COMMENTS		*Lack blinding of medication to participant and some conflict of interest from author*	
What is the overall risk of bias?		Low Moderate High	*Moderate- meds not blinded to participants*

	Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No –*	

iii. Tao 2021

Study ID	Tao 2021
Study Citation	Tao et.al. Exenatide, Metformin, or Both for Prediabetes in PCOS: A Randomized, Open-label, Parallel-group Controlled Study *The Journal of Clinical Endocrinology & Metabolism*, 2021, Vol. 106, No. 3, e1420–e1432 doi:10.1210/clinem/dgaa692
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Premenopausal women with PCOS age 18-45, with prediabetes and overweight/obesity*
PCOS diagnostic criteria	*Rotterdam*
Presence of infertility	*Not reported*
Presence of other condition/s	*BMI ≥25kg/m²* *Prediabetes – presence of IFG (FBG 5.6-6.9mmol/L) and/or IGT (PPG levels for the 75-g OGTT between 7.8-11.0mmol/L) and/or HbA1c 5.7-6.4%.*
Medication History	*No*
N per group	*Allocated/randomised: 183 (61 EXE+MET; 61 EXE; 61 MET)* *Assessed at end of study: 150 (: 50 (EXE + MET), 50 (MET), 50 (EXE)*

Setting	*University teaching hospital, Renji Hospital Affiliated to Shanghai Jiaotong University School of Medicine, Shanghai, China*	
Intervention	*Exenatide once daily injection) (Byetta) 10-20ug plus metformin 1500mg-2000mg daily for 12 weeks* *Exenatide once daily (Byetta) without Metformin* *Initial dose was 10 μg/day and increased to 20 μg/day after 1 month*	
Comparison	*Metformin (Glucophage) 1500mg-2000mg orally daily for 12 weeks* *Initiated at 500mg tds for 1 week and increased to 1000mg bd after 1 week*	
Co-interventions	*"All patients received guidance concerning diet and exercise as appropriate"*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary outcomes: Remission of prediabetes (normal OGTT after 12 weeks treatment* *Secondary: anthropometric, hormonal, metabolic - FBG, Fasting insulin, HOMA-IR, 2-hour glucose increment in OGTT, TG, total cholesterol(TC), HDL, and low-density lipoprotein (LDL),* *free androgen index (FAI), free testosterone (FT), Total testosterone (T), sex hormone binding globulin (SHBG), dehydroepiandrosterone (DHEAS), androstenedione (A2)*	
Follow up Duration	*12 weeks*	
Summary Result/s	*Compared with MET monotherapy, EXE alone or EXE+MET achieved a higher rate of remission of prediabetes among patients with PCOS by improving postprandial insulin secretion*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The aim was to evaluate EXE, MET and a combination of the two for clinical efficacy for prediabetes in women with PCOS.*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*

If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* *Diagnosed according to Rotterdam criteria* *18-45 years old* *BMI ≥25* *Diagnosed with prediabetes – presence of IFG (FBG 5.6-6.9mmol/L) and/or IGT (PPG levels for the 75-g OGTT between 7.8-11.0mmol/L) and/or HbA1c 5.7-6.4%.* *Premenopausal* *First onset of PCOS that had not received any hypoglycemic medications in the preceding 3 months, or received diet and behavioural interventions for 3 months but still meeting OGTT criteria for prediabetes.*
Exclusion criteria	Yes Partial No Not reported	*Yes* *subjects with self- reported allergy to either glucagon-like peptide 1 receptor agonists (GLP-1RA) or MET; subjects with severe liver function test abnormality (defined as alanine aminotransferase [ALT] 2.5 times or higher than the upper limit of normal range), or renal dysfunction (serum creatinine >132 μmol/L, and/or estimated glomerular filtration rate <60 mL/ min/1.73 m^2), hypertension (>160/100 mmHg), active infection, secondary diabetes, and subjects with active alcohol misuse, pregnancy, or breast feeding.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Computer generated*

	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported* *"All eligible patients were randomly assigned… using the random number created by a computer-generated coding system".*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*EXE + Met = 11/61 = 18%* *Reasons: Poor compliance 11* *MET = 11/61 = 18%* *Reasons: Poor compliance 8, AE 3* *EXE = 11/61 = 18%* *Reasons: Poor compliance 9, AE 2*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*No* *ITT analysis not described, per protocol described only.*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*No* *Clinical trial registration states that improvement of fatty liver (ultrasonography) was a secondary outcome measure . This was not reported and there are no related publications.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes* *No difference for age or any parameters*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Partial – modelling done for primary outcome of remission of prediabetes but this was not relevant to our review*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *Authors reported they had no COIs*

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes* *Sample size calculation reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Lack of allocation concealment and blinding key reason for high ROB*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes high risk of bias*	

iii. Zheng 2017/2019

Study ID	*Zheng 2017; Zheng 2019*
Study Citation	*Zheng, S., Liu, E., Zhang, Y., Long, T., Liu, X., Gong, Y., ... & Wang, F. (2019). Circulating zinc-α2-glycoprotein is reduced in women with polycystic ovary syndrome, but can be increased by exenatide or metformin treatment. Endocrine Journal, 66(6), 555-562. (APA)* *Zheng, S., Zhang, Y., Long, T., Lu, J., Liu, X., Yan, J., ... & Wang, F. (2017). Short term monotherapy with exenatide is superior to metformin in weight loss, improving insulin resistance and inflammation in Chinese overweight/obese PCOS women. Obesity Medicine, 7, 15-20.*
Study Country	China

BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS, age 18-40* *Overweight and obese (Chinese Obesity Working Group standard)*
PCOS diagnostic criteria	*Rotterdam*
Presence of infertility	*NR*
Presence of other condition/s	*Overweight/obese*
Medication History	*NR*
N per group	*Allocated/randomised: 82 (41 Exenatide 10ug bid sc, 41 metformin 1000mg bid)* *Assessed at end of study: 63 (31 Exenatide, 32 metformin)*
Setting	*Third Affiliated Hospital of Guangzhou Medical University, Endocrinology Department (Outpatients)*
Intervention	*Exenatide (Byetta, Baxter Pharmaceutical Solutions, 2.4mls/vessel) dose was 10ug bid for 12 weeks*
Comparison	*Metformin (US-Shanghai Squibb Pharmaceuticals, 500mg/tablet) dose was 1000mg bid for 12 weeks*
Co-interventions	*All patients receive diet and exercise advice*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Weight, WC, BMI, WHR, TC, TG, HDL-C, LDL-C, hs-CRP, metabolic (e.g. fasting glucose, FINS, HOMA-IR, 2hPBG, 2hINS, AUC glucose, AUC insulin, FAI, SHBG, DHEAS, T at pre-treatment baseline and after 12-week treatment* *mFG score, Matsuda index [insulin secretion index (ISI)], Menstrual regularity (menstrual periods), Gastrointestinal effects (nausea, diarrhea, Bloating, Vomiting, Gastrointestinal spasm, stomachache, constipation), Other adverse effects (dizziness, weakness, subcutaneous induration)*
Follow up Duration	*12 weeks (post-test)*
Summary Result/s	*Exenatide was more effective than metformin in reducing body weight, waist circumference, 2hr glucose, fasting insulin, 2 hr insulin, HOMA-IR, AUC-insulin, FAI and hs-CRP.*

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*The purpose of the study was to observe characteristics of serum ZAG (not reported) and its relationship with endocrine and metabolic indicators of PCOS patients, and to explore the effects of exenatide or metformin on serum ZAG levels in overweight/obese PCOS patients.*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes - reported* *Rotterdam* *Age 18-40* *Obese/overweight*
Exclusion criteria	Yes Partial No Not reported	*Yes* *Not overweight/obese* *Hyperprolactinemia, congenital adrenal hyperplasia, other adrenal or ovarian tumours that produce testosterone*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported* *The study reported that participants were "randomly and equally assigned" but did not describe the method of randomisation.*

	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported* *There was no reporting of how allocation was concealed.*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No* *No blinding was reported however as interventions have different delivery systems, it is likely that participants were not blinded.*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes* *They both received the same lifestyle advice*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Exenatide group: 10/41= 24.4%* *Metformin group: 9/41 = 22.0%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Not reported*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Partial* *The trial was registered. Menstrual cycle was specified in the registration but not reported in this paper.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Partial* *Only age was reported. No t-test was performed on baseline variables.*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Partial* *Outcomes not adjusted for age*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors declared no conflicts of interest. Funding was obtained from the National Natural Science Foundation of China (No. 81200607) and the project of the Key Laboratory for Major Obstetric Diseases of Guangdong Higher Education Institutes (No. 2012Z05)*

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Lack of randomisation, allocation concealment and blinding key reason for high RoB*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes high risk of bias*	

iv. Liu 2017/Li 2022

Study ID	Liu 2017/Li 2022
Study Citation	*Li et al., Archives of Gynecology and Obstetrics. 1-11, 2022* Liu et al. *Clinical Endocrinology* 2017; 87:767-774.
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS (18-40) with overweight/obesity and attempting to conceive, with no other cause for female infertility and no male infertility.*
PCOS diagnostic criteria	*Rotterdam*

Presence of infertility	*Yes; without contraception, no male infertility for 2 years and not pregnant*
Presence of other condition/s	*Overweight/obese (BMI ≥ 24kg/m^2)* *Infertility*
Medication History	*Not reported*
N per group	*Allocated/randomised: 176 (88 pre-gestational Exenatide 12 weeks then metformin 12 weeks, 88 metformin 24 weeks)* **note that Li 2022 reports 160 randomised due to some participants not wanting to have ART at the centre)* *Assessed at 12 weeks: 158 (78 Exenatide, 80 metformin – all outcomes except pregnancy) (Note Li 2022 reports 72 and 75)* *Assessed at 64 weeks: 147 (72 Exenatide, 75 metformin – pregnancy only)*
Setting	*Third Affiliated Hospital of Guangzhou Medical University, Endocrinology Outpatients department.*
Intervention	*Pre-gestational Exenatide (Amylin Pharmaceuticals Inc, San Diego, USA) 10ug bd for 12 weeks, followed by Metformin 1000mg bd for 12 weeks.* *Exenatide was commenced at 5ugbd, and participants who could not tolerate AEs were instructed to reduce the dose to 5ug bd.* *In the second phase (after 12 weeks) Exenatide was ceased and participants commenced on Metformin at a dose of 500mg bd then titrating up by 500mg every 3 days to a final dose of 1000mg bd.*
Comparison	*Metformin (Bristol-Myers Squibb Co. New York, USA) 1000mg bd for 24 weeks.* *Commenced at 500mg bd then titrated up by 500mg every 3 days up to a dose of 1000mg bd.*
Co-interventions	• ***Lifestyle interventions (diet and exercise) were actively promoted in both groups according to international guidelines (ADA Standards of Medical Care 2018).*** • ***Combined OCP and barrier contraception in the first phase (12 weeks) (cyproterone and ethinyl estradiol, Bayer Technology and Engineering Co., Ltd., Leverkusen, Germany)*** • ***ART as needed in second phase. All participants were instructed to have regular intercourse (2-3 times weekly). Ovulation assessment and ART were offered to participants who failed successful pregnancy. OI was given***

	for 3 cycles, then IVF-ET was provided once. Metformin was ceased upon confirmation of pregnancy.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Androgenecity (FAI, testosterone, SHBG), Metabolic (Fasting gluc/insulin, 120min gluc/insulin, HOMA-IR), Lipids, hs-CRP, Anthropometric (weight, BMI, WHR, WC, body composition), pregnancy rate, incidence of miscarriage, preterm delivery, menstrual frequency ratio, live birth rate, the ratio of cumulative number of pregnancies to total number, mild or moderate gastrointestinal (GI) discomfort, hypoglycemic events*	
Follow up Duration	*12 weeks (androgens, metabolic, lipids, anthropometric etc)* *64 weeks (pregnancy outcomes)*	
Summary Result/s	*In overweight/obese Chinese women with PCOS, 12 weeks of exenatide therapy significantly reduced body weight and central adiposity, insulin resistance, inflammatory markers and menstrual cycles compared to metformin. Pregestational exenatide for 12 weeks followed by metformin was more likely to result in spontaneous pregnancy than metformin, however there was no difference in pregnancy rate after ART.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The study aimed to assess treatment effects associated with Metformin or exenatide on body weight, fat mass, glycemic control, IR, hormonal levels, inflammatory markers and safety after 12 weeks of treatment and compare the conception rate in the second 12-week period in overweight/obese women with PCOS.*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* *Inclusion criteria:* *(i) is 18-40 years old; (ii) is OW/OB (body mass index [BMI] ≥24 kg/m^2); (iii) has been without contraception for more than 2 years and has not been pregnant; (iv) is attempting to become pregnant; (v) has at least one*

		unobstructed fallopian tube and a normal uterine cavity; and (vi) has a male partner with normal semen test.
Exclusion criteria	Yes Partial No Not reported	*Yes* *diagnosis of type 1 or type 2 diabetes mellitus; severe cardiovascular, kidney or liver disease (liver enzyme was more than 2 times the normal value); thyroid dysfunction; history of carcinoma; the use of drugs considered or suspected to affect the metabolic or reproductive systems in the past 3 months; or a male partner with oligospermia, asthenospermia, semen abnormal liquefaction, sexual dysfunction, or genital malformation that caused infertility.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Computer generated.*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No* *There is no mention of blinding of participants. Given that Exenatide is sc it would not be possible to blind.*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*

	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Exenatide group (note the two papers reported different numbers of individuals randomised. First paper reported 88 women per arm, second paper reported 80 women per arm)* *12 weeks 10/88 = 11.4% (According to Liu 2017)* *End of study 16/88 = 18.2%* *Metformin group* *12 weeks 8/88 = 9.1%* *End of study 13/88 = 14.8%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*No* *There was no published protocol. However the trial registration specifies that the aim was to examine the effects of metformin, spironolactone and GLP-1 RAs. The main indicators were insulin resistance and glycolipid metabolism index, insulin resistance and beta cell function, and sex hormone levels.* *Not reported are: adipokine levels, beta cell function.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes* *Groups were compared with one-way ANOVA for key variables such as age, weight.*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors declared no COI.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes* *A sample size calculation was performed. 45 per group was required for body weight as the primary variable.*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Partial* *Potential confounders were not taken into account.*
COMMENTS		*Lack of blinding and allocation concealment and selective outcome reporting are key reasons for moderate ROB.*	

What is the overall risk of bias?	Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes high risk of bias*	

v. Ma 2021

Study ID	Ma 2021
Study Citation	Ma et.al. Short-term combined treatment with exenatide and metformin for overweight/obese women with polycystic ovary syndrome. Chinese Medical Journal *134(23):2882–2889,* 2021 10.1097/CM9.0000000000001712
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS age 18-40, with overweight/obesity*
PCOS diagnostic criteria	*Rotterdam*
Presence of infertility	*Not reported*
Presence of other condition/s	overweight/obese (body mass index [BMI] ≥25 kg/m2 *No diabetes*
Medication History	*Not reported*
N per group	*Allocated/randomised: 50 (25 EXE + MET, 25 MET)* *Assessed at end of study: 40 (19 EXE + MET, 21 MET)*
Setting	*Outpatients from University teaching hospital, Department of Obstetrics and Gynaecology outpatients (Peking Union Medical College Hospital, Beijing, China)*

Intervention	*Exenatide once weekly (Bydureon) 2mg plus metformin 500mg tds for 12 weeks* *Metformin initiated at 250mg daily and increased by 250mg daily up to 500mg tds*
Comparison	*Metformin (Glucophage) 500mg tds for 12 weeks* *Metformin initiated at 250mg daily and increased by 250mg daily up to 500mg tds*
Co-interventions	*Diane-35 (ethinylestradiol 0.035 mg and cyproterone acetate 2 mg, Bayer, Leverkusen, Germany) for 21 consecutive days from the first day of menstruation or progesterone withdrawal hemorrhage, and the next cycle began after 7 days of withdrawal. Lifestyle intervention was not actively promoted*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Primary outcomes: Anthropometric changes* *Secondary: changes in reproductive hormone levels, glucose and lipids, CRP*
Follow up Duration	*12 weeks*
Summary Result/s	*Combination therapy with exenatide once weekly and metformin was more effective than metformin alone for reducing body weight, BMI, waist circumference, and improving insulin sensitivity in women with PCOS and overweight/obesity.*

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The aim was to assess the therapeutic efficacy of exenatide once weekly and metformin on body weight as well as endocrinological parameters in overweight/obese women with PCOS. The hypothesis included that EXE+MET had better efficacy in inducing weight loss and improving IR than MET alone.*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial	*Yes* *Diagnosed according to Rotterdam criteria*

	No Not reported	*18-40 years old* *BMI ≥25*
Exclusion criteria	Yes Partial No Not reported	*Yes* *Patients with diabetes; history of cancer; personal or family history of multiple endocrine neoplasia type 2; severe cardiovascular, kidney, or liver diseases; and use of statins or other drugs known or suspected to affect reproductive or metabolic functions within 3 months before entering the study*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *"A simple computer-generated randomization process. The randomized codes in this study were generated electronically using a two-block randomization technique to create a treatment allocation spreadsheet."*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported* *A treatment allocation spreadsheet was created but there is no information about whether allocation was actually concealed.*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*

	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*EXE + Met = 6/25 = 24%* *Reasons: Gastrointestinal reaction 1, Change in residence due to covid 5* *MET = 4/25 = 16%* *Reasons: Gastrointestinal reaction 1, change in residence due to covid 2, pregnant 1*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*No* *Clinical trial registration states proportion of subjects who lost 5% and 10% of BW, BP, menstrual cycle, acne severity score, ovarian volume, follicular number. These were not reported.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes* *No difference for age or any parameters*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Partial.* *"Conflicts of interest: None."* *The information of funding was not reported.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes* *Sample size calculation reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Yes*
COMMENTS		*Lack of allocation concealment and blinding key reason for high ROB*	
What is the overall risk of bias?		Low Moderate High	*High*

	Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes high risk of bias*	

2. Liraglutide

i. Nylander 2017

Study ID	Nylander 2017
Study Citation	Nylander et al., *Reproductive Biomedicine Online 35,1 (2017): 121-127* *Related manuscripts:* • **Nylander, M., Frossing, S., Clausen, H. V., Kistorp, C., Faber, J., & Skouby, S. O. (2017). Effects of liraglutide on ovarian dysfunction in polycystic ovary syndrome: a randomized clinical trial. *Reproductive Biomedicine Online, 35*(1), 121-127. doi:https://dx.doi.org/10.1016/j.rbmo.2017.03.023** • **Frossing, S., Nylander, M., Chabanova, E., Frystyk, J., Holst, J. Study Country	Denmark
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS and overweight/obesity
PCOS diagnostic criteria	Rotterdam
Presence of infertility	*Not reported*

Presence of other condition/s	*BMI>25 and or insulin resistance (*fasting plasma C-peptide >0.6 nmol/L)
Medication History	use of hormonal contraceptives within six weeks, injectable hormonal contraceptives within six months and antidiabetic or antihypertensive drugs within three months prior to randomization led to exclusion.
N per group	*72 randomized (48 LIRA, 24 placebo)* *65 analysed (44 LIRA, 21 placebo)*
Setting	Enrolled from social media (www.facebook.com/PCOSkliniskforsoeg), from private practicing gynecologists and from our outpatient PCOS clinic, securing external validity. *Herlev Gentofte Hospital, University of Copenhagen, Denmark.*
Intervention	*Liraglutide 1.8 mg qd x 26 weeks,) administered subcutaneously 1.8 mg/day, starting at 0.6 mg/day and 1.2 mg/day for the first and second week, respectively – for 26 weeks.*
Comparison	*Placebo (Novo Nordisk A/S), provided identically packed*
Co-interventions	*None*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary outcome was the difference between the groups in change from baseline to follow-up in endogenous thrombin potential (ETP) measured by thrombin generation test (TGT). Secondary outcomes were differences between groups in change from baseline to follow-up in other parameters of TGT (described in 'Assays' subsection) as well as plasma levels of vWF, PAI-1 and hsCRP. Other: Adverse effects
Follow up Duration	*26 weeks*
Summary Result/s	In overweight women with PCOS, liraglutide intervention caused an approximate 5% weight loss. There possible beneficial effects on marker of VTE. *After six months, the liraglutide group had a mean weight loss of 5.2 kg (95% CI 3.0 to 7.5, P < 0.0001) and mean reductions in fasting glucose and HbA1c of 0.24 mM (95% CI 0.05 to 0.43, P < 0.05) and 1.4 mmol/mol (95% CI 0.3 to 2.5, P < 0.05), respectively, compared with the placebo group.*

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*The aim was to determine if* intervention with the GLP-1 analog liraglutide, in overweight women with PCOS, would lead to a beneficial reduction in VTE and CVD risk markers: thrombin generation, vWF, PAI-1 and hsCRP, possibly due to a weight loss
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	≥18 years, premenopausal and had PCOS according to Rotterdam criteria, i.e., minimum two of the three (1) oligo-/amenorrhea (cycle >35 days), (2) clinical (Ferriman–Gallwey score ≥8) or biochemical hyperandrogenism (total or free testosterone levels above reference: >1.8 nmol/L and >0.034 nmol/L, respectively) and (3) polycystic ovaries (≥12 follicles (2–9 mm) and/or volume >10 mL in at least one ovary) on transvaginal

		ultrasound. Other causes to bleeding irregularities and androgen excess were excluded. The women should have BMI ≥25 kg/m2 and/or insulin resistance defined as fasting plasma C-peptide >0.6 nmol/L at screening.
Exclusion criteria	Yes Partial No Not reported	pregnancy, breastfeeding, smoking >10 cigarettes/ day, diabetes, hypertension, overt inflammatory disease, use of herbal medicine or medications known to affect the hemostatic system. The use of hormonal contraceptives within six weeks, injectable hormonal contraceptives within six months and antidiabetic or antihypertensive drugs within three months prior to randomization led to exclusion.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Women were randomized, in blocks of six, to 26 weeks of intervention with liraglutide or placebo in a 2:1 ratio.* .
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*yes*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*yes*

	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*yes*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Liraglutide:4/48 =8.3%* *2 lost to follow up* *2 abdominal pain* *Placebo:3/24=12%* *1 lost to follow up* ***1- Withdrew consent- "personal reasons"*** *1-Gall stone related abdominal pain*

	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Partial:* K and J F have given lectures at NovoNordisk sponsored symposia. C K is a member of a NovoNordisk Advisory board. J F is a member of NovoNordisk Advisory board with regard to liraglutide treatment in diabetes. **Funding** M N was supported by a grant from the University of Copenhagen throughout the study period. The study was investigator-initiated and funded by Novo Nordisk A/S, who contributed with study and placebo drug and with a grant, covering preparation of the study as well as expenses to laboratory measures. The funds were unconditioned in relation to study design, collection, analysis and interpretation of data as well as on writing the manuscript, but Novo Nordisk A/S had access to the manuscript prior to submission.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	no A sample size calculation based on an estimated standard deviation of 130 units obtained from in-house data, declared 63 subjects, randomized 2:1, needed for 80% power to find a difference in effect size of 100 nmol/min of ETP. SG
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*yes*
COMMENTS		*Conflict of interest for authors led to moderate*	

	Despite being a randomised, double-blind RCT, possible ROB from selection bias (recruiting participants from social media might have caused, i.e. including only resourceful and highly motivated women), and possible recall bias (participants did not keep a bleeding diary before inclusion, and the reported bleeding ratio at baseline). *Sample size (lack of power) and authors' financing / position as member of NovoNordisk Advisory board with regard to liraglutide treatment in diabetes – Novo Nordisk A/S contributed with study and placebo drug and with a grant, covering preparation of the study as well as expenses to laboratory measures*	
What is the overall risk of bias?	Low Moderate High Insufficient information	*moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes moderate*	

ii. Elkind-Hirsch 2022

Study ID	Elkind-Hirsch 2022
Study Citation	Elkind-Hirsch 2022., *Fertil Steril* 118:371–81, 2022
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS age 18-45, with BMI>30 kg/m2*
PCOS diagnostic criteria	*NIH*
Presence of infertility	*not reported*
Presence of other condition/s	*BMI>30 kg/m2, irregular periods (cycle length outside 21–35 days or 50 ng/dL, with biochemical hyperandrogenism (total testosterone >50 ng/dL or free androgen index [FAI] >3.87)*

Medication History	*No*	
N per group	*Allocated/randomised: 82 (55 LIRA 3, 27 placebo)* *Assessed at end of study: 67 (44 Lira 3, 23 placebo)*	
Setting	*University teaching hospital with patients from endocrinology clinics and weight management clinic, Louisiana, USA*	
Intervention	*Liraglutide 3 mg/day x 32 weeks*	
Co-intervention	*Lifestyle recommendations:* - ***diet of 500–800 kcal/day reduction made up of 50% carbohydrates, 20% proteins, and 30% of fat with increased consumption of fiber, whole grains, cereals, fruits, and vegetables*** - ***at least 30 minutes of moderate-intensity physical activity daily.***	
Comparison	*placebo* *(identical prefilled pen by Novo Nordisk A/S)*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	- ***Primary: Changes in body mass and FAI.*** - ***Anthropometrics, circulating hormones, menstrual regularity, markers of glycemic control, and lipid profiles after 32 weeks*** - ***Safety was assessed in all patients who received at least one dose of the study drug.***	
Follow up Duration	*32 weeks*	
Summary Result/s	*In the obese group, liraglutide 3mg was more effective in reducing body weight, androgenicity and cardiometabolic parameters compared with placebo*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	yes	YES The aim of this 32-week trial was to evaluate the efficacy and safety of LIRA 3 mg compared with placebo (PL) for reducing BW and hyperandrogenism in women with obesity and PCOS
Does the study have specified inclusion/exclusion criteria?	Yes	*Yes*

If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	*Yes*
Inclusion criteria		Yes	YES PCOS (NIH) with a body mass index of at least 30 kg/m2 - **irregular periods (cycle length outside 21–35 days or** <8 cycles per year) together with biochemical hyperandrogenism (total testosterone [TT] >50 ng/dL, or free androgen index [FAI] >3.87) and exclusion of known disorders for bleeding irregularities and androgen excess. Also must have agreement to use effective contraception consistently during the therapy
Exclusion criteria		Yes	Yes diabetes diagnosis, smoking within 6 months, pregnancy or lactation, clinically significant systemic disease, uncontrolled hypertension, acute pancreatitis, injectable hormonal contraceptive use within 6 months, use of oral contraceptives, other steroid hormones, drugs that affect gastrointestinal motility or carbohydrate metabolism, and/or anti-obesity drugs within 3 months before study entry.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes	YES Participants were randomly allocated (2:1) on the basis of computer-generated random numbers using the block randomization method
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*yes*

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*yes*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*yes*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*yes*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*LIRA 3 mg 11/55= 20%* *(6 intolerable SE of nausea, 2 non compliant, 1 concern about medication, 2 pregnancy)* *Placebo: 4/27= 14.8%* *(2 no benefits of meds, 1 gall bladder surgery, 1 covid exposure and need to quarantine)*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*yes*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*yes*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Partial* *This study was supported by an investigator-initiated research grant from Novo Nordisk awarded to main author (K.E.H.).* *K.E.H. reports receiving grant support from Novo Nordisk, Dexcom, AstraZeneca, and Ortho Diagnostics, serves on advisory board for NovoNordisk and AstraZeneca and is a consultant for EMD Serono, NovoNordisk, and Lilly; honoraria from NovoNordisk.* *N.C. reports grant support from Ferring Pharmaceuticals.* *J.S. reports grant support from Ferring Pharmaceuticals.* *E.S. has nothing to disclose.* *D.B. has nothing to disclose.*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes.* To calculate the sample size, we used the standard formula suggested for clinical trials by considering a type I error (a) of 0.05 and a type II error (b) of 0.20 (power ¼80%). Sample size calculation revealed that 57 participants randomized in a 2:1 ratio (LIRA 3 mg:PL) were needed. Using a 30% dropout rate, the study was designed to recruit 82 participants; enroll 54 LIRA 3 mg and 28 PL participants to ensure that the number of subjects completing the study (38 LIRA 3 mg/19 PL) as derived by the sample size calculation was met.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*yes*

COMMENTS	*Declared conflict of interest*	
What is the overall risk of bias?	Low Moderate High Insufficient information	*low*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*no*	

3. Semaglutide

i. Jensterle 2021

Study ID	Jensterle 2021
Study Citation	Jensterle M et al., *Diabetes Research and Clinical Practice* 178: 2027
Study Country	Slovenia
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS and obesity
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	*Obesity: BMI criteria no reported*
Medication History	Use of medications that cause clinically significant weight gain or loss were excluded
N per group	*30 recruited* *25 concluded the study* *Semaglutide 13* *Placebo 12*

Setting	academic outpatient clinics in University Medical Centre Ljubljana, Slovenia
Intervention	*Semaglutide* initiated at a dose of 0.5 mg once weekly for the first 4 weeks, and increased to 1.0 mg once weekly for the remaining treatment period Total 16 weeks
Comparison	*Placebo pen*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Changes in fat storage in tongue (primary), and anthropometrics at 16 weeks*
Follow up Duration	*16 weeks*
Summary Result/s	*Semaglutide treated patients lost significantly more fat in the tongue, compared with placebo. The lingual fat reduction correlates with significant reduction in BMI, body weight and waist and neck circumference.*

ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Partial* To evaluate the effect of the latest GLP-1RA semaglutide, which is also in clinical development for weight management, on fat storage in the tongue of obese women, and its relationships with several clinical and laboratory parameters.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Partial* *although BMI cutoff not mentioned*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Partial* *Cannot tell for inclusion as they were not well reported* *In the clinical trial registry and protocol states 18-50 (in protocol 18 – menopause), BMI >30*

Inclusion criteria	Yes Partial No Not reported	*Partial* *Diagnosis using Rotterdam was described, no other inclusion criteria were described apart from "30 women with PCOS and obesity was recruited". No description of obesity cutoff or age*
Exclusion criteria	Yes Partial No Not reported	Any known serious chronic illness, including diabetes, angina pectoris, coronary heart disease, congestive heart failure, severe renal and hepatic impairment, inflammatory bowel disease, gastroparesis, cancer, chronic obstructive lung disease, psychiatric and neurological disease. Use of medications that cause clinically significant weight gain or loss, previous bariatric surgery, a history of idiopathic acute pancreatitis, a family or personal history of multiple endocrine neoplasia type 2 or familial medullary thyroid carcinoma, current smoking, pregnancy, expecting pregnancy or breast feeding, allergy to any of the ingredients of the study medication and anticipated change in lifestyle (e.g. eating, exercise or sleeping pattern) during the trial. Subjects with contraindications for magnetic resonance imaging (MRI) scanning (implants, claustrophobia etc) were also excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *From protocol – RAND randomisation function is used*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Partial* *Allocated by study nurse using a subject randomisation list.*

PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes – protocol states participants were blinded*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Partial* *the person randomising and the main investigator were not blinded.*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes, but not all reported*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Obese women with PCOS* *Semaglutide = 2/15= 13%* *Placebo = 3/15 = 20 %* *Reasons for withdrawal: Due to the COVID-19 pandemic*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*No* *The protocol states a number of other outcomes such as taste discrimination, gastric emptying, blood pressure, menstrual regularity which were not reported in this paper.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*Partial* *Author is a Medical Director of Novo Nordisk in Eastern Europe and has received honoraria and research support for a wide range of pharmaceutical companies*

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*yes*
COMMENTS		*Moderate – while study is single-blinded, there is a conflict of interest and selective outcome reporting.*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No – all outcomes moderate*	

4. Orlistat

i. Moini 2015

Study ID	Moini 2015
Study Citation	Moini et. al. Effect of Orlistat on weight loss, hormonal and metabolic profiles in women with polycystic ovarian syndrome: a randomized double-blind placebo-controlled trial.
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	

Patient/population/ participants	Women with PCOS and overweight/obesity
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	Overweight/obesity
Medication History	*No – exclusion criteria stated no history of taking. Hormonal medications in the last six months*
N per group	*Allocated/randomised: 50 orlistat, 50 placebo* *Assessed at end of study: 43 orlistat, 43 placebo*
Setting	*Gynecology clinic at a University hospital*
Intervention	*Orlistat 120mg three times a day for 3 months, Aburaihan Pharmaceutical Company*
Comparison	*Placebo identical in shape, manufactured by Aburaihan Pharmaceutical Company (same company)*
Co-interventions	*Lifestyle interventions:* *Hypocaloric MUFA diet 1200-1800 kcal/day, 55% carbohydrates, 30% fat, 15% protein.* *Encouraged to walk 30 mins/day* *Weekly exercise diaries showed that consistency of exercise was 74.8% in the intervention and 77% in the control group.*
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Anthropometric, FBG, FI, HOMA-IR, total testosterone, TG, HDL, LDL.*
Follow up Duration	*3 months*
Summary Result/s	*Between-group differences for weight, BMI, WHR, TG, LDL and HDL but not testosterone, FINs, FBG, HOMA-IR*
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The aim was to determine the effects of combined orlistat and conventional hypocaloric diet compared to diet alone in overweight/obese women with PCOS*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No Not reported	*Yes* *Diagnosis according to Rotterdam* *Reproductive age (19-38)* *BMI >25* *No history of taking hormonal medications in last 6 months* *No current dietary modifications or in the past 6 months*
Exclusion criteria	Yes Partial No Not reported	*Yes* *History of cholestasis, liver disease, renal disease, malabsorption, hypothyroidism.*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes* *Random number table.*

	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Yes* *A member of the study team who was blinded to both groups visited each participant monthly.*
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Yes*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*

ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Orlistat = 7/50 = 14%* *3 - lack of compliance for follow-up visits* *2 - concerns about treatment/side effects* *1 - presence of medical conditions* *1 - use of different medical treatments* *Placeb = 7/50 = 14%* *4 - lack of compliance for follow-up visits* *1 - concerns about treatment/side effects* *2 - use of different medical treatments*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol or trial registration.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Partial* *No t-test was reported for age .No other details were reported. Mean age was 27.42 + 3.31 in control and 26.8 + 5.16 in the intervention group.*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors declared no COI*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Partial* *Potential confounders not adjusted for*
COMMENTS		*Double blinded RCT*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Unclear*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*	

ii. Song 2017

Study ID	Song 2017/Ruan 2018
Study Citation	*Effect of Diane-35, alone or in combination with orlistat or metformin in Chinese polycystic ovary syndrome patients.* *Ruan, Xiangyan; Song, Jinghua; Gu, Muqing; Wang, Lijuan; Wang, Husheng; Mueck, Alfred O* *Archives of gynecology and obstetrics / 2018;297(6):1557-1563* *Germany 2018 /*

	Effect of orlistat or metformin in overweight and obese polycystic ovary syndrome patients with insulin resistance. *Song, Jinghua; Ruan, Xiangyan; Gu, Muqing; Wang, Lijuan; Wang, Husheng; Mueck, Alfred Otto* *Gynecological endocrinology : the official journal of the International Society of Gynecological Endocrinology / 2018;34(5):413-417* *England 2018 /*
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS and overweight/obesity (BMI≥24)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	Insulin resistance (fasting insulin > 10mIU/L) Overweight/obesity
Medication History	No history of taking medication or dietary modification currently or for the preceding 3 months.
N per group	*Allocated/randomised: 240 (numbers in each group not reported – so the assumption is 60 per group for:* 1. ***Orlistat + Diane,*** 2. ***Metformin + Diane*** 3. ***Orlistat + Metformin + Diane,*** 4. ***Diane only*** *Assessed at end of study: 240*
Setting	*Patients attending the Department of Gynaecological Endocrinology in a University Hospital in Beijing, China*
Intervention	*Orlistat 120mg tds*
Comparison	*Metformin titrated up to 500mg tds* *Diane-35, 2mg cyproterone acetate and 35 μg ethinylestradiol) once daily for 21 days per cycle*

Co-interventions	*Based on each patient's basal energy requirements and on an estimation of the typical activity level, at baseline, a dietician prescribed:* - ***an individualized low-fat diet, and*** - ***moderate daily physical activity.***	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Hormonal, metabolic, anthropometric*	
Follow up Duration	*12 weeks/3 months*	
Summary Result/s	*Improvements in body weight, BMI, and HDL in the Orlistat + Diane and Orlistat + Metformin + Diane groups compared to Diane alone.* *DHEA was lower in all groups compared to Diane alone.* *SHBG was higher in the Orlistat + Metformin group compared to Diane alone.* *FAI was lower in the Orlistat group compared to Diane alone.* *Orlistat has mild side-effects and is better tolerated compared with metformin*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The aim was to evaluate the effect of Diane-24 alone or in combination with orlistat or metformin on androgen and body fat % in Chinese overweight and obese PCOS patients.*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Inclusion criteria	Yes Partial No	*Chinese women* *Age 18-40* *BMI ≥ 24*

		Not reported	*FINS > 10mIU/L* *No history of taking medication or dietary modification currently or for preceding 3 months*
Exclusion criteria		Yes Partial No Not reported	*Ischemic heart disease* *Clinical evident vascular disease* *T2D with ketoacidosis* *Renal / hepatic impairment* *Severe infection* *Malignant tumour*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Yes – random number table*
	Was allocation to intervention group concealed?	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	*No*
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Not reported*

	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*No dropouts* *"All 240 included subjects completed the 12-week study period."*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol or trial registration*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Yes*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors report no COI*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Partial* *Confounders not reported*
COMMENTS		*Lack of allocation concealment and blinding*	
What is the overall risk of bias?		Low Moderate High	*High*

	Insufficient information	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes high risk of bias*	

iii. Gu 2022

Study ID	Gu 2022
Study Citation	*Effect on the cardiovascular independent risk factor lipoprotein(a) in overweight or obese PCOS patients with ethinyl-estradiol/drospirenone alone or plus orlistat.* *Gu, Muqing; Ruan, Xiangyan; Li, Yanqiu; Li, Tianhe; Yin, Chenghong; Mueck, Alfred O* *Gynecological endocrinology : the official journal of the International Society of Gynecological Endocrinology / 2022;38(7):598-602 England 2022 /* *doi:10.1080/09513590.2022.2078805*
Study Country	China
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	*Women with PCOS and overweight/obesity (BMI ≥24)*
PCOS diagnostic criteria	*Rotterdam*
Presence of infertility	*Not reported*
Presence of other condition/s	*Overweight/obesity (BMI ≥ 24kg/m²)*
Medication History	*No hormonal contraceptives/concomitant medications that interact with OCP for 2 cycles before/throughout the study*
N per group	*Allocated/randomised: 66 (33 Orlistat + OCP, 33 OCP alone)*

	Assessed at end of study: not explicitly described as there was no reporting of dropouts in the study but assume 66	
Setting	*Department of Obstetrics and Gynecology in a University Hospital in Beijing*	
Intervention	*Orlistat 120mg tds + OCP (drospirenone 3mg/ethinylestradiol 20μg in a 24-active/4-inert pill combination) once daily*	
Comparison	*OCP alone (drospirenone 3mg/ethinylestradiol 20μg in a 24-active/4-inert pill combination) once daily*	
Co-interventions	*Lifestyle interventions: dietician prescribed personalised balanced nutrition diet based on resting energy expenditure*	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	*Anthropometric, metabolic, inflammatory markers, hormonal*	
Follow up Duration	*3 months*	
Summary Result/s	*CRP, LDL-C, Weight, BMI, WC, body fat percentage were improved in the Orlistat + OCP group compared to OCP alone*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes* *The aim was to investigate the effect of orlistat with the OCP vs OCP alone for the cardiovascular independent risk factor lipoprotein A*
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*

Inclusion criteria	Yes Partial No Not reported	*18-40* *BMI ≥24* *Rotterdam criteria*
Exclusion criteria	Yes Partial No Not reported	*Contraindications for OCP use* *Use of antilipidemic agents* *T2D* *CVD* *Renal/hepatic impairment* *Severe infections* *Hormonal contraceptives/concomitant meds that interact with OCP in previous 2 cycles*
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SELECTION BIAS – **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	*Not reported* *Sequence generation not reported*
SELECTION BIAS – **Was allocation to intervention group concealed?**	Yes Partial No Not reported	*Not reported*
PERFORMANCE BIAS – **Were patients blind to intervention group?**	Yes Partial No Not reported	*No*
PERFORMANCE BIAS – **Were investigators and care providers blind to intervention group?**	Yes Partial No Not reported	*Not reported*

	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	*Not reported*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?** **Please also record reasons for withdrawal in each group**	X% treatment X% control/ comparison Not reported	*Not explicitly reported but as the authors did not mention dropouts, assume 0%*
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*

REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	*Not reported* *This is difficult to determine if there isn't a protocol.*
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	*Partial* *"All individuals were matched according to age and BMI at the study baseline." – **but** "the Orlistat + OCP group had significantly higher serum CRP-concentrations than the OCP alone group."* *"Other characteristics were not significantly different between the groups at baseline. "*
	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	*No* *The authors report no COI*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes* *Sample size calculation was reported*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Not reported*

COMMENTS	*Lack of reporting of randomisation sequence generation and blinding key reason for high RoB*	
What is the overall risk of bias?	Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No – all outcomes high risk of bias*	

7. Study Characteristics Table

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Co-interventions	Follow up Duration	Outcomes	Summary of findings
Elkind-Hirsch 2021	Women with PCOS and BMI30-45, Endocrine and Weight Loss Clinic	Single blinded five arm RCT	Exenatide 20 Dapa 17 Exenatide + Dapa 20 Dapa + metformin 19 Phentermine-topiramate 16	Exenatide 2 mg Weekly Exenatide 2mg weekly + dapaglifozin 10mg/day Phentermine 7.5mg/Topiramate 46mg ER daily	Dapa 10 mg/day Dapa + metformin XE 10mg/2000mg	Diet and exercise counselling, encouragement to increase daily exercise	24 weeks	FAI, total testosterone, DHEAS fasting glucose, HOMA-IR, *Matsuda index: Sensitivity index (SI)* Total cholesterol, LDL, HDL, TG, Weight, BMI, WHR, WC, body fat %, Fat mass, Fat free mass-Lean BM Gastrointestinal effects Other AE	There were no differences between groups for metabolic outcomes. There was no difference between EXE and DAPA, EXE and PT, or PT and EXE/DAPA for any outcomes. EXE/DAPA resulted in most loss of weight and total body fat and WC and was superior to DAPA or DAPA/MET for body weight, BMI, total fat mass and total body fat %, and to DAPA/MET for WC. EXE/DAPA was superior to PT for triglycerides but not for any other outcomes. Phen/TM was more effective in promoting weight loss (body weight and BMI) than Dapa or Dapa/Met. PT resulted in greater reduction in body fat and body fat % than DAPA and DAPA/MET, and in waist circumference than DAPA/Met. However there were no significant between-group differences for WHR. All treatments resulted in a reduction in lean BM.

									GI AEs were most common with nausea most common in EXE group. The highest loss rate was from the PT group because of unpleasant AEs e.g. headache, insomnia and fatigue.
Tao et al. 2021	Overweight/obese PCOS patients with prediabetes; in hospital	Parallel Open-label RCT	Exenatide =50 Metformin=50	Exenatide (10-20 μg daily) sc	Metformin (1500-2000 mg daily)	Guidance on diet and exercise	12 weeks	Hormonal: free androgen index (FAI), Total testosterone (T), sex hormone binding globulin (SHBG), dehydroepiandrosterone (DHEAS), androstenedione (A2) FBG, Fasting insulin, HOMA-IR, 120min glucose from OGTT TG, total cholesterol(TC), HDL, and low-density lipoprotein (LDL), Weight, BMI, Gastrointestinal effects, Other adverse effects (headache)	MET resulted in lower FBG than EXE + MET. There was no difference between groups for measures of insulin sensitivity except for 2hr insulin which was lower in the the MET group compared to EXE or EXE+MET. There was a greater reduction in LDL cholesterol in the MET group compared to EXE+ MET. There was no difference between groups for weight and BMI. Note that the authors reported a higher remission rate of prediabetes in the EXE and EXE+ MET groups compared to MET.
Zheng et al., 2019/Zheng et al. 2017, China	Women with PCOS (18 to 40 years old); Endocrinology Department of Hospital (outpatients)	Parallel RCT	Exenatide = 31 Metformin = 32	Exenatide 10 μg, twice a day sc (20 μg total)	Metformin 1,000 mg, twice a day (2g total)	Diet and exercise advice	12 weeks (after test at baseline)	mFG score, FAI, T, SHBG, DHEAS, fasting glucose, FINS, HOMA-IR, 2hPBG, 2hINS, AUC glucose, AUC insulin, Matsuda index [insulin secretion index (ISI)], TC, LDL-C, HDL-C, TG, hs-CRP,	Exenatide was more effective than metformin in improving body weight, BMI, waist circumference, 2 hr insulin, HOMA-IR, AUC-insulin, Matsuda index, and hs-CRP. Metformin was more effective at reducing total cholesterol. Metformin was better tolerated than Exenatide in the first 8 weeks.

								Weight, WC, BMI, WHR, Menstrual regularity (menstrual periods), Gastrointestinal effects (nausea, diarrhea, Bloating, Vomiting, Gastrointestinal spasm, stomachache, constipation), Other adverse effects (dizziness, weakness, subcutaneous induration)	Exenatide was twice as likely to cause nausea in the first 8 weeks.
Li et al., 2022, China/Liu et al., 2017, China	Women with PCOS (18 to 40 years old); Endocrinology Department of Hospital (outpatients)	Crossover, open label RCT	<u>Liu 2017</u> Exenatide + lifestyle instructions = 78 Metformin + lifestyle instructions = 80 <u>Li 2022 (64 weeks – pregnancy outcomes)</u> Exenatide + lifestyle instructions = 72 Metformin + lifestyle instructions = 75	<u>Li 2022</u> First stage: Exenatide 5 μg, twice daily sc for 4 weeks and increased to 10 μg twice daily after 4 weeks; 5 μg twice a day (for those who could not tolerate adverse events) Second stage: Metformin, 500 mg, twice a day and titrating up to 1000 mg twice daily by 500 mg every 3 days <u>Liu 2017</u>	Li 2022 First stage: Metformin 500 mg, twice a day and titrated by 500 mg every 3 days up to 1000 mg twice a day for 12 weeks Second stage: Metformin 1000 mg twice a day <u>Liu 2017</u> Metformin, 500 mg once a day and gradually reached 1000 mg twice a day after 1 week	Lifestyle: Diet and exercise were actively promoted in both groups according to international guidelines (ADA Standards of Medical Care 2018). OCP for first 12 weeks: A low-dose hormonal contraceptive pill cyproterone and ethinyl estradiol	12 weeks (all outcomes except pregnancy/repro) – at completion of first phase of the crossover trial (ie EXE v MET) 64 weeks (pregnancy/reproductive0	FAI, T, SHBG, fasting glucose, FINS, HOMA-IR, 2hPBG, 2hINS, TC, LDL-C, HDL-C, TG, hs-CRP, Weight, WC, BMI, WHR, % Body fat Reproductive: menstrual regularity, pregnancy rate, miscarriage rate, preterm delivery, live birth	In overweight or obese infertility PCOS, pregestational exenatide treatment resulted in more spontaneous pregnancy likely due to greater weight reduction and improvement of insulin resistance compared with metformin treatment without obvious benefit on overall pregnancy rate after ART or pregnancy outcomes of successful conceived women. EXE resulted in more weight loss, improved fat percentage and BMI, lower WC and WHR, more menstrual cycles, lower hs-CRP, and improved insulin sensitivity (FINS, 2-hr insulin, HOMA-IR). AE: GI discomfort more frequent in the EXE group.

				First 12-week period: Exenatide 10 µg once a day and increased to 10 µg twice a day after 1 week, Second 12-week period:Metformin 1000 mg twice a day,		ART as needed in second phase.			
Ma et al. 2021	Overweight/obese women with PCOS; Department of Obstetrics and Gynecology in hospital	Parallel Open-label RCT	Exenatide+Metformin=19 Metformin=21	Exenatide (2 mg once a week) + Metformin (500 mg three times a day)	Metformin (500 - 1500 mg daily)	OCP (Diane-35 (ethinylestradiol 0.035 mg and cyproterone acetate 2 mg)	12 weeks	Hormonal:Total testosterone, DHEAS, Metabolic: Fasting plasma glucose, Fasting insulin, HOMA-IR, QUICKI, OGTT 2 h PG, OGTT 2 h insulin, Matsuda index Lipids:Total cholesterol, LDL-c, HDL-c, TG, hsCRP, Anthropometric: Weight, BMI, Waist circumference, Gastrointestinal effects Other adverse effects	Metformin combined with Exenatide was more effective than Metformin alone in reducing body weight, BMI, and waist circumference and improving some but not all metabolic outcomes (2hr insulin, Matsuda, Total cholesterol, TG, HDL, fasting gluc) in overweight/obese women with PCOS. Total testosterone was higher in the EXE+MET group compared to the MET group at end of treatment.
Nylander 2017 (Frossing 2018x2, Nylander 2017)	Women with PCOS ≥18 years BMI ≥25 kg/m2 and/or insulin resistance defined as fasting plasma C-peptide >0.6	double blind RCT	Liraglutide 1.8 mg 44 Placebo 21	Liraglutide 1.8 mg	Placebo	None	26 weeks	Hormonal (FAI, Free and total testosterone, SHBG, Androstenedione) Metabolic (fasting gluc, Matsuda) Lipids (TC, LDL, HDL, TG)	Improved free testosterone, SHBG, fasting glucose, weight, BMI, WHR, WC, fat mass, and bleeding ratio in the liraglutide group compared to placebo There was more lean mass lost in the liraglutide group compared to placebo

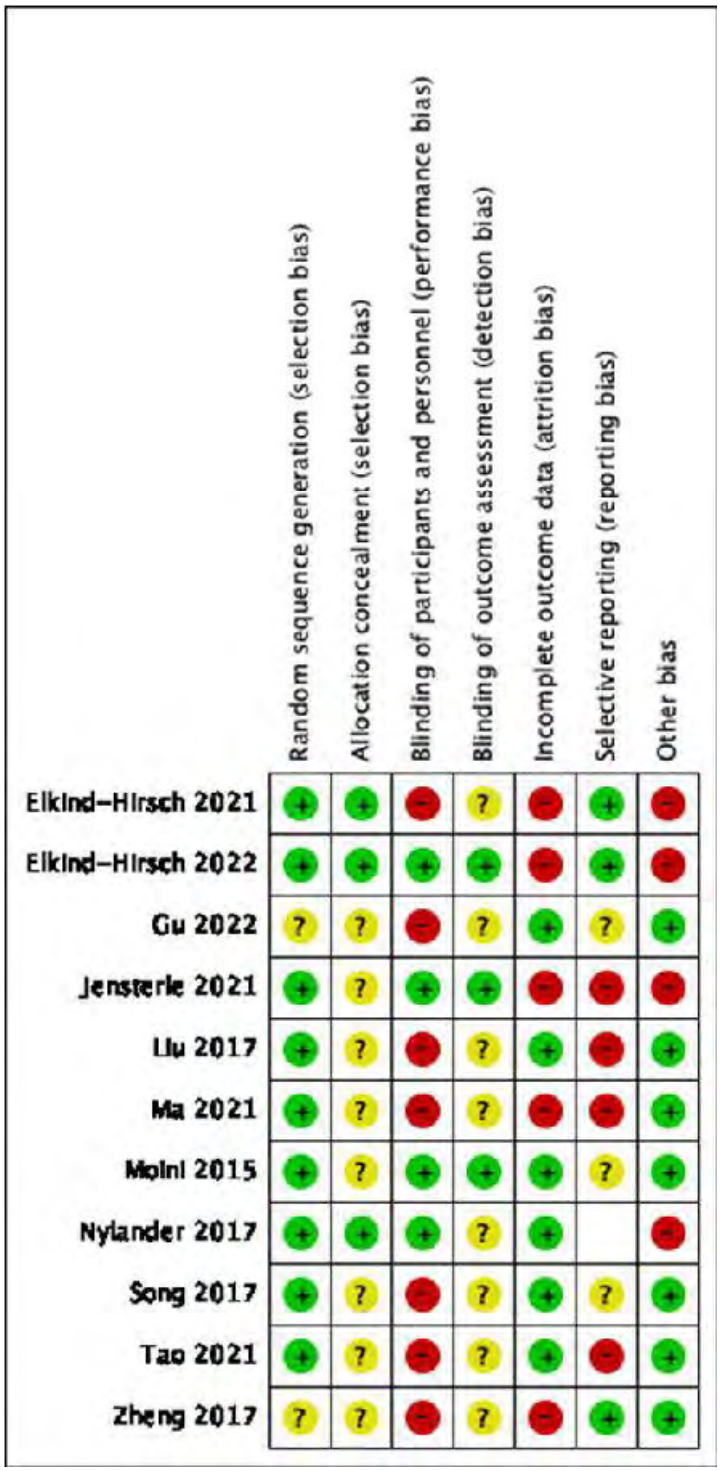
	nmol/L at screening. Herlev Gentofte Hospital, University of Copenhagen, Denmark.							Hs-CRP Anthropometric (Weight, BMI, WHR, WC, FFM, FM, %body fat) Reproductive (bleeding ratio) AEs (GI and other)	The most prevalent adverse effects were nausea (liraglutide 79% versus placebo 13%, P < 0.01), primarily seen in the start-up phase, and constipation (26% versus 0%, P < 0.01). Gallstone-related pain was experienced by 6% of women in the liraglutide group and 4% in the placebo group (NS)
Elkind-Hirsch 2022	Women with PCOS and BMI>30, Age 18-46, Outpatient Endocrinology and weight management clinic, USA.	double blind RCT	Liraglutide 3 mg = 44 Placebo= 23	Liraglutide 3 mg daily	Placebo (identical prefilled pen)	Lifestyle: diet of 500–800 kcal/day reduction made up of 50% carbohydrates, 20% proteins, and 30% of fat with increased consumption of fiber, whole grains, cereals, fruits, and vegetables at least 30 minutes of moderate-intensity physical activity daily.	32 weeks	Hormonal (FAI, Total testosterone, DHEA) Metabolic (fasting gluc, HOMA-IR, Matsuda) Lipids (TC, LDL, HDL, TG) Anthropometric (Weight, BMI, WHR, WC, % 5% and 10% weight loss, FFM, FM, % body fat) Reproductive (menstrual cycles/year) AEs (GI and other)	Liraglutide 3mg daily improved FAI but not total testosterone and DHEA compared to placebo Liraglutide improved all measures of glucose metabolism and insulin resistance (fasting gluc, HOMA-IR, Matsuda), and body weight, central adiposity, body composition compared to placebo but there was no difference in fat free mass between groups. There was no difference between groups for lipids except for triglycerides Women in the liraglutide group had more menstrual periods than the placebo group Women in the liraglutide group complained of more nausea, vomiting, diarrhoea, constipation, reflux, indigestion, prolonged menstrual bleeding, injection site induration although statistical analysis for between-group comparisons were not reported.

									The placebo group reported more COVID-19 infections and absence of menstrual cycles.
Moini 2015	Women with PCOS and overweight/obesity;Gynecology Clinic in University hospital in Iran	Parallel double blind RCT	Orlistat = 43 Placebo = 43	Orlistat 120mg tds	Placebo	Hypocaloric MUFA diet Encouraged to walk 30 mins/day	3 months	Hormonal: Total testosterone Metabolic: Fasting glucose, FINS, HOMA-IR Lipids: LDL, HDL, TG Anthropometric: Weight, BMI, WHR AEs	Between-group differences for weight, BMI, WHR, TG, LDL and HDL but not testosterone, FINs, FBG, HOMA-IR
Gu 2022	Women with PCOS (Rotterdam), 18-40y.o., overweight / obese (BMI ≥ 24) Department of Gynecological Endocrinology, Beijing Obstetrics and Gynecology Hospital, Capital Medical University, Beijing, China	Parallel open-label RCT	Orlistat + LS + OCP = 33 LS + OCP alone = 33	Orlistat 120mg 3x day, plus OCP and lifestyle: OCP (DRSP 3mg / EE 20 μg in a 24-active/4-inert pill regimen; Lifestyle: Personalized balanced nutrition diet based on the patient's resting energy expenditure.	OCP alone (DRSP 3mg / EE 20 μg in a 24-active/4-inert pill regimen) and lifestyle (Personalized balanced nutrition diet based on the patient's resting energy expenditure)	OCP and lifestyle (Personalized balanced nutrition diet based on the patient's resting energy expenditure)	3 months	Hormonal (free/total testosterone, SHBG) Metabolic (Fasting glucose, fasting insulin) Lipids (TC, HDL, LDL, TG) CRP Anthropometric (weight, BMI, WC, % body fat)	Reductions in LDL-C, weight, BMI, WC, BFP, CRP and FT were significantly greater in in the Orlistat + OCP group.
Song 2017	Chinese women diagnosed with PCOS according to	Parallel, open-label, RCT	Orlistat + Diane-35 + Lifestyle = 60	**(1) Orlistat, 120 mg 3x daily before each meal + cointerventio**	**(3) Lifestyle + Diane alone** **(4) Metformin + lifestyle + Diane**	Lifestyle in all groups - Based on each patient's basal energy	12 weeks	Hormonal (FAI, Free/total testosterone, SHBG, DHEAS, Androstenedione)	Compared to Diane-35 alone: - DHEA-S significantly decreased in all groups - SHBG significantly increased in the Orlistat + Metformin group

	Rotterdam criteria Age 18–40 years BMI ≥ 24 kg/m2 FINS > 10 mIU/L, No dietary modification for the preceding 3 months Patients attending the Department of Gynecological Endocrinology, Beijing Obstetrics and Gynecology Hospital, Capital Medical University (Beijing, China).		Metformin + Diane-35 + Lifestyle = 60 Orlistat + Metformin + Diane + lifestyle = 60 Diane-35 + Lifestyle = 60	**ns of Lifestyle + Diane** **(2) Orlistat + Metformin + Diane + Lifestyle**	Metformin: up to 1.5g daily.	requirements and on an estimation of the typical activity level, at baseline, a dietician prescribed: - an individualized low-fat diet, and moderate daily physical activity. Diane-35 (2mg cyproterone acetate and 35 lg ethinylestradiol) 1x daily during the 3 cycles, at the same time for 21 days in all groups		Metabolic (Fasting glucose, fasting insulin, HOMA-IR) Lipids (TC, HDL, LDL, TG) Anthropometric (Weight, BMI, WC, Fat mass, % Body fat) – no data available apart from differences between groups and unlabelled figures, contacted authors for numerical data but no response AEs	- FAI significantly decreased in the Orlistat group There were no between-group differences for metabolic outcomes. Both Orlistat and Orlistat + Metformin increased HDL compared to Diane alone Both Orlistat and Orlistat + Metformin were superior to Diane alone for reducing body weight and BMI Orlistat + Metformin was superior to Metformin for body fat %reduction (Numerical data is not provided in the numerical tables) There was no difference in other anthropometric outcomes between Orlistat and Orlistat v Metformin. There were no between-group differences between Orlistat and Metformin. Orlistat has mild side-effects and is better tolerated compared with metformin.
Jensterle 2021	Women with PCOS and obesity, academic centre in Slovenia	Single blinded placebo-controlled trial	Semaglutide 13 Placebo 12	Semaglutide 1 mg once weekly for 16 weeks	Placebo	None	16 weeks	Metabolic: fasting gluc, FINS, HOMA-IR, 120 min gluc and insulin Lipids: Total chol, LDL, HDL, TG	Semaglutide was superior to placebo for body weight, BMI, waist circumference, HDL, visceral body fat, plasma insulin and 120min glucose Nausea and vomiting were reported in the semaglutide group but were transient and mild-moderate in severtiy

								Anthropometric: weight, BMI, WC, visceral body fat AEs	

8. Risk of Bias summary



9. GRADE ASSESSMENTS AND EVIDENCE PROFILE

1. Introduction

Meta-analyses were conducted on the following comparisons:

1. Exenatide v Metformin (2 RCTs) (Zheng, Zhang et al. 2017, Tao, Zhang et al. 2021)

2. Orlistat + lifestyle + OCP v lifestyle + OCP (2 RCTs) (Song, Ruan et al. 2018, Gu, Ruan et al. 2022)

For the following comparisons, a meta-analysis was not possible on any outcomes either due to the comparison only having one representative RCT or RCTs reporting non-parametric data (median and IQR) or change scores without any information on standard deviation or standard error. We have provided a narrative synthesis for convenience.

Exenatide v DAPA (Dapagliflozin)

Exenatide + DAPA v DAPA

Exenatide + OCP v MET (Metformin) + OCP

Exenatide + MET v MET alone

Exenatide + MET + OCP (Oral Contraceptive Pill) v MET + OCP alone

Exenatide v Phentermine/Topiramate

Exenatide v DAPA + MET

Liraglutide v Placebo

Liraglutide + LS (lifestyle) v Placebo + LS

Semaglutide v Placebo

Phentermine/Topiramate v DAPA

Phentermine/Topiramate v DAPA + MET

Phentermine/Topiramate v EXE + DAPA

Orlistat + LS v LS +-placebo

Orlistat + LS v MET + LS

Orlistat + LS + OCP v MET + LS + OCP

Orlistat + LS + OCP + MET v MET + LS + OCP

2. Narrative Syntheses

EVIDENCE SUMMARY

We found 16 manuscripts[1-16] representing 11 trials and 996 participants. Four trials were included in meta-analyses[5,16-18] . All studies enrolled women with overweight/obesity and/or insulin resistance. There were no studies on adolescents. Five studies trialled exenatide [1,10,11,16,18], three orlistat [5,12,17], two liraglutide [2,13], one semaglutide [19] and one phentermine-topiramate as well as exenatide [1]. Four studies were placebo-controlled [2,12,13,19], four used metformin as a comparator [10,11,16,20], two trials used the oral contraceptive pill (OCP) and lifestyle [5,17] alone, and one trial used metformin and lifestyle [17].

The majority of trials were at unclear risk of selection bias, mainly due to failure to specify if or how allocation was concealed. More than half of trials were at high risk of performance bias due to lack of blinding of participants and personnel, three quarters were at unclear risk of detection bias, and less than half were at low risk for reporting bias. More than a quarter of trials were at high risk of other bias, mainly due to conflicts of interest.

META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY

Exenatide

There was no difference between exenatide and metformin for androgenicity, most metabolic outcomes, most lipid outcomes and anthropometric outcomes. There was very low certainty evidence that metformin was superior to exenatide for fasting glucose, while EXE was superior to MET for AUC insulin and the Matsuda index. Exenatide + OCP was superior to metformin + OCP for most but not all metabolic, anthropometric outcomes and reproductive outcomes, while there were no between-group differences for androgenicity and lipids.

There was no difference between exenatide + metformin (+-OCP) and metformin alone (+- OCP) for androgenicity, most metabolic outcomes, and most lipid parameters. MET was superior to EXE + MET for 120 minute insulin and LDL cholesterol. EXE +MET + OCP was superior to MET + OCP for change in fasting glucose, 120 minute glucose, and 120 minute insulin. EXE + MET + OCP was superior to MET + OCP for body weight, BMI and WC although there was no difference between EXE + MET and MET alone for weight and BMI.

There was no difference between exenatide and phentermine/topiramate for androgenicity, metabolic, lipids, or anthropometric outcomes.

Liraglutide

Liraglutide (+-lifestyle) was superior to placebo (+- lifestyle) for menstrual cycles and some but not all androgenicity and metabolic outcomes but not for lipids. Liraglutide was superior to placebo for anthropometric outcomes including weight and fat mass. However, liraglutide alone resulted in more lean body mass loss than placebo, but this was not seen when liraglutide was combined with lifestyle interventions.

Semaglutide

Semaglutide was superior to placebo for some but not all metabolic outcomes and lipid parameters, and anthropometric measures including visceral body fat.

Orlistat

Orlistat was superior to placebo for anthropometric and lipid outcomes but not for androgenicity or metabolic outcomes. Orlistat + lifestyle + OCP was superior to lifestyle + OCP alone for some but not all androgenicity outcomes, lipid and anthropometric outcomes while there were no differences for metabolic outcomes. There was low certainty evidence that orlistat + lifestyle + OCP is superior to lifestyle + OCP alone for SHBG, LDL, and CRP and that there is no difference between groups for HDL, fasting insulin, and triglycerides.

There were no between-group differences for orlistat vs metformin or orlistat + metformin vs metformin alone for androgens, metabolic, lipids and anthropometric outcomes. The only exception was that orlistat + metformin was superior to metformin alone for body fat % reduction.

i. Exenatide v DAPA – single trial (Elkind-Hirsch 2021)

Benefits: There was no statistically significant difference between EXE and DAPA for any of the outcomes in the study which are: Hormonal (FAI, TT, DHEAS), Metabolic (FBG, HOMA-IR, Matsuda), Lipids (TC, LDL, HDL, TG), Anthropometric (weight, BMI, WHR, WC, fat free mass, fat mass, fat %).

There was very serious imprecision (single trial, sample size 37 for these two arms) and the trial was rated at moderate risk of bias due to lack of blinding of the participants and potential conflicts of interest due to pharmaceutical industry funding.

Risks: GI AEs were the most common in the EXE group.

ii. Exenatide + DAPA v DAPA – single trial (Elkind-Hirsch 2021)

Benefits: EXE + DAPA was superior to DAPA alone for the outcomes of body weight, BMI, fat mass and % body fat. There were no between group differences for the other anthropometric outcomes of WHR, WC, and fat free mass, and no differences for hormonal (FAI, TT, DHEAS), Metabolic (FBG, HOMA-IR, Matsuda) and lipids (TC, LDL, HDL, TG).

There was very serious imprecision (single trial, sample size 37 for these two arms) and the trial was rated at moderate risk of bias due to lack of blinding of the participants and potential conflicts of interest due to pharmaceutical industry funding.

Risks: Injection site reactions were reported in the EXE + DAPA group (4/20).

iii. Exenatide v Metformin – two trials (Tao 2021, Zheng 2017), MA for four outcomes

a. *Exenatide v Metformin*

Benefits: See GRADE for HOMA-IR, FINS, FBG, 2hr insulin

There was no difference between groups for mFG (1 trial - Zheng), total testosterone (2 trials), SHBG (2 trials), DHEA (2 trials), androstenedione (1 trial – Tao), AUC glucose (1 trial – Zheng), LDL cholesterol (2 trials), HDL (2 trials), triglycerides (2 trials), weight (2 trials), BMI (2 trials), WHR (1 trial – Zheng), WC (1 trial – Zheng), and menstrual regularity (1 trial – Zheng).

EXE was superior to MET for FAI in one trial (Zheng) but not in another (Tao). MET was superior to EXE for 2hr glucose, Matsuda index and total cholesterol (1 trial – Zheng). EXE was superior to MET for AUC insulin (1 trial – Zheng) and hsCRP (1 trial – Zheng)

There was very serious imprecision (very small sample sizes and very small number of studies) and both trials were rated at high risk of bias due to unclear sequence generation, allocation concealment and lack of blinding.
Risks: Nausea was more frequent in the EXE group (Zheng) and more participants in the EXE group withdrew due to AEs (Zheng).

b. *Exenatide + OCP v Metformin + OCP – single trial (Liu 2017)*

Benefits:

EXE + OCP was superior to MET + OCP for metabolic outcomes (FINS, HOMA-IR, 2hr insulin, 2 hr glucose) and for most but not all anthropometric outcomes. Mean post treatment BMI, WC and body fat % were lower in the EXE + OCP group compared to MET + OCP. Mean post treatment weight was higher in the MET + OCP group compared to EXE + OCP (68.66kg v 68.17kg).

The ratio of actual menses to expected menses was higher in the EXE + OCP group compared to MET + OCP (0.90 v 0.68).

Mean post treatment hsCRP was lower in the EXE + OCP group compared to the MET + OCP group (2.30 mg/L v 3.23 mg/L).

There were no differences between EXE + OCP and MET + OCP for the following outcomes: Metabolic (FBG, 2hr insulin), Lipids (TC, LDL, HDL, TG), anthropmetric (WHR)

There was serious imprecision (single trial, sample size 158 for non-pregnancy outcomes, 147 for pregnancy outcomes) and the trial was rated at high risk of bias due to black of blinding, unclear allocation concealment, and selective outcome reporting.

Risk:

There was no difference between groups for miscarriage, twin pregnancy, preterm delivery, GDM, gestational hypertension, fetal macrosomia.

GI AEs were more frequent in the EXE + OCP group compared with MET + OCP.

iv. Exenatide + Metformin V Metformin

a. *Exenatide + Metformin V Metformin – single trial (Tao 2021)*

Benefits: There were no between-group differences between EXE + MET v MET for FAI, TT, SHBG, DHEAS, Androstenedione, FBG, FINS, HOMA-IR, 2hr gluc, Total cholesterol, HDL, TG, weight and BMI.

MET was superior to EXE + MET for 2 hr insulin and LDL cholesterol.

There was very serious imprecision (very small sample sizes and very small number of studies) and the trial was rated at high risk of bias due to unclear sequence generation, allocation concealment and lack of blinding.

Risks: No AEs were reported in the EXE + MET group although AEs were not well reported overall – only in the context of reason for withdrawal.

b. *Exenatide + oral contraceptive pill + Metformin v oral contraceptive pill + Metformin – single trial (Ma 2021)*

Benefits: EXE + MET was superior to MET for FBG, 2hr insulin, TC, TG, BMI, and WC.

MET was superior to EXE + MET for TT, Matsuda index, and weight.

There were no between group differences for DHEAS, FINS, HOMA-IR, QUICKI, 2 hr glucose, LDL, HDL, hsCRP.

There was very serious imprecision (very small sample sizes and very small number of studies) and the trial was rated at high risk of bias due to unclear sequence generation, allocation concealment and lack of blinding.

Risks: there was more bloating in the EXE + MET group but other GI AEs were comparable. There were injection site reactions in the EXE+MET group.

v. Exenatide v Phentermine/Topiramate – single study (Elkind-Hirsch 2021)

Benefits: There were no between group differences for any outcomes (Hormonal – FAI/TT/DHEAS), metabolic (FBG, HOMA-IR, Matsuda), Lipids (TC, LDL, HDL, TG), anthropometric (Weight, BMI, WHR, WC, body fat %, Fat mass, Fat free mass-Lean BM).

There was very serious imprecision (single trial, sample size 37 for these two arms) and the trial was rated at moderate risk of bias due to lack of blinding of the participants and potential conflicts of interest due to pharmaceutical industry funding.

Risks: Nausea was more common with EXE while other AEs were more common in the PT group such as insomnia, rapid heart rate and dizziness

vi. Exenatide v Dapagliflozin + Metformin – single trial (Elkind-Hirsch 2021)

Benefits: There were no between group differences for any outcomes (Hormonal – FAI/TT/DHEAS), metabolic (FBG, HOMA-IR, Matsuda), Lipids (TC, LDL, HDL, TG), anthropometric (Weight, BMI, WHR, WC, body fat %, Fat mass, Fat free mass-Lean BM).

There was very serious imprecision (single trial, sample size 37 for these two arms) and the trial was rated at moderate risk of bias due to lack of blinding of the participants and potential conflicts of interest due to pharmaceutical industry funding.

Risks: Nausea was more common in the EXE group and upset stomach, yeast infection and urinary symptoms in the DAPA + MET group.

vii. Liraglutide v placebo

a. *Liraglutide v placebo – single trial (Nylander 2017)*

Benefits: LIRA was superior to placebo for TT, SHBG, FBG, weight, BMI, WHR, WC,fat mass, and menstrual cycles.

LIRA resulted in more lean body mass loss compared to placebo.

There were no between group differences for FAI, Androstenedione, hsCRP, Matsuda index, Lipids (TC, LDL, HDL, TG), % body fat.

There was very serious imprecision (single trial, small sample size) and the trial was rated at moderate risk of bias due to potential conflict of interest

Risks: GI AEs were more common in the LIRA group.

b. Liraglutide + lifestyle v placebo + lifestyle – single trial (Elkind-Hirsch 2022)

Benefits: LIRA was superior to placebo for FAI, FBG, HOMA-IR, Matsuda, TG, weight, BMI, WHR, WC, % with 5% weight loss, % with 10% wt loss, % body fat, menstrual cycle.

There were no between-group differences for TT, DHEAS, TC, HDL, LDL, fat free mass.

There was very serious imprecision (single trial, small sample size) and the trial was rated low for risk of bias.

Risks: Women in the liraglutide group complained of more nausea, vomiting, diarrhoea, constipation, reflux, indigestion, prolonged menstrual bleeding, injection site induration

The placebo group reported more COVID-19 infections and absence of menstrual cycles.

viii. Semaglutide v placebo – single trial (Jensterle 2021)

Benefits: Semaglutide was superior to placebo for body weight, BMI, waist circumference, HDL, visceral body fat, fasting insulin and 120min glucose.

There were no between-group differences for FBG, HOMA-IR, 2-hr insulin, TC, LDL, and TG.

There was very serious imprecision (single trial, very small sample size) and the study was rated at moderate risk of bias due to potential conflict of interest and selective outcome reporting.

Benefits: There was more nausea in the semaglutide group.

ix. Phentermine/topiramate v Dapagliflozin – single trial (Elkind-Hirsch 2021)

Benefits: PT was superior to DAPA for body weight, BMI, body fat mass and body fat %.

There were no between-group differences for hormonal outcomes (FAI, TT, DHEAS), metabolic outcomes (FBG, HOMA-IR, Matsuda), lipids (TC, HDL, LDL, TG), central adiposity (WC, WHR) and fat free mass.

There was very serious imprecision (single trial, sample size 37 for these two arms) and the trial was rated at moderate risk of bias due to lack of blinding of the participants and potential conflicts of interest due to pharmaceutical industry funding.

Risks: PT caused nausea, upset stomach, insomnia, headache and fatigue, while DAPA caused urinary symptoms and vaginal irritation.

x. Phentermine/topiramate v Dapagliflozin + Metformin

Benefits: PT was superior to DAPA + MET for body weight, BMI, body fat mass and body fat %.

There were no between-group differences for hormonal outcomes (FAI, TT, DHEAS), metabolic outcomes (FBG, HOMA-IR, Matsuda), lipids (TC, HDL, LDL, TG), central adiposity (WC, WHR) and fat free mass.

There was very serious imprecision (single trial, sample size 37 for these two arms) and the trial was rated at moderate risk of bias due to lack of blinding of the participants and potential conflicts of interest due to pharmaceutical industry funding.

Risks: PT caused more fatigue, headache, rapid heart rate, and insomnia.

xi. Phentermine/topiramate v Exenatide + Dapagliflozin

Benefits: EXE/DAPA was superior to PT for triglycerides. There were no between-group differences for the other outcomes: Hormonal (FAI, TT, DHEAS), Metabolic (FBG, HOMA-IR, Matsuda), Lipids (TC, LDL, HDL), Anthropometric (weight, BMI, WHR, WC, fat free mass, fat mass, fat %).

There was very serious imprecision (single trial, sample size 37 for these two arms) and the trial was rated at moderate risk of bias due to lack of blinding of the participants and potential conflicts of interest due to pharmaceutical industry funding.

Risks: EXE/DAPA caused more upset stomach, yeast infection. PT caused more fatigue, insomnia and headache.

xii. Orlistat + lifestyle v placebo + lifestyle – single trial (Moini 2015)

Benefits: Orlistat was superior to placebo for LDL, HDL, TG, and weight.

There were no between-group differences for TT, FBG, FINS, HOMA-IR, and WHR.

There was serious imprecision (single study, small sample size - 96) and the study was rated at unclear risk of bias due to lack of reporting of allocation concealment and no protocol/trial registration available to determine selective outcome reporting.

Risks: More than half of women reported urgency to go to the bathroom and 30% reported oily spotting in undergarments. About one in five women reported oily or fatty stool.

xiii. Orlistat + lifestyle + oral contraceptive pill v Metformin + lifestyle + oral contraceptive pill – single trial (Song 2017)

Benefits: There were no between-group differences for Hormonal (FAI, Free/total testosterone, SHBG, DHEAS, Androstenedione), Metabolic (Fasting glucose, fasting insulin, HOMA-IR), Lipids (TC, HDL, LDL, TG) and Anthropometric (Weight, BMI, WC, Fat mass, % Body fat) outcomes.

There was serious imprecision (single study) and the study was rated at high risk of bias due to lack of information on allocation concealment and lack of blinding.

Risks: A small proportion of participants reported GI AEs with orlistat (flatulence and oily spotting).

xiv. Orlistat + lifestyle + OCP v lifestyle + OCP – two trials (Gu 2022 and Song 2017), MA for six outcomes

Benefits: Orlistat was superior to LS and OCP alone for SHBG (low certainty) and LDL (low certainty).

Orlistat was superior to LS and OCP alone for body weight, BMI, DHEAS, FAI (1 trial - Song), CRP (1 trial - Gu), weight (2 trials), BMI (2 trials), and % body fat (1 trial – Gu). Note that numerical data on endpoint weight and BMI were not available from the Song trial as only a figure with no data labels was presented.

There was no difference between groups on meta-analysis for FBG, FINS, HDL and TG.

There was no difference between groups for free or total testosterone (2 trials), androstenedione (1 trial – Song), HOMA-IR (1 trial – Song), total cholesterol (2 trials), waist circumference (1 trial - Gu).

There was serious imprecision (small number of trials, small sample sizes) and both trials were rated at high risk of bias due to lack of reporting of randomisation and allocation concealment and lack of blinding.

Risks: A small proportion of participants reported GI AEs with orlistat (flatulence and oily spotting).

xv. Orlistat + Metformin + OCP + LS v Metformin + OCP + LS – single trial (Song 2017)

Benefits: Orlistat + Metformin was superior to metformin for body fat % reduction (numerical data not available). There were no between-group differences for other outcomes: Hormonal (FAI, Free/total testosterone, SHBG, DHEAS, Androstenedione), Metabolic (Fasting glucose, fasting insulin, HOMA-IR), Lipids (TC, HDL, LDL, TG) and Anthropometric (Weight, BMI, WC, Fat mass).

There was serious imprecision (single study) and the study was rated at high risk of bias due to lack of information on allocation concealment and lack of blinding.

Risks: A small proportion of participants reported GI AEs with orlistat (flatulence and oily spotting).

1. GRADE Comparisons

i. Exenatide v Metformin

COMPARISON: Exenatide v Metformin												
	Quality assessment						No. participants					
No. studies	**Design**	**Risk of bias**	**Inconsistency**	**Indirectness**	**Imprecision**	**Other**	**EXE**	**MET**	**Effect, fixed [95% CI]**	**Favours**	**Certainty**	**Importance**
Outcome: HOMA-IR												
2	RCT	serious[1]	Serious inconsistency[3]	no serious indirectness	Very serious imprecision[2]	none	81	82	MD 0.30 (-0.67, 1.28)*	NS	⨁◯◯◯ VERY LOW	
Outcome: Fasting insulin (pmol/L)

Question 4.5.

Are anti-obesity pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?

BACKGROUND:

Unhealthy higher weight is increasing in prevalence throughout the world. Depending on the dataset and ethnicity, 50-70% of women with PCOS are of significantly higher weight and have insulin resistance adversely affecting fertility and psychological health and increasing metabolic risks including type 2 diabetes mellitus and metabolic syndrome. Weight loss improves outcomes as previously outlined.

In class II (BMI 35-40 kg/m^2) and class III (≥40 kg/m2) higher weight, lifestyle interventions are not durably effective.

Higher weight is also a significant concern for many affected adolescents and women with PCOS. Whilst lifestyle change has a key role in the management of higher weight, the role of anti-obesity pharmacological agents in achieving weight loss and potential associated health benefits is increasingly recognised with recent guidelines (1,2), and systematic reviews (3) in the area. However, the role of these agents in PCOS and in reproductive-aged women remains unclear.

Semaglutide, liraglutide, phentermine/topiramate, naltrexone/bupropion and orlistat are approved anti-obesity medications in adults, each of which has been compared to placebo in randomised controlled trials. These medications are increasingly being used in adults for assistance with weight loss. However, there is limited available data in women with PCOS.

Only the agents approved for weight loss have been considered in malign evidence-based recommendations.

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Anti-obesity versus placebo
Anti-obesity versus lifestyle

CONCENSUS RECOMMENDATION

- **CR:** Anti-obesity medications including liraglutide, semaglutide, both glucagon-like peptide-1 (GLP-1) receptor agonists and orlistat, could be considered, in addition to active lifestyle intervention, for the management of higher weight in adult women with PCOS as per general population guidelines.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

- Health professionals should ensure concurrent effective contraception when pregnancy is possible, for women who take GLP-1 receptor agonists, as pregnancy safety data are lacking.
- Gradual dose escalation for GLP-1 receptor agonists is recommended to reduce gastrointestinal adverse effects.

Shared decision making, when discussing GLP-1 receptor agonist use with women with PCOS, needs to consider side effects, and the potential need for long-term use in weight management, given the high risk for weight regain after discontinuation, and the lack of long-term safety data.

GRADE CONSIDERATIONS

Justifications:
Very few studies and small numbers in PCOS.
However, this is a high priority area for clinicians and women with PCOS.
The evidence to support the recommendation based on general population research is strong.

Subgroup considerations:
Recommendations will only apply to adult women with a higher weight not adolescents. There were no studies identified in adolescents and there is no evidence for these medications in the management of non-PCOS adolescents who are of a higher weight.

Implementation considerations:
Delivery of the medications (especially considering some are injectable), side effects and cost may affect acceptability of this intervention.
The cost of the medications may make it difficult to afford for some women both in the short-term and long-term.
Cost and regulation of these medications in different regions needs to be considered when implementing this recommendation, especially in women with moderate to severe excess weight whose biggest concern is weight management.

Monitoring and evaluation considerations:
There are known contraindications and side effects of these medications that need to be evaluated and monitored for if used for management of higher weight.
Post-marketing surveillance of some newer anti-obesity agents are required.
The role and the adverse effects of long-term therapy require more monitoring.

Research priorities:
There is a need for high-quality well-designed studies with metabolic, reproductive and psychological outcomes of high certainty comparing the anti-obesity medications to placebo in adolescents and women with PCOS.
Studies need to directly compare groups at the end of the intervention and also report on any adverse effects related to the medications.
The role and the adverse effects of long-term therapy require more research.

Question 4.6.

Are anti-androgen pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	Are anti-androgen pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
Clinical leads (key contacts)	Selma Witchel, Daniela Romualdi, and Alexia Pena Vargas
Allocation ranking	Level 2- updated systematic review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits (language, year)
Inclusion	Females with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity and weight. Subgroups: adolescents (10-19y), adults, post-menopausal. Must be taking contraception.	Oral anti-androgen pharmacological agents (spironolactone, cyproterone acetate, finasteride, flutamide) alone or in combination with lifestyle, metformin, OCP, anti-obesity agents. All doses, duration of more than 6 months	Placebo or any other intervention (listed in intervention) or combinations of those listed in intervention	Androgenicity: Hirsutism- FG score (ethnicities), FAI, testosterone, SHBG, DHEAS, androstenedione, Irregular cycles Metabolic: insulin resistance HOMA, Clamp, OGTT Lipids: Chol LDL, HDL TG, CRP Psychological: Qol, depression Arthropometric: weight BMI, WHR Adverse effects: cycle irregularity, mood Liver function tests Hirsutism, insulin resistance, metabolic effects. Pregnancy with adverse outcomes Under virilisation of male births	Evidence based guidelines, systematic reviews, randomised controlled trials.	None
Exclusion	Females without PCOS.	Placebo, no intervention or any intervention other than an aromatase inhibitor.	Agent or combination used in the intervention.	None	Non-evidence-based guidelines, non-systematic reviews, any study lower than a RCT.	None

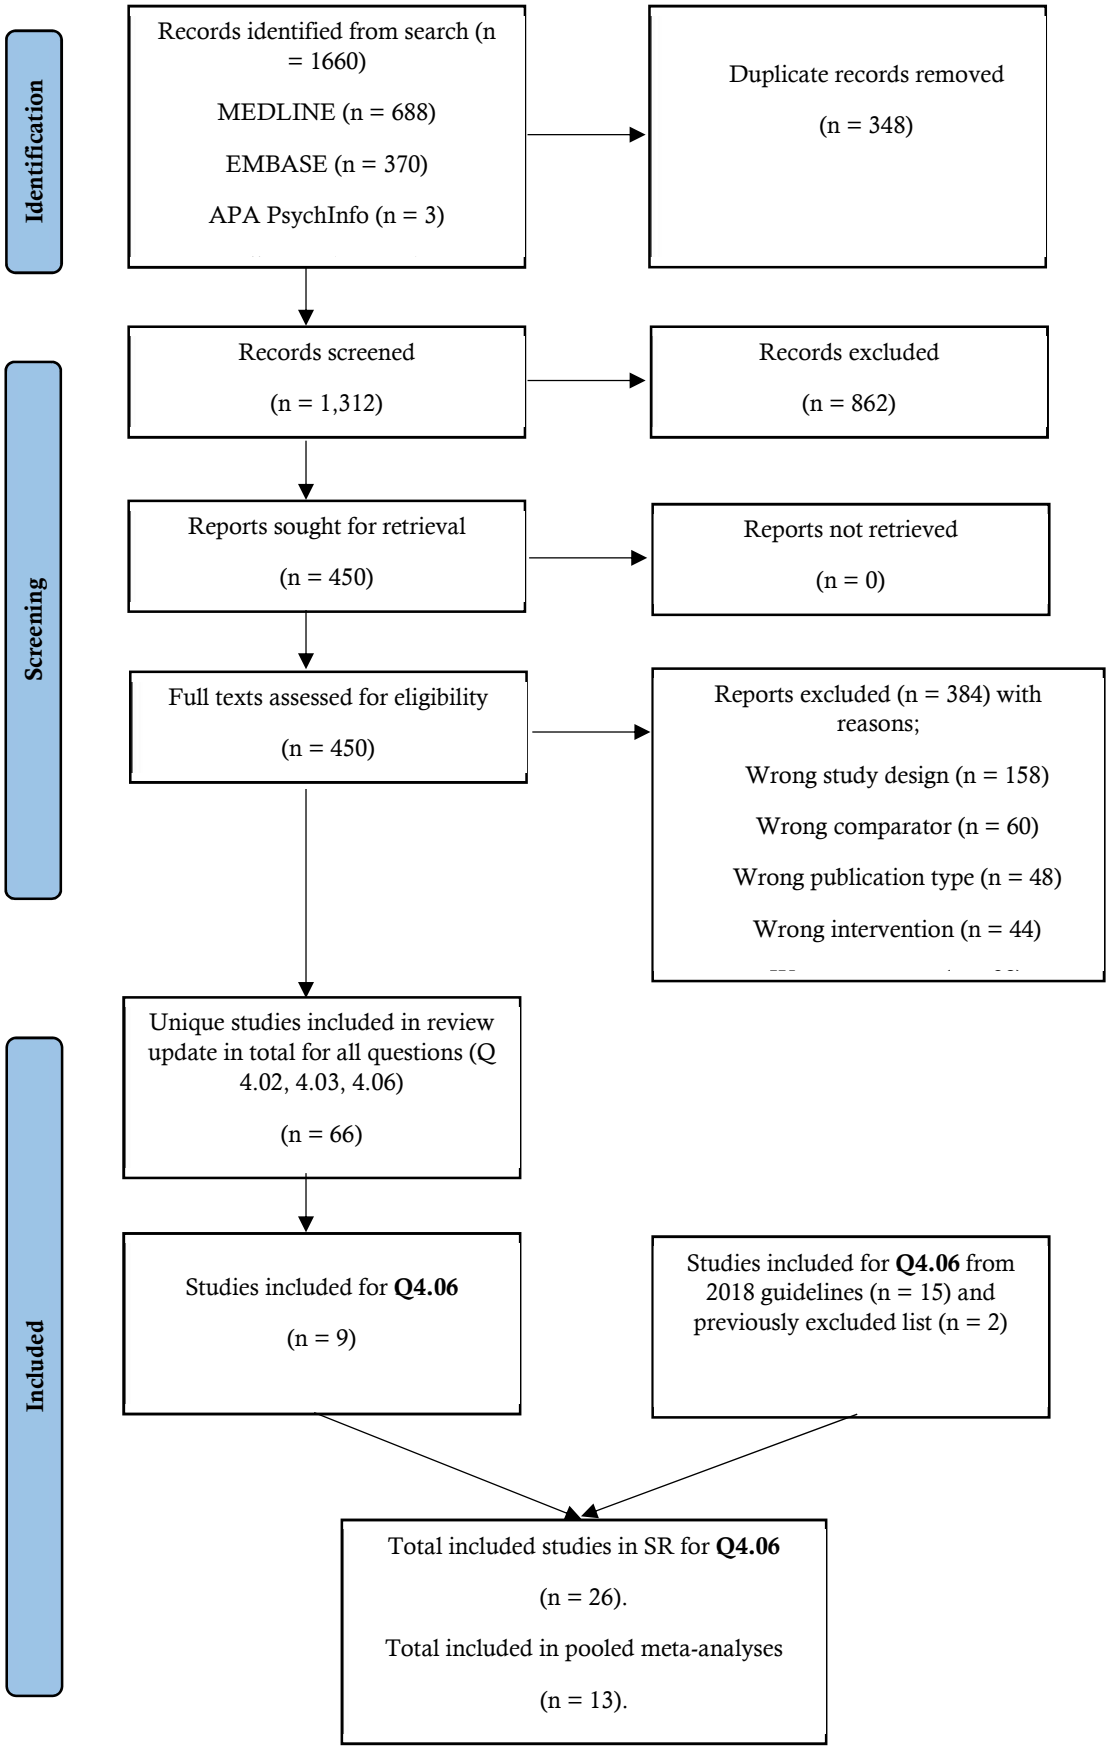
3. SEARCH RESULTS: PRISMA flowchart



4. STUDY INCLUSION

Evidence processing: The literature search and screening were performed together in one Endnote library and Covidence project for anti-androgens, metformin, and COCP treatments in PCOS. Studies were selected by two reviewer/s in consultation with the evidence team/ key contact(s) using study selection and appraisal criteria (PICOs) established a priori. The articles were screened by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. Full-text studies were assessed in duplicate. Study appraisal was conducted by two reviewers independently with discussion to resolve any discrepancy.

Of the updated search and studies from previous guidelines and previously excluded list, **26 studies met the inclusion criteria for this question 4.6 on anti-androgens**, as detailed below.

4.1. Table of Included Studies

4.2. Excluded studies (on full-text assessment)

Reference	Reason
Unknown. Effect of green tea pills and metformin versus placebo on the Nrf2-antioxidant system and proinflammatory cytokines, including IL-6 and TNF-a, in peripheral blood mononuclear cells of women with polycystic ovary syndrome: a single blind randomized clinica 2017.	Wrong publication type.
Effect of supplementation in treatment of women with polycystic ovary syndrome. Clinical trial of the effect of inofolic supplementation compared with metformin on parameters of mental health and oxidative stress in women with polycystic ovary syndrome 2017.	Wrong publication type.
Effect of inofolic supplementation in treatment of women with polycystic ovary syndrome. Clinical trial of the effect of inofolic supplementation compared with metformin on metabolic profiles and gene expression related to insulin and lipid in women with polycystic ovary syndrome 2017.	Full text not obtainable.
Comparison of oral contraceptives including Contrasmine, Etisterone and Desoceptive with Ovustop-L (LD) on clinical, biochemical and metabolic findings, and quality of life in women with polycystic ovary syndrome. A Randomized cross-over clinical trial to assess the effectiveness of oral contraceptives including Contrasmine, Etisterone and Desoceptive with Ovustop-L (LD) on clinical, biochemical and metabolic findings, and quality of life in women with polycystic o 2017.	Full text not obtainable.
The efficacy of Fennel infusion and cupping on ovarian failure. Comparison of ovarian cupping and fennel infusion with Metformin on oligomenorrhea and ovulation in women with polycystic ovarian syndrome: a clinical trial 2017.	Full text not obtainable.
Scientific Impact Paper No. 13: Metformin Therapy for the Management of Infertility in Women with Polycystic Ovary Syndrome. Obstetrician & Gynaecologist 2017, 19, 339-339, doi:10.1111/tog.12436.	Wrong study design.
Effect of using metformin on the incidence of gestational diabetes and preeclampsia in pregnant women with polycystic ovary. Effect of using metformin versus not using on the incidence of gestational diabetes and preeclampsia in pregnant women with polycystic ovary: A randomized clinical trial 2018.	Wrong publication type

?Effects of myo-inositol on induction of ovulation. Comparison the effects of myo-inositol plus clomiphene citrate with metformin plus clomiphene citrate on induction of ovulation among patients with polycystic ovarian syndrome. 2018.	Wrong publication type
New strategies to lose weight for women with polycystic ovary syndrome. Novel strategies in weight loss in women with polycystic ovary syndrome: does the gut microbiome play a role? 2018.	Wrong publication type
A study to compare the efficacy of two drugs on the success of assisted reproductive therapy in women with polycystic ovarian syndrome and undergoing treatment with IVF. Randomised Control Trial comparing the effects of Metformin to Myoinositol on ART outcome in women with PCOS undergoing IVF cycles 2018.	Wrong publication type
A study to compare the efficacy and adverse effects of metformin versus myoinositol plus d-chiroinositol combination therapy in polycystic ovarian syndrome. A prospective randomised comparative study of metformin versus myoinositol plus d-chiroinositol combination therapy in polycystic ovarian syndrome 2019.	Wrong publication type
Effect of combined electroacupuncture and medical therapy on insulin resistance in polycystic ovary syndrome patients. Combination of electroacupuncture and pharmacological treatment in improving insulin resistance (HOMA-IR) in polycystic ovary syndrome patients: a double-blind randomized clinical trial 2020.	Wrong study design
Study to find Effects of Chandraprabha Vati(Ayurvedic Medicine) in Polycystic Ovarian Syndrome Characterised by Small cysts in ovary with irregular,Scanty menses and excess/unwanted hairs on Face,Thighs,Abdomen etc. â??Randomized controlled clinical trial to study the efficacy OF Chandraprabha vati in PCOS.â?? 2020.	Wrong study design
A clinical trial to study the effect of exercise and metformin on mitochondrial health in patients with polycystic ovarian syndrome (PCOS). To assess the efficacy of moderate-intensity exercise training and metformin on mitophagy and mitochondrial phenotype in patients with polycystic ovarian syndrome (PCOS) 2020.	Wrong publication type
ffect of oral contraceptives on levels of adipokines, and adiposity indices in women with polycystic ovary syndrome. A randomized clinical trial to compare the effectiveness of oral contraceptives containing levonorgestrel, desogestrel, cyproterone acetate, and drospirenone on levels of adipokines, and adiposity indices in women with polycystic ovary syndrome. 2020.	Wrong publication type
Effect of treatment by OCP on infertility in PCOD patients. The randomized, single -blinded clinical trial comparing OCP effect before frozen embryo transfer versus gonadotropin â“ releasing hormone agonist injection on improving the outcome of pregnancy in infertile patients with hyper androgenic poly 2020.	Fulltext not obtainable
Expression of concern: Comparison of myo-inositol and metformin on mental health parameters and biomarkers of oxidative stress in women with polycystic ovary syndrome: a randomized, double-blind, placebo-controlled trial The effects of fish oil omega-3 fatty acid supplementation on mental health parameters and metabolic status of patients with polycystic ovary syndrome: a randomized, double-blind, placebo-controlled trial. Journal of Psychosomatic Obstetrics & Gynecology 2020, 41, I-I, doi:10.1080/0167482X.2020.1842508	Wrong publication type
Evaluation of therapeutic effects of crocina (saffron tablets) in patients with polycystic ovary syndrome: a randomized double-blind clinical trial. 2021.	Wrong publication type
A clinical study in women suffering from polycystic ovary syndrome (PCOS) to test the drug LPRI-424 (dienogest/ethinyl estradiol) during 9 months of treatment. A multicentre, phase III, double-blind, randomised clinical trial to assess the efficacy and safety of LPRI-424 (dienogest 2.00 mg / ethinyl estradiol 0.02 mg) in the treatment of polycystic ovary syndrome (PCOS) versus placebo during 9 cycles 2021.	Wrong publication type
A clinical trial to study the effect of myoinositol based therapy in combination with metformin as compared to metformin alone in women with polycystic ovarian syndrome. A Randomized Controlled Trial comparing Myoinositol based therapy in combination with Metformin versus Metformin monotherapy on the clinical, metabolic and hormonal parameters in Obese reproductive age women with Polycystic Ovarian Syndrome 2021.	Wrong publication type
Efficacy of very low carbohydrate diet combined with metformin in overweight / obese PCOS patients on changing of clinical phenotype, gut microbiota and plasma metabolome after treatment: a randomized, controlled clinical trial. 2021.	Fulltext not obtainable
A Phase II, randomised, multi-centric, multi-national clinical trial to evaluate the efficacy, tolerability, and safety of a fixed dose combination of Spironolactone, Pioglitazone & Metformin (SPIOMET) for adolescent girls and young adult women (AYAs) with polycystic ovary syndrome (PCOS). 2021.	Wrong publication type
Investigation on the efficacy and safety of Ceylon cinnamon (Cinammomum zeylanicum) compared to metformin in ameliorating symptoms of Polycystic Ovary Syndrome (PCOS): A randomized controlled trial. Investigation on the Efficacy and Safety of Ceylon Cinnamon (Cinammomum zeylanicum) and Metformin in Ameliorating Polycystic Ovary Syndrome (PCOS): A Randomized Controlled Trial 2022.	Wrong comparator

4. FINDINGS

Comparisons Included:

- **Comparison 1**. Anti-androgen vs Placebo - ADOLESCENTS
- **Comparison 2.** Anti-androgen (daily) vs Anti-androgen (every 3 days)
- **Comparison 3.** Anti-androgen + lifestyle vs Placebo + lifestyle – ADULTS
- **Comparison 4.** Anti-androgen + lifestyle vs Anti-androgen + metformin + lifestyle
- **Comparison 5.** Anti-androgen vs metformin - ADULTS
- **Comparison 6.** Anti-androgen vs Anti-androgen + metformin – ADULTS
- **Comparison 7**. Anti-androgen vs COCP – ADULTS
- **Comparison 8**. Anti-androgen + metformin + Pioglitazone (SPIOMET) vs COCP – ADOLESCENTS
- **Comparison 9.** Anti-androgen + metformin vs COCP - ADOLESCENTS
- **Comparison 10**. Anti-androgen + metformin + COCP vs COCP - ADULTS
- **Comparison 11**. Anti-androgen + COCP vs COCP +/- placebo – ADULTS
- **Comparison 12.** Anti-androgen + COCP vs metformin – ADULTS
- **Comparison 13.** Anti-androgen + lifestyle vs metformin + lifestyle - ADULTS
- **Comparison 14.** Anti-androgen + metformin + lifestyle vs metformin + lifestyle - ADULTS

COMPARISON 1. Anti-androgen vs Placebo - ADOLESCENTS (6 MONTHS)

▪ EVIDENCE SUMMARY:

There was one study that compared a low-dose anti-androgen (finasteride) as compared to placebo in adolescent girls with PCOS. This study was of high risk (Tartagni, 2014) of bias and from Italy.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

In the mean difference estimates, it was highlighted that placebo was superior to the anti-androgen for reducing hirsutism as per the modified FG score. Certainty in the evidence was very low, as the single identified study was high risk of bias, with a very small sample size.

There were no differences in BMI, SHBG, testosterone, DHEAS, and androstenedione. The certainty of the evidence for these findings was very low due to high risk of bias and very small sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random	P-value	Favours	Certainty
Body mass index	1	14	0.50 kg/m^2 [-3.64, 4.64]	0.81	None	⊕◯◯◯ VERY LOW

COMPARISON 2. Anti-androgen (daily) vs Anti-androgen (every 3 days) – ADULTS (6 MONTHS – 12 MONTHS)

▪ EVIDENCE SUMMARY:

There were two RCTs that compared a daily anti-androgen and an anti-androgen given every 3 days (twice per week) in adult women with PCOS with 6- and 12-month follow-ups. Both studies had a high risk of bias (Falsetti 1999; Tartagni, 2004), and were conducted in Italy.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

In meta-analysis, a daily anti-androgen was superior to every 3-day regimen for hirsutism and androstenedione. Certainty in the evidence is very low for these outcomes, as both studies are high risk of bias with a small sample size.

There was no difference in SHBG, testosterone, DHEAS, BMI, fasting insulin and adverse events such as decreased libido and headache. The certainty of the evidence for these findings was very low reflective of the high risk of bias of both studies assessed and sample size.

Falsetti 1999 reported that two women (3.6%) dropped out of the study due to liver toxicity due to high transaminase levels potentially from the flutamide intervention.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI] or OR [95% CI], I-V, random	P-value	Favours	Certainty
Hirsutism	2	80	-3.48 [-4.58, -2.39]	<0.00001	Daily AA	⊕◯◯◯ VERY LOW

COMPARISON 3. Anti-androgen + lifestyle vs Placebo + lifestyle – ADULTS (6 MONTHS – 12 MONTHS)

- **EVIDENCE SUMMARY:**

There were two studies that assessed the comparison between anti-androgen (flutamide) with lifestyle intervention and placebo with lifestyle intervention in adult women with PCOS with 6- and 12-month follow-ups, of which one had a moderate risk of bias (Amiri, 2014), and the other had a low risk of bias (Gambineri, 2006). Studies were conducted in Iran and Italy.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Only three outcomes between the studies could be included in meta-analysis, with no specific intervention being superior. The certainty of the evidence ranged from low to very low due to risk of bias, small sample size, and was further downgraded as Amiri 2014 reported that the population was considered overweight, but the inclusion range was 19 to 35, thereby including lean women. Moreover, the exact BMIs of the population were not listed. It is noted that due to unit reporting leading to uncertainty, certain outcomes could not be pooled in meta-analysis, and instead, Gambineri 2006 was used for single study mean difference estimates. For the single study mean difference estimates, anti-androgen + lifestyle was superior for managing body weight, DHEAS, fasting insulin, LDL, triglyceride levels, frequency of menstruation, QUICKI, and insulin sensitivity index, as compared to the placebo + lifestyle intervention. The certainty of the evidence ranged from low to very low due to risk of bias and small sample.

There was no difference in outcomes such as BMI, hirsutism, SHBG, FAI, testosterone, and androstenedione. The certainty in the evidence of these findings ranged from very low to low reflective of the moderate risk of bias in Amiri 2014 and small sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random	P-value	Favours	Certainty

COMPARISON 4. Anti-androgen + lifestyle vs Anti-androgen + metformin + lifestyle - ADULTS

(6 MONTHS – 12 MONTHS)

- **EVIDENCE SUMMARY:**

There were three RCTs that compared anti-androgen with lifestyle intervention with a combination therapy of anti-androgen and metformin with lifestyle intervention in adult women with PCOS with 6 to 12 months follow-up, of which two were low risk of bias (Gambineri, 2006; Ganie, 2013) and one was moderate (Amiri, 2014). Studies were conducted in India, Italy, and Iran.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

In meta-analysis, the combination therapy of an anti-androgen + metformin + lifestyle intervention was superior for fasting glucose compared to the anti-androgen + lifestyle intervention, with a moderate certainty of evidence. Conversely, the anti-androgen + lifestyle intervention was superior for triglycerides compared to the combination anti-androgen + metformin + lifestyle intervention, with a low certainty of evidence, due to the very small sample. In the single study mean difference estimates, the combination therapy of anti-androgen + metformin + lifestyle intervention was superior for WHR, with a high certainty of evidence.
There was no difference between other outcomes including BMI, hirsutism, SHBG, testosterone, fasting insulin, QUICKI in meta-analysis, with a certainty of evidence that ranged from very low to low mostly due to the risk of bias and inclusion of Amiri 2014 where it is uncertain whether the study included lean women. The certainty in the evidence of fasting insulin which was high. In the single study mean difference estimates, there was no difference in weight, total cholesterol, FAI, DHEAS, androstenedione, HDL, and HOMA-IR. Certainty in these finding ranged from very low to low due to risk of bias and sample sizes. Since the BMIs of the population of Amiri 2014 was uncertain, a sensitivity analysis was conducted to assess the influence of Amiri 2014 on several outcomes. When removing Amiri 2014 from BMI, hirsutism, SHBG, testosterone, and fasting glucose, they were still not statistically significant. Gambineri 2006 assessed tolerability to flutamide via liver function tests and reported that it was well-tolerated by all participants but did not report specific values.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random	P-value	Favours	Certainty
BMI	3	204	-0.05 kg/m^2 [-1.21, 1.11]	0..94	None	⊕⊕◯◯ LOW

Did not run meta-analysis due to uncertainty in units. Have used the other study in the above MD calculations above for this reason.

COMPARISON 5. Anti-androgen vs MET - ADULTS (12 MONTHS)

(Also see in metformin question, 4.3)

- **EVIDENCE SUMMARY:**

There was one study that compared an anti-androgen (finasteride) and metformin, with no additive lifestyle intervention in adult women with PCOS with 6- and 12-month follow-ups. This study was a high risk of bias (Diri, 2017), and was conducted in Turkey.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

In single study mean difference estimates, anti-androgen intervention had higher SHBG levels, as compared to metformin, with a very low certainty of evidence reflective of the high risk of bias and very small sample size.

There was no difference between finasteride and metformin on BMI, hirsutism, free testosterone, DHEAS, androstenedione, and HOMA-IR. The certainty in the evidence for these findings were very low due to the only study identified being high risk of bias and the associated small sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random	P-value	Favours	Certainty
BMI	1	35	-0.20 kg/m^2 [-2.37, 1.97]	0.86	None	⊕◯◯◯ VERY LOW
Hirsutism	1	35	0.60 [-2.80, 4.00]	0.73	None	⊕◯◯◯ VERY LOW
SHBG	1	35	11.50 nmol/l [-0.08, 23.08]	0.05	AA	⊕◯◯◯ VERY LOW
Free testosterone	1	35	-0.30 pg/ml [-0.85, 0.25]	0.29	None	⊕◯◯◯ VERY LOW
DHEAS	1	35	-669.00 ng/ml [-1430.65, 92.65]	0.09	None	⊕◯◯◯ VERY LOW
Androstenedione	1	35	0.30 ng/ml [-0.13, 0.73]	0.17	None	⊕◯◯◯ VERY LOW
HOMA-IR	1	35	-0.20 [-0.88, 0.48]	0.56	None	⊕◯◯◯ VERY LOW

OUTCOME 5.1. – 5.7: BMI, hirsutism, SHBG, free testosterone, DHEAS, androstenedione, HOMA-IR

COMPARISON 7. Anti-androgen vs COCP - ADULTS (12 months)

(Also see in COCP question, 4.02)

- **EVIDENCE SUMMARY:**

There was one study that investigated the comparison of an anti-androgen (spironolactone) and the COCP in adult women with PCOS with 12 months follow-up. The one identified study was a moderate risk of bias (Spritzer, 2000), and was from Brazil.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

There was only one outcome reported that was conducive to analysis. It was identified that hirsutism was higher in the spironolactone group compared to the COCP group after 12 months. The certainty for hirsutism was very low reflective of the moderate risk of bias and very low sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random	P-value	Favours	Certainty
Hirsutism	1	19	4.00 [1.21, 6.79]	0.005	AA	⊕◯◯◯ VERY LOW

COMPARISON 8. Spironolactone + MET + Pioglitazone (SPIOMET) vs COCP - ADULTS (12 months)

(Also see in COCP and metformin questions, 4.2, 4.3)

- **EVIDENCE SUMMARY:**

Five studies were identified that compared a combination therapy of spironolactone + metformin + pioglitazone (SPIOMET) compared to the combination oral contraceptive pill in adult women with PCOS with 12 months follow-up. All these studies were in the same population of women, and thus, Ibanez 2020 was considered the main publication due to the largest sample size and full outcome list. Therefore, there was nothing extracted from Malpique 2019 and Diaz 2018. FAI was reported as an extra outcome in deZegher 2021 and Acne scores from Ibanez 2017 and were hence extracted. These set of studies were assessed as moderate risk of bias (Ibanez, 2020), and were conducted in Spain.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

In the single study mean difference estimates, SPIOMET was superior for hirsutism, SHBG, fasting insulin, HOMA-IR, LDL, CRP, FAI, and ALT. Conversely, the SPIOMET group had higher androstenedione. The certainty in the evidence was low for all these outcomes reflective of the moderate risk of bias and small sample size. There were no differences in BMI, WC, testosterone, triglycerides, HDL, and AST levels. The certainty in the evidence was low reflecting the moderate risk of bias and sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random	P-value	Favours	Certainty

COMPARISON 9. Anti-androgen + MET vs COCP – ADOLESCENTS (9 months)

(Also see in COCP and metformin questions, 4.2, 4.3)

- **EVIDENCE SUMMARY:**

There was one RCT that investigated the combination therapy of an anti-androgen (specifically, flutamide) + metformin against the combined oral contraceptive in adolescent girls with PCOS with 9 months follow-up, of which was a moderate risk of bias (Ibanez, 2004). This study was conducted in Spain.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

In the single study mean difference estimates, the flutamide-metformin combination was superior for reducing SHBG, triglycerides, HDL, and LDL levels, as compared to the COCP. The certainty was very low, which was reflective of the moderate risk of bias and very small sample size.

There was no difference in BMI, hirsutism, fasting glucose/insulin ratio, and testosterone, with a very low certainty of the evidence, which was reflective of the moderate risk of bias and very small sample size.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random	P-value	Favours	Certainty
BMI	1	32	-0.50 kg/m^2 [-2.03, 1.03]	0.52	None	⊕◯◯◯ VERY LOW

COMPARISON 11. Anti-androgen + COCP vs COCP +/- placebo – ADULTS (6 – 12 MONTHS)

- **EVIDENCE SUMMARY:**

There were five RCTs that addressed the comparison of a combination therapy of an anti-androgen and combined oral contraceptive pill with the combined oral contraceptive with (in the case of Moretti, 2018) and without a placebo with 6 to 12 months follow-up. All the five studies were moderate risk of bias (Burchall, 2017; Hagag, 2014; Meyer, 2007; Tartagni, 2000; Vieira, 2012). Studies were conducted in Australia, Brazil, Italy, and Israel.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

In meta-analysis, the COCP alone was superior for total cholesterol, LDL, triglycerides, , as compared to the anti-androgen + COCP. The certainty in the evidence for these findings ranged from very low to low due to the risk of bias and/or small sample. In the single mean difference estimates, the COCP was superior for fasting insulin, HOMA-IR, and FAI, as compared to the AA + COCP. The certainty in the evidence for these outcomes was low due to the risk of bias and sample size.

In meta-analysis, there were no differences in weight, BMI, testosterone, SHBG, HDL, and adverse events such as breast tenderness, and nausea. The certainty in the evidence ranged from very low to low due risk of bias and sample size, except for BMI which was moderate due to only being downgraded due to the risk of bias. In the single study mean difference estimates, there were no difference in hirsutism, acne, fasting glucose, free testosterone, DHEAS, androstenedione, CRP, ALT, AST, and other adverse events (menorrhagia, premenstrual pelvic pain, metrorrhagia, hypercholesterolemia, hypertriglyceridemia, dysmenorrhea, menstrual spotting, and minor depressive state/mood reduction). The certainty in the evidence for all these findings ranged from very low to low due to the risk of bias and sample size.

Since Moretti 2018 had a placebo group in the comparison where the other studies did not, a sensitivity analysis was conducted to assess the influence of Moretti 2018 on all parameters where Moretti 2018 was included. Removing Moretti 2018 from the pooled analysis of weight, BMI, total cholesterol, HDL, adverse events (breast tenderness, nausea) had no effect on the significance attained. However, when removing Moretti from LDL and triglycerides, these outcomes were no longer significant.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random; OR [95% CI], I-V, random	P-value	Favours	Certainty

COMPARISON 12. Anti-androgen + COCP vs MET - ADULTS (6 – 12 MONTHS)

- **EVIDENCE SUMMARY:**

There were four RCTs that investigated that addressed the comparison of a combination therapy of an anti-androgen + COCP against metformin in adult women with PCOS with 6 to 12 months follow-up. The studies were either low (Mehrabian, 2016), moderate (Burchall, 2017; Meyer, 2007), or high risk of bias (Alpanez, 2017) with 6 and 12 month follow-ups. The studies were conducted in Australia, Spain, and Iran.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Due to the nature of the diversity in the way outcomes were reported, only BMI could be pooled in meta-analysis, which showed no effect with a moderate certainty of evidence only downgrading due to the inclusion of a moderate risk of bias study (Burchall, 2017). In the single study mean difference estimates, the combination anti-androgen + COCP was superior in free testosterone, androstenedione, DHEAS, CRP, and menstrual dysfunction. Conversely, metformin was superior for fasting glucose. The certainty of the evidence for these findings ranged from very low to low due to the risk of bias and sample size, except for CRP which was moderate only being downgraded due to the sample size.

There was no difference for BMI in meta-analysis, with a moderate certainty of evidence. In the single study mean difference estimates, fasting insulin HOMA-IR, testosterone, HDL, triglycerides, and adverse events such as abnormal glucose tolerance and dyslipidaemia. The certainty in the evidence for these outcomes ranged from very low to low due to the risk of bias and small sample size, except for triglycerides which was only downgraded due to the sample size.

Whilst Alpanez 2017 did not report specific liver function test results, it was reported that liver markers such as transaminases were checked routinely and remained unchanged throughout the study except in three women.

OUTCOME 12.13-12.16: Menstrual dysfunction, abnormal glucose tolerance, dyslipidaemia, hypertension

OUTCOME: Adverse events - LISTED BELOW				**OUTCOME TYPE: Dichotomous**				
COMPARISON: Anti-androgen + COCP vs COCP +/- placebo - ADULTS								
Author, year	Unit of outcome (e.g. g, mg)	Method of measurement	Mean (specify if median) in intervention group	SD (or specify if other measure) in intervention group	Sample size (n within this group)	Mean (specify if median) in control group	SD (or specify if other measure) in control group	Sample size (n within this group)
Outcome: Menstrual dysfunction								
Alpanez 2017 (HRB)*	Odds ratio*	12 months	OR: 0.06	95% CI: 0.02, 0.23	AA + OCP: 24	MET: 22	Crude	N/A
Outcome: Abnormal glucose tolerance								
Alpanez 2017 (HRB)*	Odds ratio*	12 months	OR: 1.7	95% CI: 0.7, 4.4	AA + OCP: 24	MET: 22	Crude	N/A
Outcome: Dyslipidaemia								
Alpanez 2017 (HRB)*	Odds ratio*	12 months	OR: 0.6	95% CI: 0.2, 1.8	AA + OCP: 24	MET: 22	Crude	N/A

COMPARISON 13. Anti-androgen + lifestyle vs MET + lifestyle - ADULTS (6 – 12 MONTHS)

- **EVIDENCE SUMMARY:**

There were four RCTs that addressed the comparison of anti-androgen + lifestyle against metformin + lifestyle in adult women with PCOS with 6 – 12 months follow-up. Two studies were low risk of bias (Gambineri, 2006; Ganie 2013) and two were moderate risk of bias (Ganie, 2004; Amiri, 2014). The studies were conducted in India, Iran, and Italy.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

In meta-analysis, the anti-androgen + lifestyle was superior for frequency of menstruation, hirsutism, fasting insulin and fasting glucose-insulin ratio as compared to the metformin + lifestyle intervention. The certainty in the evidence ranged from very low, low, to moderate, mostly being downgraded due to the inclusion of Amiri 2014 where it is unclear whether lean women were included in the analysis. Conversely, the metformin + lifestyle intervention was superior for SHBG and HDL, with a very low and low certainty of evidence, respectively.

There was no difference in weight, BMI, WHR, testosterone, DHEAS, fasting glucose, and QUICKI in meta-analysis. The certainty of the evidence ranged from very low to low, except in the cases of WHR, testosterone, and QUICKI where there was only downgrading due to risk of bias or statistical heterogeneity. In the single study mean difference estimates, there was no difference in FAI, androstenedione, OGTT, HOMA, total cholesterol, LDL, and triglycerides, with the certainty of evidence ranging from very low to low reflective of the risk of bias and small sample sizes.

Since the BMIs of the population of Amiri 2014 was uncertain, a sensitivity analysis was conducted to assess the influence of Amiri 2014 on several outcomes. When removing Amiri 2014 from BMI and fasting glucose, the significance obtained remained unchanged. However, when removing Amiri 2014 from hirsutism and SHBG, they were no longer significant.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random	P-value	Favours	Certainty
Weight	2	144	-5.64 kg [-19.33, 8.05]	0.42	None	⊕⊕◯◯ LOW

meta-analysis not run due to uncertainty in units

COMPARISON 14. Anti-androgen + MET + lifestyle vs MET + lifestyle - ADULTS (6 – 12 MONTHS)

▪ EVIDENCE SUMMARY:

There were four RCTs that addressed the comparison between a combination therapy of an anti-androgen + metformin + lifestyle against metformin + lifestyle in adult women with PCOS with 6-12 months follow-up. Three of the studies were low risk of bias (Gambineri, 2006; Ganie, 2013; Mazza, 2014) and one was moderate risk of bias (Amiri, 2014). The studies were conducted in India, Iran, and Italy.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

In meta-analysis, the anti-androgen + metformin + lifestyle intervention was superior for testosterone and fasting glucose, with a very low to low certainty of evidence. In the single study mean difference estimates, the anti-androgen + metformin + lifestyle intervention was superior for insulin sensitivity index, with a low certainty of evidence due to the very small sample size.

There was no difference in weight, BMI, WHR, hirsutism, SHBG, DHEAS, fasting insulin, HDL, LDL, triglycerides, and HOMA-IR in meta-analysis. The certainty in the evidence of these findings ranged from very low to low due to indirectness from being unsure of the population BMI in Amiri 2014, except for DHEAS, LDL, triglycerides that were moderate downgraded for inconsistency or sample size, and HOMA-IR being high. In the single study mean difference estimates, there was no difference in frequency of menstruation, FAI, androstenedione, fasting glucose-insulin ratio, QUICKI, OGTT, and total cholesterol, with a certainty of evidence low for androstenedione, QUICKI, and OGTT due to the risk of bias and/or small samples, except for FAI and total cholesterol that were moderate downgraded due to sample size, and QUICKI and frequency of menstruation being high.

Since the BMIs of the population of Amiri 2014 was uncertain, a sensitivity analysis was conducted to assess the influence of Amiri 2014 on several outcomes. When removing Amiri 2014 from BMI, hirsutism, SHBG, testosterone, the significance obtained remained unchanged. However, when removing Amiri 2014 from WHR, this outcome was then statistically significant, and fasting glucose was no longer statistically significant.

Outcome or Subgroup	Studies	n	Effect Estimate; MD [95% CI], I-V, random	P-value	Favours	Certainty
Weight	3	210	-0.92 kg [-7.30, 5.45]	0.78	None	⊕⊕◯◯ LOW
BMI	4	262	-0.20 kg/m^2 [-1.43, 1.02]	0.74	None	⊕⊕◯◯ LOW
WHR	2	170	-0.00 [-0.06, 0.06]	0.93	None	⊕◯◯◯ VERY LOW
Hirsutism	4	262	-0.58 [-1.86, 0.69]	0.37	None	⊕⊕◯◯ LOW
SHBG	3	144	-0.59 nmol/l [-4.52, 3.34]	0.77	None	⊕⊕◯◯ LOW
Testosterone	4	262	-0.29 nmol/l [-0.52, -0.06]	0.01	AA + MET + LS	⊕◯◯◯ VERY LOW
DHEAS	2	92	-0.24 µg/ml [-0.92, 0.45]	0.50	None	⊕⊕⊕◯ MODERATE
Fasting insulin	3	210	-1.22 µU/ml [-2.87, 0.43]	0.15	None	⊕⊕⊕⊕ HIGH

---

1 Gambineri 2006, Amiri 2014

2 Not downgraded as evidence is either low or moderate risk, and the study with low risk has a weighting of 64.9%.

3 Downgraded once due to statistically significant heterogeneity

5 Downgraded once due to small sample size or twice for very small sample.

6 Gambineri 2006 (low risk of bias study).

7 Downgraded for indirectness as Amiri 2014 stated it was an overweight population, but the study has an inclusion of women with BMI 19 to 35 (not reporting BMIs), thus indicating this population could include lean women, whereas Gambineri 2006 is an overweight population with reported BMIs.

1 Downgraded as at least one study is moderate RoB or very serious for at least one high RoB
2 Downgraded due to inconsistent direction of effect
3 Downgraded due to statistically significant ($p<0.05$) or high heterogeneity (>50%).
4 Downgraded due to no overlapping or at least one non-overlapping CI
5 Downgraded due to wide CIs
6 Downgraded once due to sample size (and when sample is not similar numbers between intervention and comparison group) and twice for very small sample
7 Downgraded due to indirectness as not systematic measurement of this outcome in Moretti 2018).

COMPARISON 12: Anti-androgen + COCP vs MET – ADULTS (6 months to 12 months)											
	Quality assessment					No of participants

Question 4.6.

Are anti-androgen pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?

BACKGROUND:

Treatment with anti-androgen drugs has been utilized to improve physical appearance, psychological health, and quality of life because these common clinical features adversely impact the health and well-being of women with PCOS (1, 2).

This sub-topic examines available data regarding the efficacy of anti-androgens in adolescents and adult women with PCOS. Available evidence was evaluated for all possible comparisons including monotherapy with anti-androgens and combination therapy involving other medications such as metformin, COCPs, and SPIOMET. For these comparisons, 24 studies were examined. Only eight studies were published after 2017; five of these studies were published by the same group, raising the possibility for inclusion of some subjects in several studies.

Women with PCOS often manifest metabolic features such as insulin resistance, hyperinsulinemia, dyslipidemia, and greater weight. Insulin resistance and hyperinsulinemia promote excessive ovarian and adrenal androgen secretion. One mechanism of action attributed to metformin is improved insulin sensitivity leading to decreased circulating androgen concentrations. Limited data suggest that hyperandrogenemia exacerbates insulin resistance and hyperinsulinemia (3).

Due to the growth cycle of hair, at least a 9–12 months course treatment is required in order to evaluate the effectiveness of the antiandrogen treatment in improving hirsutism and/or acne. To date, spironolactone, cyproterone acetate (CPA), finasteride and flutamide are the most thoroughly investigated and commonly used agents.

Assessment of the potential benefits and adverse consequences must be evaluated before prescribing any medications. Regarding this specific topic, the potential for adverse side effects for anti-androgens, COCPs, and/or metformin needs to be assessed. Anti-androgens are teratogens that interfere with virilization of a male fetus (4, 5). Hence, it is mandatory to use concomitant contraception with anti-androgens (especially monotherapy with anti-androgens) to avoid undervirilisation of a male fetus in the event of unplanned pregnancy. According to general population guidelines, absolute contraindications for COCP use include women with history of migraine with aura, deep vein thrombosis (DVT)/pulmonary emboli (PE), known thrombogenic mutations, multiple risk factors for arterial cardiovascular disease, history of ischemic heart disease or stroke, complicated valvular heart disease, breast cancer, neuropathy, severe cirrhosis and malignant liver tumours. In case of increased risk profile other methods like progestin only preparations (i.e. hormonal IUD) could be considered.

Metformin is an insulin sensitizer that is used to treat impaired glucose tolerance and PCOS symptoms in adolescents and women. Due to its low cost and availability, metformin is commonly used to treat adolescents and women with PCOS. Metformin has mild side effects of nausea, vomiting, diarrhoea, and flatulence. Metformin can be used alone or in combination with anti-androgens for PCOS.

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Comparisons Included:
o Comparison 1. Anti-androgen vs Placebo - ADOLESCENTS
o Comparison 2. Anti-androgen (daily) vs Anti-androgen (every 3 days)
o Comparison 3. Anti-androgen + lifestyle vs Placebo + lifestyle – ADULTS
o Comparison 4. Anti-androgen + lifestyle vs Anti-androgen + metformin + lifestyle
o Comparison 5. Anti-androgen vs metformin - ADULTS
o Comparison 6. Anti-androgen vs Anti-androgen + metformin – ADULTS
o Comparison 7. Anti-androgen vs COCP – ADULTS
o Comparison 8. Anti-androgen + metformin + pioglitazone (SPIOMET) vs COCP – ADOLESCENTS
o Comparison 9. Anti-androgen + metformin vs COCP - ADOLESCENTS
o Comparison 10. Anti-androgen + metformin + COCP vs COCP - ADULTS
o Comparison 11. Anti-androgen + COCP vs COCP +/- placebo – ADULTS
o Comparison 12. Anti-androgen + COCP vs metformin – ADULTS
o Comparison 13. Anti-androgen + lifestyle vs metformin + lifestyle - ADULTS
o Comparison 14. Anti-androgen + metformin + lifestyle vs metformin + lifestyle - ADULTS

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** In combination with effective contraception, antiandrogens should only be considered to treat hirsutism in women with PCOS, if there is a suboptimal response, after a minimum of six months of COCP and/or cosmetic therapy.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **CR:** Given the negative psychological impact of female pattern hair loss, anti-androgens in combination with COCP could be trialled, acknowledging the lack of evidence in the PCOS population.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

- Whenever pregnancy is possible, health professionals must educate and counsel women and adolescents, parent/s or guardian/s, regarding the risks of incomplete development of external genital structures of male fetuses (undervirilization) when anti-androgens are used. To prevent this, women who can get pregnant should be strongly counselled to use effective contraception (e.g. Intrauterine device or COCPs).

Anti-androgens could be considered to treat hirsutism, in the presence of another effective form of contraception, for women with contraindications for COCP therapy or when COCPs are poorly tolerated.

- When prescribing antiandrogens, based on general population recommendations, health professionals should consider that:
  - Spironolactone at 25-100 mg / day appears to have lower risk of adverse effects.
  - Cyproterone acetate at doses ≥ 10 mg is not advised due to increased risks including for meningioma.
  - Finesteride has an increased risk of liver toxicity.
  - Flutamide and bicalutamide have an increased risk of severe liver toxicity.
  - The relatively limited evidence on anti-androgens in PCOS needs to be appreciated with small numbers of studies and limited numbers of participants.

GRADE CONSIDERATIONS

Justifications:

COMPARISON 1. Anti-androgen vs Placebo – ADOLESCENTS

One randomized control trial (RCT) was performed and published in 2014 (7). This study included 14 girls diagnosed with PCOS using Rotterdam criteria. The 14 patients were randomized to two treatment groups: 1) low dose finasteride (2.5 mg) every three days and 2) placebo. Outcome measures included BMI, gonadotropins, total testosterone, DHT, androstenedione, androstenediol glucuronide, SHBG, lipids, and liver function studies. The study lasted six months. The FG score was significantly lower at six months in the finasteride-treated group. As would be anticipated, androstanediol glucuronide and DHT concentrations were lower at 3 and 6 months. Finasteride-treated subjects reported positive subjective outcome of this study (excellent + good: finasteride treated = 13 and placebo = 0). Side effects were not reported – finasteride was “well tolerated” by subjects. Low quality data due to limited number of subjects. Hence, cannot make definitive recommendations in favor of an anti-androgen versus placebo.

Comparison 2. Anti-androgen (daily) vs Anti-androgen (every 3 days)

One RCT compared daily versus intermittent anti-androgens in adult women with PCOS with 6- and 12-month follow-ups. This study (8) had a high risk of bias. All subjects were 18 years of age and older in this study.

Tartagni et al (8) enrolled 38 women categorized as 38 with idiopathic hirsutism and 16 with PCOS. Subjects were randomized assigned to finasteride 2.5 mg daily or finasteride 2.5 mg every 3 days for 10 months. reported that daily finasteride was not superior to every 3-day finasteride. Outcome measures included BMI, gonadotropins, total testosterone, DHT, androstenedione, androstanediol glucuronide, SHBG, lipids, and liver function studies. The subjects reported good outcomes regardless of daily or intermittent treatment. As would be anticipated, androstanediol glucuronide and DHT concentrations were lower at the 5 month and 10-month timepoints. The authors concluded no superiority was demonstrated for either treatment.

Falsetti et al. (9) compared two different anti-androgens. This study also had a high risk of bias. In this study, women with PCOS were randomly assigned to receive either finasteride 5 mg daily or flutamide 250 mg twice daily for a total of 12 months. Both anti-androgen medications reduced the FG score at 12 months. Finasteride decreased FG score by 31% whereas flutamide decreased FG score by 60%. No hormone changes were observed with flutamide but two women had abnormal transaminase levels at 6 months. Subjects taking finasteride showed increased testosterone and decreased androstanediol glucuronide levels. The authors concluded that flutamide was more effective than finasteride. This study does not address the specified comparison.

Hence, only one RCT actually addressed this comparison. This RCT presents low quality data due to the limited number of subjects. Hence, no definitive recommendation in favor of a daily anti-androgen versus an intermittent anti-androgen (every 3 days) can be made.

Comparison 3. Anti-androgen + lifestyle vs Placebo + lifestyle – ADULTS

Two studies were available that assessed the comparison between anti-androgen (flutamide) with lifestyle intervention compared to placebo with lifestyle intervention in adult women with PCOS with 6- and 12-month

follow-ups. One study had a moderate risk of bias (10) and the other had a low risk of bias (11). Due to differences in units, meta-analyses could not be performed for some outcome measures.

BMI in Amiri (10) ranged between 19-35 kg/m^2 thus including both lean women and women of a higher weight. Amiri (10) stated that 117 women were recruited, 120 women were randomized, and 105 women completed the study. All subjects were started on a hypocaloric diet. One month later, subjects were randomized to four groups: 1) metformin (1500 mg daily); 2) flutamide (500 mg daily); 3) metformin (1500 mg daily) and flutamide (500 mg daily); and 4) placebo. Outcome measures included BMI, total testosterone, DHT, androstenedione, androstanediol glucuronide, SHBG, lipids, fasting blood glucose, fasting insulin, and liver function studies. No difference in outcomes was evident for BMI, hirsutism, SHBG, FAI, testosterone, and androstenedione.

Per Gambineri et al. (11), single study mean difference estimates, anti-androgen + lifestyle was superior for managing body weight, DHEAS, fasting insulin, LDL, triglyceride levels, frequency of menstruation, QUICKI, and insulin sensitivity index, as compared to the placebo + lifestyle intervention. The certainty of the evidence ranged from low to very low due to risk of bias and small sample. No differences in outcomes such as BMI, hirsutism, SHBG were evident. For this RCT, Gambineri et al (11) placed subjects on a hypocaloric diet for the first month and then on a hypocaloric diet plus placebo, metformin (850 mg, orally, twice a day), flutamide (250 mg, orally, twice a day), or metformin plus flutamide for the subsequent 12 months (20 subjects in each group). Forty women were included in their previous 2004 study. The Rotterdam criteria were used for the diagnosis of PCOS. Outcome measures included BMI, FG score, total T, androstenedione, DHEAS, SHBG, lipids, liver and renal function studies, an OGTT, and CT assessment of body fat. These authors concluded that "…flutamide significantly decreased visceral fat, glucose-stimulated glucose levels, and LDL cholesterol levels and improved insulin sensitivity, therefore favoring the achievement of a healthier metabolic profile, particularly in the long term. Moreover, after 12 months of treatment, we found that flutamide significantly increased the frequency of menstruation."

Reviewing the Forest Plots and prepared analyses and recognizing the limited number of subjects, no definitive recommendation can be made for this comparison, Anti-androgen + lifestyle vs Placebo + lifestyle.

Comparison 4. Anti-androgen + lifestyle vs Anti-androgen + metformin + lifestyle

Three RCTs are included in this comparison; two studies (10, 11) were included in Comparison 3. This comparison includes a third RCT by Ganie et al. (12). For this comparison, several outcomes are considered including hirsutism, lipids, androgen concentrations, and metabolic features (glucose and insulin).

No differences were apparent for BMI, hirsutism, total testosterone, fasting insulin, and QUICKI. However, certainty varied between very low to low due to small sample sizes and lack of details regarding BMI distribution in Amiri et al.(10). Since the BMIs of the population of Amiri 2014 was uncertain (10), a sensitivity analysis was conducted to assess the influence of Amiri 2014 (10) on several outcomes. When removing Amiri 2014 (10) from BMI, hirsutism, SHBG, testosterone, and fasting glucose, they were still not statistically significant. In the single study mean difference estimates, there was no difference in weight, total cholesterol, FAI, DHEAS, androstenedione, HDL, and HOMA-IR. Certainty in these findings ranged from very low to low due to risk of bias and sample sizes.

Fasting glucose was significantly lower for anti-androgen + metformin + lifestyle compared to anti-androgen + lifestyle (P=0.002). Thus, in meta-analysis, the combination therapy of an anti-androgen + metformin + lifestyle intervention was superior for lowering fasting glucose with a moderate certainty of evidence.
Conversely, the anti-androgen + lifestyle intervention was superior for triglycerides compared to the combination anti-androgen + metformin + lifestyle intervention, with a low certainty of evidence, due to the very small sample.

The certainty in the evidence that fasting insulin was similar was high in two studies (11, 12).

However, clinical care of women with PCOS is unlikely to depend on fasting glucose or triglyceride concentrations.

Comparison 5. Anti-androgen vs metformin - ADULTS

One RCT compared an anti-androgen (finasteride) and metformin without additive lifestyle intervention in adult women with PCOS with 6- and 12-month follow-ups. This study by Diri et al., (13) had high risk of bias. This study enrolled 70 patients with PCOS diagnosed by Rotterdam criteria but only 52 completed the study (13 failed to follow up, 2 stopped metformin, and 3 became pregnant). Subjects were randomized to three treatment groups: 1) finasteride 5 mg/day (n=16); 2 metformin 850 mg, bid (n=19); and 3) finasteride and metformin (n=17).

Fasting glucose concentrations improved in both finasteride and metformin groups, but were not different at 12 months. The finasteride group had higher SHBG concentrations at 12 months compared to the metformin group. The metformin group had lower estradiol concentrations. This is a single study with a small number of subjects and very low certainty.

Comparison 6. Anti-androgen vs Anti-androgen + metformin – ADULTS

Diri et al (13) was the only RCT that investigated anti-androgens with a combination of anti-androgens (finasteride) and metformin without additive lifestyle intervention in adult women with PCOS with 12 months follow-up. This study enrolled 70 patients with PCOS diagnosed by Rotterdam criteria but only 52 completed the study (13 failed to follow up, 2 stopped metformin, and 3 became pregnant). Subjects were randomized to three treatment groups: 1) finasteride 5 mg/day (n=16); 2 metformin 850 mg, bid (n=19); and 3) finasteride and metformin (n=17).

HOMA-IR and AUC-glucose were higher and estradiol concentrations were lower in the finasteride + metformin group compared to the finasteride group. This study was considered to be at high risk of bias and data were considered to be of very low level of certainty.

Comparison 7. Anti-androgen vs COCP – ADULTS

In the RCT (14), 46 hirsute women were separated randomly into two groups, stratified for polycystic ovary syndrome. One group (21 patients, 10 PCOS) received spironolactone only (200 mg/day) while the other group (23 patients, nine PCOS) received COCP consisting of CPA (50 mg/day) with ethinyl estradiol (35 microgram/day). Outcome measures included FG score, testosterone, androstenedione, and LH. FG score, testosterone, androstenedione, and LH concentrations decreased with COCP. This is a single study with a small number of subjects. Of note, it is unclear whether the subjects taking spironolactone alone were using an effective form of contraception.

Comparison 8. Anti-androgen + metformin + Pioglitazone (SPIOMET) vs COCP – ADOLESCENTS

In a series of studies, Ibáñez and colleagues (15, 16) have compared a specific regimen (SPIOMET: spironolactone 50 mg/day, pioglitazone 7.5 mg/day, and metformin 850 mg/day) with COCP (20 µg ethinylestradiol plus 100 mg levonorgestrel). This regimen consists of spironolactone + pioglitazone + metformin. She and colleagues hypothesize that hepatovisceral fat excess (central adiposity) attributed to restricted prenatal nutritional restriction followed by postnatal nutritional excess contributes to the development of PCOS.

Five studies were identified that compared a combination therapy of spironolactone + metformin + pioglitazone (SPIOMET) compared to COCP, the combination oral contraceptive pill in adult women with PCOS with 12 months follow-up. All these studies involved the same population of women. For this reason, Ibáñez et al. 2020 (16) was considered the main publication due to the largest sample size and full outcome list. Therefore, there was nothing extracted from Malpique 2019 (17) and Diaz 2018 (18). FAI was reported as an extra outcome in deZegher 2021 (19) and acne scores were from Ibáñez et al., 2017 (20) and were hence extracted. Given these multiple publications utilizing at least some common subjects raises concerns regarding high risk of bias.

The 2020 Ibáñez (16) publication in the Journal of the Endocrine Society includes data from an earlier study with this more recent study that includes 62 lean adolescents with PCOS. For this specific study, the primary endpoint was posttreatment ovulation rate; secondary outcomes included hirsutism score, fasting insulin, androgens, lipids, high-molecular-weight (HMW) adiponectin, C-reactive protein (CRP), carotid intima-media thickness (cIMT), body composition, and hepato-visceral fat. Subjects were treated for 12 months and subsequently followed for another 12 months.

Subjects treated with SPIOMET showed more ovulations post-therapy than those treated with COCP during the first 12 months after completion of this study. At 12 months, completion of medication, no differences were found for FG scores, testosterone, androstenedione, BMI Z-score, BMI, HOMA-IR, OGTT, lipids. SHBG levels were significantly higher in the COCP group at 12 months. Insulin (fasting and mean insulinemia Z score) was lower in the SPIOMET group. This combination of three medications has only been utilized by these investigators. Side effects/adverse events were not discussed. No data was available regarding benefits/risk among higher weight young women with PCOS. And, no longer term follow-up data (beyond 12 months) were reported.

No information regarding side effects is included. The certainty in the evidence was low for all these outcomes reflective of the moderate risk of bias and small sample size.

Comparison 9. Anti-androgen + metformin vs COCP - ADOLESCENTS

One RCT (15) investigated the combination therapy of an anti-androgen (specifically, flutamide)

+ metformin against the combined oral contraceptive in adolescent girls with PCOS for 9 months with follow-up. This study included 54 adolescent and young adult women. Subjects “not at risk for pregnancy” were enrolled in flutamide + metformin vs COCP study (n=32; mean age 14.6 ± 0.3 yr; range, 13–16 yr). For the OCP group, “appreciable decreases in hirsutism score and testosterone, as well as increments in SHBG and high-density lipoprotein (HDL) cholesterol” were noted. For the girls receiving flutamide + metformin monotherapy, testosterone, triglycerides, and lipids “reverted toward normal”. Side effects/adverse events were not discussed.

Young women at risk for pregnancy were treated with COCP and enrolled in a second sub-study with two groups: 1) COCP alone or 2) COCP + flutamide + metformin. This second sub-study is not included in this analysis and is considered in Comparison 10.

No definitive recommendations can be offered due to the small number of subjects with moderate risk of bias.

Comparison 10. Anti-androgen + metformin + COCP vs COCP - ADULTS + ADOLESCENTS

One RCT (15) investigated the combination therapy of an anti-androgen (specifically, flutamide) + metformin against the combined oral contraceptive in adolescent girls with PCOS for 9 months with follow-up. This study included 54 adolescent and young adult women. Young women at risk for pregnancy were treated with COCP and enrolled in a second sub-study with two groups: 1) COCP alone or 2) COCP + flutamide + metformin. For this sub-study (n=22; mean age 18.6 ± 0.3 yr; range, 17–21 yr), the specific study comparisons were monophasic OC (ethinylestradiol 30 µg + drospirenone 0.3 mg, 21 d/month) or COCP + anti-androgen + metformin (ethinylestradiol 30 µg + drospirenone 0.3 mg, 21 days, flutamide, 62.5 mg daily and metformin, 850 mg daily).

Subjects “not at risk for pregnancy” were enrolled in flutamide + metformin vs COCP study. For this sub-study, the specific study comparisons were anti-androgen + metformin (flutamide, 62.5 mg daily and metformin, 850 mg daily) or monophasic OC (ethinylestradiol 30 µg + drospirenone 0.3 mg, 21 d/month). This sub-study was considered in Comparison 9.

No differences in BMI, hirsutism, fasting glucose/insulin ratio, testosterone, triglycerides, HDL, or LDL levels were apparent. Side effects/adverse events were not discussed. There was a very low certainty in the evidence due to the moderate risk of bias and very small sample size.

Comparison 11. Anti-androgen + COCP vs COCP +/- placebo – ADULTS (6-12 months)

Five RCTs addressed the comparison of a combination therapy of an anti-androgen and combined oral contraceptive pill with the combined oral contraceptive with (in the case of Moretti, 2018 (21)) and without a placebo with 6 to 12 months follow-up. All the five studies were found to have a moderate risk of bias (22-26).

Moretti et al (21) was the only publication reporting outcome data with bicalutamide, an androgen receptor antagonist, in women with PCOS. The major outcome for this study was effects on hirsutism. Subjects were randomized to receive COCP (third generation: ethinylestradiol (0.030 mg) and a progestin with the same antiandrogen activity (chlormadinone acetate 2 mg, drospirenone 3 mg, or dienogest 2.5 mg) with or without oral bicalutamide 50 mg daily. Each group included 35 subjects. The combination of COCP and bicalutamide showed greater efficacy to decrease FG scores than COCP alone. No adverse events were reported.

Total cholesterol was lower in COCP ± placebo group (P=0.002), LDL cholesterol was lower in COCP ± placebo group (P-0.01), and triglycerides were lower in COCP ± placebo group (P=0.0001).

To summarize, no differences in weight, BMI, testosterone, SHBG, HDL, and adverse events such as breast tenderness, and nausea were noted. The certainty in the evidence ranged from very low to low due risk of bias and sample size, except for BMI which was moderate due to only being downgraded due to the risk of bias. In the single study mean difference estimates, there were no difference in hirsutism, acne, fasting glucose, free testosterone, DHEAS, androstenedione, CRP, ALT, AST, and other adverse events (menorrhagia, premenstrual pelvic pain, metrorrhagia, hypercholesterolemia, hypertriglyceridemia, dysmenorrhea, menstrual spotting, and minor depressive state/mood reduction). The certainty in the evidence for all these findings ranged from very low to low due to the risk of bias and sample size.

Comparison 12. Anti-androgen + COCP vs metformin – ADULTS

Four RCTs investigated that addressed the comparison of a combination therapy of an anti-androgen + COCP against metformin in adult women with PCOS with 6 to 12 months follow-up. The studies were either low (27) , moderate (22, 24), or high risk of bias (28) with 6- and 12-month follow-ups.

Due to the nature of the diversity in the way outcomes were reported, only BMI could be pooled in meta-analysis, which showed no effect with a moderate certainty of evidence only downgrading due to the inclusion of a moderate risk of bias study (22).

In the single study mean difference estimates, the combination anti-androgen + COCP was superior in free testosterone, androstenedione, DHEAS, CRP, and menstrual dysfunction. Conversely, metformin was superior for fasting glucose. The certainty of the evidence for these findings ranged from very low to low due to the risk of bias and sample size, except for CRP which was moderate only being downgraded due to the sample size.
There was no difference for BMI in meta-analysis, with a moderate certainty of evidence. In the single study mean difference estimates, fasting insulin HOMA-IR, testosterone, HDL, triglycerides, and adverse events such as abnormal glucose tolerance and dyslipidemia. The certainty in the evidence for these outcomes ranged from very low to low due to the risk of bias and small sample size, except for triglycerides, which was only downgraded due to the sample size.

Comparison 13. Anti-androgen + lifestyle vs metformin + lifestyle – ADULTS

Four RCTs addressed the comparison of anti-androgen + lifestyle versus metformin + lifestyle in adult women with PCOS with 6 – 12 months follow-up. Two studies were low risk of bias (11, 12) and two were moderate risk of bias (10, 29).
The
Amiri (10) stated that 117 women were recruited, 120 women were randomized, and 105 women completed the study. All subjects were started on a hypocaloric diet. One month later, subjects were randomized to four groups: 1) metformin (1500 mg daily); 2) flutamide (500 mg daily); 3) metformin (1500 mg daily) and flutamide (500 mg daily); and 4) placebo. Outcome measures included BMI, total testosterone, DHT, androstenedione, androstanediol glucuronide, SHBG, lipids, fasting blood glucose, fasting insulin, and liver function studies. BMI decreased. Hirsutism score decreased more in the flutamide group. Higher SHBG concentrations in the flutamide group.

Ganie (29) assessed menstrual frequency in two studies and reported more menses in the anti-androgen group.

For meta-analysis, hirsutism was improved with anti-androgen (P=0.03). SHBG was higher in the anti-androgen group (P=0.03). Fasting insulin was lower in the anti-androgen group (P=0.03). No apparent differences in testosterone, DHEAS, fasting glucose, QUICKI, androstenedione, HOMA-IR, or BMI.

Comparison 14. Anti-androgen + metformin + lifestyle vs metformin + lifestyle – ADULTS

Four RCTs addressed the comparison between a combination therapy of an antiandrogen + metformin + lifestyle against metformin + lifestyle in adult women with PCOS with 6-12 months follow-up. Three of the studies were low risk of bias (11, 12, 30) and one was moderate risk of bias (10) .

For meta-analysis, no differences in weight, BMI, WHR, hirsutism, SHBG, DHEAS, fasting insulin, HDL, LDL, triglycerides, and HOMA-IR were found. Testosterone and fasting insulin were lower in the anti-androgen + metformin + lifestyle group (P=0.01 and P=0.04, respectively).

Subgroup considerations:

Higher weight is a confounding factor in evaluating the effect of treatment on the metabolic assessment and other clinical parameters (e.g. menstrual irregularities).

Implementation considerations:

Potential barriers to implementation of the recommendations relate to the availability and costs of various COCP combinations, availability and costs of other medical interventions. One major limitation is how to encourage and obtain prolonged adherence to healthy lifestyle changes.

Monitoring and evaluation considerations:

- Assuring effective contraception when anti-androgens or other potentially teratogenic medications are utilized
- Assess risk for impaired glucose tolerance, diabetes, dyslipidemia recognizing that risks for these consequences are higher in individuals with high BMI or specific ethnic backgrounds.
- Assessment for risk for VTE by obtaining a thorough family history.

Research priorities:
Large scale population-based studies are required to validate comparisons that show potential differences.
Large scale comparative studies in particular in adolescents are required to determine the optimal COCP preparation in relation to specific progestins and estrogen doses.
Large scale comparative studies to determine optimal combination of therapies for specific phenotypes. Do optimal therapies differ for women with PCOS with much higher weight vs lean women?
Large scale studies comparing COCP and emerging anti-obesity medications plus the combination of COCP plus anti-obesity medications as weight is an important complaint in women with PCOS.
Comparison of efficacy of different antiandrogens agents
Comparison of efficacy of different treatment schedules
Assessment of optimal monitoring of adverse events
A better selection of study participants in order to make possible a tailored approach - BMI, age, different phenotypes and metabolic assessment should be taken into consideration for future research.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

As detailed above, most comparisons were conditional recommendations to not recommend either option. Limited data due to few studies and sample number of subjects results in these conclusions. See above for details. All comparisons assessed within this subtopic are listed below. Nevertheless, not all comparisons will require a recommendation with a GRADE assessment in the final document. The comparison with SPIOMET should not be considered due to the limited outcome data and low level of certainty regarding the data. The importance of effective contraception when anti-androgens are used as monotherapy must be emphasized.

Panel discussion:

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Side effects and adverse events were not systematically reported but no major side effects were described and very few subjects withdrew from treatment due to side effects even with combinations

Metformin can cause mild GI side effects

COCP can cause mild side effects such as spotting and breast tenderness.

COCP are associated with risk for VTE

Spironolactone used as monotherapy can cause irregular menses and hyperkalemia

All anti-androgens are teratogens

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Overall certainty of evidence is low to very low.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☒ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Overall health care professionals and consumers share goals to promote weight loss, regular menses, fertility, and decreased androgen excess. Health professionals and consumers will likely value these revised recommendations.

Nevertheless, health care professionals and consumers may have different values and view main outcomes differently. Priorities for consumers include higher weight and difficulties losing weight, infertility, and hirsutism. And shared-decision making to individual therapeutic interventions will benefit all.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Individual preferences need to be considered.

● COSTS

How large are the resource requirements (costs)?

Judgement:

☒ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Costs for COCPs, anti-androgens, and metformin vary according to specific preparations, insurance and health care arrangements.

COCP availability might be an issue in some countries, i.e. cyproterone acetate is not available in all regions.

Using combinations of medications increases costs. Currently, evidence is limited regarding the benefits of multiple medications.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

Insufficient data is available to accurately answer this query.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

No data are available regarding cost effectiveness on COCP, anti-androgens, and/or metformin for management of PCOS. No data are available specifically regarding lifestyle interventions. However, one presumes that weight loss and healthy lifestyle interventions likely improve general health and lower health care expenses. .

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Updated recommendations will likely benefit all individuals and have a positive impact on health equity.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Key stakeholders include:

Health care system: COCP, metformin, and antiandrogens are not approved as specific treatments for PCOS by regulatory bodies. Currently, evidence-based and expert opinions favor the use of the medications for treatment of specific symptoms in individuals with PCOS.

Health care professionals are likely to find the recommendation acceptable (COCP and/or metformin) when targeting specific symptoms. Unsure of acceptability of combination treatments.

Patient acceptance (women) can vary if there are moral and ethical barriers to using COCP and/or if adherence issues exist when multiple combinations are proposed.

Patient acceptance (adolescent) can vary if parent/s and or guardian/s are concerned about specific therapies.

Question 4.7.

In adolescents and adults with PCOS, is inositol alone or in combination with other therapies, effective for management of hormonal and clinical PCOS features, weight and reproductive outcomes**?**

CONTENTS

Table 1. PICO Criteria for Inclusion – Not to be adapted To be used by evidence team to decide which studies will be included when screening search results.	
Question	Q 4.7) In adolescents and adults with PCOS, is inositol alone or in combination with other therapies, effective for management of hormonal and clinical PCOS features, weight and reproductive outcomes?
Clinical leads (key contacts)	**Non-reproductive outcomes** **Dr Carolyn Ee** General practitioner Western Sydney University, Australia C.Ee@westernsydney.edu.au **Prof Selma Witchel** Paediatric endocrinologist Children's Hospital of Pittsburgh of UPMC, University of Pittsburg, USA witchelsf@upmc.edu **A/Prof Alexia Pena Vargas** Paediatric endocrinologist The Robinson Research Institute at the University of Adelaide, Australia alexia.pena@adelaide.edu.au **Prof Poli Mara Spritzer** Endocrinologist Universidade Federal do Rio Grande do Sul, Brazil spritzer@ufrgs.br **Reproductive outcomes** **Prof Rong Li** Obstetrician-gynaecologist Reproductive Medical Centre, Peking University Third Hospital, China roseli001@sina.com
Allocation ranking	Level 1- New systematic review

3. Selection criteria

In adolescents and adults with PCOS, is inositol alone or in combination with other therapies, effective for management of hormonal and clinical PCOS features, weight and reproductive outcomes

PICO	P	I	C	O	Study type	Limits
Inclusion	Females with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity and weight. Subgroups: adolescents (10-19y), adults (incl. peri-menopause), post-menopausal, overweight/obesity	Inositol (Myoinsotiol or D-Chiroinositol) alone or in combination, and combined with usual care, lifestyle, or any other interventions. Any dose and any duration.	Placebo or any other intervention (listed in intervention) or combinations of those listed in intervention. Comparisons should be meaningful to delineate the effects of inositol.	Androgenicity: Hirsutism- FG score (ethnicities), FAI, testosterone, SHBG, DHEAS, androstenedione, Irregular cycles Metabolic: insulin resistance HOMA, Clamp, OGTT Lipids: Chol LDL, HDL TG, CRP Psychological: Qol, depression Anthropometric: weight BMI, WHR, body composition Adverse effects: All Reproductive outcomes (for GDG 5): Live birth rate, pregnancy rate (biochemical or clinical ultrasound), ovulation, single and multiple pregnancies, miscarriage rate, other adverse events, quality of life, cost effectiveness.	Evidence based guidelines, systematic reviews, randomised controlled trials	English language. New search. No limit on date
Exclusion	Females without PCOS.		Agent or combination used in the intervention.

Evidence processing: Studies were selected and appraised by 9 reviewer/s in consultation with the evidence team/ key contact using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by 9 reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. In total, **36 studies met inclusion criteria for this review and 26 were included after integrity assessment.**

5. DATA EXTRACTION TABLES

DICHOTOMOUS OUTCOMES –

i. D- chiro-inositol (DCI)

i. D-Chiro Inositol (DCI) v Placebo

OUTCOME: Ovulation							**OUTCOME TYPE:** Dichotomous			
		COMPARISON (if applicable): DCI v Placebo								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Iuorno et al. 2002	N of women who ovulated	Serum prog > 8.0ng/mL	6	-	10	2	-	10	crude	NA

ii. Myoinositol (MI) + DCI comparisons

ii. MI+DCI+FA v MI+FA

OUTCOME: Oligomenorrhoic patients			**OUTCOME TYPE:** Dichotomous
		COMPARISON (if applicable): MI + DCI + FA vs MI + FA	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Sample size (n within this group)	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Sample size (n within this group)	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Le Donne 2019 – 3mo	No definition of oligomenorrhoea was provided	count	2	-	12	9	-	10	Crude	NA
Le Donne 2019- 6 mo	No definition of oligomenorrhoea was provided	count	0	-	12	2	-	10	Crude	NA

iii. MI+DCI+Met vs Met

OUTCOME: Menstrual regularity					**OUTCOME TYPE:** Dichotomous			
COMPARISON (if applicable): MYI+DCI+Metformin vs Metformin alone								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Bahadur 2021	%	Reported as menstrual irregularity	Rate=38.9%	NA (N=36 in this group)	Rate=63.9%	NA (N=36 in this group)	Crude	NA

iv. MI+DCI v MI+DCI

OUTCOME: Menses			**OUTCOME TYPE:** Dichotomous
		COMPARISON (if applicable): MI + DCI vs MI + DCI	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group N	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Sample size (n within this group)	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Sample size (n within this group)	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Nordio et al. 2019	count	Number of participants who had return of menses	1:3.5 = 0 2.5:1 = 0 5:1 = 1 20:1 = 3 40:1 = 5 80:1 = 4		n = 8 n = 7 n = 8 n = 8 n = 8 n = 8	0:1 = 0		n = 8	Crude	NA

OUTCOME: Pregnancy Rate (positive HCG among those who had embryo transfer)										
OUTCOME TYPE: Dichotomous										
		COMPARISON (if applicable): MI + DCI vs MI + DCI								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Mendoza 2019	Count	+HCG 2 weeks post retrieval	N = 17	-	25	6	-	19	Crude	NA

OUTCOME: Pregnancy Rate (positive HCG among all participants includes spontaneous pregnancies)										
OUTCOME TYPE: Dichotomous										
		COMPARISON (if applicable): MI + DCI vs MI + DCI								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**

Mendoza 2019	Count	+HCG 2 weeks post retrieval	N = 19	-	30	N = 7	-	30	Crude	NA

OUTCOME: Live Birth Rate (among all participants includes IVF+spontaneous pregnancies)										
		COMPARISON (if applicable): MI + DCI vs MI + DCI								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Mendoza 2019	Count	+HCG 2 weeks post retrieval	N = 15	-	30	N = 4	-	30	Crude	NA

- Note the results in study have n=16 for live births in intervention group due to counting a twin delivery counted as 2 live births. Reduced count by 1 to correct for this.

iii. MI Comparisons

v. MI+FA vs FA alone

OUTCOME: Ovulation rate						**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): MI + FA v FA alone										
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention**	**Sample size**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/**	**Sample size**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**

				/ exposure group			**comparison group**			
Pourghasem 2019	N of women with normal ovarian function	Mature follicle on TVU	31	-	50	24	-	50	Crude	NA

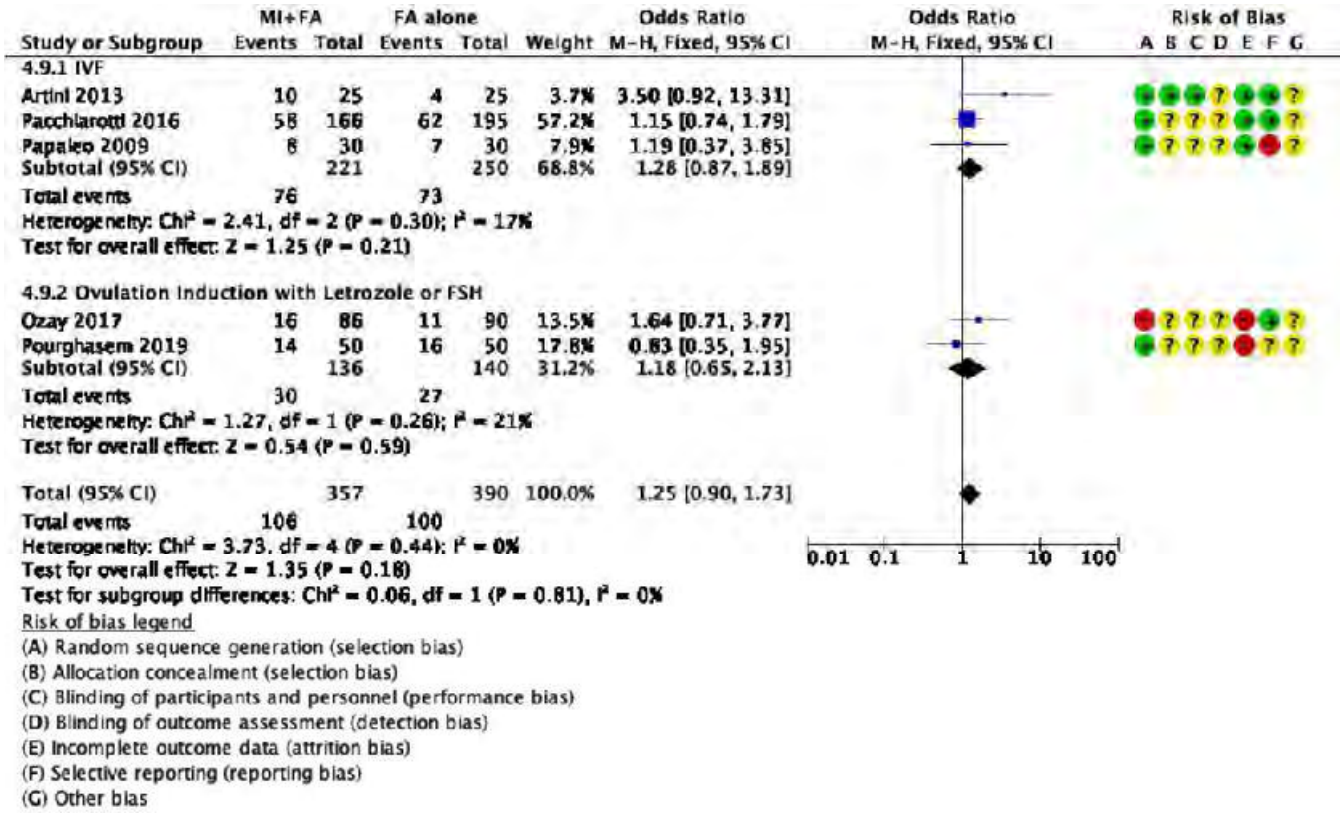
OUTCOME: Live birth rate				**OUTCOME TYPE:** Dichotomous				
COMPARISON (if applicable): eg. MI+FA vs FA alone								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Artini et al 2013	%		32%	Not provided	12%	Not provided	Crude	

OUTCOME: Pregnancy rate – biochemical	**OUTCOME TYPE:** Dichotomous
COMPARISON (if applicable): Myo-Inositol + Folic Acid versus Folic Acid alone	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Papaleo 2009	Count	% defined as a small transitory increase in bHCG	n=1	9.1%	n=1	10%	Crude	NA

OUTCOME: Pregnancy rate – clinical				**OUTCOME TYPE:** Dichotomous					
COMPARISON (if applicable): Myo-Inositol + Folic Acid versus Folic Acid alone									
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**	**Co intervention**
Papaleo 2009	Count	Visualization of an embryo with cardiac activity at 6-7 weeks	n=8	26.6%	n=7	23.3%	Crude	NA	IVF
Pacchiarotti 2016	Count	%	n=58/166	36.7%	n=62/195	31%	Crude	NA	IVF

Artini et al 2013	%	US confirmed	40% (n=10)	Not provided	16% (n=4)	Not provided	Crude		IVF
Ozay et al 2017	%	US confirmed	18.6% (n=16/86)	Not provided	12.2% (n=11/90)	Not provided	Crude		COH + IUI
Pourghasem 2019	N	Gestational sac on US at 5 weeks N=50	14	-	16 N=50	-	Crude		Letrozole



a. Figure 1. MI+FA v FA alone: Clinical Pregnancy Rate

OUTCOME: Pregnancy rate (+HCG)	**OUTCOME TYPE:** Dichotomous	
COMPARISON (if applicable): Myo-Inositol + Folic Acid versus Folic Acid alone		

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Mean (specify if median) in intervention/ exposure group	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Mean (specify if median) or median in control / comparison group	SD (or specify if other measure: SE, IQR or 95% CI) in control group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?	Cointervention
Papaleo 2009	Count	% Total number of pregnancies including biochemical, SAB and clinical	n=11	37.9% (of 29 because 1 cycle was cancelled)	n=10	37.0% (of 27 because 3 cycles was cancelled)	Crude	NA	IVF
Artini et al 2013	%	Positive HCG	60% (n=15)	Not provided	32% (n=8)	Not provided	Crude		IVF
Akbari Sene 2019	%	Unclear if +hcg or clinical preg rate	40%	Not provided	35%	Not provided	Crude		IVF

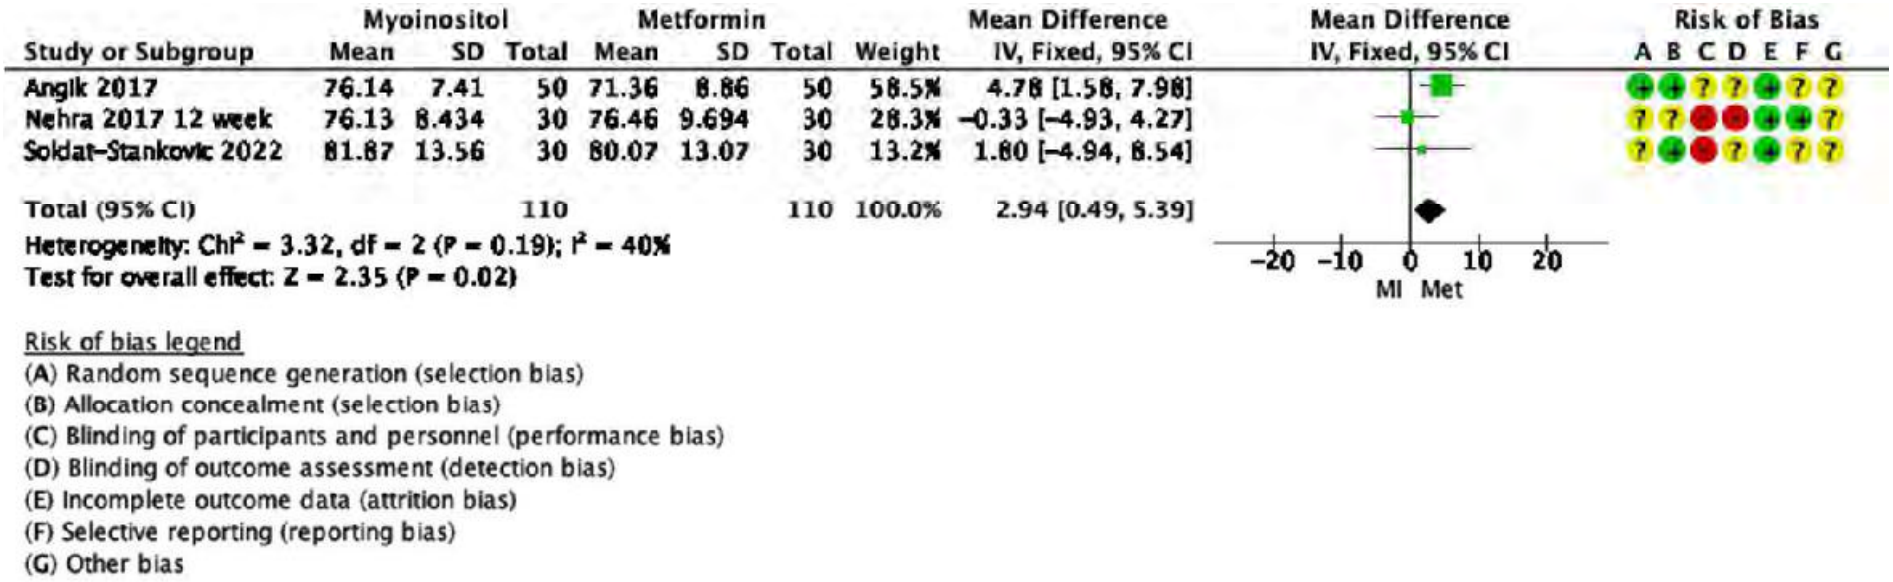
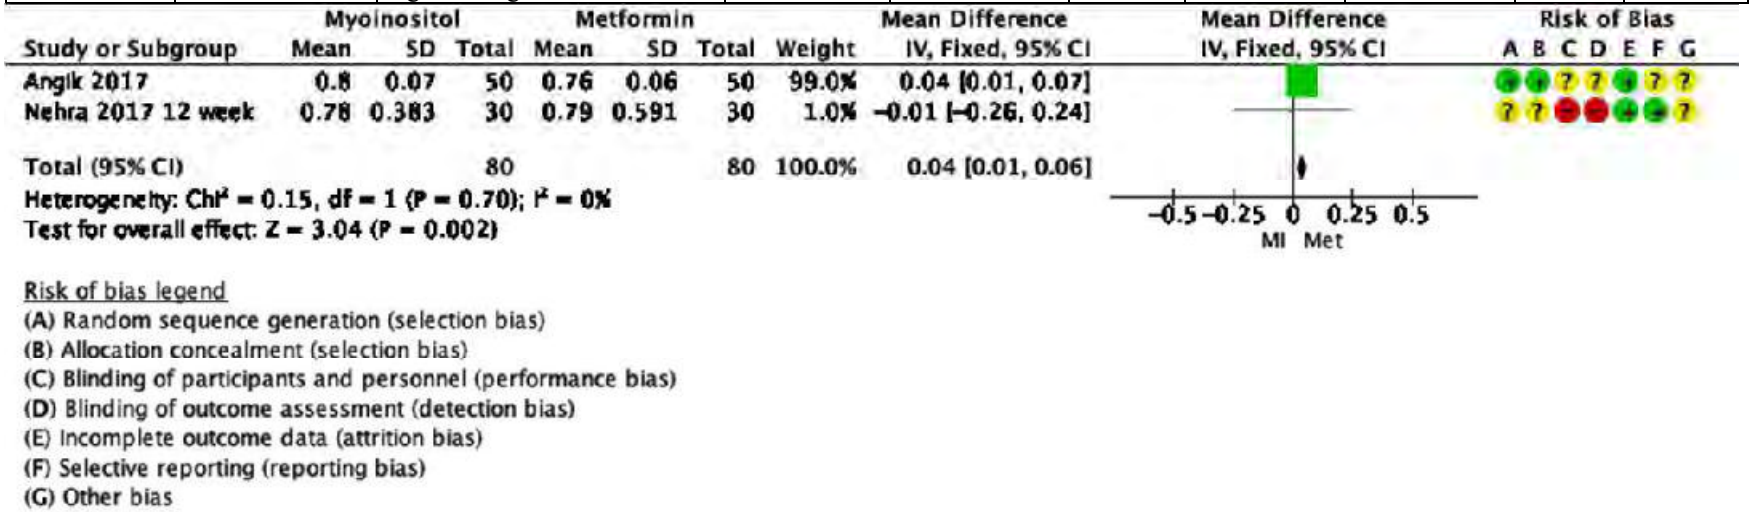
Angik 2017	NR	NR	76.14	7.41	50	71.36	8.86	50	Crude	NA
Nehra 2017 (12 week measurement)	cm	Waist circumference is measured with a tape midway between the lowest rib margin and the iliac crest in standing position	76.13	SE 1.54/ SD 8.434		76.46	SE 1.77/SD9.694		Crude	NA
Ravn et al. 2022	cm			IQR 100 (93;104)	16		IQR 100 (90;105)	12	Crude	
Soldat-Stankovic, 2022	cm	WC was measured at the midpoint between the lower border of the rib cage and the iliac crest by using a flexible centimeter tape.	BMI ≤25 mean=70.87 BMI>25 mean=92.87 Calculated combined mean=81.87	BMI ≤25 SD=7.77 BMI>25 SD=7.83 Calculated combined SD=13.56	BMI ≤25 n=15 BMI>25 n=15	BMI ≤25 mean=70.47 BMI>25 mean=89.67 Calculated combined mean=80.07	BMI ≤25 SD=7.34 BMI>25 SD=10.13 Calculated combined SD=13.07	BMI ≤25 n=15 BMI>25 n=15	Crude	NA



h. Figure 32. MI v Met Waist Circumference

OUTCOME: WHR										**OUTCOME TYPE:** Continuous
		COMPARISON (if applicable): MI v Metformin								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Angik 2017	NR	NR	0.80	0.07	50	0.76	0.06	50	Crude	NA
Tagliaferri 2017	NR	Taken during early follicular phase of spontaneous or induced (medroxyprogesterone	Median= 0.85	IQR= 0.08		Median= 0.81	IQR= 0.12		Crude	NA

		acetate 10mg/day for 7 days) menstrual cycles (day: 3±7) Waist circumference – minimum value between iliac crest and lateral costal margin; hip circumference maximum value over buttocks. Cut off point for high WHR set at 0.80.								
Nehra 2017 (12 week measurement)	Waist circumference/Hip circumfirence	Waist circumference is measured with a tape midway between the lowest rib margin and the iliac crest in standing position. The hip circumference is measured over the widest part of gluteal region.	0.78	SE 0.007/SD 0.0383		0.79	SE 0.0108/ SD 0.591		Crude	NA



i. Figure 33. MI v Met Waist Hip Ratio

OUTCOME: Body fat mass							**OUTCOME TYPE:** Continuous			
		COMPARISON (if applicable): MI vs Metformin								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Soldat-Stankovic, 2022	kg	Body composition was estimated using bioelectrical impedance analysis (inBody 370, Biospace Co. Ltd, Seoul, South Korea).	BMI ≤25 mean=14.74 BMI>25 mean=33.53	BMI ≤25 SD=4.71 BMI>25 SD=9.70	BMI ≤25 n=15 BMI>25 n=15	BMI ≤25 mean=14.99 BMI>25 mean=31.13	BMI ≤25 SD=4.66 BMI>25 SD=7.92	BMI ≤25 n=15 BMI>25 n=15	Crude	NA

OUTCOME: Menstrual regularity							**OUTCOME TYPE:** Continuous			
		COMPARISON (if applicable): MI versus Metformin								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Fruzzetti et al. 2017	days		57 ± 50		24	54 ± 40		22	Crude	NA
Ravn et al. 2022	days			IQR 36 (32;60)	16		IQR 34 (28;37)	12	Crude	NA
Raffone et al. 2010	days from the first day of the menstrual cycle	Weekly serum progesterone dosage - progesterone levels higher than 8.0 ng/ml were considered significant for spontaneous ovulation.	14.8 (± 1.8)		60	16.7 (±2.5)		60	Crude	NA

vi. MI v Placebo

OUTCOME: Testosterone (assume free?)							**OUTCOME TYPE:** Continuous			
		COMPARISON (if applicable): MI vs placebo								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Change score**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Dona 2012	Nmol/L	ECLIA	-0.35	0.24	18	-0.01	0.29	8	Crude	NA

OUTCOME: Androstenedione										**OUTCOME TYPE:** Continuous
		COMPARISON (if applicable): MI vs placebo								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Change score**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Change score**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Dona 2012	Nmol/L	Solid-phase competitive chemi-luminescent enzyme immunoassay	-3.96	2.16	18	0.28	0.39	8	Crude	NA

OUTCOME: Fasting glucose			**OUTCOME TYPE:** Continuous
		COMPARISON (if applicable): MI vs placebo	

Author, year	Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)	Method of measurement	Change score	SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group	Sample size (n within this group)	Change score	SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group	Sample size (n within this group)	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Dona 2012	Mmol/L	Enzymatically with glucose hexokinase kit	-0.14	0.31	18	0.06	0.13	8	Crude	NA

OUTCOME: Fasting insulin							**OUTCOME TYPE:** Continuous			
		COMPARISON (if applicable): MI vs placebo								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Change score**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Change score**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
