Question 2.8.

Are anti-depressants and anxiolytics effective for management and support of depression and/or anxiety or disordered eating in women with PCOS?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	2.7 Are anti-depressants and anxiolytics effective for management and support of depression and/or anxiety or disordered eating in women with PCOS?
Clinical leads (key contacts)	Anuja Dokras, Leah Brennan
Allocation ranking	Level 2 - systematic review update

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Females of any age, ethnicity or weight diagnosed with PCOS (by Rotterdam, NIH or AES). Diagnosed depression and/or anxiety, disordered eating, body image distress and/or psychosexual dysfunction using a different screening tool than that used for outcomes. Subgroups: Adolescents Ethnicity Phenotype	Anti-depressants and anxiolytics.	Placebo or psychological or other pharmacological interventions; lifestyle interventions; acupuncture.	Changes in depression and/or anxiety and/or disordered eating. Self-management indicators.	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials.	English language. Human studies
Exclusion	Females without diagnosed PCOS.	None	None	None	Non-evidence based guidelines, non-systematic reviews, any study lower than a RCT.	None

6. FINDINGS

Comparison included:

- **Comparison 1.** Sertraline versus placebo

COMPARISON 1: Sertraline versus Placebo

▪ EVIDENCE SUMMARY:

One study compared Sertraline versus placebo in women with PCOS (Masoudi et al., 2021). Relevant outcomes included depression scores using the Hamilton Depression Rating Scale. This study was judged as moderate risk of bias.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Sertraline was more effective than placebo in reducing depression scores in women with PCOS. Evidence for this outcome was of low quality due to being derived from a single small study with a moderate risk of bias.

Outcome or Subgroup	Studies	n	Time*Treatment effects	P	Favours	Certainty
Hamilton Depression Rating Scale	1	64	F (2,124) = 171.12	<0.001	Sertraline	⊕⊕◯◯ LOW

Study ID	Masoudi 2021	
Study Citation	Masoudi M, et al. Effect of sertraline on depression severity and prolactin levels in women with polycystic ovary syndrome: a placebo-controlled randomized trial. Int Clin Psychopharmacol. 2021 Sep 1;36(5):238-243.	
Study Country	Iran	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age 18-45)	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	*Not reported*	
Presence of other condition/s	*Excluded if BMI > 30 kg/m2, antidepressant use in prior 3months, pregnancy or breast-feeding, refusal or inability to provide written informed consent and presence of any comorbidity affecting the endocrine system (i.e. congenital adrenal hyperplasia, prolactinoma, pituitary adenoma or thyroid disease), anxiety disorders, and the use of any medications that increase the level of prolactin*	
Medication History	*See above*	
N per group	*Allocated/randomised:* *Sertraline (prolactin< 25 mg/dL): 19* *Sertraline (prolactin> 25 mg/dL): 18* *Placebo (prolactin< 25 mg/dL): 19* *Placebo (prolactin> 25 mg/dL): 18* *Assessed at end of study:* *Sertraline (prolactin< 25 mg/dL): 17* *Sertraline (prolactin> 25 mg/dL): 15* *Placebo (prolactin< 25 mg/dL): 17* *Placebo (prolactin> 25 mg/dL): 15*	
Setting	Outpatient gynecology clinics of Imam Khomeini and Arash hospitals [both affiliated with Tehran University of Medical Sciences]	
Intervention	*Sertraline 50mg daily*	
Comparison	*Placebo*	
Outcomes (primary and other) with definition (eg. self-reported, fasting)	Change in HDRS scores throughout the study and the safety outcome was the alteration in prolactin levels	
Follow up Duration	*6 weeks*	
Summary Result/s	*Between both groups of patients with normal and high baseline prolactin levels, those who received sertraline had a significantly lower HDRS after treatment compared to the placebo group. Among patients who received sertraline in both normal and high prolactin groups, the effect of sertraline on HDRS was independent from the baseline prolactin level.*	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial	*Yes: The aim was to determine whether sertraline would significantly change HDRS scores throughout the study period and whether this*

		No Not reported	*was independent of initial prolactin level*
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	*Yes*
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	*Yes*
Inclusion criteria		Yes Partial No Not reported	PCOS diagnosis was based on the Rotterdam 2003 criteria (Rotterdam ESHRE/ASRM-Sponsored PCOS consensus workshop group, 2004) and exclusion of other gynecologic conditions.
Exclusion criteria		Yes Partial No Not reported	Key exclusion criteria were a BMI higher than 30 kg/m2 , antidepressant use in prior 3months, pregnancy or breast-feeding, refusal or inability to provide written informed consent and presence of any comorbidity affecting the endocrine system (i.e. congenital adrenal hyperplasia, prolactinoma, pituitary adenoma or thyroid disease). Moreover, clinical suspicion of other psychological disorders – especially anxiety disorders, which might alter prolactin levels (Labad, 2019) – and the use of any medications that increase the level of prolactin led to exclusion from the study.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Did the study have an adequate method of randomisation?	Yes Partial No Not reported	*Yes* Each group was randomly assigned with a 1:1 ratio to receive sertraline or placebo identical in appearance. The randomized sequence was generated centrally by computer in permuted blocks of four.
SELECTION BIAS	Was allocation to intervention group concealed?	Yes Partial No Not reported	Enrolling physicians, outcome assessors and study participants were all blinded to the treatment regimen.
PERFORMANCE BIAS	Were patients blind to intervention group?	Yes Partial No Not reported	*Yes*
PERFORMANCE BIAS	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	*Yes*
PERFORMANCE BIAS	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	*Yes*
DEDETECTION BIAS	Were outcome assessors blind to intervention group?	Yes Partial No Not reported	*Yes*

	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Yes*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes*
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study dropped out?	X% treatment X% control/ comparison Not reported	*Prolactin <25 mg/dL:* *Sertraline = 2/19 = 10.5%* *Placebo = 2/19 = 10.5%* *Prolactin> 25mg/dL:* *Sertraline = 3/18 = 16.7%* *Placebo = 3/18 = 16.7%*
ATTRITION BIAS	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	*Yes*
REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Not reported*
CONFOUNDING	Were the groups similar at baseline with regard to key prognostic variables?	Yes Partial No Not reported	*Yes*
CONFOUNDING	If confounding was present, was it controlled for?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*Not reported*
OTHER BIAS	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Yes for the prolactin <25 ng/dL group*
OTHER BIAS	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Partial, repeated measures analysis of variance conducted for HDRS*
COMMENTS		*Lack of randomisation and blinding key reason for high RoB*	
What is the overall risk of bias?		Low Moderate High Insufficient information	*Moderate*

Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	*No-but groups differed in that power calculations suggested sample size analysed was too low for prolactin≥25 ng/dL group*

Question 2.8.

Are anti-depressants and anxiolytics effective for management and support of depression and/or anxiety or disordered eating in women with PCOS?

BACKGROUND:

Depression and anxiety are exceptionally common throughout the world with a higher prevalence in women and represent a major public health problem. Psychoeducation, cognitive behavioural therapy, and combinations of psychotherapeutic approaches are considered to be the preferred treatment options for depression and anxiety (1, 2). Lifestyle and other therapies that target PCOS features have shown improvement in psychological symptoms in PCOS (3).

The Australian Clinical Practice Guidelines for Mood Disorders (4), advises that it is useful to construct a template to capture each patients' problems using the biopsychosocial and lifestyle model (BPSL Model) and to consider the predisposing, precipitating and perpetuating factors. Considering the PCOS patient's problems in this way is particularly useful, since the biological mechanisms related to mood disorder aetiology include altered reproductive and metabolic factors that are part of PCOS. In clinically managing depression in a woman with PCOS, any obvious precipitating environmental factors need to be addressed. Interpersonal violence, recent losses, physical ill health, financial and other social stresses are prominent factors that can trigger or perpetuate depression, in an acute or more persistent manner. It is important to take a careful history from the patient and her family and friends about any manic or hypomanic episodes to delineate bipolar from unipolar mood disorders. This delineation has very important implications for optimal management, prognosis, and avoiding iatrogenic worsening of affective instability.
Following physical examination and laboratory investigations aiming to eliminate other comorbid conditions, moderate to severe Major Depressive Disorder in women with PCOS, will need antidepressant pharmacotherapy. From clinical experience, antidepressants are useful in managing depression in women with PCOS, who have moderate to severe depression. The first line of antidepressant treatment is usually with one of the following – an SSRI, 'selective serotonin reuptake inhibitor', NARI 'noradrenergic reuptake inhibitor', a NaSSA 'noradrenergic and specific serotonergic antidepressants', a NDRI 'norepinephrine – dopamine reuptake inhibitor' or a melatonin agonist. Second line treatment includes SNRIs 'serotonin and noradrenaline reuptake inhibitors', TCAs 'tricyclic antidepressants' or serotonin modulators. Third line treatment includes MAOIs 'monoamine oxidase inhibitors' and reversible MAOIs (4).

Anxiolytics, Antidepressants and the Management of Anxiety Disorders in PCOS
Anxiety disorders are common in women with PCOS. Generalised Anxiety Disorder, Social Anxiety Disorder, Panic Disorder and the phobias as described in the DSM 5, can be present in PCOS but are often in a subsyndromal manner with many having anxiety symptoms without meeting DSM 5 criteria (5). In clinical practice, many women with PCOS present feeling anxious, with intermittent exacerbation of anxiety symptoms and even panic. Psychological therapy can be very helpful in this condition.
Where medical treatment is indicated, it is more common practice to prescribe an SSRI (particularly sertraline) to treat anxiety if the preferred first line psychotherapeutic treatment options have not succeeded. Consistent with general population guidelines, off-label use of very low dose antipsychotics is also used when anxiety symptoms are very severe – but some of these medications can cause weight gain and other metabolic issues which is not ideal in PCOS (6). Benzodiazepines are only used in very limited, short term fashion in severe anxiety/panic, but are not recommended for longer term use because of the addiction issues (1, 2). In particular, anxiolytics such as alprazolam are rapidly physiologically addictive as well as psychologically addictive, and can impair cognition.

Anxiolytics, Antidepressants and the Management of Eating Disorders in Women with PCOS
Cognitive behavioural therapy is the first-line treatment for eating disorders (7). In general antidepressants are used to treat superimposed depression in women with PCOS who have eating disorders. Antidepressants are not usually indicated as specific treatment for eating disorders. Similarly, anxiolytics are not used as standard treatments for eating disorders, but may be used to treat comorbid anxiety. Eating disorders generally do not respond well to antidepressants or anxiolytic medications (7).

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Sertraline versus Placebo	⨁⨁◯◯ LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Antidepressant medications versus none

CONSENSUS RECOMMENDATION

- **CR:** Psychological therapy could be considered first-line management, and antidepressant medications considered in adults where mental health disorders are clearly documented and persistent, or if suicidal symptoms are present, based on general population guidelines.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

- Lifestyle intervention and other therapies (e.g. COCP, metformin, laser hair removal) that target PCOS features should be considered, given their potential to improve psychological symptoms.
- Where pharmacological treatment for anxiety and depression is offered in PCOS, health professionals should apply caution:
  - to avoid inappropriate treatment with antidepressants or anxiolytics.
  - to limit use of agents that exacerbate PCOS symptoms, including weight gain.
- Health professionals should be aware that not managing anxiety and depression may impact adherence to PCOS treatment / management.

GRADE CONSIDERATIONS

Justifications:
We only found one study that compared Sertraline versus placebo in women with PCOS (8). Relevant outcomes included depression scores using the Hamilton Depression Rating Scale and this study was judged as moderate risk of bias. The recommendation is based on general population guidelines for treatment of anxiety and depression.

Subgroup considerations:
We have no evidence in adolescents with PCOS.

Implementation considerations:

Health professionals need to be adequately trained in the management of common mental health disorders.

In many countries it is not usual practice to screen adolescents or adults with PCOS for depression and/or anxiety symptoms and doing so may identify affected patients who would otherwise be missed. Screening may have resource implications such as an impact on length of consultation, however this can be reduced by the use of the screening tools recommended here. If depression and/or anxiety symptoms are detected, intervention may require referral to other health practitioners. Additional time with the patient may also be required to complete an appropriate care plan. Access to appropriate information and appropriately trained and experienced health professionals is important but may be limited. It is the responsibility of all health professionals to understand the impact of PCOS on psychological health and to screen for and manage these disorders.

Feasibility - A pragmatic approach may be to screen all women and adolescents at the time of PCOS diagnosis and where appropriate, at the time of their regular physical health checks for PCOS. Use clinical judgment considering an individual woman's risk factors to inform if additional screening is warranted. Align timing and interval of screening during the antenatal and postnatal periods with regional general population guidelines.

Partner with mental health professionals to improve feasibility related to referral for further care

The life stage of a woman should also be considered when screening for mental health disorders as risk factors and life events may differ. Consider issues around culture and sexual orientation.

The cultural identity and preferred language of a woman are also important considerations. Be aware of possible variations in presentation of mental health disorders and conduct screening in a culturally sensitive manner.

Monitoring and evaluation considerations:

Follow general population guidelines for anxiety and depression for monitoring and evaluation, including tolerability to side effects (e.g. weight gain).

Research priorities:

The role of various therapies in mental health disorders in PCOS in adults and adolescents.

The etiology and pathophysiology of mental health disorders in PCOS which may inform more targeted therapy.

Examination of the impact of depression or anxiety on the process and outcome of PCOS treatment and management, and the impact of PCOS treatment and management on depression or anxiety.

Examination of the effectiveness of treatment for depression or anxiety in women with PCOS, including the impact this has on the process and outcome of PCOS treatment and management

GUIDELINE DEVELOPMENT GROUP 3

Lifestyle Management

	Clinical Questions
3.1	In women with PCOS, are lifestyle interventions (compared to minimal or nothing) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?
3.2	In women with PCOS, are behavioural interventions (compared to different types of behavioural interventions) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?
3.3	In women with PCOS, are diet interventions (compared to different diets) effective for improving anthropometric, metabolic, fertility, and emotional wellbeing outcomes?
3.4	In women with PCOS, are exercise interventions (compared to different exercises) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?
3.5	Why are women with PCOS at increased risk of weight gain?
3.6	What is the burden of weight stigma in PCOS? *CLINICAL PRACTICE POINT:* *How do we alleviate weight stigma in PCOS in and outside healthcare settings?*

GDG 3

Question 3.1.

In women with PCOS, are lifestyle interventions (compared to minimal or nothing) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?

1. SELECTION CRITERIA

Table 1. PICO Criteria for Inclusion	
Question	Q 3.1) In women with PCOS, are lifestyle interventions (compared to minimal or nothing) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life, and emotional wellbeing outcomes?
Clinical leads (key contacts)	Dr. Kathleen Hoeger M.D., M.P.H. Obstetrics and Gynecology, Reproductive Endocrinology Kathy Hoeger: Kathy_Hoeger@URMC.Rochester.edu
Allocation ranking	Level 2- Update systematic review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(Language, year)*
Inclusion	Females of reproductive age (postmenarchal and premenopausal) with PCOS (diagnosed by the NIH 1990 [1], Rotterdam 2003 [2], or AE-PCOS 2006 [3] criteria). Age ranges include (based on published Cochrane paper) Adolescents 13-18 years Young Adults 19-24 years Adults 19-44 years Middle Aged 45-64 years	Lifestyle intervention (defined as a dietary, exercise or behavioral intervention, or a combination) as further classified below: Dietary intervention versus minimal treatment. Exercise intervention (resistance or aerobic exercise) versus minimal treatment. Behavioral management techniques for modifying diet or exercise versus minimal treatment. A combination of dietary, exercise, or behavioral intervention versus minimal treatment. All study durations are over two weeks.	Usual Care	Primary outcomes *Fertility* Live birth and pregnancy, as defined by study authors Miscarriage, as defined by the study authors Secondary outcomes Reproductive Menstrual regularity (an initiation of menses or significant shortening of cycle length where possible), ovulation (number of ovulatory menstrual cycles where possible) Endocrine (total testosterone, sex hormone-binding globulin (SHBG), free androgen index (FAI), and clinical hyperandrogenism (hirsutism assessed clinically by Ferriman-Gallwey score) Anthropometric Weight, BMI, adiposity distribution (by measures including waist circumference, waist-to-hip ratio (WHR)) Metabolic Oral glucose tolerance test (OGTT), glucose Fasting glucose Fasting lipids (total cholesterol, high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C), triglycerides) Fasting insulin Oral glucose tolerance test (OGTT), insulin	For the specified outcomes, systematic reviews and RCTs addressing the outcomes are sought.	English Limit to publications between March 5, 2018, to August 10, 2022 (the earlier date was a final search date of the previous guideline update as indicated in the Cochrane review 2019, Issue 3. Art. No.: CD007506
Exclusion	Women taking anti-obesity medications (e.g., orlistat). Women with PCOS who are not defined as diagnosed by the NIH 1990[38], Rotterdam 2003[39], or AE-PCOS 2006[40] criteria.			Quality of life and participant satisfaction	Any study lower than a RCT. Non-RCT studies are excluded.

Evidence processing: Studies were selected and appraised by a total of 5 reviewers (Steph Cowan, Kimberly Hopkins, Thais Rasia, Isabella Xavier, Julia Michalak) in consultation with the evidence team/ key contact (Kathy Hoeger, Lisa Moran) using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by one reviewer. When a decision could not be made based on the title and abstract alone, the full text was retrieved. **Eighteen studies (7 RCTs retrieved in the current search, conducted after the previous guideline update in 2018) and 11 RCTs from the previous update guideline (published in the Cochrane review 2019) met the inclusion criteria for this review (see Table 4.1).**

*Note that four studies (Mani 2018, Mirfeizi 2013, Saremi 2016, Vizza 2016) out of a total of 15 RCTs initially identified in the Cochrane review were excluded from this review because their PCOS definition was unclear and therefore lacked compliance with the updated PICO of this GDG.

Statistical analyses (Description of meta-analysis)

Effect sizes for each outcome measure were expressed as the weighted mean difference (MD) and 95% confidence interval (CI) between the intervention and control (minimal treatment) groups, and the studies were weighted based on the inverse of the variance for the evaluated measure with a random-effects model.

Mean differences and standard deviations (SD) of lean tissue mass measures were collected to estimate pooled effects across evaluated measures except indicated explicitly for each outcome (e.g., for weight, BMI and waist circumference, mean change instead of post-intervention data were used for Moeller 2021, Oberg 2018, and Stener-Victorin 2009-2013. Consistent with the methodology used in the previous update of this GDG. [Cochrane review 2019, Issue 3. Art. No.: CD007506]). When medians and interquartile ranges were reported instead of means and SD, we used medians in place of means and the formula of SD=(third quartile-first quartile)/1.35 to calculate the SD.

The chi-square test was used to evaluate heterogeneity, and the Cochran Q and I^2 statistics were reported. The I^2 value describing the percentage variation between studies was calculated as 100%×([Q–df])/Q, Q being the χ2 value, and df corresponding to degrees of freedom. Low, moderate, and high heterogeneity were defined according to the cut-offs of 25%, 50%, and 75%, respectively, using the I^2 test values. Tau-square was estimated using the restricted maximum likelihood (REML) method to evaluate between-study variance. Maryam Kazemi performed all analyses using R version 3.6.1. (R Foundation for Statistical Computing, Vienna, Austria). Results were considered significant at $P<0.05$.

5. STUDY CHARACTERISTICS FOR INCLUDED STUDIES

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Almenning et al. 2015 Norway	Women with PCOS; Medical Center	Parallel RCT	Intervention (high intensity interval training = 10 and strength training =11) Control = 10	3 weekly exercise sessions for 10 weeks with normal diet (high intensity interval training did high interval training, strength training did strength training)	Maintain normal diet and physical activity	10 weeks	testosterone, SHBG, FAI, total cholesterol, HDL-C, LDL-C, triglycerides, glucose, insulin, weight, BMI, waist circumference	High-intensity interval training for ten weeks improved insulin resistance, without weight loss, in women with polycystic ovary syndrome. Body composition improved significantly after both strength training and high-intensity interval training. This pilot study indicates that exercise training can improve the cardiometabolic profile in polycystic ovary syndrome without weight loss.	Not Applicable
Brown et al. 2009 USA	Women with PCOS aged 18 to 50; Medical Center	Parallel RCT	Intervention = 21 Control = 16	8-12 week ramp up followed by 12-week moderate intensity exercise	no change in lifestyle	12 weeks for control, 20-24 weeks for intervention	Bioavailable testosterone, Ferriman-Gallwey score, OGTT glucose, lipid profile, fasting glucose and insulin, OGTT insulin, weight, BMI, waist/hip ratio	Moderate-intensity exercise without significant weight loss improved several components of the lipoprotein profiles of women with PCOS.	Not Applicable
Costa et al. 2018, Brazil	Women with PCOS; Medical Center	Parallel RCT	Intervention =14 Control=13	16-weeklong supervised aerobic training three times per week	No exercise intervention	16 weeks	Health-related quality of life, cardiorespiratory fitness, cardiometabolic profile, and affective response	The exercise intervention was more effective in improving cardiometabolic profiles, anthropometry (body mass, waist circumference), cardiorespiratory fitness, and affective response versus the control.	Not Applicable
Dietz de Loos et al. 2022, Netherlands	Women with PCOS and BMI >25 kg/m^2; Outpatient clinic	Parallel RCT	Intervention (three-component lifestyle intervention with or without short message service [SMS]- = 27 SMS+) = 16	Lifestyle intervention (cognitive behavioral therapy, diet, exercise) with and without short message service	Care as usual (CAU)	1 year	Metabolic Syndrome prevalence, metabolic parameters, weight changes	Lifestyle intervention improved metabolic parameters and decreased weight and MetS prevalence vs control.	Not Applicable

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
			Control = 24						
Guzick et al. 1994 USA	Women with PCOS aged 20 to 40 years and Obese; Medical Center	Parallel RCT	Intervention = 6 Control = 6	12-week behavioral weight control program	No treatment	12 weeks	Total testosterone, SHBG, non-SHBG testosterone, height, weight, body fat distribution, fasting glucose, insulin	Weight loss in obese, hyperandrogenic, anovulatory women appears to reduce insulin and non-SHBG T concentrations despite the absence of a change in gonadotropin secretion and may lead to the resumption of ovulation.	Not Applicable
Hoeger et al. 2004 USA	Women with PCOS and BMI > 25 kg/m^2; Research Center	Parallel RCT	Intervention = 11 Control = 9	Lifestyle intervention with placebo (individualized meal plan and exercise plan)	No lifestyle intervention	48 weeks	Morning urinary pregnanediol glucuronide, menstrual diaries, testosterone, SHBG, FAI, F-G score, height, weight, BMI, waist/hip circumference, OGTT glucose, lipid profile, OGTT insulin	Key methodologic issues for a large-scale, randomized trial of lifestyle intervention in PCOS include minimizing early dropout from the lifestyle intervention and including a range of body mass index that is not skewed toward severe obesity. Weight reduction might play the most significant role in the restoration of ovulation in obese women with PCOS.	Not Applicable
Hoeger et al. 2008 USA	Women with PCOS ages 12 to 18 and obese; Research Center	Parallel RCT	Intervention: 11 Control = 11	Lifestyle intervention (training classes on diet, exercise, and behavior modification skills)	Standard office advice on nutrition and exercise	24 weeks	Urine pregnanediol, menstrual cycle average per 24 weeks, total and free testosterone, SHBG, FAI, hirsutism, OGTT glucose, lipid profile, OGTT insulin, BMI, waist circumference	Both lifestyle modification and oral contraceptives significantly reduce androgens and increase SHBG in obese adolescents with PCOS. Metformin, in combination with lifestyle modification and oral contraceptives, reduces central adiposity, reduces total testosterone, and increases HDL, but does not enhance overall weight reduction.	Not Applicable
Jedel et al. 2011 (Stener-Victorian 2009-2013) Sweden	Women with PCOS age 18 to 30; Academic Medical Center	Parallel RCT	Intervention = 34 Control = 17	Weight maintenance, moderate exercise	No exercise	16 weeks	Menstrual pattern, total testosterone, SHBG, free testosterone, FAI, F-G score, lipid profile, fasting glucose and insulin, height, weight, BMI, sagittal abdominal	Physical exercise lowered high sympathetic nerve activity, and menstrual frequency decreased the levels of several sex steroids and improved HRQoL in women with PCOS versus no intervention.	Not Applicable

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
							diameter, WHR, quality of life		
Kiel et al. 2021 Norway and Australia	Women with PCOS; Academic Medical Center	Parallel RCT	Interventions (low-intensity interval training [LV]-; high-intensity interval training [HIT] = 21 HV-HIT = 20) Control = 23	16-week low-volume HIT workout, or 16-week high-volume HIT workout followed by 36-week home-based HIT	Nonexercising	12 months	Menstrual frequency (primary), markers of cardiometabolic and reproductive health, quality of life, adherence to and enjoyment of HIT	A semi-supervised HIT intervention did not increase the menstrual frequency in women with PCOS. No between-group differences in menstrual frequency, but within-group change in each group was observed; HIT has the clinical benefit on both pregnancy rate and QoL in PCOS women	Not Applicable
Kogurea et al. 2020 Brazil	Women with PCOS; Academic Medical Center	Parallel RCT	Interventions (continuous aerobic training = 37 intermittent aerobic training = 35) Control = 38	16 weeks of continuous aerobic training or 16 weeks of intermittent aerobic training	Non-training	Not Applicable	testosterone, FAI, SHBG, height, weight, hip circumference, waist circumference, WHR, actual BMI, BSQ, FSFI, FRS, HADS	Only the continuous aerobic training group had improved the core for a cognitive-affective dimension of body image. However, both the continuous aerobic training and the intermittent aerobic training groups had lower depression, anxiety, and sexual function scores after the intervention.	Not Applicable
Moeller et al., 2018 Denmark	Women with PCOS; Academic Medical Center	Parallel RCT	Intervention (motivational interviews) = 19 Control = 18	Motivational interviews were conducted once every 2 weeks (12 total times)	Standard care (no extra appointments, patients seen initially and at follow up only)	6 months	Weight, hip and waist circumference, WHO-5, MDI, Sf-36, PCOS-Q, BMI	Motivational interviews had no effect on weight loss or QoL versus control.	Not Applicable
Nasrekani et al. 2016 Iran	Women with PCOS; Medical Center	Parallel RCT	Intervention = 10 Control = 10	3 days/week of aerobic training	No intervention	12 weeks	Weight, BMI	The intervention group had reduced weight and increased Vo2max compared to controls.	Not Applicable

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
Oberg et al., 2018, Sweden	Women with PCOS who were overweight/obese (BMI ≥ 27 kg/m^2)/ Teaching hospital	Parallel RCT	Intervention = 30 Control = 27	Group meetings 3 per month where they were counseled on weight control, personal leadership, mindfulness, physical activity and diet. Meetings incorporated goal setting, stimulus control, problem-solving and stress management techniques to aid in behavioral change. One-on-one coaching sessions 1 per month to discuss individual training regimens and diet changes	General healthy lifestyle rec-commendations given by a midwife and supported by a pamphlet with written advice about diet and exercise	Intervention and control groups occurred in parallel for 4 months; however, after 4 months, the control group undertook the intervention (again for 4 months) and the entire study sample was followed up at 12 months	Weight, BMI, fat mass, lean body mass, testosterone, SHBG, FAI, menstrual function	A significantly higher proportion of patients in the intervention the group improved their menstrual function compared to the control. Logistic regression analysis showed that receiving the 4-month intervention was the only significant predictor of improved menstrual function. The interventions significantly increased endometrial thickness and decreased levels of DHEA compared to the control.	Not Applicable
Ribeiro, 2019 and 2021 and 2021, Brazil (2 publications reporting on the same study)	Women with PCOS; Academic Medical Center	Parallel RCT	Interventions (Continuous aerobic training = 28 Intermittent aerobic training = 29) Control = 30	Both continuous and intermittent aerobic training on 3 days per week for 40-60 minutes with a 5-minute warm-up and 5 minutes cool down between 50%-60% of the maximum heart rate For specific protocols of continuous and intermittent training sessions (which varied	No training	4 months	WC, HC, WHR, fat mass, lean body mass, weight, BMI, testosterone, QoL, SHBG, fasting insulin, fasting glucose, HDL-C, TC, TG, LDL-C, FAI	Both exercises reduced obesity indices, hyperandrogenism, and quality of life in PCOS women without changes in telomere length or inflammatory biomarkers versus controls.	Not Applicable

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
				each week) see Table 1 of the published manuscript					
Saremi et al., 2013 Iran	Women with PCOS; Medical Center	Parallel RCT	Intervention = 11 Control = 11	Aerobic training 3 days/week for 40-60 min each	Asked not to do more physical activity then they used to	8 weeks	Total testosterone, HDL-C, LDL-C, triglycerides, fasting glucose, fasting insulin, weight, BMI, waist circumference, WHR	No summary report is available.	Not Applicable
Stefanaki et al., 2015 Greece	Women with PCOS aged 15 to 40; Academic Medical Center	Parallel RCT	Intervention = 23 Control = 23	8-week mindfulness stress management program	No intervention	8 weeks	BMI, QoL	Post-intervention, between-group results revealed statistically significant reductions in stress, depressive and anxiety symptoms, as well as in salivary cortisol concentrations, along with an increase in Life Satisfaction and Quality of Life scores in the intervention group only. There was no significant "placebo" effect on the outcome measures. Mindfulness techniques seem promising in ameliorating stress, anxiety, depression, and the quality of life in women with PCOS versus controls.	Not Applicable
Turan et al. 2015 Turkey	Women with PCOS and BMI < 25 kg/m^2; Academic Medical Center	Parallel RCT	Intervention = 16 Control = 16	Structured exercise programs 3 times/week (aerobic and resistance exercise)	General dietary and behavioral advice	8 weeks	Menstrual cycle, total testosterone, free testosterone, total cholesterol, HDL-C, LDL-C, triglycerides, fasting glucose, fasting insulin, BMI, waist circumference	Short-term regular exercise programs can improve the anthropometric, cardiovascular, and metabolic parameters of non-overweight women with PCOS versus controls.	Not Applicable
Vigorito et el. 2007 Italy	Women with PCOS and overweight;	Parallel RCT	Intervention = 45 Control = 45	Structured supervised training sessions 3 times/week	No training program	12 weeks	Menses diary, testosterone, SHBG, FAI, Ferriman-Gallwey	A 3-month structured exercise training program improves cardiopulmonary	Not Applicable

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other [add as needed]
	Academic Medical Center						score, height, weight, BMI, waist circumference, WHR, OGTT glucose, lipid profile, fasting glucose and insulin, OGTT insulin	functional capacity in women with PCOS versus controls.	

Abbreviations: RCT: randomized control trial, CAU: care as usual, SMS+: with short message service, SMS-: without short message service, BMI: body mass index, PCOS: polycystic ovary syndrome, WHR: waist-to-hip ratio, WC: waist circumference, HC: hip circumference, mFG, F-G score: Ferriman-Galleway Score, LV-HIT: low volume-high intensity training, HV-HIT: high volume-high intensity training, HIT: high intensity training, QoL: quality of life, CAT: continuous aerobic training, IAT: intermittent aerobic training, FAI: free androgen index, SHBG: sex hormone binding globulin, BSQ: body shape questionnaire, FSFI: female sexual function index, FRS: Figure Rating Scale, HADS: hospital anxiety and depression scale, MI: motivational interview, WHO-5: world health organization 5 wellbeing index, MDI: major depression inventory, SF-36: short-form-36, PCOSQ: polycystic ovary syndrome questionnaire; 17-OHP, 17-Hydroxyprogesterone; AMH, anti-mullerian hormone; BMI, body mass index; CRP, c-reactive protein; DBP, diastolic blood pressure; DHEA, dehydroepiandrosterone; DHT, dihydrotestosterone; FAI, free androgen index; FSH, follicle stimulating hormone; HC, hip circumference; HOMA, homeostatic model assessment; HDL-C, high density lipoprotein cholesterol; LDL-C, low density lipoprotein cholesterol; LH, luteinizing hormone; PCOS, polycystic ovary syndrome; QoL, quality of life; RCT, randomised controlled trial; SBP, systolic blood pressure; SHBG, sex hormone-binding globulin; TC, total cholesterol; TG, triglycerides; TSH, thyroid stimulating hormone; WC, waist circumference; WHR, waist-hip-ratio.

6. FINDINGS

COMPARISON 1: LIFESTYLE vs MINIMAL/ NO TREATMENT

- **EVIDENCE SUMMARY:**

We included 18 RCTs (23 publications) with 634 participants. One study assessed fertility as the primary outcome of pregnancy rate. One study reported the secondary reproductive outcome of ovulation rate and two as menstrual regularity.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Lifestyle treatment improved anthropometric outcomes, including WC (N=12 effect estimates; N=423 women; MD: -1.32; 95%CI [-2.46; -0.18] cm; P=0.0271; I^2=5%); WHR (N=6 effect estimates; N=288; MD: -0.03; 95%CI [-0.05; -0.01]; P=0.0257; I^2=0%), secondary endocrine and reproductive outcomes, including Ferriman-Gallwey score (N=6 effect estimates; N=230 women; MD: -0.97; 95%CI [-1.90; -0.03]; P=0.0448; I^2=0%); fasting insulin (N=14 effect estimates; N=467; MD: -1.87; 95%CI [-3.10; -0.65] pmol/L; P=0.0056; I^2=3%); total cholesterol (N=12 effect estimates; N=427; MD: -0.15; 95%CI [-0.26; -0.03] mmol/L; P=0.0161; I^2=0%) and LDL-C (N=12 effect estimates; N=387 women; MD: -0.15; 95%CI [-0.28; -0.02] mmol/L; P=0.0256; I^2=0) levels vs. minimal treatment. Groups exhibited comparable outcomes in other measures, including body weight, BMI, SHBG, total testosterone, FAI, glucose regulation (fasting and 2-hour postprandial glucose levels), HDL-C, and TG levels (all P≥0.05). Studies had a serious risk of bias across reported outcomes and were mainly of moderate (N=6 outcome: BMI, WC, HDL-C, LDL-C, TG), low (N=7 outcomes: weight, WHR, Ferriman-Gallwey score, SHBG, 2-hour area under the curve for OGTT, insulin, total cholesterol) while N=2 had a very low quality in reporting testosterone and FAI outcomes.

Lifestyle intervention may improve the WC, WHR, Ferriman-Gallwey score, fasting insulin, total cholesterol, and LDL-C levels in women with PCOS vs minimal treatment. We are uncertain of the effect of lifestyle intervention on other measures evaluated. Few studies looked at the impact of lifestyle intervention on pregnancy, ovulation rate, or menstrual cyclicity, and no study evaluated miscarriage to the best of our knowledge. Most studies in this review were of low quality, mainly due to a high risk of bias across most domains or high heterogeneity (>50%) for the testosterone and FAI outcomes.

7. GRADE ASSESSMENTS AND EVIDENCE PROFILE

COMPARISON: Lifestyle treatment v minimal treatment (control)												
	Quality assessment						No. participants					
No. studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other	Intervention	Control	Effect, random [95% CI]	Favours	Certainty	Importance

Abbreviations: CAT: continuous aerobic training, IAT: intermittent aerobic training, PCOSQ: polycystic ovary syndrome questionnaire, FRS: Figure Rating Scale, BSQ: body shape questionnaire, FSFI: female sexual function index, HADS: hospital anxiety and depression scale, WHO-5: world health organization 5 wellbeing index, MDI: major depression inventory, SF-36: short-form-36.										

Meta-analyses outcomes: Meta-analyses were not conducted due to insufficient (n<3) RCTs reporting this outcome.

APPENDIX. STUDY CHARACTERISTICS AND QUALITY APPRAISAL

For clarity: N=7 RCTs (8 publications) retrieved in the updated search (after 2018 Guideline: search date March 5, 2018, to August 10, 2022) are shown in the green highlights below) and N=11 RCTs (15 publications) included in the Cochrane review are highlighted in grey below. Studies are sorted alphabetically.

Study ID	Almenning 2015
Study Citation	Almenning I, Rieber-Mohn A, Lundgren KM, Shetelig Løvvik T, Garnæs KK, Moholdt T. EIects of high intensity interval training and strength training on metabolic, cardiovascular and hormonal outcomes in women with polycystic ovary syndrome: a pilot study. PloS One 2015;10(9):e0138793.
Study Country	Norway
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (age not reported)
PCOS diagnostic criteria	ESHRE/ASRM
Presence of infertility	Not Reported
Presence of other condition/s	Not Reported
Medication History	No
N per group	HIT (high intensity interval training), n= 10; ST (strength training), n= 11; control, n= 10
Setting	Not Reported
Intervention	HIT: "two weekly sessions of four x 4 minute HIT at 90-95% of individual heart rate maximum separated by three minutes of moderate-intensity exercise at 70% of HR, and one weekly session of ten x 1 minute with maximal intensity HIT, separated by one minute of rest/ very low activity." ST: "eight dynamic strength drills with a resistance of 75% of one repetition maximum, with 10 reps and three sets separated by one-minute rest between sets. The load was progressively increased once the participant could successfully perform three sets of ten reps."
Comparison	Maintain a normal diet and physical activity
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Testosterone, SHBG, FAI, total cholesterol, HDL-C, LDL-C, triglycerides, glucose, insulin, weight, BMI, waist circumference
Follow up Duration	10 weeks
Summary Result/s	High-intensity interval training for ten weeks improved insulin resistance, without weight loss, in women with polycystic ovary syndrome. Body composition improved significantly after both strength training and high-intensity interval training. This pilot study indicates that exercise training can improve the cardiometabolic profile in polycystic ovary syndrome in the absence of weight loss.

Study ID	Almenning 2015	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Not Reported
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	PCOS was defined according to the ESHRE/ASRM criteria: A minimum of two of the following: PCO morphology (12 or more 2-9mm follicle or >10mL in volume, in at least one ovary)". Hyperandrogenism (either clinical signs of hirsutism (Ferriman Gallwey score ≥8) or acne or biochemical (testosterone >3.0nmol/L, calculated free testosterone >32nmmol/L, SHBG 5%). Oligomenorrhea (intermenstrual interval >35 days and androgenism. If they fulfilled only one of these criteria, a vaginal ultrasound was done to confirm the diagnosis before study entry
Exclusion criteria	Yes Partial No Not reported	Regular high-intensity endurance or strength training (defined as > 2 sessions of vigorous exercise per week), physical ailments/injuries that limited exercise performance, ongoing pregnancy, concurrent treatments (insulin sensitizers as metformin and pioglitazone) or drugs known to affect gonadotropin or ovulation, with a wash out period of one month prior to inclusion. The exception was regular use of oral contraceptives, and women were included if they did not change the type or dose > 1 month prior to the study or during the intervention period.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

Study ID		Almenning 2015	
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes Computer random number generator developed and administered at Unit for Applied Clinical Research at the University to randomise the subjects, Baseline testing was done before randomization.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	No
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	No
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	No
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	HIT 2/10 = 20% ST 3/11 = 27.27% Control 1/10 = 10%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Not reported

Study ID		Almenning 2015	
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes
	If confounding was present, was it controlled for?	Yes Partial No Not reported	NR
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not Reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes (stated there was a power calculation)
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Not Reported
COMMENTS		Lack of randomization and a blinding key reason for high RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	High (no blinding for participant reported outcomes and clinician reported outcomes)
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Brown 2009	
Study Citation	Brown AJ, Setji TL, Sanders LL, Lowry KP, Otvos JD, Kraus WE, et al. EIects of exercise on lipoprotein particles in women with polycystic ovary syndrome. Medicine and Sciences in Sports and Exercise 2009;41(3):497-504.	
Study Country	USA	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age 18-50)	
PCOS diagnostic criteria	8 or fewer menses per year and clinical or biochemical hyperandrogenism (hirsutism: Ferriman-Gallwey < 8 or bioavailable testosterone > 8.4 ng/dL, 2 SD above laboratory mean)	
Presence of infertility	Not Reported	
Presence of other condition/s	No	
Medication History	No	
N per group	Intervention, n= 21; control, n= 16	
Setting	Duke University Medical Centre	
Intervention	active weight maintenance encouraged, 8- to 12-week ramp-up followed by a 12-week moderate-intensity exercise program (16 to 24 weeks total, average 228 minutes/week at 40% to 60% peak VO2)	
Comparison	no change in lifestyle	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	bioavailable testosterone (Mayo Lab), Ferriman-Gallwey score (clinician assessed), OGTT glucose, lipid profile (total cholesterol, HDL-C, LDL-C, triglycerides by conventional spectrophotometric assays), fasting glucose and insulin, OGTT insulin, weight, BMI, waist/hip circumference	
Follow up Duration	24 weeks for intervention, 12 weeks for control	
Summary Result/s	Not Reported	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Moderate-intensity exercise without significant weight loss improved several components of the lipoprotein profiles of women with PCOS.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes

Study ID		Brown 2009	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	PCOS, age 18 to 50 years, sedentary lifestyle (no regular exercise during the usual week), ability to come to study exercise facility for monitored exercise, agreement to maintain current weight/dietary patterns for study
Exclusion criteria		Yes Partial No Not reported	menopause, current/planned pregnancy, recent breastfeeding, congenital adrenal hyperplasia, uncontrolled thyroid disease, hyperprolactinemia, or fasting hyperglycemia (> 6.9 mmol/L), unresolved medical conditions, history of malignancy other than non-melanoma skin cancer in the past 5 years, study participation in past 30 days
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes Randomization was accomplished by generating a random sequence of two variables (for instance, As and Bs, representing the two treatment groups)
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	No
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	No
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	No

Study ID		Brown 2009	
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not Reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	No
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not Reported
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Intervention 13/21 = 61.9% Control 4/16 = 25%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Not Reported
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	No
CONFOUN	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Partial (intervention group significantly older)

Study ID		Brown 2009	
D I N G	**If confounding was present, was it controlled for?**	Yes Partial No Not reported	Not Reported
O T H E R B I A S	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not Reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes (stated there was a power calculation)
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Not Reported
COMMENTS		Lack of randomisation and blinding key reason for high RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	Insufficient information (low participant reported outcome bias but the unclear risk for clinician-reported outcome bias)
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Costa 2018	
Study Citation	Costa et al., Med. Sci. Sports Exerc. 50: 1357-1366, 2018	
Study Country	Brazil	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age 18 to 34 yr)	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s	Obese (39.9 kg/m^2≥BMI≥25 kg/m^2)	
Medication History	Excluded if the patient uses medications (including over-the-counter preparation)	
N per group	Randomized: 30 (15 exercise; 15 control) Assessed at the end of study: 27 (13 exercise; 14 control)	
Setting	University Hospital, Federal University of Rio Grande do Norte, Natal/RN, Brazil	
Intervention	Supervise aerobic exercise training three times per week for 16 weeks	
Comparison	No exercise intervention	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Changes in body mass, waist circumference, cardiometabolic profile (HDL, LDL, TG, FG, PG, OGTT, insulin, IR), inflammatory markers (Il-6, TFN-alpha, CRP), blood pressure (systolic, diastolic, mean), and cardiorespiratory fitness (VO2 peak).	
Follow up Duration	16 weeks	
Summary Result/s	In the exercise group, patients improved their cardiometabolic profiles, reduced BMI, WC, resting SBP, DBP, MBP and TC. Patients also increased their VO2peak values. There were no changes in the markers of inflammation in the exercise group. In the control group, there were an increase in TNF-alpha. Exercise intervention was more effective in improving cardiometabolic profiles, anthropometry (body mass, waist circumference) cardiorespiratory fitness, and affective response versus the control.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	The aim was to determine whether a supervised 16-weeks long aerobic exercise intervention would have different effects on body weight, circulating hormones, markers of inflammation, lipid profiles, and cardiorespiratory fitness.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes

Study ID		Costa 2018	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Rotterdam criteria: The diagnosis of PCOS included at least two of the three features: i. oligo-ovulation or anovulation, ii. clinical (hirsutism and acne) or biochemical hyperandrogenism, iii. ovarian morphology on ultrasound, Overweight and obese: BMI between 25 and 39.9 kg/m^2
Exclusion criteria		Yes Partial No Not reported	Women who participated in an exercise training program in the last three months and performed 150min/week or more exercise were excluded. None of the women had renal or hepatic dysfunction, used medications (including over-the-counter) known to impact anxiety, depression, reproductive, cardiovascular, or metabolic function within 90 days of the study.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Randomization was computer generated (randomization.com)
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	No
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Not reported
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes

Study ID		Costa 2018	
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Women in aerobic training 1/15=6.67% Women without exercise intervention 2/15=13.33%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes
CONFOUN	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes

Study ID		Costa 2018	
DING	**If confounding was present, was it controlled for?**	Yes Partial No Not reported	Not reported
OTHERBIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS		Five participants were considered sample of convenience who could not engage in aerobic training since located in remote location and allocated into control group	
What is the overall risk of bias?		Low Moderate High Insufficient information	High
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		Yes	

Study ID	Dietz de Loos 2022	
Study Citation	Dietz de Loos et al., European *Journal of Endocrinology* 186: 53–64 2022	
Study Country	Netherlands	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age: 18 to 38 years)	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s	BMI (>25 kg/m2)	
Medication History	No	
N per group	Allocated/randomised: 183 (60 SMS+; 63 SMS-; 60 CAU) Assessed at the end of study: 67 (16 SMS+; 27 SMS-; 24 CAU)	
Setting	Outpatient clinic within the division of reproductive endocrinology and infertility at Erasmus MC, Netherlands	
Intervention	Three-component lifestyle intervention (LSI) with short message service support (SMS+ or SMS-)	
Comparison	Care as usual	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Changes in body weight (BMI), metabolic parameters (HOMA-IR, SBP, DBP, glucose, insulin, cholesterol, HDL, LDL, TG), and Metabolic Syndrome (prevalence, cMetS z-score)	
Follow up Duration	One year	
Summary Result/s	Lifestyle intervention improved metabolic parameters and decreased weight and MetS prevalence versus control.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	The aim was to determine whether a lifestyle intervention with and without SMS support would have different effects on MetS prevalence, metabolic parameters, and weight loss.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes

Study ID		Dietz de Loos 2022	
Inclusion criteria		Yes Partial No Not reported	The diagnosis of PCOS was achieved if at least of the following features were present: ovulatory dysfunction (cycle interval length > 35 or < 21 days), clinical (modified Ferriman Gallwey score ≥ 5), and/or biochemical (testosterone measured with RIA: free androgen index (FAI) cut off > 4.5 and/or total testosterone > 3.0, testosterone measured with liquid chromatography-tandem mass spectrometry (LC-MS/MS): FAI cut off > 2.9 and/or total testosterone > 2.0 nmol/L) hyperandrogenism and polycystic ovarian morphology (PCOM; ≥12 follicles (measuring 2–9 mm in diameter) and/or ovarian volume > 10 cm^3 in at least one ovary using an ultrasound machine with a transvaginal probe of less than 8 MHz).
Exclusion criteria		Yes Partial No Not reported	Patients who lacked proficient use of Dutch language were excluded. Also, patients who have severe mental illness, adrenal diseases or ovarian tumours, other causes of androgen excess or malformations of internal genitalia were excluded. Using endocrine screening, women with secondary endocrine, drug-relate, and genetic causes of secondary obesity were also excluded. If the patient became pregnant during the study, they were excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes, women were randomly assigned using a computer-generated random numbers table.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported
PERFORMANCE	**Were patients blind to intervention group?**	Yes Partial No Not reported	No
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Not reported

Study ID		Dietz de Loos 2022	
BIAS	**Aside from the experimental intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Treatment SMS+ = 44/60 = 73.3% SMS- = 36/63 = 57.1% CAU 36/60 = 60%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported
CONFOUN	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes

Study ID		Dietz de Loos 2022	
FUNDING	**If confounding was present, was it controlled for?**	Yes Partial No Not reported	Not reported
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	J. L.reports grants from Ansh Labs, Webster, Tx, USA, grants from Ferring, Hoofddorp, NL, grants from Dutch Heart Association, Utrecht, NL, grants from Zon MW, Amsterdam, NL, grants from Astellas, Tokyo, Japan, grants from Roche Diagnostics, Basel, Switzerland, personal fees from Ferring, Hoofddorp, NL, personal fees from Titus Healthcare, Hoofddorp, NL and is an unpaid board member and president-elect of the AE-PCOS Society, outside the submitted work.
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Insufficient information
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		Not Applicable	

Study ID	Guzick 1994	
Study Citation	Guzick DS, Wing R, Smith D, Berga SL, Winters SJ. Endocrine consequences of weight loss in obese, hyperandrogenic, anovulatory women. Fertility and Sterility 1994;61(4):598-604.	
Study Country	USA	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age 20-40)	
PCOS diagnostic criteria	Anovulation or oligo-ovulation (< 4 bleeding episodes in previous 12 months, anovulation confirmed by weekly progesterone levels and only anovulatory women used) and negative pregnancy test, hyperandrogenism (testosterone > 2.43 mmol/L)	
Presence of infertility	Not Reported	
Presence of other condition/s	No	
Medication History	Not Reported	
N per group	Intervention, n= 6; control, n= 6	
Setting	University Research Centre, University of Pittsburgh School of Medicine	
Intervention	weight loss, 12-week behavioral weight control program comprising 8 weeks of very low-calorie diet (Optifast, additional meals and multivitamin supplement), then reintroduction of foods and gradual increase in energy intake until 4200 to 5040 kJ/day reached. Behavior modification training around eating behaviors, increasing energy expenditure (1050 kJ/week extra to 4200 kJ/week extra, 2 miles, 5x week	
Comparison	no treatment or study visits, 12-week waiting interval	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Ovulation, total testosterone, SHBG, non-SHBG testosterone (based on separation of SHBG-bound titrated from unbound and albumin-bound testosterone by ammonium sulfate precipitation, height, weight, body fat distribution (WHR), fasting glucose, insulin	
Follow up Duration	12 weeks	
Summary Result/s	Weight loss in obese, hyperandrogenic, anovulatory women appears to reduce insulin and non-SHBG T concentrations despite the absence of a change in gonadotropin secretion and may lead to resumption of ovulation.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Not Reported

Study ID		Guzick 1994	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	PCOS, age 20 to 40 years, obese (between 130% and 200% of ideal body weight according to 1983 Metropolitan Height and Weight Tables for women), negative pregnancy test
Exclusion criteria		Yes Partial No Not reported	medical conditions that would compromise the safety of a very low-calorie diet, including chronic renal failure, cardiovascular or cerebrovascular disease, liver disease, cancer or psychosis, exclusion of specific causes of hyperandrogenism (tumour of the adrenal gland, congenital adrenal hyperplasia, Cushing's syndrome, acromegaly, hyperprolactinemia, drug-induced hyperandrogenism)
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?

COMMENTS		Lack of randomisation and blinding key reason for high RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	Insufficient information (low risk for participant-reported outcome bias but unclear risk for clinician-reported outcome bias and objective outcomes)
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Hoeger 2004	
Study Citation	Hoeger KM, Kochman L, Wixom N, Craig K, Miller RK, Guzick DS. A randomized, 48-week, placebo-controlled trial of intensive lifestyle modification and/or metformin therapy in overweight women with polycystic ovary syndrome: a pilot study. Fertility and Sterility 2004;82(2):421-9.	
Study Country	USA	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age not reported, BMI > 25 kg)	
PCOS diagnostic criteria	fewer than 6 menses/year, hyperandrogenism (serum total testosterone > 50 ng/dL, no hirsutism by Ferriman-Gallwey)	
Presence of infertility	Not Reported	
Presence of other condition/s	Not Reported	
Medication History	Not Reported	
N per group	Intervention, n=11; control, n= 9	
Setting	General Clinical Research Centre, University of Rochester	
Intervention	weight loss, lifestyle intervention with placebo defined as aim 7% to 10% weight loss, registered dietitian/exercise physiologists, individualized meal plan with 500 to 1000 calorie deficit/ day (50% carbohydrate, 25% protein, 25% fat, low GI foods, individualized exercise plan 150 minutes/week). Group meetings and progress monitoring weekly for 0 to 24 weeks, biweekly for 25 to 48 weeks	
Comparison	no lifestyle intervention and placebo (no dietary or exercise instruction)	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weekly morning urinary pregnanediol glucuronide (if elevation in urinary pregnanediol glucuronide noted preceding menstrual flow counted as an ovulatory event, consecutive weekly elevated levels were counted as a single ovulatory event), menstrual diaries, testosterone, SHBG, FAI, F-G score (clinician assessed), height, weight (kg), BMI, waist/hip circumference, OGTT 0, 30, 60, 120, 180 minutes glucose (AUC calculated trapezoidally), lipid profile (total cholesterol, HDL-C, LDL-C, triglycerides), OGTT 0, 30, 60, 120, 180 minutes insulin (AUC calculated trapezoidally)	
Follow up Duration	48 weeks	
Summary Result/s	Key methodologic issues for a large-scale, randomized trial of lifestyle intervention in PCOS include minimizing early dropout from the lifestyle intervention and including a range of body mass index that is not skewed toward severe obesity. Weight reduction might play the most significant role in the restoration of ovulation in obese women with PCOS.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Not Reported

Study ID		Hoeger 2004	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	overweight (BMI > 25 kg/m^2), PCOS
Exclusion criteria		Yes Partial No Not reported	pregnancy (hCG performed at each visit), DM2 (known or elevated fasting glucose), abnormal liver and kidney function, use of antihypertensives or statin therapy, exclusion of other reproductive disorders (Cushing's syndrome, hyperprolactinemia, thyroid disease, androgen-secreting tumors, adrenal disease
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes The randomization schedule was computer generated in blocks by an independent pharmacy representative.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Yes
PERFORMANCE	**Were patients blind to intervention group?**	Yes Partial No Not reported	No
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	No

Study ID		Hoeger 2004	
BIAS	**Aside from the experimental intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Yes
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Not Reported
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Not Reported
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Intervention 5/11= 45.45% Control 2/9 = 22.2%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Not Reported
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not Reported
CONFOUN	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes

Study ID		Hoeger 2004	
DING	**If confounding was present, was it controlled for?**	Yes Partial No Not reported	Not Reported
OTHERBIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not Reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	No (stated there was no power calculation)
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Not Reported
COMMENTS		Lack of randomisation and blinding key reason for high RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	Low
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Hoeger 2008
Study Citation	Hoeger K, Davidson K, Kochman L, Cherry T, Kopin L, Guzick DS. The impact of metformin, oral contraceptives, and lifestyle modification on polycystic ovary syndrome in obese adolescent women in two randomized, placebo-controlled clinical trials. Journal of Clinical Endocrinology and Metabolism 2008;93(11):4299-306.
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (age 12-18, BMI > 95th percentile)
PCOS diagnostic criteria	irregular menses (> 45-day menstrual cycles/fewer than 8 menses in the preceding year), hyperandrogenism (acne, hirsutism Ferriman-Gallwey >7, elevated androgens)
Presence of infertility	Not Reported
Presence of other condition/s	Not Reported
Medication History	No
N per group	Intervention, n=11; control, n= 11
Setting	General Clinical Research Centre, University of Rochester
Intervention	weight loss, lifestyle intervention versus placebo. Closed group intervention format, 5 to 6 members per group, participants and one adult family member (parent or guardian) in structured training classes on diet, exercise, and behavior modification skills with frequent contact, flexible personal strategies, self-esteem, and social support. 16-session core curriculum group and individual appointments. Therapy goals of a 5% to 7% weight loss and a level of exercise of at least 150 minutes/week
Comparison	standard office advice on nutrition and exercise for healthy living (written information on best lifestyle choices at enrolment but no formal education) and seen monthly
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weekly urine pregnanediol assessment for ovulation, menstrual cycle average per 24 weeks, total and free testosterone, SHBG, FAI, hirsutism (Ferriman-Gallwey), OGTT at 0, 30, 60, 120 minutes (AUC glucose), lipid profile (total cholesterol, HDL-C, LDL-C, triglycerides), OGTT at 0, 30, 60, 120 minutes (AUC insulin), BMI, waist circumference
Follow up Duration	24 weeks
Summary Result/s	Both lifestyle modification and oral contraceptives significantly reduce androgens and increase SHBG in obese adolescents with PCOS. Metformin, in combination with lifestyle modification and oral contraceptives, reduces central adiposity, reduces total testosterone, and increases HDL, but does not enhance overall weight reduction.

Study Country	Sweden
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (age 18 to 37 years)
PCOS diagnostic criteria	PCO (at least 12 follicles, 2 mm to 9 mm and/or increased ovarian volume > 10 mL by 2D ultrasound on one or both ovaries) and one of following (oligomenorrhoea with an intermenstrual interval > 35 days and/or clinical and/or biochemical signs of hyperandrogenism (hirsutism or acne))
Presence of infertility	Not reported
Presence of other conditions	Not reported
Medication History	Women on medications < 3 months prior to study commencement excluded
N per group	Allocated/randomized: 84 (For intervention versus control N = 51 randomized (n = 34 intervention, n = 17 control), n = 45 completed and analyzed (n = 30 intervention, n = 15 control). For paper, n = 5 intervention and n = 6 control reported (subset))
Setting	University teaching hospital with patients from gynecology/ endocrinology clinics, Glasgow, UK

Study ID	Jedel 2011 (or Stener-Victorin 2009-2013)	
Intervention	Weight maintenance, exercise: instructed to do 30 to 45 minutes 3x per week moderate exercise beyond daily physical activity (brisk walking, cycling, aerobic) with pulse frequency above 120/minute and weekly follow-up and guidance	
Comparison	No exercise, given same information about importance of physical activity and diet as physical activity group in one session by a physiotherapist and given option to phone study coordinator at any point.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Menstrual pattern by daily recordings of basal body temperature, 12-week documentation of menstrual pattern pre-study, menstrual bleeding patterns confirmed by daily recordings of basal body temperature throughout the entire study period and via interviews by gynecologists and gynecological assessment, total testosterone, SHBG, free testosterone (radioimmunoassay), FAI, F-G score (clinician assessed), lipid profile (total cholesterol, HDL-C, LDL-C, triglycerides), fasting glucose and insulin, height, weight, BMI, sagittal abdominal diameter, WHR, Quality of life: PCOSQ	
Follow up Duration	16 weeks	
Summary Result/s	Physical exercise lowered high sympathetic nerve activity and menstrual frequency, decreased the levels of several sex steroids, and improved HRQoL in women with PCOS versus no intervention.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	The aim was to determine whether weight maintenance exercise would have different effects on body weight, circulating hormones, menstrual patterns, and lipid profiles.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	PCOS, age 18 to 37 years
Exclusion criteria	Yes Partial No Not reported	Breastfeeding < 6 months prior, known endocrine or neoplastic causes of hyperandrogenism, including adrenal secreting tumors, Cushing's syndrome, congenital adrenal hyperplasia and hyperprolactinaemia. Women on medications < 3 months prior to study commencement excluded
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		
SEL **Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes Randomization was performed by the study coordinator according to a computerized list with stratification for age and BMI using a randomized block model.

Study ID		Jedel 2011 (or Stener-Victorin 2009-2013)	
SELECTION BIAS	**Was allocation to intervention group concealed?**	Yes Partial No Not reported	Not reported
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	No Participant/treatment provider blinding not possible due to the interactive nature of the intervention. Potential for lack of participant blinding to introduce bias for the self-reported outcome of menstrual diaries.
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Yes "Independent observers and with blind, independent analysis," outcome assessor and data analyst blinded and reduced risk of bias for clinician-reported outcomes of hirsutism (Ferriman-Gallwey), weight, body mass index, adiposity distribution.
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Yes "Independent observers and with blind, independent analysis," outcome assessor and data analyst blinded and reduced risk of bias for clinician-reported outcomes of hirsutism (Ferriman-Gallwey), weight, body mass index, adiposity distribution.
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRI	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	*Intervention women* *17/34= 50%* *Control women* *11/18=39%*

Study ID		Jedel 2011 (or Stener-Victorin 2009-2013)	
TIONBIAS	**Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?**	Yes Partial No Not reported	Yes
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Partial The study protocol is available and all of the studies prespecified (primary and secondary) outcomes that are of interest in the review have been reported in the prespecified way with the exception of: health-related quality of life, progsterone values mentioned in methods but not results and potential data for ovulation. On contacting authors these outcomes are to be included in future analysis.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Yes
OTHERBIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported

Study ID	Jedel 2011 (or Stener-Victorin 2009-2013)	
If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Not reported
COMMENTS		
What is the overall risk of bias?	Low Moderate High Insufficient information	*High*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*	No – all outcomes have a high risk of bias	

Study ID	Kiel 2021
Study Citation	Kiel IA, Lionett S, Parr EB, Jones H, Røset MAH, Salvesen Ø, Hawley JA, Vanky E, Moholdt T. High-Intensity Interval Training in Polycystic Ovary Syndrome: A Two-Center, Three-Armed Randomized Controlled Trial. Med Sci Sports Exerc. 2022 May 1;54(5):717-727. doi: 10.1249/MSS.0000000000002849. Epub 2022 January 12. PMID: 35019901.
Study Country	Norway and Australia
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (age 18-45; BMI stratified for < or ≥ 27)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Measured in quality of life report
Presence of other condition/s	No
Medication History	No
N per group	Control = 23 (non-exercising) LV-HIT = 21 (low-volume HIT workout) HV-HIT = 20 (high-volume HIT workout)
Setting	Department of Circulation and Medical Imaging at the Norwegian University of Science and Technology in Trondheim, Norway, and at the Mary MacKillop Institute for Health Research at the Australian Catholic University in Melbourne, Victoria, Australia
Intervention	16-week low-volume HIT workout or 16-week high-volume HIT workout followed by 36-week home-based HIT
Comparison	Non-training
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Menstrual frequency (using menstruation diary and questionnaire), fertility (questionnaire), number of pregnancies, ovarian morphology (only Norway; multifrequency transvaginal ultrasound transducer), body composition (DXA in Australia, bioelectrical impedance analysis in Norway), waist and hip circumference, seated blood pressure, fasting blood samples, 2-h oral glucose tolerance test, insulin sensitivity (HOMA-IR), plasma glucose concentration (Roche Modular P), serum insulin concentrations (enzyme-linked immunosorbent assay), glucose and insulin AUC, HbA1c, total cholesterol, HDL, LDL, triglycerides,17OH-progesterone, prolactin, testosterone, albumin, AMH, SHBG, FAI, physical activity (questionnaire and activity monitor), dietary intake (diet recall), physical activity enjoyment (questionnaire), quality of life (polycystic ovary syndrome questionnaire), Ferriman Gallwey score; VO2 peak (indirect calorimetry)
Follow up Duration	12 months
Summary Result/s	A semi-supervised HIT intervention did not increase the menstrual frequency in women with PCOS. No between-group differences in menstrual frequency, but within-group change in each group was observed; HIT has clinical benefits on both pregnancy rate and QoL in women with PCOS.

Study ID		Kiel 2021	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes, the aim was to determine whether 16 wks of LV-HIT or HV-HIT followed by 36 wk home based HIT would increase menstrual frequency during 12 months with PCOS women compared to no exercise control.
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Eligible participants were aged between 18 and 45 yr and diagnosed with PCOS according to the Rotterdam criteria
Exclusion criteria		Yes Partial No Not reported	Already undertaking two or more weekly sessions of endurance exercise that induced heavy breathing, hormonal contraceptives, taking insulin sensitizers or drugs known to affect gonadotropin or ovulation (wash-out period of 3 months before inclusion), pregnancy, breastfeeding within 24 wk, known cardiovascular diseases, or other endocrine disorders (congenital adrenal hyperplasia, Cushing syndrome, or androgen-secreting tumors).
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes, a computer random number generator developed and administered at the Faculty of Medicine, Department of Public Health and General Practice, NTNU, Trondheim, Norway, was used at both study centers.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	No Investigators were informed about the allocation results by email after registration of new participants. Participants and study personnel were not blinded to group allocation
PERF	**Were patients blind to intervention group?**	Yes Partial No Not reported	No Participants and study personnel were not blinded to group allocation

Study ID		Kiel 2021	
PERFORMANCE BIAS	**Were investigators and care providers blind to intervention group?**	Yes Partial No Not reported	No Investigators were informed about the allocation results by email after the registration of new participants

Study Citation	Kogure GS, Lopes IP, Ribeiro VB, Mendes MC, Kodato S, Furtado CLM, Silva de Sá MF, Ferriani RA, Lara LADS, Reis RMD. The effects of aerobic physical exercises on body image among women with polycystic ovary syndrome. J Affect Disord. 2020 Feb 1;262:350-358. doi: 10.1016/j.jad.2019.11.025. Epub 2019 November 9. PMID: 31735408.	
Study Country	Brazil	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age 18-39)	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	No	
Presence of other condition/s	No	
Medication History	No	
N per group	Control = 38 (no training) CAT = 37 (aerobic training) IAT = 35 (aerobic training)	
Setting	Endocrine Gynecology and Infertility Outpatient Clinic of the Department of Gynecology and Obstetrics, University Hospital, Ribeirão Preto Medical School, University of São Paulo	
Intervention	16 weeks of continuous aerobic training or 16 weeks of intermittent aerobic training	
Comparison	Non-training	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Attitudinal component of body image (body shape questionnaire), perceptual dimension of body image (Figure Rating Scale), sexual dysfunction (female sexual function index questionnaire), anxiety and depression (HADS), testosterone, FAI, SHBG, height, weight, hip circumference, waist circumference, WHR, actual BMI	
Follow up Duration	Not Applicable	
Summary Result/s	Only the continuous aerobic training group had improved the core for the cognitive-affective dimension of body image. However, both the continuous aerobic training and the intermittent aerobic training groups had lower depression, anxiety, and sexual function scores after the intervention. Motivational interviews had no effect on weight loss or QoL versus control.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes, the aim was to evaluate the effects of two aerobic physical exercises, continuous and intermittent in different protocols on body dis(satisfaction) in women with PCOS, as well as the possible relation of the responses of anxiety, depression and sexual dysfunction to the exercise.

Study ID		Kogurea 2020	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Partial
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	women aged 18–39 years with PCOS
Exclusion criteria		Yes Partial No Not reported	The exclusion criteria were: performance of regular physical exercise at least 3 times per week, smoking, pregnancy, diabetes, congenital adrenal hyperplasia, thyroid diseases, hyperprolactinemia, Cushing's syndrome or musculoskeletal disorders, and use of medications that interfere with the hypothalamic pituitary ovarian axis.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	***Did the study have an adequate method of randomisation?***	Yes Partial No Not reported	Yes The randomization was computer generated by an external source, in blocks of 15, with 5 women per group. Women were consecutively and separately collected, depending on the participant's BMI at the time of inclusion. A stratified randomization was performed according to BMI (<30 and ≥30 kg/m^2). The participants in the exercise were then further randomized into three groups: continuous aerobic physical training group (CAT), intermittent aerobic physical training group (IAT), and the control group with no aerobic exercise (CG).

Study Country	Denmark	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (BMI ≥ 30)	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	No	
Presence of other condition/s	No	
Medication History	No	
N per group	Standard care = 18 Motivational interview with standard care = 19	
Setting	Department of Gynecology and Obstetrics, Odense University Hospital	
Intervention	MI was conducted using a mix of face-to-face or Skype video interviews. Field notes and mind mapping were used to keep track of the interviews. MI was planned once every 2 weeks, that is a total of 12 times for each participant in MI group. Cancellation of MI was handled by text messaging instead.	
Comparison	Standard care	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, hip and waist circumference, QoL (WHO-5, MDI, SF-36, PCOS-Q)*, BMI *WHO-5: world health organization 5 wellbeing index *MDI: major depression inventory *SF-36: short-form-36	
Follow up Duration	6 months	
Summary Result/s	Intervention groups were comparable at baseline. Groups were comparable after 6 months in terms of weight, weight loss, BMI, QoL, serum testosterone, and serum lipids. Motivational interviews had no effect on weight loss or QoL versus control.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes, the aim was to investigate if MI as add on to standard advice (SA) improved weight loss and increased QoL in obese women with PCOS compared with SA alone
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes

Study ID		Moeller 2018	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Inclusion criteria were PCOS diagnosed by the Rotterdam criteria and body mass index (BMI) ≥ 30 kg/m2. Participants accepted to use of barrier control as contraception during the study.
Exclusion criteria		Yes Partial No Not reported	Women were excluded if they used oral contraceptives or initiated metformin treatment within 3 months before study inclusion. Women with current pregnancy wishes were excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Not Reported
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not Reported

COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No	

Study ID	Nasrekani 2016	
Study Citation	Nasrekani ZA, Fathi M. EIicacy of 12 weeks aerobic training on body composition, aerobic power and some women-hormones in polycystic ovary syndrome infertile women. Iranian Journal of Obstetrics, Gynecology and Infertility 2016;19(5):1-10.	
Study Country	Iran	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age not reported)	
PCOS diagnostic criteria	meeting 2 from 3 criteria as follows: 1) anovulation or low ovulation (having oligo-menorrhoea, amenorrhoea or poly-menorrhoea), 2) elevation of androgenic hormones in the body or having hirsutism and ratio of LH/FSH>2, 3) having polycystic ovaries in the ultra-sonography	
Presence of infertility	Not Reported	
Presence of other condition/s	Not Reported	
Medication History	Not Reported	
N per group	Intervention, n=10; control, n= 10	
Setting	Not Reported	
Intervention	12 weeks, 3 days/week aerobic training with the intensity of 40% to 65% maximum heart rate reserve	
Comparison	there was no intervention in the control group	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	weight, BMI	
Follow up Duration	12 weeks	
Summary Result/s	The intervention group had reduced weight and increased Vo2max compared to controls.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Not Reported
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Partial (just inclusion)
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes

Study ID		Nasrekani 2016	
Inclusion criteria		Yes Partial No Not reported	Healthy women, according to the Health Questionnaire, not under medication, non-smokers, infertility, not participating in any exercise program and having PCOS according to 2 from the 3 criteria mentioned above
Exclusion criteria		Yes Partial No Not reported	Not Reported
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes Third-party randomization and allocation by the University's Unit for Applied Clinical Research
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not Reported

OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not Reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes (stated there was a power calculation)
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Not Reported
COMMENTS		Lack of randomisation and blinding key reason for high RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	Insufficient Information
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Oberg 2018	
Study Citation	Oberg et al. Clin Endocrinol (Oxf). 2019 Mar;90(3):468-478.	
Study Country	Sweden	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Sixty-eight women, aged 18-40 years, BMI ≥ 27 kg/m^2	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s	Not reported	
Medication History	Not reported. Indicated exclusion criteria were "taking regular medication."	
N per group	34	
Setting	Academic medical canter	
Intervention	Behavioral modification program (Intervention for 4 months consisted of a structured approach to achieve long-term weight control for improvement of reproductive and metabolic function, as well as the quality of life)	
Comparison	Minimal intervention	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Menstrual cyclicity (primary) Ovulation and pregnancy loss (secondary)	
Follow up Duration	4 months (intervention period) 12 months (post-intervention follow-up period)	
Summary Result/s	A significantly higher proportion of patients in the intervention group improved their menstrual function compared to the control. Logistic regression analysis showed that receiving the 4-month intervention was the only significant predictor of improved menstrual function. The interventions significantly increased endometrial thickness and decreased levels of DHEA compared to the control.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes

Study ID		Oberg 2018	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes Women aged 18-40 years, with a body mass index (BMI) of at least 27 kg/m2 and fulfilling all three PCOS diagnostic criteria according to the Rotterdam Consensus21 of having oligomenorrhea or amenorrhea, displaying polycystic ovaries on a transvaginal ultrasound scan and having clinical or biochemical hyperandrogenism were eligible to enter the study.
Exclusion criteria		Yes Partial No Not reported	Yes Exclusion criteria were taking regular medication, another ongoing medical condition, smoking, pregnancy, or breastfeeding, having a history of an eating disorder or a substantial weight change during the past year. A wash-out period of 3 months was used if taking hormonal contraceptives. Several women had the desire to become pregnant, but all women accepted to use of nonhormonal contraception during the first 4 months of the study.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes Women were randomized in a ratio of 1:1 to either receive intervention (n = 34) or control treatment (n = 34). The randomization was performed with blocks of eight patients using the program SAS Systems 9.1 (SAS Institute Inc, Cary, NC, USA).
	Was allocation to intervention group concealed?	Yes Partial No Not reported	No Due to the apparent difference in the interventions, neither patients nor care providers were blinded to the allocation.
PERFOR MANCE	**Were patients blind to intervention group?**	Yes Partial No Not reported	No Due to the apparent difference in the interventions, neither patients nor care providers were blinded to the allocation.

Study ID		Oberg 2018	
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	No Due to the apparent difference in the interventions, neither patients nor care providers were blinded to the allocation.
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	Yes Partial No Not reported	11.8% (4/34) in the intervention arm 20.6% (7/34) in the control arm
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes

Study ID		Oberg 2018	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Not reported (applicable)
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	No Although the a priori power calculation concluded that the sample size was adequate, one potential limitation of the study is the dropout rate (16% after 4 months and 31% after 1 year).
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low to Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Due to insufficient power to detect primary versus secondary outcomes, conclusions should be taken into account with caution.	

Study ID	Ribeiro 2019 (and 2021)	
Study Citation	Ribeiro et al. et al. J Health Psychol. 2021 Aug;26(9):1307-1317. Int J Environ Res Public Health. 2021 Oct 27;18(21):11274.	
Study Country	Brazil	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Eighty-seven women, aged 18-40 years, BMI 18-39.9 kg/m^2	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s	Not reported	
Medication History	Not reported.	
N per group	37 (continuous aerobic training) 35 (intermittent aerobic training) 38 (control)	
Setting	Academic medical canter	
Intervention	The exercises were carried out on a treadmill, three times per week for 16 weeks. The participants' anthropometric characteristics and biochemical and hormonal concentrations were measured before and after aerobic training or observation period, as the telomere length that was evaluated using quantitative real-time PCR.	
Comparison	Minimal intervention	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Anthropometric metabolic, hormonal, and quality of life (by the validated Portuguese version of the self-reported MOS SF-36) without specification of primary or secondary outcomes	
Follow up Duration	4 months (intervention period)	
Summary Result/s	Both exercises reduced obesity indices, hyperandrogenism, and quality of life in women with women without changes in telomere length or inflammatory biomarkers versus controls.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes

Study ID		Ribeiro 2019 (and 2021)	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes Women aged between 18 and 39 years, who did not practice regular physical exercise (at least three times per week) were included in this study. The participants were not using any pharmacological intervention for PCOS treatment and had no dietary energy restrictions. The subjects were recruited at the Gynecological Endocrinology Outpatient Clinic of the Human Reproduction Service of the Gynecology and Obstetrics Department of Ribeirao Preto Medical School, University of São Paulo.
Exclusion criteria		Yes Partial No Not reported	Yes Exclusion criteria were the presence of systemic diseases, use of drugs that interfere in the hypothalamic-pituitary-ovarian axis, congenital adrenal hyperplasia, diabetes, smoking, pregnancy, thyroid diseases, hyperprolactinemia, musculoskeletal disorders, or Cushing's disease.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes The allocation group was placed inside opaque, sealed envelopes, grouped in blocks of 15 and consecutively picked depending on the BMI of the participant at the time of study inclusion. After the run-in period, 110 volunteers were randomly assigned in a 1:1:1 fashion to one of three groups (continuous aerobic training (n=28), intermittent aerobic training (n=29), and control group (CG), without training (n=30). Random allocation was conducted by the principal investigator, and participants were enrolled and assigned to the intervention groups by research assistants.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Not reported

Study ID		Ribeiro 2019 (and 2021)	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes
DEDETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	Yes Partial No Not reported	24.3% (9/37) (continuous aerobic training) 17.1% (6/35) (intermittent aerobic training) 21.0% (8/38) (control)
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Not reported
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported (cautions may be exercised due to not reporting whether analyses corroborated with the intention to treat analyses)
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes

Study ID		Ribeiro 2019 (and 2021)	
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Not reported (applicable)
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes According to Cohen's agreement, 24 patients are necessary to achieve a moderate difference between groups. The final sample was increased to cover the losses.
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Partial (cautions may be exercised due to not reporting whether analyses corroborated with the intention to treat analyses)
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low to Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Yes. Cautions may be exercised due to not reporting whether analyses corroborated with intention to treat analyses.	

Study ID	Saremi 2013	
Study Citation	Saremi et a. 2013, *Iranian J of Obs, Gyn, and Inf* 16: 10, 2013	
Study Country	Iran	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age not reported)	
PCOS diagnostic criteria	ESHRE/ASRM	
Presence of infertility	Not reported	
Presence of other condition/s	Not reported	
Medication History	OCP metformin excluded from study	
N per group	Allocated/randomized: 22 (11 intervention, 11 control) Assessed at the end of study: 22 (11 intervention, 11 control)	
Setting	Not specified	
Intervention	An 8-week aerobic training program consists of training 3 days per week for 8 weeks, for 40 to 60 minutes each. Each session involved 5 to 7 minutes of warm-up, 30 to 50 minutes of main exercises on the treadmill (starting at 40% to 45% of heart rate building up to 60% to 65% of heart rate by the end of the 8th week), finishing with cooling down exercises.	
Comparison	Patients asked not to do more physical activity than they used to and not to start any physical activity without informing the research group	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Changes in total testosterone, anthropometric features (weight, BMI, waist circumference, WHR), and lipid profiles (HDL-C, LDL-C, triglycerides, fasting glucose, fasting insulin)	
Follow up Duration	8 weeks	
Summary Result/s	No summary report is available.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	The aim was to determine whether an aerobic training program would have different effects on anthropometric features, circulating hormones, and lipid profiles
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes

Study ID		Saremi 2013	
Inclusion criteria		Yes Partial No Not reported	Irregular periods of less than 21 days or more than 31 days, polycystic ovaries on ultrasound, hyperandrogenism – hirsutism and acne
Exclusion criteria		Yes Partial No Not reported	Infection, metabolic diseases, cardiovascular, renal and adrenal, and extracranial, liver, and thyroid disease; oral contraceptive use and metformin, pregnancy, abnormal prolactin and participation in regular exercise
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes They were randomly divided into 2 11-person groups
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	No Blinding of participants and study personnel would not have been possible due to the nature of the intervention, however, outcomes are biochemical assessments of hormones and triglycerides and are unlikely to be influenced by knowledge of group allocation.
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	No Not blinded, but biochemical outcomes are unlikely to be affected by blinding as they are objective measures.
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes
DETECT	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	No
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes

	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Not reported
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	High
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No – all outcomes have a high risk of bias	

Study ID	Stefanaki 2015	
Study Citation	Stefanaki et al., *Stress* 18: 57-66, 2015.	
Study Country	Greece	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (intervention group n = 23, 23.4 ± 4.62; control group n = 15, 28.3 ± 7.20)	
PCOS diagnostic criteria	ESHRE/ASRM criteria	
Presence of infertility	Not reported	
Presence of other condition/s	Not reported	
Medication History	No psychotropic medication before or during study	
N per group	Allocated/randomized: 46 (23 intervention, 23 control) Assessed at the end of study: 28 (23 intervention, 15 control)	
Setting	Medical School of Athens University, and the First Department of Pediatrics of the National & Kapodistrian University of Athens, Greece.	
Intervention	An 8-week mindfulness stress management program, which consisted of a 30-minute audio CD of directed mindfulness and diaphragmatic breathing exercises that participants were required to undertake daily, preferably before bedtime. Participants were monitored by the principal investigator via a scheduled meeting or telephone call.	
Comparison	Control group with no intervention. Participants underwent salivary cortisol collection and questionnaires as per the intervention group but did not have the mindfulness stress management program.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Changes in BMI and quality of life (PCOSQ)	
Follow up Duration	8 weeks	
Summary Result/s	Post-intervention, between-group results revealed statistically significant reductions in stress, depressive and anxiety symptoms, as well as in salivary cortisol concentrations, along with an increase in Life Satisfaction and Quality of Life scores in the intervention group only. There was no significant "placebo" effect on the outcome measures. Mindfulness techniques seem promising in ameliorating stress, anxiety, depression, and the quality of life in women with PCOS versus controls.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	The aim was to determine whether a stress management program would affect body weight and quality of life differently.

Study ID		Stefanaki 2015	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Pre-menopausal women age 15 to 40, diagnosed with PCOS by ESHRE/ASRM criteria (that is have at least 2 of the following: Quote: "(a) chronic anovulation, (b) clinical and/or biochemical hyperandrogenism and (c) polycystic ovaries on ultrasound after exclusion of related disorders). For adolescents, at least 2 years must have elapsed since menarche".
Exclusion criteria		Yes Partial No Not reported	Pregnancy, a genetic or endocrine disorder, neuropsychiatric disorders requiring psychotropic medication (eg antipsychotics, antidepressants, or anticonvulsants), practice of stress management techniques within 2 months of study enrolment, simultaneous participation in other trials, inability to read or write in Greek".
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes An online randomization internet site (www.random.org) was used to assign the participants to intervention and control groups
	Was allocation to intervention group concealed?	Yes Partial No Not reported	No Cannot blind participants; questionnaires are susceptible to bias, but salivary cortisol is an objective measure.
PERFORMANCE	**Were patients blind to intervention group?**	Yes Partial No Not reported	No No concealment was used within the groups.
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Yes "The fellow researcher who administered the questionnaires and obtained the salivary cortisol devices at the end of the 8 weeks was blinded (unaware of the assigned group of the patients."

Study ID		Stefanaki 2015	
BIAS	**Aside from the experimental intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes

Study ID	Turan 2015	
Study Citation	Turan et al., *J of Physical Therapy Sci* 27: 2293-2297, 2015. Turan V, Mutlu EK, Solmaz U, Ekin A, Tosun O, Tosun G, et al. Benefits of short-term structured exercise in non-overweight women with polycystic ovary syndrome: a prospective randomised controlled study. *Journal of Physical Therapy Science* 2015;**27**(7):2293-7.	
Study Country	Turkey	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (17 to 34 years)	
PCOS diagnostic criteria	ESHRE/ASRM	
Presence of infertility	Not reported	
Presence of other condition/s	Not reported	
Medication History	Not reported	
N per group	Allocated/randomized: 32 (16 training, 16 control) Assessed at the end of the study: 20 (14 training, 16 control)	
Setting	Physical Therapy and Rehabilitation Fitness Unit of Dokuz Eylul University, Turkey	
Intervention	Patients participated in a structured exercise program 3 times per week for 8 weeks. During each session (50 to 60 minutes), the patients performed aerobic and resistance exercises. Supervised by a physiotherapist.	
Comparison	At the beginning of the study, general dietary and behavioral advice, but not a structured calorie restriction program, was provided to all study participants. All patients were counseled regarding a healthy, balanced meal plan with regular food and nutritional composition in which 50% of the calories were from carbohydrates, 25% from protein and 25% from fat.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Menstrual cycle, total testosterone, free testosterone, total cholesterol, HDL-C, LDL-C, triglycerides, fasting glucose, fasting insulin, BMI, and waist circumference.	
Follow up Duration	8 weeks	
Summary Result/s	Short-term regular exercise programs can lead to improvements in anthropometric, cardiovascular, and metabolic parameters of non-overweight in women with PCOS versus controls.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	The aim was to determine whether a structured exercise program would have different effects on body weight, circulating hormones, menstrual cycle, and lipid profiles

Study ID		Turan 2015	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Body mass index (BMI) was in the normal range (< 25 kg/m2); diagnosed on the ba- sis of ESHRE/ASRM criteria (2003), which requires the presence of 2 of the following: Quote: "(1) a poly- cystic ovary, defined as the presence of >10 cysts 2–8 mm in diameter, an ovarian volume >10 cm3, and an echodense stroma on transvaginal or pelvic ultrasonography; ... (2) clinical hyperandrogenism (Ferriman-Gallwey12) score >8) or biochemical hyperandrogenism (serum testosterone level >3.6 pg/mL in the absence of other causes of hyperandrogenism); and (3) oligomenorrhoea and/or anovulation".
Exclusion criteria		Yes Partial No Not reported	"Patients with endocrinological diseases, including diabetes, thyroid, adrenal, or pituitary gland dysfunction; cardiovascular, hepatic, or pulmonary disease; a history of orthopedic or other physical symptoms that would otherwise limit exercise performance; and those who had exercised regularly within the last 6 months".
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes Randomization was carried out using a computer-generated random number table and pre-labeled, sealed envelopes.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Yes Pre-labeled, sealed envelopes
PERFORMANCE	**Were patients blind to intervention group?**	Yes Partial No Not reported	No Unable to blind participants to intervention, but objective biochemical measures were used.
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	No Unable to blind participants to intervention, but objective biochemical measures were used.

Study ID		Turan 2015	
BIAS	**Aside from the experimental intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	No
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Women in an exercise program 2/16 = 12.5% Women not in an exercise program 0/16 = 0%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes
REPORT BIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported Not stated as registered; all prespecified outcomes reported. Data are presented as mean ± standard error rather than the standard deviation.

Study ID		Turan 2015	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Partial Groups appear even at baseline, except for BP (the control group appears to have a lower mean BP of 110/70 compared to the intervention groups mean BP of 120/75, and the control group has a higher mean estradiol at 56.7 pmol/ L compared to the intervention groups mean estradiol of 36.0 pmol/L. The significance of this is unclear.
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Not reported
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Not reported
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	High
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No – all outcomes have a high risk of bias	

Study ID	Vigorito 2016	
Study Citation	Vigorito C, Giallauria F, Palomba S, Cascella T, Manguso F, Lucci R, et al. Beneficial effects of a three-month structured exercise training program on cardiopulmonary functional capacity in young women with polycystic ovary syndrome. *Journal of Clinical Endocrinology and Metabolism* 2007;92(4):1379-84.	
Study Country	Italy	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (age 21.7 ± 2.3-intervention versus 21.9 ± 1.9 year-control)	
PCOS diagnostic criteria	ESHRE/ASRM criteria, PCO identified by transvaginal ultrasound and hirsutism by Ferriman-Gallwey score > 8	
Presence of infertility	Not reported	
Presence of other condition/s	Overweight (not defined)	
Medication History	No use of oral contraceptives, glucocorticoids, anti-andro- gens, ovulation induction agents, anti-diabetic or anti-obesity drugs or other hormonal drugs within the previous 6 months and during 3 months of study duration	
N per group	Allocated/randomized: 90 (45 intervention,45 control)	
Setting	University Federico II of Naples, School of Medicine, Italy	
Intervention	Not specifically aimed to induce weight loss, structured, supervised training sessions 3 x/week, 5-minute warm up and cool down, 30-minute exercise with 60% to 70% VO2 max bicycle ergometer	
Comparison	No training program. Both intervention and control received general dietary and behavioral advice without a structured calorie restriction program, healthy balanced meal plan was encouraged (50% carbohydrate, 25% protein, 25% fat, low GI food intake)	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Menses regularity, testosterone, SHBG, FAI, clinical hyperandrogenism (clinician assessed Ferriman-Gallwey score), height, weight, BMI, waist circumference, waist/hip ratio, AUC OGTT glucose (0, 30, 60, 90, 120, 180 minutes), lipid profile (total cholesterol, HDL-C, LDL-C, triglycerides), fasting glucose and insulin, AUC OGTT insulin (0, 30, 60, 90, 120, 180 minutes)	
Follow up Duration	12 weeks	
Summary Result/s	A 3-month structured exercise training program improves cardiopulmonary functional capacity in women with PCOS versus controls.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	The aim was to determine whether a supervised, structured training session would have different effects on menstrual regularity, circulating hormones, anthropometric features, and metabolic profiles.

Study ID		Vigorito 2016	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	PCOS, overweight (not defined)
Exclusion criteria		Yes Partial No Not reported	Pregnancy, glucose intolerance (2-hour OGTT), diabetes, hypothyroidism, hyper-prolactinoma, Cushing's syndrome, non-classical congenital adrenal hyperplasia, neoplastic, hepatic, respiratory, cardiovascular disorder, concurrent medical illness (i.e., heart failure, lung, renal disease), smoking
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Not reported Randomly assigned but not stated how; insufficient information about the process to permit a judgment. At study entry, PCOS women were randomly subdivided into two groups composed of 45 patients each.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported Not stated, insufficient information about the process to permit a judgment.
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	No Participant/treatment provider blinding not possible due to the interactive nature of the intervention. Potential for lack of participant blinding to introduce bias for the self-reported outcome of menstrual diaries.
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Yes All clinical assessments performed by a physician blinded to patient al- location into study protocol." Outcome assessor blinded and therefore reduced the risk of bias for the clinical reported outcomes of Ferriman-Gallwey score, weight, BMI, adiposity distribution. All clinical assessments performed by physician blinded to patient al- location into study protocol. Outcome assessors were blinded and therefore reduced the risk of bias for objective outcomes of biochemical data.

Study ID		Vigorito 2016	
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	No Insufficient information to permit a judgment, study not registered as a clinical trial. From the results section of the paper, all of the studies prespecified (primary and secondary) outcomes that are of interest in the review have been reported in a prespecified way with the exception of menstrual regularity data for controls.
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	No dropouts No intention to treat analysis but no dropouts were reported for intervention or control group and no missing outcome data.
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	No Insufficient information to permit a judgment, study not registered as a clinical trial. From results section of the paper, all of the studies prespecified (primary and secondary) outcomes that are of interest in the review have been reported in a prespecified way except menstrual regularity data for controls.

Question 3.1.

In women with PCOS, are lifestyle interventions (compared to minimal or nothing) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?

BACKGROUND:

Lifestyle modification has been a cornerstone of management in PCOS and has been recommended as first line treatment by the first International Guidelines (1). There are many reasons for this recommendation including that women with PCOS have a greater prevalence of metabolic disorders such as type 2 diabetes and metabolic syndrome (2,3). Women with PCOS are also more likely to be overweight or obese (4) with subsequent exacerbation of metabolic and reproductive disorders, and have a predisposition to longitudinal weight gain that is greater than the general population, with women with PCOS gaining an excess of 2.6 kg over 10 years compared with women without PCOS (5). Weight gain in adulthood is an independent risk for metabolic disease (6) so prevention of weight gain or weight loss can be foundational to medical therapies to address the risks of PCOS.

Data from small studies of women with PCOS are generally supportive that women participating in lifestyle modification programs can reduce body weight in similar amount to women without PCOS (7). However there overall mixed results noted and with the majority of the studies reported considerable drop-out rates varying between 12% and 47%. The variable success of the interventions and the high drop-out rates make the implementation of such programs challenging in the clinical setting (8).

Additionally, the acceptance of lifestyle programs by women with PCOS is not well studied. Women with PCOS consume similar diets and engage in comparable levels of physical activity compared to women without PCOS, despite having a higher BMI (9). Notably no differences between minutes spent in moderate and vigorous physical activity (except in total activity) is seen between women with and without PCOS when studied previously and more detailed analysis is performed in Q 3.5 for diet and physical activity. The adoption and maintenance of lifestyle changes involve a complex set of behavioural changes. Support of these changes and implementation in general practices remains a challenge. (10)

Given the overall need identified therefore, the evaluation of RCTs of lifestyle modification trials in the setting of PCOS with respect to anticipated benefits or lack thereof in reproductive and metabolic health is important to inform the updated guidelines. This can be used to assist with translation of those areas found beneficial both to the women with PCOS and the practitioners assisting them.

Summary of Evidence

Included studies

Eighteen studies (7 RCTs conducted after the previous guideline update in 2018 and 11 RCTs from the previously update guideline and published in the Cochrane review 2019) were identified for this review for a total of 18 studies included. From the initial Cochrane review from 2019, 4 of the 15 studies were excluded as their definition of PCOS was unclear. There was a total of 23 publications reviewed with 634 participants. No study assessed fertility as the primary outcome, 1 reported pregnancy rate, 3 reported ovulation rates and 3 reported menstrual regularity as an outcome.

Methodological quality/risk of bias

Studies had a serious risk of bias across reported outcomes and were mainly of moderate (N=6 outcome: BMI, WC, HDL-C, LDL-C, TG), low (N=7 outcomes: weight, WHR, Ferriman -Gallwey score, SHBG, 2-hour area under the curve for OGTT, insulin, total cholesterol) while N=2 had a very low quality in reporting testosterone and FAI outcomes. Few studies looked at the impact of lifestyle intervention on pregnancy, ovulation rate, or menstrual cyclicity, and no study evaluated miscarriage. Most studies in this review were of low quality, mainly due to a high risk of bias across most domains or high heterogeneity (>50%) for the testosterone and FAI outcomes.

Certainty of the evidence

The body of evidence in the systematic review was of a low to moderate certainty with serious risk of bias, no serious risk of inconsistency, serious risk of indirectness, and serious risk of imprecision. There was no serious risk of publication bias.

Consistency of studies

The included studies were all parallel RCTs with variable interventions. Control groups were no intervention, care as usual or general healthy lifestyle advice. Eleven studies used an exercise intervention (1, 2, 3, 8, 9, 10, 12, 14a, 14b, 15,17, 18) , 5 used a combination lifestyle intervention with diet, exercise and behavioural treatment (4, 5, 6, 7, 13) , and 2 used behavioural intervention alone (11, 16) . Duration of the interventions were 8-48 weeks with the majority <16 weeks. Participant numbers ranges from 12-90.

Results

Fertility outcomes are described in Table 1. Lifestyle treatment improved anthropometric outcomes, including waist circumference (WC) (N=12 effect estimates; N=423 women; MD: -1.32; 95%CI [-2.46; -0.18] cm; P=0.0271; I2=5%); Waist: hip ratio (WHR) (N=6 effect estimates; N=288; MD: -0.03; 95%CI [-0.05; -0.01]; P=0.0257; I2=0%). With respect to secondary endocrine and reproductive outcomes, lifestyle treatment improved Ferriman-Gallwey score (N=6 effect estimates; N=230 women; MD: -0.97; 95%CI [-1.90; -0.03]; P=0.0448; I2=0%); fasting insulin (N=14 effect estimates; N=467; MD: -1.87; 95%CI [-3.10; -0.65] pmol/L; P=0.0056; I2=3%); total cholesterol (N=12 effect estimates; N=427; MD:-0.15; 95%CI [-0.26; -0.03] mmol/L; P=0.0161; I2=0%) and LDL-C (N=12 effect estimates; N=387 women; MD: -0.15; 95%CI [-0.28; -0.02] mmol/L; P=0.0256; I2=0) levels vs. minimal treatment. Lifestyle treatment and minimal treatment exhibited comparable outcomes in other measures, including body weight, BMI, SHBG, total testosterone, FAI, glucose regulation (fasting and 2-hour postprandial glucose levels), HDL-C, and TG levels (all P≥0.05). See Tables 1-4 below. There was insufficient reporting on impact of lifestyle intervention versus minimal treatment on quality of life as a secondary outcome for meta-analysis but these are summarized in Table 5.

Results for outcomes are presented in the tables below.

Table 1. Fertility outcomes

Pregnancy rates	No data were available for analysis on pregnancy outcomes, live birth or miscarriage. Kiel et al 2021 (9) demonstrated an increase in pregnancy rate with low volume High intensity Interval Training (LV-HIT) intervention versus control intervention; LV-HIT (n = 5/15; 33%) vs. control group (n = 0/16, P = 0.02). HV-HIT 3/16 became pregnant (NS).
Menstrual regularity	The studies reported data as mean±SD menstrual cycles for lifestyle versus minimal treatment (24 weeks 2.88±1.7 versus 2.85±1.6, MD 0.03 95% CI -1.64 to 1.70, p=0.97 and 48 weeks 5.4±3.6 versus 4.3±2.1 MD 1.10 95% CI -2.17 to 4.37, p=0.51) (6) , 27/45 (60%) of treatment group having normal menstrual cycles with no reported data for the control group (18) , an average of 2.3 versus 2.5 cycles per 24 weeks for lifestyle compared to controls (7) and Jedel et al. 2011 (8) reported a statistically significant difference in menstrual frequency between the exercise group and no intervention group after 16 (p<0.05) and 32 weeks (p<0.05). Kiel et al 2021 (9), found no differences with LV or HV HIT intervention compared with no intervention. Oberg et al 2018 demonstrated a higher proportion of patients in the intervention group (behavioural modification) improved menstrual regularity compared to the control group, mean difference 35% (95% CI: 16-60), P = 0.003.
Ovulation	The studies looking at ovulation reported data as mean±SD ovulations for lifestyle versus minimal treatment (24 weeks 2.25±1.7 versus 2.23±2.1, MD 0.02 95% CI -1.93 to 1.97, p=0.98, and 48 weeks 6.0±3.6 versus 2.8±2.9 MD 3.20 95% CI -1.02 to 7.42, p=0.14) (6) , 4/6 versus 1/6 people ovulatory in lifestyle versus control group (OR 6.59 95% CI 0.73 to 59.34, p=0.09) (5) and 60% versus 50% ovulatory cycles for lifestyle versus the controls (7) . Oberg et al 2018 (13), did not show a difference in ovulation rates between groups.

Table 2. Androgen outcomes

Biochemical hyperandrogenism	Lifestyle treatment groups demonstrated comparable total testosterone levels versus minimal treatment in 14 studies with 542 participants; MD: -0.06; 95%CI [-0.21; 0.10]; P=0.4598. For Free androgen index (FAI) lifestyle intervention was similar to minimal treatment post intervention in 13 studies and 512 participants; MD: 0.23; 95%CI [-1.25; 0.78]; P=0.6269. SHBG was measured in 13 studies and 512 participants and levels were comparable post intervention for lifestyle and minimal treatment groups; MD 1.94; 95%CI [-1.32; 5.21]; P=0.2192.
Clinical hyperandrogenism Ferriman Gallwey (FG) Score	Six papers reported FG scores with a total of 230 participants. There was a higher reduction in FG score with lifestyle intervention compared to minimal intervention, effect estimates; MD: -0.97; 95%CI [-1.90; -0.03]; P=0.0448; None of the trials reported on acne vulgaris.

Table 3. Anthropometric outcomes

Adiposity (BMI, weight)	There was comparable weight loss post-intervention in the lifestyle versus minimal treatment groups. There were 14 included studies with 554 participants with effect estimates of MD: -1.02; 95%CI [-2.08; 0.04]; P=0.0585. With respect to BMI, intervention groups lifestyle versus minimal treatment demonstrated comparable BMI post intervention, effect estimates: MD: -0.30; 95% CI [-0.60; 0.01] P=0.0571.
Adiposity distribution (WC, WHR)	Lifestyle intervention groups demonstrated greater reduction in waist Circumference (WC) than minimal treatment groups in 12 studies with 423 participants. Effect estimates; MD -1.32; 95% CI [-2.46; -0.18]; P=0.0271. In 6 studies with 288 participants, lifestyle intervention resulted in significant reduction in WHR compared to minimal treatment groups. Effect size MD: -0.03; 95%CI [-0.05; -0.01]; P=0.0257.

Table 4. Metabolic outcomes

Fasting insulin	Fasting insulin was measured in 14 trials with 467 participants. Lifestyle treatment groups demonstrated decreased fasting insulin levels compared to minimal treatment groups post intervention. Effect estimates MD: -1.87; 95% CI [-3.10; -0.65]; P=0.0056
Glucose tolerance	There was no evidence of effect for endpoint fasting glucose (nmol/L) (MD -0.02; 95% CI [-0.09; 0.05; 480 participants, 14 trials, p=0.5138) between lifestyle intervention and minimal treatment. For endpoint 2 hour OGTT glucose there was no evidence for effect for lifestyle compared to minimal treatment in 4 studies with 148 participants, effect estimate MD: -5.05; 95% CI [-34.95; 24.85]; P=0.6282.
Lipid profile	Twelve studies measured lipid profiles with 387 participants. Lifestyle treatment groups demonstrated decreased total cholesterol (mmol/L) with effect estimates MD: -0.15; 95% CI [-0.26; -0.03); P=0.0056 and LDL cholesterol (mmol/L) with effect estimates MD: -0.15 95% CI [-0.28; -0.02]; P=0.0256. There was no evidence for effect for HDL cholesterol (mmol/L) with effect estimate MD 0.0; 95% CI [p-0.07; 0.07]; P=0.9285 between the intervention groups.

Table 5. Quality of Life/Emotional Wellbeing summary

Body shape Questionnaire (BSQ), Female Sexual Function Index (FSFI) and Hospital	Kogurea et al 2020 (10) examined body image pre and post continuous (CAT) or intermittent aerobic training (IAT) versus a control group (CG). Exercise interventions did not impact body perceptual dimension. BSQ improved after CAT (P=<0.01) compared to CG and within the CAT and IAT intervention but this was confounded by BMI. FSFI and HADS improved after CAT and IAT compared to controls (P=0.02) and within the CAT and IAT groups.

Anxiety Depression Score (HADS), Short form-36 (SF-36)	Moeller et al 2018 (11) did not see significant changes in SF-36 with motivational interviewing intervention. Ribeiro et al 2019 (19) examined continuous (CAT) and intermittent aerobic (IAT) training compared to a control group with a 16 week intervention. There was a significant increase in Physical function in CAT (P=0.022), Physical Role Functioning (P<0.001), General Health Perception (P<0.001), Vitality (P<0.001), Social Role Functioning (P<0.001), Emotional Role Functioning (P<0.001), and Mental Health (P<0.001). For IAT significant increases were found in Physical Functioning (P<0.001), Physical Role Functioning (P=0.027), General Health Perception (P<0.001), Vitality (P<0.001), Social Role Functioning (P<0.001), Emotional Role Functioning (P=0.011) and Mental Health (P<0.001). These were not compared to CG however where there were no changed noted after 16 weeks.
PCOS-Q domains	Kiel et al 2021 (9) reported on 16 week and 12 month PCOS-Q after HIT or control group. There was no significant impact on any PCOS-Q domain at 16 weeks. At 12 months the body hair domain (P=0.007) and the infertility domain (P=0.003) improved after HV-HIT compared to control and in body hair domain in HV-HIT vs Lv-HIT9 (P=0.025). Moeller et al 2018 (11) demonstrated improvement in 3 domains of PCOS-Q with motivational interviewing, weight (P=0.004), Infertility (P=0.044) and menstruation (P=0.037).

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
Comparison 1. Lifestyle intervention versus minimal/ no treatment	⊕◯◯◯ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Lifestyle interventions versus minimal or no treatment

- Lifestyle interventions are included individually or in combination as detailed below:
    - Dietary intervention vs minimal treatment
    - Exercise intervention (resistance or aerobic) vs minimal treatment
    - Behavioural management techniques for modifying diet or exercise vs minimal treatment
    - Combination of dietary, exercise, or behavioural intervention vs minimal treatment
    - All with duration more than 2 weeks.

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Lifestyle intervention (exercise alone or multicomponent diet combined with exercise and behavioural strategies) should be recommended for all women with PCOS, for improving metabolic health including central adiposity and lipid profile.

- **GRADE Direction and Strength of Recommendation**:

☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **CR:** Healthy lifestyle behaviours encompassing healthy eating and/or physical activity should be recommended in all those with PCOS to optimise general health, quality of life, body composition and weight management (maintaining weight, preventing weight gain and/or modest weight loss).

GRADE Direction and Strength of Recommendation:

☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

- Health professionals should be aware that lifestyle management is a core focus in PCOS management.
- Lifestyle management goals and priorities should be co-developed in partnership with women with PCOS, and value women's individualised preferences.
- Health professionals should discuss barriers and facilitators to optimise engagement and adherence to lifestyle change, including psychological factors, physical limitations, socioeconomic factors, sociocultural factors, as well as personal motivators for change. The value of broader family engagement should be considered. Referral to suitably trained allied health professionals needs to be considered for lifestyle management in women with PCOS.
- Behavioural support in achieving lifestyle change could include: Goal setting, problem solving, self-monitoring and reviewing, e.g. use of SMART goals (Specific Measurable, Achievable, Realistic and Timely)
- There are benefits to a healthy lifestyle even in the absence of weight loss.
    - In those with higher weight, weight management can be associated with significant clinical improvements and the following key points need to be considered including: A lifelong focus on prevention of further

weight gain If the goal is to achieve weight loss, a tailored energy deficit could be prescribed for women, considering individual energy requirements, body weight and physical activity levels.
    - The value in improvement in central adiposity (e.g. waist circumference, waist-hip ratio) or metabolic health
    - The need for ongoing assessment and support

- Health providers should be aware of the higher prevalence of eating disorders and weight stigma when discussing lifestyle management with women with PCOS. [see 3.6]

- Healthy lifestyle and optimal weight management, in the context of structured, intensive and ongoing clinical support, appears equally effective in PCOS as in the general population.

- In those who are not overweight, in the adolescent and at key life points, the focus should be on healthy lifestyle and the prevention of excess weight gain.

- Insulin resistance is considered as a pathophysiological factor in PCOS. However, clinically available insulin assays are of limited clinical relevance and should not be used in routine care (refer to recommendation 1.9.12).

GRADE CONSIDERATIONS

Justifications:
Updated systematic review for this question identified more studies to be included than 2018 Guidelines. Recommendations from general population data are supportive of healthy lifestyle interventions. Few undesirable side effects noted although access, cost and equity are concerns.

Subgroup considerations:
Studies in this review were mainly from adult population with only 1 study including adolescent population. Predominantly these studies were in Caucasian populations with 3 from South America and one from the Middle East. Caution is noted in interpretation for other populations and ethnicities.
No studies included pregnant women or post-menopausal women.

Implementation considerations:
Substantial resources are likely needed to implement the comprehensive lifestyle modifications. The duration and type of intervention is not uniform across the studies therefore specific protocols cannot be recommended. Studies were predominantly in academic medical centers and not community based.

Monitoring and evaluation considerations:
Metrics around women's satisfaction of overall lifestyle management support.
Fidelity checks that health professionals' provision of lifestyle management is consistent with guideline recommendation.

Research priorities:
Additional adequately powered high quality randomised control trials and pragmatic implementation trials are needed to further clarify the efficacy of lifestyle interventions specifically:
Different delivery methods (app based for example)
Longer term follow up to interventions
Duration/sustainability
Co-designed lifestyle intervention

More well studied outcomes for:
Reproductive health – menstrual cycle, ovulation, pregnancy, live births
Emotional health

More diverse populations to be studied:
Diverse ethnicities in low resource environments
Across different life stages – adolescent, post-menopausal, pregnancy
Benefits in non-overweight population

The effects of lifestyle [including optimal amount and type of diet and physical activity] in the preconception period in women, reporting on live birth and obstetric outcomes.

Harmonisation of research outcomes for lifestyle interventions

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Summary of evidence shows benefit to lifestyle intervention in reduction in central adiposity, lipid profile and fasting insulin.

No significant benefit demonstrated to fertility although menstrual function may be improved. Improvement in endocrine function was not clearly demonstrated. There is too little data on emotional outcomes for clear recommendation although improvements were demonstrated in the majority of studies reporting this outcome.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

High dropout rates are noted in many studies but no specific undesirable effects otherwise demonstrated or measured.

Undesirable effects can include women's loss of confidence due to difficulty maintaining sustainable lifestyle change.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

The body of evidence is of a very low to moderate certainty depending on outcome.

Low certainty – WHR, FG score, fasting insulin, total cholesterol

Moderate certainty – waist circumference, LDL

Very low for other outcomes

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☒ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

No specific evidence available in the studies. Likely patient groups and health providers value improvements in health parameters but unclear regarding intervention.

Lack of evidence on quality metrics of lifestyle management with overall overemphasis on weight and BMI which are inadequate markers of metabolic health.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

No significant undesirable effects demonstrated and evidence of some improvements likely favors the option.

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☐ Varies	☐ Large costs	☒ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

No identified cost assessments but the majority of interventions reported are intensive and would require substantial resources.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

No evidence.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

There are no cost-effectiveness studies presented. As noted costs of studied interventions not reported but are resource intensive, but are balanced by health outcome improvements.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

The implementation may be variable due to availability of local resources but recommendation is likely to improve equity.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Health care teams and patients are likely to find lifestyle intervention acceptable. Funders may not prioritise lifestyle management support.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Given the need for intervention teams in the lifestyle medication studies available, the feasibility of the implementation of the intervention would be highly variable.

Question 3.2.

In women with PCOS, are behavioural interventions (compared to different types of behavioural interventions) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	In women with PCOS, are behavioural interventions in addition to diet and/or exercise (compared to diet and/or exercise alone) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?
Clinical leads (key contacts)	Cheryce Harrison
Allocation ranking	Level 1 - new systematic review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Females of reproductive age (postmenarchal and premenopausal) with diagnosed PCOS (NIH, Rotterdam or AEPCOS criteria). Subgroup by age group: Adult 19-44 years Middle Aged 45-64 years Young Adult 19-24 years Adolescent 13-18 years	Behavioural intervention combined with a lifestyle intervention (the latter defined as a structured dietary or exercise intervention designed to induce weight loss through an energy deficit or not designed to induce weight loss through an energy deficit) Duration of lifestyle intervention ≥ 2 weeks.	Lifestyle intervention alone (as described in Intervention)	Primary: Fertility, live birth and pregnancy, Miscarriage, as defined by study authors Secondary: Menstrual regularity (an initiation of menses or significant shortening of cycle length where possible), ovulation (number of ovulatory menstrual cycles where possible) Endocrine: total testosterone, sex hormone-binding globulin (SHBG), free androgen index (FAI) and clinical hyperandrogenism (hirsutism assessed clinically by FerrimanGallwey score) Anthropometric: Weight, BMI, adiposity distribution (by measures including waist circumference, waist-to-hip ratio (WHR)) Metabolic: Oral glucose tolerance test (OGTT), glucose, Fasting glucose, Fasting lipids (total cholesterol, high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C), triglycerides), Fasting insulin, Oral glucose tolerance test (OGTT), insulin, Quality of life and participant satisfaction	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials (RCTs).	English language New search - screen from beginning (no time limit/update).
Exclusion	Taking anti-obesity medications (other than metformin). Bariatric surgery. Conditions with reproductive symptoms similar to PCOS, including congenital adrenal hyperplasia, Cushing's syndrome, hyper-prolactinaemia, thyroid disease and androgen-secreting tumours. Participants are not excluded based on type 2 diabetes, co-morbidities or medication use for clinical or metabolic features of PCOS, as long as this medication use is not a primary component of the intervention or control arms.	Behavioural interventions that are not quantifiable or are delivered alone or with other interventions not classified as lifestyle interventions (diet/exercise), such as medications, supplements, etc. Behavioural interventions combined with anti-obesity medication or surgery	Other behavioural interventions/ minimum or usual care/ standard dietary or exercise advice Behavioural interventions that are not quantifiable or combined with anti-obesity medication or surgery	None	Any study lower than a randomized controlled trial study. Non-randomized controlled trials are excluded.	None

Evidence processing: The literature search and screening were performed together in Covidence. Studies were selected and appraised by two reviewers using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. No studies met inclusion criteria for this review.

Question 3.2.

In women with PCOS, are behavioural interventions (compared to different types of behavioural interventions) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?

BACKGROUND:

Clinical need for the question

Lifestyle intervention (diet, physical activity and behavioural interventions) is first line PCOS treatment. With weight gain increasing in women across the population, and prevention of weight gain a national and international priority, the need for preventive strategies also extends to PCOS [1]. Indeed, women with PCOS demonstrate a greater mean 10-year weight gain of 8.9kg (95% CI: 7.5-10.2) compared to women without PCOS [6.2kg (95% CI: 6.0-6.5)] [2] which translates to ~1kg average expected weight gain in PCOS per year compared to the mean of ~600 grams/year in young women without PCOS.

Previous lifestyle intervention studies in PCOS have focused on short-term dietary interventions with or without an exercise component. Numerous uncontrolled dietary intervention studies which have shown limited success, with an overall weight loss effect of between 5-15% of initial body weight in addition to improvement in complications exacerbated by weight gain including IR, menstrual dysfunction and psychological features [3], however retention and sustainability were suboptimal. With the majority of lifestyle intervention studies focused on dietary intervention there is an unmet need to explore other strategies in PCOS, including behaviour change interventions.

Behavioural and cognitive behavioural interventions are the most commonly used psychological approaches to weight management. Behaviour therapy results in significantly greater weight loss than placebo, and behaviour/cognitive behaviour therapy combined with diet and exercise is more effective than diet and exercise interventions alone. More intensive behavioural interventions are associated with greater weight loss [4]. Behavioural and cognitive behavioural intervention approaches target the behaviours (and their antecedents and consequences) and cognitions thought to be responsible for maintaining a positive energy balance [5]. Behavioural and cognitive behavioural interventions have the strongest empirical support in the treatment of overweight/obesity and are recommended by international practice guidelines for the treatment of overweight and obesity [e.g., 6, 7].

On systematic review, three randomised controlled trials (across five published papers (8-12) evaluating behavioural change therapy in conjunction with lifestyle (i.e. diet and/or physical activity) were identified. On evaluation all three trials were deemed ineligible for inclusion due to use of cognitive behavioural therapy (CBT) to address depression in women with PCOS (8) or lacked a structured lifestyle intervention comparator group (9, 10). Both RCTs (9, 10) contained a comparator group considered to be aligned to care as usual, with allocated participants provided unstructured, general healthy lifestyle recommendations with or without encouragement to lose weight through publicly available services.

Although not eligible to inform a GRADE recommendation the identified studies provide preliminary insight of the efficacy of behavioural therapy in conjunction with lifestyle (diet and/or physical activity) intervention in women with PCOS. Across the three RCTs, study design was highly heterogeneous, with sample sizes ranging 15 to 183 and intervention duration either 4 months (8, 10) or 12 months (9). Dropout rate was highly variable, ranging from 16.2% (10) to 63.3% (12-month trial (9)). Risk of bias was either moderate (n=2 studies) or high (n=1 study). All studies included overweight women.

The following outcomes were assessed:

<u>Outcome 1: Anovulation (assessed in 2 studies, moderate ROB)</u>

One study (10) reported a significantly higher proportion of participants with improved menstrual cyclicity following a 4-month intervention compared with care as usual (59% [n = 20/34] vs 24% [n = 8/34]) with a mean difference of 35% (95% CI: 16-60, P = 0.003).

<u>Outcome 2: Weight loss (assessed in 3 studies, moderate/high ROB)</u>

Two studies with small/moderate sample sizes of n=15 and n=68 reported no significant differences between groups in weight following intervention (8, 10).

One larger study (n=120) reported a significant difference in weight loss between groups at 12 months of 3.7 kg in favour of lifestyle with behavioural intervention compared with care as usual (d = −0.25; P < 0.001). However, the dropout rate was >50%, increasing uncertainty of reported results.

Outcome 3. Waist hip ratio (assessed in 2 studies, moderate/high ROB)

One study with small sample size (n=15) reported a significant difference in WHR between groups (p=0.04) in favour of intervention, however risk of bias was high. One study reported no change following intervention.

Outcome 4. Quality of life (assessed in 1 study, moderate ROB)

No significant difference between interventions

Outcome 5. HOMA-IR (assessed in 3 studies, moderate/high ROB)

No significant difference between interventions

Outcome 6. Lipids (cholesterol, triglycerides, HDL, LDL; assessed in 2 studies, moderate ROB)

No significant difference between intervention in any variables

Overall, results suggest intervention involving structured lifestyle (diet and/or exercise) with behavioural modification is not favourable to care as usual for the outcomes of WHR, QoL, HOMA-IR or lipids following intervention. There is some evidence to support lifestyle (diet and/or exercise) with behavioural modification for weight loss, however results need to be interpreted with caution due to a significant reported dropout rate (>50% at follow-up) and an overall moderate risk of bias.

There is some evidence to support lifestyle (diet and/or exercise) with behavioural modification for improving menstrual function from one study, deemed moderate risk of bias with relatively small sample size over 4-month period.

GRADE EVIDENCE CERTAINTY

Comparison	GRADE for critical outcomes
Comparison 1. Behavioural lifestyle versus control	No evidence

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Lifestyle (structured diet and/or exercise therapy) with behavioural intervention [L+B] versus Lifestyle (structured diet and/or exercise) intervention alone [L]

CONCENSUS RECOMMENDATION

CR: Lifestyle interventions could include behavioural strategies such as goal-setting, self-monitoring, , problem solving, assertiveness training, reinforcing changes and relapse prevention, to optimise weight management, healthy lifestyle and emotional wellbeing in women with PCOS.

GRADE Direction and Strength of Recommendation:

☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

Behavioural support could include: goal setting, problem solving, self-monitoring and reviewing, or SMART goals (Specific, Measurable, Achievable, Realistic and Timely).

Comprehensive healthy behavioural or cognitive behavioural interventions could be considered to increase support, engagement, retention, adherence and maintenance of healthy lifestyle and improve health outcomes in women with PCOS.

GRADE CONSIDERATIONS

Justifications:
None of the identified studies met the eligible criteria for inclusion.

Subgroup considerations:
None

Implementation considerations:
Overall, there remains a paucity of evidence to definitively support implementation of the additional of behavioural therapy on top of lifestyle management in women with PCOS as an evidence base has not been established to guide what should be implemented, how, by whom, where and at what cost.

Cost effectiveness
High quality evidence to assess this criterion is not available. Regional circumstances should be considered when assessing cost and resources.

Equity
Lack of evidence to support equity in intervention design to diverse groups of women, using variable intervention delivery techniques to enhance reach, accessibility and engagement. Co-design not featured in intervention design broadly.

Acceptability
Health professional training, time, capability and confidence may limit acceptability for implementation of behavioural and cognitive behavioural interventions. Barriers could be related to the balance between consultation time available and efficacy to induce change.

Feasibility

Policy settings, health system enablers, education and engagement of health professionals and patient considerations (such as the cost of longer consultations and/or consultations with other health professionals) will affect feasibility.

Implementation
Barriers to implementation could include resources available to healthcare professionals, adequate training and clinical acceptability related to time, potentially increased engagement with additional health care providers and increased patient contact.

Monitoring and evaluation considerations:
Monitoring the access for behavioural therapy for lifestyle management.
Difficult to monitor due to lack of standardised training for delivering behavioural therapy.

Research priorities:
Clear and consistent definition of behavioural therapy, lifestyle interventions and outcomes in research.

There remains a paucity of high-quality evidence to inform this question. Further studies are required to definitely evaluate outcomes, alongside feasibility evaluation, include cost-effectiveness analysis to inform broader scale-up.

High-quality randomised controlled trials evaluating the efficacy of behavioural interventions to optimise health behaviour change and/or weight management are required to evaluate additional benefits of adding of behavioural strategies and/or behavioural/cognitive behavioural interventions to dietary and/or exercise prescription approaches in this population for improved anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes.

Longitudinal evaluation from PCOS specific research would address current gaps and provide insight across feasibility, acceptability, implementation and efficacy.

High-quality randomised controlled trials are important to address:

- The extent of the additional benefits of adding behavioural strategies and/or behavioural/cognitive behavioural interventions to stand-alone dietary and/or exercise prescription approaches in improving weight, metabolic, reproductive and psychosocial well-being;
- Provide evidence of the efficacy of differing types of lifestyle management;
- Provide evidence for the effect of behavioural strategies and/or behavioural/cognitive behavioural interventions across varying phenotypic profiles of women with polycystic ovary syndrome including variation by body mass index categories of healthy, overweight or obese;
- Provide evidence for the effect of behavioural strategies and/or behavioural/cognitive behavioural interventions in the prevention of weight gain compared to weight loss.
- Provide evidence for the effect of behavioural strategies and/or behavioural/cognitive behavioural interventions for improved metabolic (i.e. insulin resistance), reproductive (i.e. menstrual dysfunction, infertility) and psychosocial dysfunction (i.e. quality of life, depression, anxiety, disordered eating) in women with PCOS.
- Provide evidence to inform intervention acceptability to participants given high-dropout rates that are mainstay across lifestyle interventions, particularly those of longer duration.

GDG 3

Question 3.3.

In women with PCOS, are diet interventions (compared to different diets) effective for improving anthropometric, metabolic, fertility, and emotional wellbeing outcomes?

1. SELECTION CRITERIA

Table 1. PICO Criteria for Inclusion	
Question	Q 3.3) In women with PCOS, are diet interventions (compared to different diets) effective for improving anthropometric, metabolic, fertility, and emotional wellbeing outcomes?
Clinical leads (key contacts)	**Dr. Kate Marsh** PCOS Health and Nutrition Centre, Australia drkatemarsh@gmail.com
Allocation ranking	Level 2- Update systematic review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(Language, year)*
Inclusion	Women with Polycystic Ovary Syndrome. All ages (diagnosed by the NIH 1990 [1], Rotterdam 2003 [2], or AE-PCOS 2006 [3] criteria). Women of all weights. All medical conditions (co-morbidities). Document specific co-morbidities. Any lifestyle characteristics. Document all characteristics (e.g., smokers).	All types of dietary compositions. Interventions were included that both aimed to achieve weight loss and for which weight loss was not specifically aimed or weight maintenance was aimed for. Commonly prescribed dietary compositions include low carbohydrate, low GI, reduced calorie, very low calorie, and high protein diets. Diet intervention may include herbal or complementary medicines or ingredients, but the control diet must also use the same herbal or complementary medicine. Duration of dietary intervention ≥ 2 weeks.	All types of dietary compositions (different from the intervention diet).	**Anthropometric outcomes.** These include weight loss measures such as % and kg of original weight lost, % and kg weight loss over time (e.g., kg/week) if reported, reduction in BMI, reduction in WC and waist-to-hip ratio, % and kg fat mass (central/truncal and total) measured using BIA, DEXA, MRI or CT, % and kg lean mass. **Fertility outcomes** include the rate of pregnancy, rate of live birth, and rate of miscarriage. Menstrual regularity; Initiation of menses or significant shortening of cycle length or any other reporting formats. Ovulation measures such as the number of ovulatory menstrual cycles or any other reporting formats. **Non-fertility outcomes** such as reproductive hormonal parameters. These include total testosterone, sex hormone binding globulin (SHBG), measures of free androgens (e.g., free androgen index, free testosterone), and hirsutism (Ferriman-Gallwey score). **Metabolic outcomes.** These include insulin and glucose measures such as fasting blood glucose, oral glucose tolerance test (OGTT) glucose and insulin, fasting insulin, homeostasis assessment of insulin resistance (HOMA-IR), insulin sensitivity test – oral glucose tolerance test (ISI-OGTT), postprandial glucose, HbA1-C. Lipid profile measures such as total cholesterol, high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C), LDL: HDL ratios, triglycerides, apoproteins. Blood pressure, highly sensitive C-reactive protein (CRP), fibrinogen, and plasminogen activator inhibitor (PAI). **Quality of life outcomes, and emotional wellbeing outcomes.** **Surrogate measures of insulin resistance.**	Systematic reviews and RCTs addressing the outcomes are sought for the specified outcomes.	English Limit to publications between 7 June 2017 to 10 August 2022 (as an update of the previous draft of GDG 3.3. in the 2018 guideline)
Exclusion	Women taking anti-obesity medications (e.g., orlistat). Women with PCOS who are not defined as diagnosed by the NIH 1990[38], Rotterdam 2003[39], or AE-PCOS 2006[40] criteria.	Comparisons of different modes of delivery of the same or different dietary interventions. Use of other dietary supplements (e.g., meal replacements, diet pills).	Usual diet or original patient diet if it is has not defined its nutritional composition.	Fat mass measured using skin-fold tests.	Any study lower than an RCT. Non-RCT studies are excluded.

OR clinical trial.mp. or clinical trial.pt. or random.mp."	Not Applicable

Evidence processing: Studies were selected and appraised by a total of 6 reviewers (Isabella Xavier, Julia Michalak, Steph Cowan, Kimberly Hopkins, Thais Rasia, Loyal Pattuwage) in consultation with the key contacts/ evidence team (Kate Marsh, Lisa Moran, Aya Mousa, Jillian Tay) using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by one reviewer. When a decision could not be made based on the title and abstract alone, the full text was retrieved. Eighteen publications from 12 RCTs met the inclusion criteria for this review (see Table 4.1). Out of 12 RCTs, four (8 publications) were retrieved from the updated search (after the 2018 guideline); eight RCTs (10 publications) were retrieved from the previous version of the guideline.

*Note that five studies (Gower 2013/Hoover 2021, Mehrabani 2012, Panico 2014, Wong 2016, Moran 2003/7) that were initially excluded from the previous guideline met the revised PICO of the present update and were therefore included.

5. Study Characteristics of Included Studies

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other
Asemi et al. 2014-2015, Iran	Women with PCOS; AMC	Parallel RCT	Intervention, 24 Control, 24	DASH diet with target energy deficit 350–700 kcal/d	Iranian traditional dietary pattern and target energy deficit of 350–700 kcal/d	8 wks	Fasting insulin, fasting glucose, HOMA-IR, TC, LDL-C, HDL-C, TG, weight, WC	DASH eating pattern resulted in the improvement of insulin resistance, serum hs-CRP levels, and abdominal fat accumulation vs control diet.	Low risk
Azadi-Yazdi et al., 2016, Iran	Women with PCOS; AMC	Parallel RCT	Intervention, 28 Control, 27	DASH diet with target energy deficit 350–500 kcal/d	Control diet and target energy deficit of 350–500 kcal/d)	12 wk	Weight, BMI, WC, waist-to-hip ratio, lean mass, fat mass, FAI, total testosterone, SHBG	DASH diet had beneficial effects on weight, BMI, fat mass, androstenedione, SHBG, and antioxidant capacity vs control diet.	Moderate risk/Low certainty
Foroozanfard et al., 2017, Iran	Women with PCOS; AMC	Parallel RCT	Intervention, 30 Control, 30	DASH diet with target energy deficit 350–700 kcal/d	Iranian traditional dietary pattern with target energy deficit 350–700 kcal/d	12 wk	Weight, BMI, FAI, total testosterone, SHBG, fasting glucose, insulin sensitivity, insulin, HOMA-IR	DASH diet had beneficial effects on weight, BMI, AMH, markers of insulin metabolism, SHBG, FAI, NO, and MDA levels compared with the low-calorie control diet but did not affect other metabolic profiles vs control diet.	Low risk
Gower et al., 2013, USA	Women with PCOS; AMC	Cross-over RCT	Intervention, 27; Control, 23	Low carbohydrate diet without energy restriction	Standard diet without energy restriction	8 wks (20 wks post-intervention follow up)	β-cell responsiveness, Serum testosterone concentration, insulin sensitivity (primary); fasting glucose, fasting insulin, FSH, LH, SHBG, testosterone, free androgen index, serum cholesterol	Modest reduction in dietary CHO in the context of a weight-maintaining diet likely improves metabolic profile that may lead to a decrease in circulating testosterone vs control diet.	Moderate risk/Low certainty
Hoover et al., 2021, USA	Women with PCOS; AMC	Cross-over RCT	Intervention, 30 Control, 30	Low glycemic load diet	High glycemic load diet	Eight weeks (20 wks post-intervention follow-up)	Insulin, glucose	No significant differences between any outcomes between the groups of interest were observed.	High risk/Low certainty
Hosseini Marnani et al., 2021, Iran	Women with PCOS; AMC	Parallel RCT	Intervention, 15 Control, 15	High-protein, low-carbohydrate diet	Standard diet	12 wk	Fasting insulin, fasting glucose, HOMA-IR, fat%, muscle%	No significant differences between any outcomes between the groups of interest were observed.	High risk/Low certainty
Kazemi et al. 2018-2020, Canada	Women with PCOS; AMC	Parallel RCT	Intervention, 30 Control, 31	Low glycemic index pulse-based diet without energy restriction	TLC diet without energy restriction	16 wks (with 6 and 12 mos post-	Weight, BMI, WC, total body fat mass, trunk fat mass, total body fat, total body lean mass, SBP, DBP, FPG, Fasting insulin,	A low glycemic index diet rich in dietary pulses was more effective at reducing metabolic profile (insulin resistance, diastolic blood pressure,	Low risk

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings	Other
						intervention follow-up)	HbA1c, HOMA-IR, fasting insulin/glucose ratio, total cholesterol, HDL-C, LDL-C, TC/HDL-C, TG, hsCRP, FNPO, OV, FAI, menstrual cycle length, HRQol	LDL-C, TC/HDL-C and increasing HDL-C than the TLC group). Reproductive and HRQoL outcomes did not differ between groups post-intervention (similar improvements over time), despite a greater loss in femoral neck BMD in the pulse-based diet group.	
Mehrabani et al., 2012, Iran	Women with PCOS; AMC	Parallel RCT	Intervention, 23 Control, 26	Modified hypocaloric diet (MHCD) with a target energy deficit of 500-1000 kcal/d	Conventional hypocaloric diet (CHCD) with a target energy deficit of 500-1000 kcal/d	12 wks	Fasting insulin, fasting glucose, HOMA-IR, TC, LDL-C, HDL-C, TG, weight, WC, TT, FAI, body composition including total body fat and lean body mass, FSH, LH, estradiol, total testosterone, DHEAS, and androstenedione Fasting insulin and adiponectin Serum glucose, triglyceride, total cholesterol, HDL-C	Modified hypocaloric diet with high-protein and low-glycemic-load foods increased in insulin sensitivity and decreased in hsCRP level vs control diet.	Moderate risk/Low certainty
Moran et al. 2003, Australia	Caucasian women with PCOS and overweight BMI	RCT	Intervention, 14 Control, 14	High protein (HP; 40% carbohydrate and 30% protein)	low protein (LP; 55% carbohydrate and 15% protein) diet	12 wk restriction + 4 wk maintenance	Weight, BMI, body fat by DXA, SHBG, total testosterone (bound and unbound), LH, FSH, progesterone, estradiol, TSH, PRL, and 17α-hydroxyprogesterone; TC, LDL, HDL, TG, insulin, glucose (and AUC insulin + glucose); HOMA-IR, menstrual cyclicity, ovulation, hirsutism, dietary compliance.	Modest difference in HDL-C and TC/HLD-C ratio, glucose AUC and FAI between diets but all other outcomes NS, despite changes over time/ within-group in multiple outcomes.	High risk
Panico et al., 2014, Italy	PCOS women	Cross-over RCT	Intervention, 7 Control, 7	Isocaloric and isoenergetic moderately low-glycaemic-load diets	Moderately high-glycaemic-load diets	6 mos	Fasting insulin, fasting glucose, HOMA-IR, total cholesterol, TG, weight, TT, FSH, LH, DHEAS	An isocaloric and isoenergetic low-glycemic-load diet improved metabolic outcomes (insulin resistance and serum androgen levels) vs control diet.	High risk/Very low certainty

Moderate risk/Low certainty

Abbreviations: PCOS: polycystic ovary syndrome, RCT: randomized control trial, AMC: academic medical center, DASH: dietary approaches to stop hypertension, BMI: body mass index, FAI: free androgen index, SHBG: sex hormone binding globulin, HOMA-IR: homeostatic model assessment for insulin resistance, AMH: anti mullerian hormone, NO: nitric oxide, MDA: malondialdehyde, GL: glycaemic load, HPP: high-protein, low-carbohydrate diet + placebo capsule, SDP: standard diet + placebo capsule, PBD: pulse-based diet, TLC: therapeutic lifestyle changes, FNPO: follicle numbers per ovary, SHBG: sex hormone binding globulin, OV: ovarian volume, FAI: free androgen index, HA: hyperandrogenism, OD: ovarian dysmorphology, PI: postintervention, HRQoL: Health related quality of life, TC: total cholesterol, HDL-C: high density lipoprotein cholesterol, LDL-C: low density lipoprotein cholesterol, TG: triglycerides, WC: waist circumference, hsCRP: high-sensitivity C-reactive protein, FSH: follicle stimulating hormone, LH: luteinizing hormone, CHO: carbohydrate, BMD: bone mineral density, FPG: fasting plasma glucose, HbA1c: hemoglobin A1C, TT: total testosterone, DHEAS: dehydroepiandrosterone sulfate, HP: high protein, NP: normal protein, HC: high cholesterol, MHCD: modified hypocaloric diet, CHCD: conventional hypocaloric diet, 17-OH P: 17-hydroxyprogesterone, OGTT: oral glucose tolerance test.

6. FINDINGS:

COMPARISON 1: Diet interventions versus other diet interventions

Evidence Summary:

We included 12 RCTs (18 publications) with 496 participants. With the exception of the comparison of high protein/low carb diet versus standard diets, all other results are summarized descriptively for most comparisons since meta-analyses were not feasible due to: (1) heterogeneity in the dietary composition of intervention arms; (2) variability in the dietary composition of control arms (e.g., high glycaemic, standard diet, TLC diet, high fat diet); and (3) variability in energy restriction prescribed (e.g., with energy restriction to variable levels or without energy restriction). For the three trials that compared the DASH to variable control diet (Asemi 2014-2015, Azadi-Yazdi 2016, and Foroozanfard 2017, see rows 1-3 in Section 5 Table above), all were small (n=48-60) and from only a single country (Iran), making any pooled analyses or assumptions less representative/ generalizable across PCOS populations for the purposes of the present report. Note also that there are notices of concern published alongside studies from this group (including Asemi et al. 2015) regarding concerns around study integrity and unsatisfactory responses from the authors/ ethics committees. Hence, results should be interpreted with caution.

Overall, out of the 12 included RCTs, nine had a parallel design, and two had a cross-over design (Gower et al., 2013 & Hoover et al., 2021 [same study population] and Panico et al., 2014) and approximately half (50%) were conducted in Iran (n=6 RCTs) with 25% in the USA (n=3 RCTs).

Regarding the meta-analysis results of high protein/low carb diet versus standard diets, our pooled analyses revealed that HDL-C decreased following the consumption of the high protein diet (N=3 effect estimates; N=95 women; MD: -2.27; 95%CI [-4.29; -0.24] mg/dL; P=0.03; I^2=79%). In contrast, other evaluated outcomes did not differ between diet groups, including WC (N=1 effect estimate; N=18 women; MD: -4.03; 95%CI [-14.87; -6.81] cm; P=0.5), total testosterone (N=1 effect estimate; N=49 women; MD: 0.20; 95%CI [-0.24; 0.64] ng/mL; P=0.4), FAI (N=1 effect estimate; N=49 women; MD: 0.90; 95%CI [-0.95; 2.75] mg/dL; P=0.3), fasting insulin (N=3 effect estimates; N=106 women; SMD: 0.45; 95%CI [-0.56; -1.46] mg/dL; P=0.4; I^2=83%), glucose (N=4 effect estimates; N=125 women; MD: -1.68; 95%CI [-0.13; 3.50] mg/dL; P=0.07; I^2=0%), HOMA-IR (N=3 effect estimates; N=106 women; SMD: 0.39; 95%CI [-0.51; 1.29]; P=0.4; I^2=79%), LDL-C (N=3 effect estimates; N=95 women; MD: -7.62; 95%CI [-27.70; 12.45] mg/dL; P=0.5; I^2=80%), TG (N=2 effect estimates; N=77 women; MD: -6.58; 95%CI [-15.52; 2.36] mg/dL; P=0.03; I^2=79%). Further details are available in Table 1.1.1. Summary table of meta-analysis results. As clarified earlier, meta-analyses for comparing the impacts of other dietary patterns on PCOS health outcomes were not possible due to the paucity of data.

Overall, these observations highlight the need for more RCTs across geographically, racially, and ethnically diverse populations. Overall, mounting data point to the potential health benefits of modifying the glycaemic index or load of the diet with an emphasis on energy control for achieving and maintaining a healthy weight/ body composition and balancing the dietary composition of the diet with healthy eating habits. The dietary patterns may include plant-based diets rich in vegetables, pulse foods, complex carbohydrates, or the DASH eating plan. These dietary patterns may benefit metabolic regulation (e.g., insulin sensitivity) and androgen status (testosterone) levels in PCOS, albeit data are sparse on HRQoL and emotional well-being.

Conclusions: Together, there remains uncertainty around the effects of any specific diet interventions (compared to different diets) for improving anthropometric, metabolic, fertility, and emotional well-being outcomes in PCOS, due to significant heterogeneity across studies, small sample sizes of current RCTs and lack of harmonized assessment of health outcomes (including fertility and emotional well-being), making pooling of results challenging. However, descriptive evaluations indicate that modifying the glycaemic index may improve the metabolic (e.g., insulin resistance) and reproductive (hyperandrogenism) health outcomes of PCOS. Few studies looked at the impact of lifestyle intervention on menstrual cyclicity and HRQoL, and no study evaluated pregnancy, ovulation rate, or miscarriage to

the best of our knowledge. Most studies were heterogeneous and of moderate to high risk of bias and low quality/ certainty.

Outcome: HDL												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[4]	Low external validity[3]	24	24	NS differences	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: LDL												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[4]	Low external validity[3]	24	24	NS differences	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Triglycerides												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[4]	Low external validity[3]	24	24	NS differences	No difference	⊕◯◯◯ VERY LOW	CRITICAL

[1] Downgraded once for risk of bias due some/majority of the evidence being derived from moderate or high risk of bias studies
[2] Downgraded once for serious imprecision due to small sample sizes in the included studies
[3] Downgraded once due to all studies being conducted in Iran, two of which compared with DASH with a traditional Iranian diet, meaning the evidence has poor generalisability/ external validity
[4] Downgraded twice for very serious imprecision due to the evidence being derived from a single study with a small sample size

Note: Inconsistency was not downgraded for studies showing mixed results where some had an effect and the others did not; this was only downgraded where studies showed *significant* effects but in different directions. NS, non-significant. Please note: some studies by this group (including Asemi et al. 2015 included in this analysis) have been issued with Notices of Concern due to serious concerns raised about the integrity of the reported methods, results and analysis, where responses by the leading author and ethics committees were been unsatisfactory and inconclusive.

COMPARISON 2: Low glycaemic load (high fat/low carb) versus high glycaemic load												
	Quality assessment						No. participants*					
No. studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other	Low GL	High GL	Effect, narrative	Favours	Certainty	Importance
Outcome: Weight

Outcome: Total testosterone												
1	RCT	very serious[1]	not applicable	not applicable	very serious[2]	none	23	26	0.20 [-0.24, 0.64]	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Free androgen index												
1	RCT	very serious[1]	not applicable	not applicable	very serious[2]	none	23	26	0.90 [-0.95, 2.75]	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Fasting insulin												
3	RCT	very serious[1]	very serious[5]	no serious indirectness	serious[3]	none	52	54	SMD= 0.45 [-0.56, 1.46]	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Fasting glucose												
4	RCT	very serious[1]	serious[4]	no serious indirectness	serious[3]	none	61	64	1.68 [-0.13, 3.50]	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: HOMA-IR												
3	RCT	very serious[1]	very serious[5]	no serious indirectness	serious[3]	none	52	54	SMD= 0.39 [-0.51, 1.29]	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: HDL												
3	RCT	very serious[1]	serious[4]	no serious indirectness	serious[3]	none	46	49	-2.27 [-4.29, -0.24]	**Lower in High Protein Diet**	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: LDL												
3	RCT	very serious[1]	very serious[5]	no serious indirectness	serious[3]	none	46	49	-7.62 [-27.70, 12.45]	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Triglycerides												
2	RCT	very serious[1]	no serious inconsistency	no serious indirectness	serious[3]	none	37	40	-6.58 [-15.52, 2.36]	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Change in Testosterone												
2	RCT	very serious[1]	no serious inconsistency	no serious indirectness	serious[3]	none	36	39	-0.01 [-0.15, 0.13]	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Change in HDL-C												
2	RCT	very serious[1]	no serious inconsistency	no serious indirectness	serious[3]	none	36	39	1.33 [-3.26, 5.92]	No difference	⊕◯◯◯ VERY LOW	CRITICAL

Outcome: Change in LDL-C											
2	RCT	very serious[1]	no serious inconsistency	no serious indirectness	serious[3]	none	36	39	-1.87 [-10.77, 7.02]	No difference	⨁◯◯◯ VERY LOW	CRITICAL
Outcome: Change in Triglycerides											
2	RCT	very serious[1]	serious[4]	no serious indirectness	serious[3]	none	36	39	1.51 [-13.83, 16.86]	No difference	⨁◯◯◯ VERY LOW	CRITICAL

[1] Downgraded twice for risk of bias due all the evidence being derived from high/ moderate risk of bias studies

[2] Downgraded twice for very serious imprecision due to the evidence being derived from a single study with a very sample size

[3] Downgraded once for serious imprecision due to small sample sizes in the included studies

[4] Downgraded once for inconsistency due to variation in the direction of the effect estimate and/or wide CI

[5] Downgraded twice for very serious inconsistency due to variation in the direction of the effect estimate and/or wide CI and significant heterogeneity by I^2 or CIs not overlapping

COMPARISON 4: Low glycaemic index versus therapeutic lifestyle change												
	Quality assessment						No. participants*					
No. studies	**Design**	**Risk of bias**	**Inconsistency**	**Indirectness**	**Imprecision**	**Other**	**Low GI**	**TLC**	**Effect, random [95% CI]**	**Favours**	**Certainty**	**Importance**
Outcome: Weight												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	31	30	NS between groups	No difference	⊕⊕◯◯ LOW	CRITICAL
Outcome: BMI												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	31	30	NS between groups	No difference	⊕⊕◯◯ LOW	CRITICAL
Outcome: Waist circumference												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	31	30	NS between groups	No difference	⊕⊕◯◯ LOW	CRITICAL
Outcome: Total testosterone												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	31	30	NS between groups	No difference	⊕⊕◯◯ LOW	CRITICAL
Outcome: Free androgen index												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	31	30	NS between groups	No difference	⊕⊕◯◯ LOW	CRITICAL
Outcome: Fasting insulin												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	30	29	NS between groups	No difference	⊕⊕◯◯ LOW	CRITICAL
Outcome: Fasting glucose												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	30	29	NS between groups	No difference	⊕⊕◯◯ LOW	CRITICAL
Outcome: HOMA-IR												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	30	29	NS between groups	No difference	⊕⊕◯◯ LOW	CRITICAL
Outcome: HDL												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	31	30	Increased in pulse-based low GI diet	**Low GI**	⊕⊕◯◯ LOW	CRITICAL
Outcome: LDL												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	31	30	Reduced in pulse-based low GI diet	**Low GI**	⊕⊕◯◯ LOW	CRITICAL
Outcome: Triglycerides												
1	RCT	no serious risk of bias	not applicable	not applicable	very serious[1]	none	31	30	Reduced in pulse-based low GI diet	**Low GI**	⊕⊕◯◯ LOW	CRITICAL

[1] Downgraded twice for very serious imprecision due to the evidence being derived from a single study with a small sample size.
Note: single study by Kazemi et al. 2018 examined this comparison. Effects reported refer to differences between groups rather than differences from baseline within each group.

COMPARISON 5: Low glycaemic load (High fat/ low carb) versus low fat												
	Quality assessment						No. participants*					
No. studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other	Low GL (High fat/ low carb)	Low Fat	Effect, random [95% CI]	Favours	Certainty	Importance
Outcome: Weight												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: BMI												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	Greater decrease in BMI percentile in low fat group	**Low fat**	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Waist circumference												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Total testosterone												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Free androgen index												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Fasting insulin												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Fasting glucose												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: HOMA-IR												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: HDL												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: LDL												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: Triglycerides												
1	RCT	serious[1]	not applicable	not applicable	very serious[2]	Low external validity[3]	7	9	NS between groups	No difference	⊕◯◯◯ VERY LOW	CRITICAL

[1] Downgraded once for serious risk of bias due to the evidence being derived from a single study with moderate risk of bias.
[2] Downgraded twice for very serious imprecision due to the evidence being derived from a single study with a very small sample size.
[3] Downgraded once due to low external validity since the single included study is limited to adolescents with overweight/obesity and results are not generalisable to wider populations of women with PCOS
Note: single study by Wong et al. 2015 examined this comparison. Effects reported refer to differences between groups rather than differences from baseline within each group.

7.1. DATA EXTRACTION TABLES – DICHOTOMOUS OUTCOMES

Not applicable.

7.2. DATA EXTRACTION TABLES – CONTINUOUS OUTCOMES

For clarity, all studies included in the updated search after the publication of the previous guideline in 2018 are shown in grey rows, and others that were included in the updated search are shown in green rows below.

OUTCOME: Weight										
		COMPARISON (if applicable):								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**

OUTCOME: HRQoL										**OUTCOME TYPE:** Continuous
		COMPARISON (if applicable):								
Author, year	**Unit of outcome (e.g. g, mg, µg, mmol/L, etc.)**	**Method of measurement**	**Mean (specify if median) in intervention/ exposure group**	**SD (or specify if other measure: IQR, SE or 95% CI) in intervention / exposure group**	**Sample size (n within this group)**	**Mean (specify if median) or median in control / comparison group**	**SD (or specify if other measure: SE, IQR or 95% CI) in control/ comparison group**	**Sample size (n within this group)**	**Are these values adjusted or crude?**	**If adjusted, what variables were included in the model?**
Kazemi et al., 2018	Not Applicable	Researcher-designed HRQoL questionnaire across five domains*	Not Applicable	Not Applicable**	28	Not Applicable	Not Applicable**	27	Crude	Not Applicable
Abbreviations: HRQoL, health-related quality of life, TLC: therapeutic lifestyle changes *Domains included: health concerns (12 items); (2) healthcare satisfaction (five items); (3) knowledge about PCOS (23 items); (4) healthy lifestyle behaviors (six and eight items in the subdomains of active living and healthy eating, respectively); and, (5) feelings and experiences about participating in the intervention (13 items). ** Baseline and post-intervention values across domains were reported on the Likert scale. Crude values not applicable for the purposes of current review and summarized below: Mean scores of the five domains of the HRQoL survey improved across both the pulse-based and TLC diet groups post-intervention without differences between groups. The largest mean increases in time-effects occurred in the domains of healthy eating ($p = 0.0001$, ES [partial eta squared as a result of the analyses of variance] = 0.68), knowledge about PCOS ($p < 0.001$, ES = 0.48), physical activity ($p = 0.0001$, ES = 0.37), healthcare satisfaction ($p < 0.0001$, ES = 0.35), feelings and experiences about participating in the lifestyle intervention ($p = 0.004$, ES = 0.14), and health concerns ($p = 0.02$, ES = 0.11). Together, both interventions improved HRQoL scores in women with PCOS without prescribed energy-restriction.										
OUTCOME: Emotional well-being										**OUTCOME TYPE:** Continuous

Abbreviations: HPLC, high protein low-carbohydrate diet; LPHC, low-protein high-carbohydrate diet.										

APPENDIX. STUDY CHARACTERISTICS AND QUALITY APPRAISAL

For clarity: N=5 RCTs retrieved in the updated search (after the 2018 Guideline) are shown in tables with heading rows highlighted in the green highlights below, and N=8 RCTs included from previous RCTs retrieved in the 2018 Guideline for this GDG are highlighted in tables with heading rows highlighted in the green highlights below. Studies are sorted alphabetically.

Study ID	Asemi 2014
Study citation	Asemi, Z., Samimi, M., Tabassi, Z., Shakeri, H., Sabihi, S. S., & Esmaillzadeh, A. (2014). Effects of DASH diet on lipid profiles and biomarkers of oxidative stress in overweight and obese women with polycystic ovary syndrome: a randomized clinical trial. *Nutrition, 30*(11-12), 1287-1293. Asemi, Z., & Esmaillzadeh, A. (2015). DASH diet, insulin resistance, and serum hs-CRP in polycystic ovary syndrome: a randomized controlled clinical trial. *Hormone & Metabolic Research, 47*(3), 232-238.
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	
Patient/population/participants	DASH diet group age= 22.1±3.2 years Control diet group age = 24.7±6.0 years
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	DASH diet group BMI= 30.3±4.5 kg/m² Control diet group BMI = 28.6±5.8 kg/m²
Medication History	Women with "current or previous (within the last six mo) use of hormonal, antidiabetic, or ant obesity medications" were excluded
N per group	The number of participants that were: ● Allocated/randomised: DASH diet group= 27, control diet group= 27 ● Assessed at the end of study: DASH diet group= 24, control diet group= 24
Setting	Kashan, Iran. "women who attended gynecology clinics affiliated with Kashan University of Medical Sciences, Kashan, Iran, were screened for PCOS"
Intervention	Eight-week intervention. "As all study participants were overweight or obese, both diets were designed to be calorie-restricted (350–700 kcal less than the computed energy requirement for each participant; 350 kcal for women with BMI 25–27.5 kg/m2; 500 kcal for those with BMI 27.5–31 kg/m2; and 700 kcal for those with BMI >31 kg/m2) to avoid ethical problems. We used two dietary plans. The first was a DASH diet that consisted of 52% carbohydrates, 18% proteins, and 30% total fats. The DASH diet was designed to be rich in fruits, vegetables, whole grains, and low-fat dairy products and to be low in saturated fats, cholesterol, refined grains, and sweets. The prescribed sodium in the DASH diet was <2,400 mg/d…. This study was not a feeding trial; therefore, we did not prepare foods for the participants; they only received 7-d menu cycles. The diets were individually planned using a "calorie-count" system. To facilitate compliance with the diets, participants were given and instructed to use an exchange list. To control for the participants' dietary intakes throughout the study, the dietitian called the participants to resolve any problems. Furthermore, to examine compliance with the diets, we asked participants to record their dietary intakes every 2 wk. All participants spent about 45 min with a dietitian learning the basics of their diets"
Comparison	"As all study participants were overweight or obese, both diets were designed to be calorie-restricted (350–700 kcal less than the computed energy requirement for each participant; 350 kcal for women with BMI 25–27.5 kg/m2; 500 kcal for those with BMI 27.5–31 kg/m2; and 700 kcal for those with BMI >31 kg/m2) to avoid ethical problems. We used two dietary plans. The second plan, the control diet, also contained 52% carbohydrates, 18%

Study ID	Asemi 2014	
	protein, and 30% total fat; however, the two diets were different in terms of food groups contained. This study was not a feeding trial; therefore, we did not prepare foods for the participants; they only received 7-d menu cycles. The diets were individually planned using a "calorie-count" system. To facilitate compliance with the diets, participants were given and instructed to use an exchange list. To control for the participants' dietary intakes throughout the study, the dietitian called the participants to resolve any problems. Furthermore, to examine compliance with the diets, we asked participants to record their dietary intakes every 2 wk. All participants spent about 45 min with a dietitian learning the basics of their diets"	
Outcomes	Body weight, BMI, Dietary intake measurements (not relevant to systematic review), Total cholesterol (not relevant to systematic review), Triglycerides, VLDL (not relevant to systematic review), HDL (not relevant to systematic review), LDL (not relevant to systematic review), TC:HDL-C ratio (not relevant to systematic review), Total antioxidant capacity (not relevant to systematic review), Total glutathione (not relevant to systematic review), Fasting plasma glucose, Insulin, HOMA-IR (not relevant to systematic review), HOMA-B (not relevant to systematic review), High sensitivity CRP (not relevant to systematic review), WC, Hip circumference (not relevant to systematic review)	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Summary Result/s	DASH eating pattern resulted in the improvement of insulin resistance, serum hs-CRP levels, and abdominal fat accumulation vs controls.	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Inclusion Criteria	Yes Partial No Not reported	"Overweight or obese (body mass index [BMI]≥25 kg/m2) women ages 18 to 40 y diagnosed with PCOS based on the Rotterdam criteria were recruited in this study…Diagnosis of PCOS was determined according to the Rotterdam criteria. Women with two of the following criteria were considered as having PCOS: oligovulation, anovulation, or a combination of both; excess androgen activity (clinical or biochemical); and polycystic ovaries (by gynecologic ultrasound)."
Exclusion Criteria	Yes Partial No Not reported	"We did not include women ages <18 or >40 y; those with BMI < 25 kg/m2; women with neoplastic, hepatic, renal, cardiovascular or malabsorptive disorders; those with current or previous (within the last six mo) use of hormonal, antidiabetic, or antiobesity medications; and those

Study ID		Asemi 2014	
			intending to adopt a diet and/or a specific physical activity program."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	"Random assignment was done by the use of computer-generated random numbers."
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Yes
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	No The study dietitian was aware of dietary assignment
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Yes
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATT	**What percentage of the individuals recruited into each**	X% treatment X% control/ comparison	DASH diet group= 11% (IVF treatment (n=1), health problems (n=1), use of medications (n=1)

Study ID		Asemi 2014	
RITIONBIAS	**arm of the study dropped out?**	Not reported	Control diet group= 11% (IVF treatment (n=1), became pregnant (n=1), use of medications (n=1))
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported No report of a registered protocol
CONFOUNDING	**Were the groups similar at baseline with regards to key prognostic variables?**	Yes Partial No Not reported	Yes
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Yes "Participants were stratified according to BMI (<30 and ≥30 kg/m^2) and age (<30 and ≥30 y)"
OTHERINTERNALVALIDITY/BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes No Partial No Not reported	Not reported
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
Comments			
What is the overall risk of bias?		Low Moderate High Insufficient information	Low - All of the criteria have been fulfilled or where criteria have not been fulfilled, it is very unlikely the conclusions of the study would be affected.

Study ID	Asemi 2014
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	No

Study ID	Azadi-Yazdi 2016
Study Citation	Azadi-Yazdi M, Karimi-Zarchi M, Salehi-Abargouei A, Fallahzadeh H, Nadjarzadeh A. Effects of Dietary Approach to Stop Hypertension diet on androgens, antioxidant status and body composition in overweight and obese women with polycystic ovary syndrome: a randomised controlled trial. J Hum Nutr Diet. 2017 Jun;30(3):275-283. doi: 10.1111/jhn.12433. Epub 2016 Nov 7. PMID: 28466507.
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS (BMI = 25-40; aged 20-40)
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	Overweight and obese
Medication History	No
N per group	Control diet: 27 DASH diet: 28
Setting	Baghaeipoor Gynaecology clinic
Intervention	DASH diet: 50–55% carbohydrate, 15–20% protein and 25–30% total fat; rich in fruits, vegetables, whole grains and low-fat dairy products, as well as low in saturated fats, cholesterol, refined grains and sweets; 350-500kcal less than energy requirement
Comparison	Control diet: 50–55% carbohydrate, 15–20% protein and 25–30% total fat; 350-500kcal less than energy requirement
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Height (stadiometer), weight (digital scale), WC (nonstretch plastic tape), hip circumference circumference (nonstretch plastic tape), body composition (body composition analyzer), total testosterone (ELISA), SHBG (ELISA), androstenedione (ELISA), FAI, total antioxidant capacity (DPPH), energy intake, protein, carbohydrates, fat, cholesterol, MUFA, SFA, PUFA, dietary fibre, soluble fibre, vitamin C, magnesium, calcium, potassium, sodium, sucrose, grains, simple sugar, vegetables, fruits, diary, meats, nuts, fats and oils
Follow up Duration	12 weeks
Summary Result/s	DASH diet had beneficial effects on weight, BMI, fat mass, androstenedione, SHBG, and antioxidant capacity
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Study ID		Azadi-Yazdi 2016	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes, the aim was to examine the effect of the DASH diet on the androgenic profile, total antioxidant capacity, body weight and composition in women with PCOS in the context of a randomised controlled clinical trial.
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Overweight or obese (BMI = 25–40 kg m–2) women aged 20–40 years who were newly diagnosed with PCOS based on the Rotterdam criteria, did not use hormonal contraception or other medications that could alter the concentration of androgens, did not use hormones as medication for 3 months prior to the study, were without type 1 diabetes, and were not using anti-obesity medications or engaging in a specific physical activity program, were included in the trial.
Exclusion criteria		Yes Partial No Not reported	Participants were excluded from the study if hormonal therapy or other medications that could affect PCOS or weight were initiated for them during the study
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes, equally randomised into DASH diet and control diet groups using block randomisation. Random assignment was conducted using computer-generated random numbers
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Yes
PERFORMANCE	**Were patients blind to intervention group?**	Yes Partial No Not reported	Yes
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Not reported

Study ID		Azadi-Yazdi 2016	
BIAS	**Aside from the experimental intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
DEDETECTIONBIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITIONBIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Control diet 3/30 dropped = 10% DASH diet 2/30 dropped = 6.67%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported

Study ID		Azadi-Yazdi 2016	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Yes, adjusted for energy intake
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS		Lack of randomisation and blinding key reason for high RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Foroozanfard 2017	
Study Citation	Foroozanfard F, Rafiei H, Samimi M, Gilasi HR, Gorjizadeh R, Heidar Z, Asemi Z. The effects of dietary approaches to stop hypertension diet on weight loss, anti-Müllerian hormone and metabolic profiles in women with polycystic ovary syndrome: A randomized clinical trial. Clin Endocrinol (Oxf). 2017 Jul;87(1):51-58. doi: 10.1111/cen.13333. Epub 2017 Apr 11. PMID: 28316072.	
Study Country	Iran	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (BMI > 25; aged 18-40)	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s	Overweight and/or obese	
Medication History	No	
N per group	Control diet: 30 DASH diet: 30	
Setting	Naghavi Clinic in Kashan, Iran	
Intervention	DASH diet: consisted of 52%-55% carbohydrates, 16%-18% proteins and 30% total fats. The DASH diet was rich in fruits, vegetables, whole grains and low-fat dairy products and low in saturated fats, cholesterol, refined grains and sweets. Suggested sodium intake in the DASH diet was <2400 mg/d.	
Comparison	Control diet: also designed to contain 52%-55% carbohydrates, 16%-18% protein and 30% total fats; however, DASH and control diets were different in terms of food groups contained. Control diet was designed based on Iranian traditional dietary pattern.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Height, weight, BMI, serum AMH (ELISA), fasting plasma glucose (commercial kits), serum insulin (ELISA), HOMA-IR, HOMA-B, QUICKI, total testosterone (commercial kits), SHBG (commercial kit), FAI, FSH (ELISA), LH (ELISA), 17-OH progesterone (ELISA), plasma NO (Griess method), MDA level (TBARs method), energy intake, fat, protein, carbohydrate, SFA, PUFA, cholesterol, total dietary fiber, sodium, potassium, magnesium, calcium, fruit, vegetable, nuts, fats and oils	
Follow up Duration	12 weeks	
Summary Result/s	Low-calorie DASH eating pattern for 12 weeks among overweight or obese subjects with PCOS had beneficial effects on weight, BMI, AMH, markers of insulin metabolism, SHBG, FAI, NO and MDA levels compared with low-calorie control diet, but did not affect other metabolic profiles.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes, they hypothesized that the DASH diet might benefit in patients with PCOS to improve their metabolic profiles.

Study ID		Foroozanfard 2017	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Partial, no specified inclusion
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Not reported
Exclusion criteria		Yes Partial No Not reported	We excluded women who were pregnant during the intervention, and adrenal hyperplasia, androgen-secreting tumours, hyperprolactinemia, thyroid dysfunction, diabetes or impaired glucose tolerance at enrollment.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes Prior to random assignment, patients were stratified based on BMI (25-29.9 and ≥30 kg/m2) and age (<40 and ≥40 years). Then, participants were randomly assigned to consume either the low-calorie DASH (N=30) or control diet (N=30) for 12 weeks. Randomization assignment was performed using computer-generated random numbers.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Yes
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Yes
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Partial Only the study dietitian was not blinded
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes

Study ID		Foroozanfard 2017	
DEDETECTIONBIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITIONBIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	Control diet 3/30 dropped = 10% (but still analysed all 30) DASH diet 4/30 dropped = 13.3% (but still analysed all 30)
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported
CONFOUN	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes

Study ID		Foroozanfard 2017	
D I N G	**If confounding was present, was it controlled for?**	Yes Partial No Not reported	Yes We adjusted all analyses for baseline values of biochemical variables, age and BMI
O T H E R BI A S	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS		Lack of randomisation and blinding key reason for high RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	Low
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Gower 2013
Study Citation	Gower BA, et al., 2013, Favourable metabolic effects of a eucaloric lower-carbohydrate diet in women with PCOS, Clinical Endocrinology, 79(4): 550-557.
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	

Study ID	Gower 2013
Patient/population/ participants	PCOS patients Age (years) 31.2 ± 5.8 BMI (kg/m2): 31.8 ± 5.7
PCOS diagnostic criteria	NIH "The criteria for diagnosis of PCOS were consistent with the NIH 1990 criteria and included (i) hyperandrogenism and/or hyperandrogenaemia, (ii) oligo-ovulation and (iii) the exclusion of any existing disorders such as Cushing's syndrome, hyperprolactinemia or congenital (nonclassic) adrenal hyperplasia."
Presence of infertility	Not reported
Presence of other condition/s	Not reported
Medication History	Not reported
N per group	N=30 Cross-over trial n=23 completed both arms n=27 completed the lower arm
Setting	All testing was conducted on an outpatient basis at the University of Alabama's Clinical Research Unit (CRU).
Intervention	Standard diet (55:18:27% energy from CHO/protein/fat) (8 weeks)
Comparison	Lower-CHO diet (41:19:40% energy from CHO/protein/fat) (8 weeks)
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Primary: β-cell responsiveness, serum testosterone concentration and insulin sensitivity. Secondary: other measures of the metabolic and reproductive endocrine profiles and the lipid profile β-cell response: using mathematical modeling techniques Insulin sensitivity: calculated using a formula based on insulin and glucose values throughout the meal test serum testosterone: immunofluorescence using the TOSOH Glucose, total cholesterol, HDL-cholesterol and triglycerides: SIRRUS analyser. Insulin was assayed by immunofluorescence on a TOSOH AIA-II analyzer FSH and LH: Immunofluorescence Sex hormone binding globulin (SHBG): immunoradiometric assay
Follow up Duration	Not reported (8 week intervention + 4 week washout + 8 week intervention)
Summary Result/s	Lower-CHO diet induced significant decreases in basal b-cell response (PhiB), fasting insulin, fasting glucose, HOMA-IR, total testosterone, and all cholesterol measures, and significant increases in insulin sensitivity and dynamic ('first-phase') b-cell response. The STD diet induced a decrease in HDL-C and an increase in the total cholesterol-to-HDL-C ratio. Across all data combined, the change in testosterone was positively associated with the changes in fasting insulin, PhiB and insulin AUC (P < 0_05).
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Study ID		Gower 2013	
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes "The objective of this study was to examine the effects of 8 weeks of controlled treatment with two eucaloric diets differing in CHO composition (41% vs 55%) on b-cell responsiveness, serum testosterone concentration and insulin sensitivity in women with PCOS."
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes "Inclusion criteria were BMI _45 kg/m2, body weight <136 kg, age 21–50 years, nondiabetic and no weight change >2_3 kg over the past six months"
Exclusion criteria		Yes Partial No Not reported	Yes "Cushing's syndrome, hyperprolactinemia or congenital (nonclassic) adrenal hyperplasia." "Exclusion criteria included regular exercise >2 h per week, pregnancy, current breastfeeding, use of medication that could affect body composition or glucose metabolism (including oral contraceptives, cholesterol medications and blood pressure medications), current use of tobacco, use of illegal drugs in last six months, major food allergies or food dislikes, and a medical history that contraindicated inclusion in the study."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Parital "….participants were assigned, using a randomization scheme, to one of two diets" Not clear how randomization was performed.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported
PERF	**Were patients blind to intervention group?**	Yes Partial No Not reported	Not reported

Study ID		Gower 2013	
PERFORMANCE BIAS	**Were investigators and care providers blind to intervention group?**	Yes Partial No Not reported	Not reported
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes

	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	n=30 enrolled n=23 completed both arms (76.6%) n=27 completed the lower arm (Lower-CHO diet (41:19:40% energy from CHO/protein/fat) (90%)
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Not reported
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes

Study ID		Gower 2013	
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Not reported Baseline characteristics for all 30 women have been reported in table 2.
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Not reported
OTHER BIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	Yes "Nothing to declare"
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Not reported
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes **"**Descriptive statistics were calculated for all variables of interest. "Paired t-tests within each diet arm were used to examine changes in main outcomes of interest." "Spearman's correlation analysis was used to examine the association between changes in insulin outcome measures and changes in testosterone."
COMMENTS		Lack of randomization and the blinding key reason for high RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Hoover 2021	
Study Citation	Hoover SE, Gower BA, Cedillo YE, Chandler-Laney PC, Deemer SE, Goss AM. Changes in Ghrelin and Glucagon following a Low Glycemic Load Diet in Women with PCOS. J Clin Endocrinol Metab. 2021 Apr 23;106(5):e2151-e2161. doi: 10.1210/clinem/dgab028. PMID: 33491091; PMCID: PMC8063255.	
Study Country	USA	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (BMI ≤ 45; aged 21-50)	
PCOS diagnostic criteria	NIH	
Presence of infertility	Not reported	
Presence of other condition/s	Not reported	
Medication History	Not reported	
N per group	High GL diet: 30 Low GL diet: 30	
Setting	Clinical Research Unit at the University of Alabama-Birmingham	
Intervention	Low GL: 41% energy from CHO, 19% energy from protein, and 40% energy from fat (GI = 50)	
Comparison	High GL diet: 55% energy from CHO, 18% energy from protein, and 27% energy from fat (GI = 60)	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Hunger, fullness, and desire to eat (VAS); GLP-1 (ELISA), ghrelin (ELISA), PYY (radioimmunoassay kits), cortisol (immunofluorescence), glucose (glucose oxidase method), Insulin (immunofluorescence), glucagon (RIA), HOMA-IR	
Follow up Duration	20 weeks	
Summary Result/s	Specifically, we found that greater glucagon was associated with lesser hunger during fasting following habituation to the low vs high GL diet. Additionally, greater postprandial glucagon was associated with lesser postprandial ghrelin following the low vs high GL meal. The high GL meal led to greater fullness in the early postprandial phase, while no significant differences were observed in the late postprandial phase. These findings suggest that a low GL diet may influence hunger/satiety through alterations in fasting and postprandial appetite-regulating hormones in women with PCOS with overweight or obesity.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes, the objective of this study was to test the hypothesis that following 4-week habituation to a low vs high GL diet, a low GL meal will increase glucagon and decrease ghrelin to reflect greater satiety and improve self-reported fullness compared with a high GL meal. Additionally, they explored the relationships among ghrelin, glucagon, and self-reported appetite in women with PCOS.

Study ID		Hoover 2021	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes Briefly, inclusion criteria were BMI ≤45 kg/m2, age 21-50 years, nondiabetic as determined by an oral glucose tolerance test at screening, and no weight change >2.3 kg over the previous six months.
Exclusion criteria		Yes Partial No Not reported	Yes Exclusion criteria included exercise >2 hours per week, pregnancy, current breastfeeding, medication affecting body composition or glucose metabolism (including oral contraceptives, cholesterol medication, and blood pressure medications), current tobacco use, use of illegal drugs in the past 6 months, major food allergies or food dislikes, and a medical history that contraindicated inclusion in the study.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Partial, after enrollment, participants were assigned to 1 of 2 eucaloric diet orders using a randomization scheme.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported
PERFORMANCE	**Were patients blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Not reported

Study ID		Hoover 2021

COMMENTS		Lack of randomisation and blinding key reason for high RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	High Did not detail randomization, and blinding was not reported
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Hosseini Marnani 2021	
Study Citation	Hosseini Marnani E., Ghadiri-Anari A., Ramezani-Jolfaie N., Mohammadi M., Abdollahi, A., Namayandeh S. M., et al., Effect of fennel supplementation along with high-protein, low-carbohydrate weight-loss diet on insulin resistance and percentage of fat and muscle mass in overweight/obese women with polycystic ovary syndrome, Journal of Functional Foods, Volume 67, 2020, 103848, ISSN 1756-4646, https://doi.org/10.1016/j.jff.2020.103848.	
Study Country	Iran	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS (BMI ≥ 25; aged 18-45)	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s	No	
Medication History	No	
N per group	SDP: 15 HPP: 15	
Setting	Outpatient clinics of Imam Ali and Diabetes Research Center	
Intervention	HPP: high-protein, low-carbohydrate diet + placebo capsule (HPP); high-protein, low-carbohydrate diet consisted of 40% carbohydrate, 30% protein, and 30% fat	
Comparison	SDP: standard diet + placebo capsule (SDP); standard diet included 55% carbohydrate, 15% protein and 30% fat	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	fasting glucose (enzymatic method), fasting insulin (ELIZA), HOMA-IR, percentage of body fat and muscle mass (Omron digital scale), energy intake, carbohydrate, protein, fat	
Follow up Duration	12 weeks	
Summary Result/s	None of the outcomes were different between the groups of interest (SDP vs HPP) out of the 4 assessed arms in this trial. However, the percentage of body fat and muscle mass decreased in all groups compared with the baseline. Moreover, 12 weeks of intervention resulted in a decrease in fasting insulin levels and HOMA-IR in SDP group.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes, the aim of this trial was to investigate the combined effect of fennel supplementation and energy-restricted diets (high-protein, low-carbohydrate diet and standard diet) on the percentage of body fat and muscle mass and also insulin resistance in overweight/obese women with PCOS.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes

Study ID		Hosseini Marnani 2021	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Inclusion criteria followed were (a) the presence of at least two out of three Rotterdam criteria: 1) oligo or anovulation, 2) clinical or biochemical sign of hyperandrogenism and 3) polycystic ovaries based on ultrasound diagnosis (more than 12 follicles with 2–9 mm range in each ovary and/ or increase in the volume of ovarian greater than 11 cm3, (b) body mass index (BMI) ≥ 25 kg/m2 and (c) age range of 18–45 years.
Exclusion criteria		Yes Partial No Not reported	Participants were excluded if they were diagnosed with congenital adrenal hyperplasia, Cushing's syndrome, hyperprolactinemia, hypothyroidism, androgen tumors, severe hirsutism or acne, history of allergy to fennel or any of its compounds, allergic asthma, liver and renal diseases, cancer, pregnancy, and tendency to get pregnant, and also if the number of missing capsules was more than 10% of the total.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes, Random assignment was carried out by an independent researcher using computer random generation.

Study Country	Canada
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	AE-PCOS
Presence of infertility	Reported-Part of inclusion criteria
Presence of other condition/s	None
Medication History	Family h/o DM, CVD, HTN. Women who took meds that are known or suspected to interfere with cardio metabolic and reproductive function, weight, and/or appetite were excluded, including hormonal and/or fertility meds w/I the past three months before recruitment; weight and appetite-affecting medications; cardiovascular disease medications, and anti-seizure or anti-psychotic medications use because of the potential to induce IR and polycystic appearing ovaries.
N per group	Randomized (computer-generated allocation schedule) Pulse-based group (PBG): 30 women Therapeutic Lifestyle Change (TLC): 31 women
Setting	Royal University Hospital in Saskatoon, Canada
Intervention	Pulse-based diet (soups, salads, and main course meals prepared with yellow split peas, green lentils, red split lentils, chickpeas, and pinto, black, and kidney beans. Two meals (i.e., lunch and dinner) were supplied daily. Each meal contained approximately 90 g of split peas or 225 g of chickpeas or beans or 150 g of lentils (cooked weight). No prescribed energy restriction.
Comparison	Standard Therapeutic Lifestyle Changes diet (TLC, including low-fat cuts of meat, poultry, and low-fat or skim dairy as the main sources of protein and limit their pulse consumption). No prescribed energy restriction.

Study ID	Kazemi, 2018-2020	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Changes in cardio-metabolic profile (Insulin, glucose, TC, HDL-C, TC/HDL-C ratio, TG, hsCRP, HbA1c), body composition and anthropometric measures (weight, BMI, WC, BMD, fat mass, lean mass), reproductive measures (ovarian morphology, female hormonal panel including testosterone, LH, FSH) FAI, hirsutism, SHBG, menstrual cyclicity and HRQoL	
Follow up Duration	16 week (intervention), 6 & 12 months (post-intervention follow up)	
Summary Result/s	Pulse-based diet was more effective at reducing insulin resistance, diastolic blood pressure, LDL-C, TC/HDL-C and increasing HDL-C than the TLC group. Both groups experienced comparable improvements in the reproductive, lumbar bone mineral density, and HRQoL outcomes, despite a greater loss in femoral neck BMD in the pulse-based diet group.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes Compare the effect of a pulse-based diet to the NCEP TLC diet on cardio-metabolic disease risk measures in reproductive-age women with PCOS for 16 weeks without energy restriction when the diets were combined with aerobic exercise and health counseling. Further, our study determined the long-term effects of the intervention on the cardio-metabolic profile of women with PCOS by follow-up of the participants 12 months after the intervention.
Does the study have specified inclusion/exclusion criteria?	Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	Yes
Inclusion criteria	Yes Partial No Not reported	Yes Between 18 to 35 years of age, had irregular periods, unwanted male-pattern facial and/or body hair growth, and infertility. Women who used metformin were included and were stratified to be randomized separately than women who were not using metformin.
Exclusion criteria	Yes Partial No Not reported	Yes Women who took medications that are known or suspected to interfere with cardio-metabolic and reproductive function, weight, and/or appetite were excluded, including hormonal and/or fertility medications within the past three months before recruitment; weight and appetite-affecting medications; cardiovascular disease medications, and anti-seizure or anti-psychotic medications use because of the potential to induce IR and polycystic appearing ovaries. Women with untreated hyperprolactinemia or thyroid disease, or, excessive adrenal androgen production due to congenital adrenal hyperplasia, Cushing's syndrome, or an adrenal tumor were excluded. Further, women with medical (e.g., cardio-pulmonary) or

Study ID		Kazemi, 2018-2020	
			dietary conditions that limited physical activity or consumption of a pulse-based diet (allergies or intolerances) were excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes Randomization was carried out using a computer-generated allocation schedule performed by an investigator who was not involved in obtaining, entering, or analyzing participant data. Randomization was stratified based on the current use of metformin, using a fixed block size of four and a permuted block design.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Partial Participants were notified of diet allocation via email and thus were not blinded. However, participants were blinded to the study hypothesis and investigators who collected and processed data analyses were blinded to allocation.
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	No (inherent to study design [nature of the dietary intervention)
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Yes The allocation sequence was concealed from the dietitian who provided health counseling and those involved in assisting with exercise training and data entry. The investigators collecting and analyzing data were also blinded to group assignment
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes
DETECTION BIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Yes
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes

Study ID		Kazemi, 2018-2020	
ATTRITION BIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	PBG 16/47 = 34% TLC 18/48 = 37.5%
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	Yes
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes (all a-priori outcomes of the study previously published in the protocol of the study were reported irrespective of data and all analyses were conducted in compliance with the intention to treat statistics)
	Were the groups similar at baseline with regard to key prognostic variables?	Yes Partial No Not reported	Yes The baseline characteristics of women who did not complete the 16-week intervention were not different from those who completed the intervention
	If confounding was present, was it controlled for?	Yes Partial No Not reported	Yes For adaptation to a healthy diet, all women consumed a TLC diet for two weeks prior to the start of the intervention. As a standard of care, all women were enrolled in an aerobic training program and received health counseling about PCOS (i.e., the value of lifestyle modifications in the management of the condition).
OTHE	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No The authors declare no conflict of interest. The funders had no role in the study design, collection, analyses, interpretation of data, writing of the manuscript, and decision to publish.

Study ID		Kazemi, 2018-2020	
R BI A S	**Was the study sufficiently powered to detect any differences between the groups?**	Yes Partial No Not reported	Partial The inability to detect FPG differences between groups post-intervention may be due to the study being underpowered
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS		Randomisation, blinding and details of processes for reproducibility key reason for Low RoB	
What is the overall risk of bias?		Low Moderate High Insufficient information	Low
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No, all outcomes have a low risk of bias	

Study ID	Mehrabani 2012
Study Citation	Mehrabani HH, et al., 2012, Beneficial effects of a high-protein, low-glycemic-load hypocaloric diet in overweight and obese women with polycystic ovary syndrome: a randomized controlled intervention study, Journal of the American College of Nutrition, 31(2): 117-125.
Study Country	Iran
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Overweight and obese PCOS women CHCD Age (y) 28.5 ± 5.2 BMI (kg/m2) 31.1 ± 4.6 MHCD Age (y) 30.5 ± 6.4 BMI (kg/m2) 31.9 ± 4.0
PCOS diagnostic criteria	Diagnosis of PCOS by menstrual irregularity (cycle length, 21 days or .35 days), hirsutism, and biochemical hyperandrogenism.
Presence of infertility	Not reported

Study ID	Mehrabani 2012	
Presence of other condition/s	Not reported	
Medication History	Participants did not use insulin-sensitizing agents	
N per group	N=60 (randomized) n=49 (completed) CHCD n=26 MHCD n=23	
Setting	Taleghani infertility research center in Tehran, Iran	
Intervention	Conventional hypocaloric diet (CHCD) (15% of daily energy from protein)	
Comparison	modified hypocaloric diet (MHCD) with a high-protein, low-glycemic load (30% of daily energy from protein plus low-glycemic-load foods selected from a list)	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Body composition including total body fat and lean body mass: bioelectrical impedance, Skinfold thickness: supra iliac area using a skinfold caliper, WC: measured with a nonstretchable tape at the area demarcated by the umbilicus and hip circumference at the widest place over the buttocks, Weight, Follicle stimulating hormone (FSH), luteinizing hormone (LH): immunoenzymometric assay method, estradiol, total testosterone, dehydroepiandrosterone sulfate (DHEAS), and androstenedione: enzyme immunoassay using a commercially available kit, Fasting insulin and adiponectin: enzyme-linked immunosorbent assay, Serum glucose, triglyceride, total cholesterol, and high-density lipoprotein cholesterol (HDL-C) : a colorimetric enzymatic assay The homeostatic model assessment for insulin resistance (HOMA) was used as a surrogate measure of insulin sensitivity	
Follow up Duration	Intervention 12 weeks Followed up at weeks 0, 4, 8, and 12 Follow-up after 12 weeks not reported	
Summary Result/s	"Weight loss was significant and similar in the two groups. Mean of testosterone in the MHCD and CHCD groups decreased from 1.78 ± 0.32 to 1.31 ± 0.26 ng/ml and from 1.51 ± 0.12 to 1.15 ± 0.11 ng/ml, respectively ($p < 0.001$). Follicle sensitizing hormone (FSH), luteinizing hormone (LH), and blood lipids concentrations were not changed except low-density lipoprotein cholesterol (LDL-C) was reduced by 24.5% ± 12.3% ($p < 0.001$ for both) after 12 weeks of intervention. MHCD resulted in a significant reduction in insulin level, homeostatic model assessment for insulin resistance (HOMA), and high-sensitivity C- reactive protein (hsCRP) concentration ($p < 0.001$)."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	Yes "the aim of this controlled intervention study was to investigate and compare the effects of two kinds of diets, including a Conventional hypocaloric diet (CHCD) and a modified hypocaloric diet (MHCD) with low-GL and high protein content on reproductive hormones, lipid profile, inflammatory factors, glucose, and insulin levels in overweight and obese women with PCOS who had not started taking any medications or changed their exercise habits since the diagnosis of their disease."

Study ID		Mehrabani 2012	
Does the study have specified inclusion/exclusion criteria?		Yes	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	Yes
Inclusion criteria		Yes	"Subjects were included if they were aged between 20 and 40 years, had a body mass index (BMI) greater than 25 and less than 38 kg/m2, and no history of using an insulin-sensitizing agent such as metformin or oral contraceptives. Inclusion criteria were diagnosis of PCOS by menstrual irregularity (cycle length, ,21 days or .35 days), hirsutism, and biochemical hyperandrogenism."
Exclusion criteria		Yes	Yes "Volunteers were excluded if they were smokers, exercised heavily, and/or had any history of cardiovascular, renal, gastrointestinal disorders, liver or metabolic diseases " "Women diagnosed with hyperprolactinemia, thyroid abnormalities, and/or nonclassic adrenal hyperplasia were also excluded from this study."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Partial ".....randomized by an independent observer. " Unclear how randomization was carried out
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported
PERFORMANCE	**Were patients blind to intervention group?**	Yes Partial No Not reported	Yes "The investigator was not blinded as to the kind of dietary intervention, but subjects were."
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	No "The investigator was not blinded as to the kind of dietary intervention, but subjects were."

Study ID		Mehrabani 2012	
BIAS	**Aside from the experimental intervention, were the groups treated the same?**	Yes Partial No Not reported	Yes
CTE CTIONBIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	No "The investigator was not blinded as to the kind of dietary intervention, but subjects were."
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Yes
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes
ATTRITIONBIAS	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	49/60 completed (81.6%) 18.4% drop out
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes Partial No Not reported	No
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Yes
CONFOUN	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Partial "No significant differences existed in subjects' characteristics at baseline for the two treatment groups, except for hip circumference"

Study ID		Mehrabani 2012	
D I N G	**If confounding was present, was it controlled for?**	Yes Partial No Not reported	Not reported
ER BI A S	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No "There are no conflicts of interest between the authors and the funding source. All coauthors accept responsibility for the content of the manuscript."
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	Yes "It was calculated that 23 subjects per group would provide 80% power to detect a difference of 7.7 nmol/L in the sex hormone-binding globulin (SHBG) levels in serum. Therefore 30 subjects were recruited for each group to cover the assumed withdrawal. Subjects were stratified to ensure equality of distribution in 2 groups for known confounding factors like age and BMI and then were randomized by an independent observer."
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		No	

Study ID	Moran 2003

COMMENTS			

Study ID	Moran 2003	
What is the overall risk of bias?	Low Moderate High Insufficient information	High Did not detail randomization, and blinding was not reported. Study had a small sample size.
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	No	

Study ID	Panico 2014
Study Citation	Panico A, et al., 2014, Effects of an isocaloric low glycemic-load diet in polycystic ovary syndrome, Nutritional Therapy & Metabolism, 32(2): 85-92.
Study Country	Italy
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	PCOS women with BMI (28.7 ± 4.9)
PCOS diagnostic criteria	Having two following manifestations 1. menstrual irregularity 2. clinical or biochemical hyperandrogenism 3. presence of polycystic ovaries on USS
Presence of infertility	Not reported
Presence of other condition/s	Not reported
Medication History	Not reported
N per group	N=7 completed protocol
Setting	Internal medicine surgery department, University Fedrico I Naples Italy
Intervention	Diet A: isocaloric and isoenergetic moderately low-glycaemic-load diets (diet A, glycaemic load = 79-105)
Comparison	Diet B: moderately high-glycaemic-load diets (diet B, glycaemic load = 123-134)
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Insulin sensitivity, FSH, LH, Testosterone, DHEAS, Cortisol, Serum glucose, Serum cholesterol
Follow up Duration	3 months period 1, subsequent 3 months period 2 (6-month study, no further follow up reported) No washup period reported

Study ID		Panico 2014	
Summary Result/s		"In conditions of stable body weight, a significant reduction of serum total testosterone (p < 0.026), dehydroepiandrosterone (p < 0.042), adrenocorticotropic hormone (ACTH; p < 0.009), glycemia (p < 0.011), and insulin 2 hours after breakfast (p < 0.019) was observed after the low-glycaemic-load diet."	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes Partial No Not reported	Yes To compare the effects of isocaloric and isoenergetic moderately low glycaemic load diets (diet A, glycaemic load = 79-105) versus moderately high-glycaemic-load diets (diet B, glycaemic load = 123-134) on endocrine patterns of polycystic ovary syndrome
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes Clinical (acne, alopecia, seborrhoea) and /or biochemical hyperandrogenism (testosterone >90 ng/dl, dehydro-epiandrosterone sulfate (DHEAS] >248 µg/dl Oligo-amenorrhoea (35-day menstrual cycles or total absence of menses) polycystic ovaries detected through USS: 10 or more follicles (having 2-8// diameter) in at least 1 of the two ovaries
Exclusion criteria		Yes Partial No Not reported	pregnancy, using OCP or insulin-sensitizing agents, endocrine disorder diabetes, nonclassic, 21-hydroxylase deficiency, ovarian or adrenal tumors, hypothalamic amenorrhoea, those planning to take part in regular physical activity
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Not reported "Following a crossover design, patients were randomly provided with an isocaloric and isoenergetic diet ….." This is not clear.
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported

Study ID		Panico 2014	
PERFORMANCE BIAS	**Were patients blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	Not reported
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes

Study ID	Panico 2014	
What is the overall risk of bias?	Low Moderate High Insufficient information	High
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?	No	

Study ID	Stamets 2004
Study Citation	Stamets K, Taylor DS, Kunselman A, Demers LM, Pelkman CL, and Legro RS, 2004, A randomized trial of the effects of two types of short-term hypocaloric diets on weight loss in women with polycystic ovary syndrome*, Fertility & Sterility*, 81(3): 630-637.
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS. Age = 21-37 years. BMI = 28-45 kg/m^2
PCOS diagnostic criteria	"A history of chronic anovulation (six spontaneous menstrual cycles per year) and unexplained elevated circulating T levels"
Presence of infertility	Not reported
Presence of other condition/s	Obese (BMI=>25 kg/m^2)
Medication History	Not reported
N per group	N = 35. High protein (HP) diet group = 17. High carbohydrate (HC) diet group = 18.
Setting	Participants were recruited from "a variety of sources" including private practices in Ohio and Pennsylvania, and at the M.S. Hershey Medical Center, Pennsylvania, and through advertisements (p631).
Intervention	High protein (HP) diet: The HP diet consisted of 30% protein, 40% carbohydrate, and 30% fat. "Energy needs of patients were calculated with the Harris-Benedict equation using an adjusted body weight for obesity and an activity factor of 1.5". Participants had a 1000kcal deficit per day [or equivalent to 4187kJ], which was 1000g/wk. Patients consumed a multivitamin/mineral supplement daily. Diet delivery regime: A dietitian guided the food choices for participants using "limited exchange lists from the American Diabetes Association Exchange Lists for Meal Planning" (p631). "Specific instructions were not given about types of carbohydrates or glycemic indices". The HP diet was given for four weeks.

Study ID	Stamets 2004	
	Other support: Patients maintained their current exercise levels throughout the four week study. Patients faxed weekly completed daily self-monitoring diet charts and their weight measurements. Patients "filled out satiety questionnaires and spoke with the dietitian weekly, reviewing their charts and answering questions related to" their prescribed diet plan.	
Comparison	High carbohydrate (HC) diet: The HC diet consisted of 15% protein, 55% carbohydrate, and 30% fat. "Energy needs of patients were calculated with the Harris-Benedict equation using an adjusted body weight for obesity and an activity factor of 1.5". Participants had a 1000kcal deficit per day [or equivalent to 4187kJ], which was 1000g/wk. Patients consumed a multivitamin/mineral supplement daily. Diet delivery regime: A dietitian guided the food choices for participants using "limited exchange lists from the American Diabetes Association Exchange Lists for Meal Planning" (p631). "Specific instructions were not given about types of carbohydrates or glycemic indices". The HC diet was given for four weeks. Other support: Patients maintained their current exercise levels throughout the four week study. Patients faxed weekly completed daily self-monitoring diet charts and their weight measurements. Patients "filled out satiety questionnaires and spoke with the dietitian weekly, reviewing their charts and answering questions related to" their prescribed diet plan.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Anthropometric: Weight; BMI; WC; waist-hip girth ratio. Metabolic: Morning 3hr oral glucose tolerance test (OGTT), with a 75g oral glucose challenge done after 10hr overnight fast; total cholesterol; high-density lipoprotein (HDL); low-density lipoprotein (LDL); serum triglycerides; blood pressure. Non-fertility: Ferriman-Gallwey scores, fasting testosterone; free and weakly-bound testosterone; follicle-stimulating hormone (FSH); prolactin (PRL); 17-OH P; dehydroepiandrosterone sulphate (DHEAS); luteinizing hormone (LH).	
Follow up Duration	Four weeks	
Summary Result/s	"Both the HP and HC diets resulted in significant weight loss, with the HC diet demonstrating a slightly greater weight loss. However, there was no significant difference in mean weight loss between the two groups"	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes All elements of a PICO are clearly described.

Study ID		Stamets 2004	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes Inclusion and exclusion criteria are clearly described (p631).
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes The authors have relevant criteria for detecting PCOS (p631).
Inclusion criteria		Yes Partial No Not reported	Yes PCOS women were selected based on a diagnosis of PCOS through "a history of chronic anovulation (≤ six spontaneous menstrual cycles per year) and unexplained elevated circulating T levels" (p631). Patients were not judged for inclusion or exclusion based on ultrasonography "because the presence or absence of polycystic ovaries has not been included in consensus criteria for the definition of the endocrine syndrome of PCOS". "None of the participants had been diagnosed previously with diabetes mellitus" (p631). "All patients were obese which was defined as a body mass index (BMI) ≥25 kg/m^2 ... were in good health and, for at least 1 month before the study, were not taking any medication (except for oral contraceptive agents which were stopped 3 months prior to the study) known to affect sex hormone levels, carbohydrate metabolism, or appetite. The participants were required to be non-smokers and to exercise no more than three times per week" (p631).
Exclusion criteria		Yes Partial No Not reported	Yes "Other causes of androgen excess (e.g. non-classical adrenal 21-hydroxylase deficiency, hyperprolactinemia, and androgen-secreting tumors)" (p631).
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes A random number table was used (p631).
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported
PERFO	**Were patients blind to intervention group?**	Yes Partial No Not reported	No Dietitians discussed the intervention or control diet plans with the respective intervention and control group patients. Patients also had to make conscious food choices to comply with either treatment group (p631-632).

Study ID		Stamets 2004	
RMANCEBIAS	**Were investigators and care providers blind to intervention group?**	Yes Partial No Not reported	No Dietitians knew the treatment groups (p631-632).
	Aside from the experimental intervention, were the groups treated the same?	Yes Partial No Not reported	Yes
CTEDCTIONBIAS	**Were outcome assessors blind to intervention group?**	Yes Partial No Not reported	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	Partial The laboratory biochemical tests are standard, valid and reliable tests. Measurements of weight-hip ratio measurements are standard, valid and reliable. The measurement of weight may be unreliable because it depended on participants' accurate self-reporting of weight. It is unclear if everyone performed weight measurements under the same conditions (e.g. same accuracy of weigh scales, same amount of clothing on) and were not subjectively recording weights or were reliably recording weights daily. The Ferriman-Gallwey scores is a standard and valid method of evaluating hirsutism. However, its reliability is varied due to the need for subjective decisions on the scoring by users.
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	Yes The laboratory tests are independent. The weight and weight-hip outcomes are independent and are not always related to each other (depending on body phenotypes). The Ferriman-Gallwey scores may not be independent because each question within the tool may reinforce other answers. However, this outcome does not influence the other outcomes assessed. Laboratory tests are objective. Measurements of weight and weight-ratio measurements are mostly objective but may involve some observer judgment depending on the equipment being used for measuring. The Ferriman-Gallwey scores need subjective decisions on the scoring by users.
ATTR	**What percentage of the individuals recruited into each arm of the study dropped out?**	X% treatment X% control/ comparison Not reported	For all the variables measured in Table 1, there were no significant differences (p633).

Study ID		Stamets 2004	
ITIONBIAS	**Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?**	Yes Partial No Not reported	Yes It appears that all participants were accounted for and analyzed to the group to which they were allocated to.
REPORTBIAS	**Is the paper free of selective outcome reporting?**	Yes Partial No Not reported	Not reported There is no published protocol available.
CONFOUNDING	**Were the groups similar at baseline with regard to key prognostic variables?**	Yes Partial No Not reported	Yes For all the variables measured in Table 1, there were no significant differences (p633).
	If confounding was present, was it controlled for?	Yes Partial No Not reported	There was 24% (4/17) drop-out in the intervention group and 28% (5/18) drop-out in the control group.
IERBIAS	**Were there any conflicts of interest in the writing or funding of this study?**	Yes Partial No Not reported	No Authors state their funding sources (p630)
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	No The study needed 17 participants per treatment arm to achieve 95% power to detect a weight loss difference of 1.5kg between the two arms, with a standard deviation of 1.2kg, in a two-sample t-test with a two-sided significance level of 5% (p632). However, the study only analyzed 13 participants per treatment arm.

Study ID		Stamets 2004	
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	Yes It is unclear if the statistical tests were planned a priori because there is no published protocol to indicate this. The authors used two-sample t-tests to analyse outcomes that used continuous data. Point estimates and measures of variability were presented for outcomes. It is unclear if there was any missing data. Figures 2 and 3 shown graphs for "combined diets". It is unclear whether this analysis is necessary because the study is aimed at finding out which diet is more effective, so therefore combining the results of the two diets does not add any useful information.
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	Moderate
Did risk of bias differ by outcome (eg. primary outcome was low risk but rest were high)?		Not reported	

Study ID	Toscani 2011
Study Citation	Toscani, M. K., Mario, F. M., Radavelli-Bagatini, S., Wiltgen, D., Matos, M. C., & Spritzer, P. M. (2011). Effect of high-protein or normal-protein diet on weight loss, body composition, hormone, and metabolic profile in southern Brazilian women with polycystic ovary syndrome: a randomized study. Gynecological Endocrinology, 27(11), 925-930.
Study Country	Brazil
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	All participants 22.72±5.68 years
PCOS diagnostic criteria	Not reported
Presence of infertility	Not reported
Presence of other condition/s	Overall, most study participants had BMI≥ 25 kg/m2 No diabetes
Medication History	"Women who had received any drugs known to interfere with hormone levels for at least 3 months before the study...were excluded"
N per group	The number of participants that were: Allocated/randomised: High protein diet= 9, normal protein diet= 9 Assessed at end of study: High protein diet= 9, normal protein diet= 9

Study ID	Toscani 2011	
Setting	Hospital de Clinicas de Porto, Brazil	
Intervention	"Energy needs were estimated by using 20–25 kcal/kg current weight/day for overweight/obese women and 25– 30 kcal/kg current weight/day for normoweight participants [19]. Patients were randomized to receive one of two diets: HP (30% protein, 40% carbohydrate, and 30% lipid)… Habitual physical activity was assessed by a digital pedometer (BP 148 Techline), which records the number of steps taken daily by each individual. Patients were not encouraged to walk more than usual". 8 week intervention	
Comparison	"Energy needs were estimated by using 20–25 kcal/kg current weight/day for overweight/obese women and 25– 30 kcal/kg current weight/day for normoweight participants [19]. Patients were randomized to receive one of two diets:… NP (15% protein, 55% carbohydrate, and 30% lipid). Habitual physical activity was assessed by a digital pedometer (BP 148 Techline), which records the number of steps taken daily by each individual. Patients were not encouraged to walk more than usual". 8 week intervention	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Body weight, WC, Physical activity (not relevant to systematic review), Blood pressure (not relevant to systematic review), Fasting glucose, 2 hour OGTT glucose, Fasting insulin, 2 hour insulin (not relevant to systematic review), HOMA (not relevant to systematic review), Total cholesterol (not relevant to systematic review), HDL (not relevant to systematic review), LDL (not relevant to systematic review), NHDL (not relevant to systematic review), Triglycerides, BMI (presented as a figure only) % body fat (not relevant to systematic review), Sum of trunk skinfolds (not relevant to systematic review), Total testosterone (not relevant to systematic review), SHBG (presented as a figure only), FAI (presented as a figure only)	
Follow up Duration	Eight weeks	
Summary Result/s	"There were no changes in lipid profile in either group. In contrast, body weight, body mass index (BMI), WC, percent of body fat, and sum of trunk skinfolds decreased significantly after both diets in both groups. Total testosterone also decreased in PCOS and controls regardless of diet."

Study Citation	Wong JMW, et al., 2016, A randomized pilot study of dietary treatments for polycystic ovary syndrome in adolescents, Pediatric Obesity, 11(3): 210-220.
Study Country	USA
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Overweight and obese adolescents with PCOS and not using hormonal contraceptives (HCs).
PCOS diagnostic criteria	AEPCOS "Each participant had a diagnosis of PCOS from her treating physician with confirmed biochemical hyperandrogenism (elevated serum-free testosterone within the last 6 months) and ovarian dysfunction (oligo-anovulation and/or polycystic ovaries on ultrasound), consistent with criteria established by the Androgen Excess Society".

Study ID	Wong 2016	
Presence of infertility	Not reported	
Presence of other condition/s	Not reported	
Medication History	not using hormonal contraceptives (HCs).	
N per group	N=19 LGL diet n=9 LF diet n= 10	
Setting	Adolescent and Young Adult Medicine Clinic at Boston Children's Hospital (BCH),	
Intervention	LGL (low-glycaemic load) Diet: Target macronutrient composition for the LGL diet was 45% of energy from carbohydrate, 35% from fat and 20% from protein	
Comparison	LF (low-fat) Diet: 55% energy from carbohydrates, 25% from fat and 20% from protein	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	The primary outcome was bioavailable testosterone. Other biochemical outcomes included blood levels of total testosterone, free testosterone, sex hormone binding globulin (SHBG), dehydroepiandrosterone sulfate (DHEAS), total cholesterol, low-density lipoprotein cholesterol (direct determination by enzymatic spectrophotometric assay), high-density lipoprotein (HDL) cholesterol, triglycerides, high sensitivity C-reactive protein and haemoglobin (Hb) A1c. Self-reported HRQL Treatment fidelity	
Follow up Duration	6 months "Outcomes were assessed at baseline, prior to random assignment and at the end of a 6-month intervention period"	
Summary Result/s	Sixteen (LGL, n = 7; LF, n = 9) participants completed the study. Body fat percentage decreased ($P < 0.05$) in response to the interventions, with no difference between the LGL and LF groups (−1.2% vs. −2.2%; $P = 0.16$). Bioavailable testosterone did not change for either group (−0.4 vs. −1.8 ng dL^{-1}; $P = 0.35$).	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	Yes To obtain preliminary data, comparing the impact of a low-glycaemic load (LGL) vs. low-fat (LF) diet on biochemical hyperandrogenism in overweight and obese adolescents with PCOS. To ascertain the feasibility of recruiting study participants in partnership with an adolescent clinic and implementing dietary interventions.

Study ID		Wong 2016	
Does the study have specified inclusion/exclusion criteria?		Yes Partial No Not reported	Yes
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes Partial No Not reported	Yes
Inclusion criteria		Yes Partial No Not reported	Yes PCOS, age between 13 and 21 years, body mass index, (BMI) ≥ 85th percentile (14), and medical clearance from a treating physician.
Exclusion criteria		Yes Partial No Not reported	Yes "type 2 diabetes (fasting plasma glucose ≥126 mg dL−1), diagnosis of an eating disorder or any other major medical illness, abnormal screening laboratory measures indicating other causes of hyperandrogenism or obesity; and smoking (>1 cigarette per week). Use of medications (hormonal contraceptives [HCs] within the past 3 months, insulin-sensitizing agents within the past month) also was exclusionary."
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	**Did the study have an adequate method of randomisation?**	Yes Partial No Not reported	Yes "Participants were randomly assigned to receive either a LGL or LF dietary prescription"
	Was allocation to intervention group concealed?	Yes Partial No Not reported	Not reported
PERFORMANCE B	**Were patients blind to intervention group?**	Yes Partial No Not reported	No "The dietitian counselled participants to consume low-glycaemic index sources of carbohydrate (including non-starchy vegetables, legumes and fruits) and to limit intake of moderate or high glycaemic index sources (including refined grains, starchy vegetables and sweets)."
	Were investigators and care providers blind to intervention group?	Yes Partial No Not reported	No Not explicitly reported but by above comment it can be judged that the patients and investigators knew what kind of die the women were going to have

GDG 3

Question 3.3.

In women with PCOS, are diet interventions (compared to different diets) effective for improving anthropometric, metabolic, fertility, and emotional wellbeing outcomes?

BACKGROUND:

Lifestyle modification, including diet, exercise and weight management, are recommended as the first line of treatment for women with PCOS. While dietary interventions resulting in weight loss have shown benefits, long-term, well controlled studies investigating different dietary approaches in women with PCOS are lacking and the role of specific dietary composition remains controversial (1).

Given the general recommendations to reduce caloric (energy) intake, rather than modifying macronutrient composition, the widespread promotion of specific dietary composition in PCOS and the limited comparative research on efficacy of specific dietary approaches in PCOS, this clinical question was prioritised.

Evidence summary

Twelve RCTs were identified (from 18 publications) including 496 participants - ten with a parallel design and two a crossover design. The majority of studies were in adult women with PCOS but one was conducted in adolescents and the majority of participants were overweight or obese. Five studies were conducted in Iran, 3 in the USA and the remaining 4 in Canada, Italy, Australia and Brazil. Subject numbers range between 14 and 61; more than half (7) of the studies had between 50–60 participants and one quarter (3) had less than 20 in participants. Duration of the studies was 4 weeks to 6 months, with most between 8-12 weeks.

Dietary interventions included the DASH (Dietary Approaches to Stop Hypertension) diet (3 studies), higher protein/lower carbohydrate diets (5 studies), higher fat/lower carbohydrate diets (3 studies) and a pulse-based low glycaemic index diet (1 study). Where specified, the macronutrient composition of intervention diets ranged from 40-55% carbohydrate, 15-30% protein and 25-40% fat and control diets 50-55% carbohydrate, 15-20% protein and 25-30% fat.

A meta-analysis of five studies (2, 3, 4, 5, 6) comparing a hypocaloric high protein/low carbohydrate diet (40% carbohydrate, 30% protein, 30% fat) vs a control diet (55% carbohydrate, 15% protein, 30% fat) showed no significant differences in anthropometric or metabolic outcomes apart from HDL-cholesterol which favoured the control diet.

For the remaining studies, a meta-analysis was not conducted due to heterogeneity in the dietary composition of intervention and control arms and variability in energy restriction prescribed (with or without energy restriction). Results are therefore summarised descriptively below.

- Three studies (7, 8, 9, 10) compared a DASH diet to a control (traditional) diet- macronutrient composition was 50-55% carbohydrate, 15-20% protein and 25-30% fat and energy was restricted in both the intervention and control groups. Analysis showed greater improvements in BMI (2 of 2 studies), waist circumference (1 of 1 study), fasting insulin (2 of 2 studies) and HOMA-IR (2 of 2 studies) and mixed findings for weight (2 of 3 studies) and FAI (1 of 2 studies) with the DASH diet versus a control diet. No differences were seen for total testosterone, fasting glucose and blood lipids (HDL, LDL and TG). These findings were of low to very low certainty. Due to notices of concern and issues raised about integrity of the studies (both in the literature and across other GDGs), these studies were included, but not used to inform any recommendations.
- One study (11-14) showed greater improvements in blood lipids (reduction in LDL and TG and increase in HDL) with a low glycaemic index pulse-based diet (2 meals per day consisting of pulses) versus a control diet (protein from lean meat, poultry and low-fat dairy foods and limited intake of pulses). No differences between the diets were seen for anthropometric measures (weight, BMI and WC), fasting glucose, fasting insulin, HOMA-IR, total testosterone or FAI. Energy wasn't restricted and macronutrient composition changes were not significantly different between the two groups however there was a significantly

greater increase in dietary fibre and reduction in glycaemic index but not glycemic load with the pulse-based diet compared to the control diet.

- Two studies (15-17) compared a eucaloric higher/fat lower carbohydrate diet with a control diet (lower in fat and higher in carbohydrate) and found no differences between the groups for fasting insulin and glucose. For other outcomes, between group comparisons were not reported.
- One study (18) compared a hypocaloric low carbohydrate higher fat diet (45% carbohydrate, 20% protein, 35% fat) versus a low-fat diet (55% carbohydrate, 20% protein, 25% fat). A greater reduction in BMI was seen in the low-fat diet group but there were no significant differences in other outcomes (weight, waist circumference, fasting glucose, fasting insulin, HOMA-IR, HDL, LDL, TG, total testosterone or FAI) between the groups.

Together these findings suggest that diets with a range of macronutrient compositions could be recommended for women with PCOS. These findings are consistent with research in the general population. A systematic review and network meta-analysis of 121 randomised trials with almost 22 000 participants found that diets of varying macronutrient compositions result in modest weight loss and substantial improvements in cardiovascular risk factors over 6 months although these improvements are not maintained at 12 months (19). Compared to usual diets, low carbohydrate and low-fat diets had similar effects on weight loss at six months. Furthermore, evidence doesn't suggest a benefit of modifying the macronutrient composition of the diet based on insulin secretion (20).

Rather than restricting carbohydrate, research in other populations suggests that the quality of carbohydrates in the diet is important and diets containing carbohydrate foods which are high in fibre and have a lower glycemic index, including wholegrains, pulses/legumes and fruit, have been shown to reduce cardiometabolic risk factors and are associated with weight loss and a lower incidence of diabetes, cardiovascular disease and cardiovascular mortality (21).

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

In women with PCOS, are diet interventions (compared to no diet or different diets) effective for improving weight loss, metabolic, fertility, and emotional wellbeing outcomes?

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Health professionals and women could consider that, there is a lack of evidence supporting any one type of diet composition over another for anthropometric, metabolic, hormonal, reproductive or psychological outcomes.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **CR:** Any diet composition consistent with population guidelines for healthy eating has health benefits, and within this, health professionals should advise sustainable healthy eating tailored to an individual's preferences and goals.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

- Tailoring of dietary changes to food preferences, allowing for a flexible, individual and co-developed approach to achieving nutritional goals and avoiding unduly restrictive and nutritionally unbalanced diets, are important, as per general population recommendations.

- Barriers and facilitators to optimise engagement and adherence to dietary change should be discussed, including psychological factors, physical limitations, socioeconomic and sociocultural factors, as well as personal motivators for change. The value of broader family engagement should be considered. Referral to suitably trained allied healthcare professionals needs to be considered when women with PCOS need support with optimising their diet.

GRADE CONSIDERATIONS

Justifications:
Given that consumer targeted information about PCOS purport the benefit of specific macronutrient composition, this recommendation is important to ensure that women and health professionals are informed on the evidence on dietary composition and efficacy. Emphasis should be on individual preferences and cultural needs of each woman and on an overall balanced and healthy dietary composition to achieve individual nutritional goals. Education for both women and health professionals is needed in this area. Specific cost and resource implications were considered but recommendations were approved on balance, informed by recommendations in the general population and benefits in PCOS.

Subgroup considerations:
There was no population subgroup analysis presented. Caution should be exercised when generalising the findings to subgroups such as some ethnic populations. All but one study was performed in adults and the majority of participants were women with higher BMI. Caution should be exercised when generalising the findings to adolescents and women across the lifespan and lean women.

Implementation considerations:
Some consumer-targeted resources (including books, websites and online programs) claim benefits for specific macronutrient composition (particularly low carbohydrate diets) and other dietary restrictions (e.g. gluten and dairy free diets) for women with PCOS, so greater education for consumers and health professionals around evidence-based dietary approaches is important.
Providing evidence-based tailored dietary advice to women with PCOS may require referral to other health professionals (e.g. dietitians) and increase the length of consultations. This has both time and cost implications.

Monitoring and evaluation considerations:
Monitor that women's goals and preferences are being captured and needs are being met.
Monitor if health professionals are providing evidence-based approaches

Research priorities:
Well designed, long-term and adequately powered studies in women across the BMI range investigating the impact of different dietary interventions on a range of outcomes (including fertility and reproductive outcomes) in this population are needed.
Further research is needed to investigate the impact of a range of dietary interventions on anthropometric, metabolic, hormonal, reproductive or psychological outcomes in women with PCOS.

It is acknowledged that not all diets need to be trialled in women with PCOS and that adequately powered, general population studies will also be of relevance to this population.
There needs to be more monitoring of safety and harm of specific dietary interventions (including disordered eating and eating disorders) and long-term follow-up. There is also a need to address the high drop-out rate from dietary intervention studies.
Further research looking at appropriate strategies for dissemination of evidence-based dietary information is also needed.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

A range of healthy diets can assist with anthropometric, metabolic, hormonal, reproductive or psychological outcomes in women with PCOS. However, there is a lack of evidence to support one particular dietary intervention over another and for women across the BMI range particularly with respect to macronutrient composition.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

No specific undesirable effects noted in most studies although dropout rates were high in some

In the Kazemi (pulse-based diet) study it was noted that 3 participants withdrew due to mild to moderate GI symptoms (bloating, flatulence, upset stomach) which were classified as 'possibly' related to the intervention.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Macronutrient composition of the diet doesn't appear to impact anthropometric or metabolic outcomes.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

There is probably no important uncertainty or variability in how much women with PCOS and health professionals value the role of dietary intervention in improving PCOS outcomes.

Lifestyle changes have been identified as the first line of treatment of PCOS.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

● COSTS

How large are the resource requirements (costs)?

Judgement:

☒ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Costs could include:

- development and distribution of educational resources for women with PCOS
- education of health professionals
- tailored dietary advice for women with PCOS by health professionals which could require longer consultation times

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

There was no evidence to inform this consideration.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

There is no evidence to compare the cost effectiveness of different dietary interventions for women with PCOS - these studies are needed.

The recommendations may increase healthcare costs through increased consultation times and referral to health professionals, however the long-term benefits of dietary and lifestyle modification may reduce the health and economic burden of PCOS

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

No specific dietary intervention / composition

The implementation may be variable due to availability of local resources but recommendation is likely to improve equity.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Findings suggest that healthy diets varying in macronutrient composition can be recommended, which allows for tailoring of dietary advice to suit the dietary preferences and resources of each woman with PCOS. This may increase acceptability among both women with PCOS and health professionals.

The recommendations are unlikely to significantly change usual care for most health practitioners although may necessitate longer consultation times and increased referral to health professionals.

Consumers (women with PCOS) may want more specific dietary advice to assist them in implementing the recommendations to lose weight and/or prevent weight gain.

Acceptability will be influenced by the expectations, cultural considerations and health literacy of the women and accessibility and affordability of the interventions.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Policy settings, health system enablers, education and engagement of health professionals and patient considerations (such as the cost of longer consultations and/or consultations with other health professionals) will affect feasibility.

The main requirement to implement the recommendation is education of health professionals and women with PCOS about evidence-based dietary recommendations, which is feasible.

There are significant expectations and misinformation that need to be combated.

Question 3.4.

In women with PCOS, are exercise interventions (compared to different exercises) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?

1. SELECTION CRITERIA

Table 1. PICO Criteria for Inclusion – Not to be adapted To be used by evidence team to decide which studies will be included when screening search results.		
Question	Q 3.4) In women with PCOS, are exercise interventions (compared to different exercises) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?	
ECR Lead	Dr Angelo Sabag, Western Sydney University, Australia	
Clinical leads (key contacts)	Prof Leanne Redman Exercise physiologist Pennington Biomedical Research Centre, USA leanne.redman@pbrc.edu	Prof Anjelica Hirschberg Obstetrician-gynaecologist Karolinska Instututet, Sweden angelica.hirschberg.linden@ki.se
Allocation ranking	Level 2- Update systematic review	

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Females with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity, weight and with any co-morbidity. Subgroup by: BMI, adolescents, adult, preconception, pregnancy, post-menopausal, PCOS phenotype, those using no other medication. Can be taking any medications to manage PCOS symptoms, DM2, co-morbidities, as long as this medication use is not a primary component of the intervention or control arms. Document diabetes status, smoking status.	All types of exercise regimes that can be quantifiable. Structure of exercise regime must be documented (eg. type, intensity, frequency, duration). Subgroup by aerobic/endurance and resistance. Short/medium/long term. "Free range exercises" or "physical activity" can be included as long as it can be quantified in terms of time, work, energy, and/or intensity. Duration of exercise intervention ≥ 2 weeks.	All types of other exercise regimes that can be quantifiable. Structure of exercise regime must be documented (eg. type, intensity, frequency, duration). Free range exercises can be included as long as it has tools for correlating to work, energy, and/or intensity. Duration of exercise intervention ≥ 2 weeks.	Anthropometric: Weight, BMI, WC Metabolic: HbA1c, Fasting insulin, fasting glucose, HOMA, OGTT insulin, OGTT glucose, lipids (total cholesterol, LDL, HDL, TG), Systolic BP Reproductive: Hirsutism (clinical HA) biochemical HA (total testosterone, SHBG, FAI, free testosterone), ovulation, menstrual regularity, Psychological: Anxiety, depression, quality of life *For pregnancy subgroups* Anthropometric: Weight, BMI, gestational weight gain Metabolic: Fasting insulin, fasting glucose, HOMA, OGTT insulin, OGTT glucose, lipids (total cholesterol, LDL, HDL, TG) Reproductive: Live birth, pregnancy, miscarriage, gestational diabetes, preeclampsia, birth weight Psychological: Anxiety, depression, quality of life	Evidence based guidelines, systematic reviews, health technology assessments, randomised controlled trials.	English language. Update original search for exercise versus other exercise and add RCT filter
Exclusion	Females without PCOS. Taking anti-obesity medications (metformin isn't an exclusion). Bariatric surgery. Patients using medications for DM2, co-morbidities or for clinical or metabolic features of PCOS, as the primary component of the intervention or control arms of a study.	Exercise interventions that cannot be quantifiable. Interventions taken with anti-obesity medications.	Treatment regime that cannot be quantifiable. Treatments used in conjunction with anti-obesity medications.		Non-evidence based guidelines, non-systematic reviews, any study lower than a RCT.

Evidence processing: Studies were selected and appraised by two reviewer/s in consultation with the evidence team/ key contact using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. **A total of 5 unique studies met inclusion criteria for this review.**

5. STUDY CHARACTERISTICS

Author, year, country	Population/ Setting	Study Design	Sample Size per group	Intervention/ exposure details	Comparison/ control details	Follow up Duration	Outcomes	Summary of findings
Almenning 2015 Norway	Women with PCOS	Parallel RCT	HIIT = 10 RT = 11	HIIT 3 days per week	RT 3 days per week	10 weeks	Metabolic, cardiovascular, and hormonal outcomes	HIIT improved insulin resistance, body composition. RT improved body composition
Benham 2021 Canada	Women with PCOS	Parallel RCT	HIIT = 16 MICT = 14	HIIT 3 days per week	MICT 3 days per week	6 months	Reproductive, anthropometric and cardiometabolic outcomes	MICT and HIIT were both effective at improving anthropometrics and some cardiometabolic health markers.
Patten 2022 Australia	Women with PCOS	Parallel RCT	HIIT = 15 MICT = 14	HIIT 3 days per week	MICT 3 days per week	12 weeks	Insulin sensitivity, hormonal profiles, menstrual cyclicity and body composition.	HIIT offers greater improvements in aerobic capacity, insulin sensitivity and menstrual cyclicity, and larger reductions in hyperandrogenism compared to MICT
Ribeiro 2020 Brazil	Women with PCOS	Parallel RCT	HIIT = 35 MICT = 37	HIIT 3 days per week	MICT 3 days per week	16 weeks	Hormonal, metabolic, anthropometric, quality of life, depression and anxiety.	MICT and HIIT training improved hormonal, anthropometric, anxiety and depression, and quality of life. Only HIIT training reduced the FAI. Only MICT training improved lipid profile.
Thomson 2008 Australia	Women with PCOS	Parallel RCT	MICT = 31 MICT+ RT = 33	MICT 5 days per week	MICT 3 days per week and RT 2 days per week	20 weeks	Weight, body composition, cardiometabolic risk factors, hormonal status, menstrual cyclicity, and ovulatory function.	The addition of aerobic or combined aerobic resistance exercise to an energy-restricted diet improved body composition but had no additional effect on improvements in cardiometabolic, hormonal, and reproductive outcomes relative to diet alone.

5.1. DATA EXTRACTION– CONTINUOUS OUTCOMES

Anthropometric outcomes

OUTCOME: Body weight				OUTCOME TYPE: Continuous				
COMPARISON (if applicable): High-intensity interval training versus moderate-intensity continuous training								
Author, year	Unit of outcome	Method of measurement	Mean in intervention group	SD/SEM in intervention group	Mean in comparison group	SD/SEM in comparison group	Are these values adjusted or crude?	If adjusted, what variables were included in the model?
Benham et al. 2021	kg	Scale	Pre: 85.2 (n = 15) Post: 85.3 (n = 11)	Pre: 6.2 Post: 6.4 SEM	Pre: 84.5 (n = 12) Post: 83.3 (n = 12)	Pre: 6.9 Post: 7.1 SEM	Crude	NA

6. FINDINGS

Comparisons Included:

- **Comparison 1. High-intensity interval training (HIIT) versus moderate-intensity continuous training (MICT)**
- **Comparison 2. HIIT versus resistance training (RT)**
- **Comparison 3. Diet + combined aerobic and resistance training (CT) versus diet + aerobic exercise (AEx)**

Outcomes Included:

- **Outcome 1. Body mass index**
- **Outcome 2. Body weight**
- **Outcome 3. Waist circumference**
- **Outcome 4. HbA1c**
- **Outcome 5. Fasting glucose**
- **Outcome 6. Fasting insulin**
- **Outcome 7. HOMA-IR**
- **Outcome 8. HDL-C**
- **Outcome 9. LDL-C**
- **Outcome 10. Triglycerides**
- **Outcome 11. Systolic blood pressure**
- **Outcome 12. Free androgen index**
- **Outcome 13. Testosterone**
- **Outcome 14. Menstrual regularity**
- **Outcome 15. Anxiety**
- **Outcome 16. Depression**
- **Outcome 17. Quality of Life**

COMPARISON 1. HIIT versus MICT

▪ EVIDENCE SUMMARY:

A total of three studies (Benham et al. 2021; Patten et al. 2022; Ribeiro et al. 2020) compared HIIT versus MICT for a range of anthropometric, metabolic and hormonal/ reproductive outcomes. These studies were conducted in Australia, Brazil, and Canada and ranged in size from 29 to 72 participants. They were deemed to have low or unclear risk of bias, for which the latter was mainly due to lack of blinding to participant group allocation by outcome assessors.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

In the meta-analyses of 2-3 pooled studies, there were no differences in any of the outcomes assessed, with most of the evidence being of low to very low certainty due primarily to imprecision (small sample sizes), in addition to unclear risk of bias and inconsistency of effect estimates and/or confidence intervals. In descriptive analysis (studies or outcomes not pooled in meta-analysis), HIIT was more effective than MICT for menstrual regularity (OR [95%CI] = 0.127 [0.017, 0.905]) with very low certainty due to imprecision (being derived from a single small study) as well as inconsistency and risk of bias. Benham et al. 2021 reported change in menstrual regularity as an absolute percentage, however, as no sample size was provided, these data could not be pooled in meta-analysis, nor could the OR be determined. In this study, HIIT improved menstrual regularity from 50% to 53% of participants, and MICT improved menstrual regularity from 29% to 42% of participants.

Data presented as standardised mean difference (Hedge's g) with 95% confidence interval.
BMI, body mass index; WC, waist circumference; FBG, fasting blood glucose; HbA1c, glycated haemoglobin; HOMA-IR, homeostatic model assessment of insulin resistance; HDL, high-density lipoprotein cholesterol; LDL, Low-density lipoprotein cholesterol; TG, triglycerides; FAI, free androgen index; SHBG, sex hormone-binding globulin

COMPARISON 2. HIIT versus RT

▪ EVIDENCE SUMMARY:

One study compared HIIT with RT (Almenning, et al. 2015) on anthropometric, metabolic and hormonal/ reproductive outcomes. This study, by Almenning et al (2015) was conducted in Norway with 21 participants and had an unclear risk of bias due to lack of blinding to participant group allocation by outcome assessors and insufficient information around allocation concealment.

▪ DESCRIPTIVE ANALYSIS SUMMARY:

There were no differences between HIIT and RT for any of the outcomes. Certainty in these results is very low due to being derived from a single, relatively small study with an unclear risk of bias.

COMPARISON 3. Diet plus combined aerobic and resistance training versus diet plus aerobic exercise

- **EVIDENCE SUMMARY:**

One study compared diet plus combined aerobic and RT with diet and aerobic exercise (Thomson, et al. 2008) on anthropometric, metabolic and hormonal/ reproductive outcomes. This study, by Thomson et al (2008) was conducted in Australia with 64 participants and had a high risk of bias due to lack of blinding to participant group allocation by outcome assessors and insufficient information around allocation concealment.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

There were no differences between diet plus combined aerobic and resistance training and diet and aerobic exercise for any of the outcomes. Certainty in these results is very low due to being derived from a single, relatively small study with a high risk of bias due to lack of blinding of outcome assessors, concealment of allocation (opaque envelopes), high dropout rate, and unclear whether analyses were undertaken as per-protocol or as intention-to-treat.

[1] Downgraded once as the study was deemed to have an unclear risk of bias.
[2] Downgraded twice as only one study with a small sample size.

MD, mean difference; AEx, Aerobic exercise; CT, Combined aerobic and resistance training, progressive resistance training; HbA1c, glycated haemoglobin; HOMA-IR, homeostatic model assessment of insulin resistance; HDL, high-density lipoprotein cholesterol; LDL, Low-density lipoprotein cholesterol.

APPENDIX. Quality Appraisal of RANDOMISED CONTROLLED TRIALS

Study ID	Almenning 2015	
Study Citation	Almenning I, Rieber-Mohn A, Lundgren KM, Shetelig Løvvik T, Garnæs KK, Moholdt T. Effects of High Intensity Interval Training and Strength Training on Metabolic, Cardiovascular and Hormonal Outcomes in Women with Polycystic Ovary Syndrome: A Pilot Study. PLoS One. 2015 Sep 25;10(9):e0138793. doi: 10.1371/journal.pone.0138793.	
Study Country	Norway	
BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Women with PCOS	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s		
Medication History	Only menstrual regularity	
N per group	*Allocated/randomised:* 21 (10 HIIT, 11 RT) *Assessed at end of study:* 16 (8 HIIT, 8 RT)	
Setting	Location of assessments not reported. Interventions completed unsupervised at a gym.	
Intervention	HIIT: twice weekly sessions of 4x4-min t 90–95% HRmax, separated by three minutes of moderate intensity exercise at 70% of HRmax; and one weekly session of 10x1-min inteverals at maximal intensity (‘all out’), separated by 1-min rest/very low activity.	
Comparison	RT: eight dynamic exercises at 75% one repetition maximum, with three sets of ten repetitions separated by 1-min rest between sets.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Preliminary efficacy outcomes included metabolic, cardiovascular, and hormonal outcomes.	
Follow up Duration	10 weeks	
Summary Result/s	High intensity interval training for ten weeks improved insulin resistance, without weight loss, in women with polycystic ovary syndrome. Body composition improved significantly after both strength training and high intensity interval training. This pilot study indicates that exercise training can improve the cardiometabolic profile in polycystic ovary syndrome in the absence of weight loss.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	The primary objective was therefore to assess the effects of ten weeks of structured exercise training on insulin sensitivity, measured with homeostatic model assessment of insulin resistance (HOMA-IR) in women with PCOS.
Does the study have specified inclusion/exclusion criteria?	Yes	

If there were specified inclusion/ exclusion criteria, were these appropriate?		Partial	Didn't define age range.
Inclusion criteria		Partial	Didn't define age range.
Exclusion criteria		Yes	Exclusion criteria included regular high-intensity endurance or strength training (defined as 2 sessions of vigorous exercise per week), physical ailments/injuries that limited exercise performance, on-going pregnancy, concurrent treatments (insulin sensitizers as metformin and pioglitazone) or drugs known to affect gonadotropin or ovulation, with a wash out period of one month prior to inclusion. The exception was regular use of oral contraceptives, and women were included if they did not change the type or dose > 1 month prior to the study or during the intervention period.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Did the study have an adequate method of randomisation?	Yes	
	Was allocation to intervention group concealed?	Unclear	
PERFORMANCE BIAS	Were patients blind to intervention group?	No	Not applicable
	Were investigators and care providers blind to intervention group?	No	Not applicable
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	Were outcome assessors blind to intervention group?	No	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study dropped out?	20% treatment 27% comparison	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Partial	Per protocol analyses applied.
REPORT	Is the paper free of selective outcome reporting?	Yes	
CONFOUNDING	Were the groups similar at baseline with regard to key prognostic variables?	Yes	
	If confounding was present, was it controlled for?	Not applicable	
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	No	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		Lack of blinding of outcome assessors and concealment of allocation (opaque envelopes) primary reasons for moderate risk classification.	
What is the overall risk of bias?		Unclear	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No	

Study ID	Benham 2021
Study Citation	Benham JL, Booth JE, Corenblum B, Doucette S, Friedenreich CM, Rabi DM, Sigal RJ. Exercise training and reproductive outcomes in women with polycystic ovary syndrome: A pilot randomized controlled trial. Clin Endocrinol (Oxf). 2021 Aug;95(2):332-343. doi: 10.1111/cen.14452.
Study Country	Canada

BRIEF CHARACTERISTICS OF RCT		
Patient/population/ participants	Previously inactive women aged 18-40 years with PCOS	
PCOS diagnostic criteria	Rotterdam	
Presence of infertility	Not reported	
Presence of other condition/s	Average BMI of participants 31.4 ± 8.4 (SD)	
Medication History	Yes	
N per group	*Allocated/randomised:* 30 (16 HIIT, 14 MICT) *Assessed at end of study:* 23 (11 HIIT, 12 MICT)*)*	
Setting	Location of assessments not reported. Interventions completed semi-supervised at a gym.	
Intervention	HIIT: participants completed 10 cycles of 30 s at high-intensity (90% of heart rate reserve (HRR), or 9/10 on a modified Borg scale1) alternating with 90 s of low-intensity aerobic exercise.	
Comparison	MICT: participants completed 40 min of moderate-intensity aerobic exercise (50%–60% HRR, or 4-6/10 on a modified Borg scale).	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Preliminary efficacy outcomes included reproductive, anthropometric and cardiometabolic health markers.	
Follow up Duration	6 months	
Summary Result/s	MICT and HIIT were both effective at improving anthropometrics and some cardiometabolic health markers.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT		
Does the study have a clearly focused question and/or PICO?	Yes	The objective was to evaluate the effects of HIIT and MICT compared with no exercise on reproductive, anthropometric and cardiometabolic health markers in women with PCOS.
Does the study have specified inclusion/exclusion criteria?	Partial	Untrained women aged 18–40 years with PCOS defined by Rotterdam criteria.
If there were specified inclusion/ exclusion criteria, were these appropriate?	Partial	Should have described who determined PCOS diagnosis.
Inclusion criteria	Partial	Women with PCOS exercising < 40 min per week.
Exclusion criteria	Yes	Exclusion criteria included: medical conditions restricting exercise, participation in >40 min of exercise training weekly and medications potentially affecting ovulation (glucocorticoids, metformin, gonadotropins, clomiphene, letrozole, oestrogens, progestins).
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?		

SELECTION BIAS	Did the study have an adequate method of randomisation?	Yes	Block randomisation based on BMI using REDCap
	Was allocation to intervention group concealed?	Yes	
PERFORMANCE BIAS	Were patients blind to intervention group?	No	Not applicable
	Were investigators and care providers blind to intervention group?	No	Not applicable
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	Were outcome assessors blind to intervention group?	Yes	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study dropped out?	18.75% treatment 21.42% comparison	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Partial	Per protocol analyses applied for primary outcomes except reproductive outcomes which was assessed as ITT.
REPORT	Is the paper free of selective outcome reporting?	Yes	
CONFOUNDING	Were the groups similar at baseline with regard to key prognostic variables?	Yes	
	If confounding was present, was it controlled for?	Not reported	

OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	No	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Low	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No	

Study ID	Patten 2022
Study Citation	Patten RK, McIlvenna LC, Levinger I, Garnham AP, Shorakae S, Parker AG, McAinch AJ, Rodgers RJ, Hiam D, Moreno-Asso A, Stepto NK. High-intensity training elicits greater improvements in cardio-metabolic and reproductive outcomes than moderate-intensity training in women with polycystic ovary syndrome: a randomized clinical trial. Hum Reprod. 2022 May 3;37(5):1018-1029. doi: 10.1093/humrep/deac047.
Study Country	Australia
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Physically inactive caucasian premenopausal women (18-45 years) with PCOS and BMI> 25 kg/m^2.
PCOS diagnostic criteria	Rotterdam and confirmed by endocrinologist.
Presence of infertility	Not reported.
Presence of other condition/s	Average BMI of participants 31.4 ± 8.4 (SD)
Medication History	No but participants taking anti-hypertensive, insulin sensitizers, dietary supplements, weight loss medication or hormonal contraceptive medications in the 3 months prior to enrolment were excluded.
N per group	*Allocated/randomised:* 29 (15 HIIT, 14 MICT) *Assessed at end of study:* 24 (13 HIIT, 11 MICT)

Setting		Victoria University in Melbourne, Australia	
Intervention		HIIT: involved twice weekly sessions of 12, 1 min intervals at 90–100% peak heart rate (%HRpeak), separated by 1min of active recovery at a light load and one weekly session of eight, 4min intervals at 90–95% HRpeak, separated by a 2min light load, activity recovery.	
Comparison		MICT: involved three sessions per week of 45 min of continuous cycling at 60–75% HRpeak.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		The primary clinical outcomes were aerobic capacity (VO_{2peak}) and insulin sensitivity (euglycaemic–hyperinsulinaemic clamp). Secondary outcomes included hormonal profiles, menstrual cyclicity and body composition.	
Follow up Duration		12 weeks.	
Summary Result/s		HIIT offers greater improvements in aerobic capacity, insulin sensitivity and menstrual cyclicity, and larger reductions in hyperandrogenism compared to MICT.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	Does 12 weeks of high-intensity interval training (HIIT) result in greater improvements in cardio-metabolic and reproductive outcomes compared to standard moderate-intensity continuous training (MICT) in women with polycystic ovary syndrome (PCOS)?
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Yes	
Inclusion criteria		Yes	Inclusion criteria were Caucasian women aged 18–45 (pre-menopausal), with a BMI greater than 25 kg/m2, insufficiently active (do not meet the minimum physical activity recommendations of 150min of moderate to vigorous activity per week), and with diagnosed PCOS.
Exclusion criteria		Yes	Exclusion criteria included diabetes, pregnancy, smoking, illness or injury that prevented or limited exercise performance and existing participation in regular physical activity. Those taking anti-hypertensive, insulin sensitizers, dietary supplements, weight loss medication or hormonal contraceptive medications in the 3 months prior to enrolment were excluded.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Did the study have an adequate method of randomisation?	Yes	Simple randomization procedure through computerized sequence generation at an allocation ratio of 1:1 and stratified by BMI. Completed by independent statistician.
	Was allocation to intervention group concealed?	Unclear	Not reported

PERFORMANCE BIAS	Were patients blind to intervention group?	No	Not applicable
	Were investigators and care providers blind to intervention group?	No	Not applicable
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	Were outcome assessors blind to intervention group?	No	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study dropped out?	13.33% treatment 21.42% comparison	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Yes	
REPORT	Is the paper free of selective outcome reporting?	Yes	
CONFOUNDING	Were the groups similar at baseline with regard to key prognostic variables?	Yes	
	If confounding was present, was it controlled for?	Yes	
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	No	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	

	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS			
What is the overall risk of bias?		Low	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No

Clin Endocrinol (Oxf). 2020 Aug;93(2):173-186. doi: 10.1111/cen.14194. Ribeiro VB, Lopes IP, Dos Reis RM, Silva RC, Mendes MC, Melo AS, de Souza HCD, Ferriani RA, Kogure GS, Lara LADS. Continuous versus intermittent aerobic exercise in the improvement of quality of life for women with polycystic ovary syndrome: A randomized controlled trial. J Health Psychol. 2021 Aug;26(9):1307-1317. doi: 10.1177/1359105319869806.
Study Country	Brazil
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Sendetary women (18-39 years) with PCOS and BMI between 18.0 to 39.9 kg/m^2.
PCOS diagnostic criteria	Rotterdam criteria
Presence of infertility	Not reported.
Presence of other condition/s	Not reported
Medication History	Not reported
N per group	*Allocated/randomised:* 72 (35 HIIT, 37 MICT) *Assessed at end of study:* 57 (29 HIIT, 28 MICT)
Setting	Ribeirão Preto Medical School, University of São Paulo, Brazil
Intervention	HIIT: involved twice weekly sessions of six to 10 2-min intervals at 70 to 90% maximal heart rate (HRmax) interspersed with 3-min recovery periods. Supervised exercise sessions.

Comparison		MICT: involved thrice weekly of 30 to 45-min of continuous cycling at 65–80% HRmax. Supervised exercise sessions. Work was matched between groups.	
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)		The primary clinical outcomes were hormonal, metabolic and anthropometric outcomes. Secondary outcomes published in other manuscripts were quality of life, depression and anxiety, sexual function, and telomere length; Both protocols were effective to improve testosterone levels, anthropometric indices, and quality of life in polycystic ovary syndrome women.	
Follow up Duration		16 weeks.	
Summary Result/s		MICT and HIIT training reduced anthropometric indices and hyperandrogenism in PCOS, whereas only HIIT training reduced the FAI. Furthermore, only MICT training improved the lipid profile; Aerobic physical training protocols could be indicated to promote mental and sexual health in women with PCOS.	
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT			
Does the study have a clearly focused question and/or PICO?		Yes	
Does the study have specified inclusion/exclusion criteria?		No	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Not applicable	
Inclusion criteria		Yes	Women diagnosed as having PCOS, aged between 18 and 39 years, with sedentary lifestyles, and with BMIs between 18 and 39.9kg/m^2 were considered eligible for this study.
Exclusion criteria		No	Exclusion criteria not reported
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Did the study have an adequate method of randomisation?	Yes	Simple randomization procedure through computerized sequence generation at an allocation ratio of 1:1 and stratified by BMI. Completed by independent statistician.
	Was allocation to intervention group concealed?	Yes	The allocation group was placed inside opaque, sealed envelopes, grouped in blocks of 15 and consecutively picked depending on the BMI of the participant at the time of study inclusion.
PERFORMANCE BIAS	Were patients blind to intervention group?	No	Not applicable
	Were investigators and care providers blind to intervention group?	No	Not applicable
	Aside from the experimental intervention, were the groups treated the same?	Yes	

DEDETECTION BIAS	Were outcome assessors blind to intervention group?	Not reported	
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study dropped out?	17.14% treatment 24.32% comparison	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	No	Per protocol analysis
REPORT	Is the paper free of selective outcome reporting?	Yes	Outcomes were published in separate manuscripts.
CONFOUNDING	Were the groups similar at baseline with regard to key prognostic variables?	Yes	
	If confounding was present, was it controlled for?	Yes	
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	No	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		Unclear whether assessors were blinded to participant group allocation.	
What is the overall risk of bias?		Unclear	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No	

Study ID	Thomson 2008
Study Citation	Thomson RL, Buckley JD, Noakes M, Clifton PM, Norman RJ, Brinkworth GD. The effect of a hypocaloric diet with and without exercise training on body composition, cardiometabolic risk profile, and reproductive function in overweight and obese women with polycystic ovary syndrome. J Clin Endocrinol Metab. 2008 Sep;93(9):3373-80. doi: 10.1210/jc.2008-0751.
Study Country	Australia
BRIEF CHARACTERISTICS OF RCT	
Patient/population/ participants	Women with PCOS
PCOS diagnostic criteria	Rotterdam
Presence of infertility	Not reported
Presence of other condition/s	
Medication History	Not reported
N per group	*Allocated/randomised:* 64 (31 MICT, 33 MICT and RT) *Assessed at end of study:* 38 (18 MICT, 20 MICT and RT)
Setting	Metropolitan research clinic
Intervention	Diet: All subjects were prescribed the same energy-restricted, high-protein diet (5000–6000 kJ/d) for a planned weight loss of 8–12 kg over the study period. The diet provided 30% of energy as protein, 40% as carbohydrate, and 30% as fat (8% saturated fat). MICT: walking/jogging five times a week for 25-45 minutes at 60-80% HRmax.
Comparison	Diet: All subjects were prescribed the same energy-restricted, high-protein diet (5000–6000 kJ/d) for a planned weight loss of 8–12 kg over the study period. The diet provided 30% of energy as protein, 40% as carbohydrate, and 30% as fat (8% saturated fat). MICT: walking/jogging three times a week for 25-45 minutes at 60-80% HRmax. RT: two days of resistance training involving 5 exercises for three sets of 12 repetitions at 50-75% 1RM.
Outcomes (primary and other) with definition (eg. self-reported, fasting etc.)	Weight, body composition, cardiometabolic risk factors, hormonal status, menstrual cyclicity, and ovulatory function.
Follow up Duration	20 weeks
Summary Result/s	In overweight and obese women with PCOS, the addition of aerobic or combined aerobic resistance exercise to an energy-restricted diet improved body composition but had no additional effect on improvements in cardiometabolic, hormonal, and reproductive outcomes relative to diet alone.
ISSUES TO CONSIDER TO ASSIST WITH RISK OF BIAS ASSESSMENT	

Does the study have a clearly focused question and/or PICO?		Yes	The objective was to evaluate the effects of aerobic and aerobic-resistance exercise when combined with an energy-restricted high protein diet (5000 6000 kJ/d) on metabolic risk factors and reproductive function in women with PCOS.
Does the study have specified inclusion/exclusion criteria?		Yes	
If there were specified inclusion/ exclusion criteria, were these appropriate?		Partial	Didn't define age or BMI range.
Inclusion criteria		Partial	Didn't define age or BMI range.
Exclusion criteria		Yes	Potential participants were excluded if they were using fertility treatments or oral contraceptives; were smokers, pregnant, breastfeeding, or had history of cardiovascular, liver, kidney or respiratory disease, diabetes, uncontrolled hypertension, or malignancy; or were participating in regular physical activity. Subjects were also excluded if they had reproductive disorders unrelated to PCOS, thyroid abnormalities, or nonclassical adrenal hyperplasia.
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Did the study have an adequate method of randomisation?	Unclear	They study was randomised but the authors didn't mention how they conducted the randomisation.
	Was allocation to intervention group concealed?	Unclear	Not reported
PERFORMANCE BIAS	Were patients blind to intervention group?	No	Not applicable
	Were investigators and care providers blind to intervention group?	No	Not applicable
	Aside from the experimental intervention, were the groups treated the same?	Yes	
DEDETECTION BIAS	Were outcome assessors blind to intervention group?	Unclear	Not reported
	Were all outcomes measured in a standard, valid and reliable way?	Yes	
	Were outcomes assessed objectively and independently?	Yes	

ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study dropped out?	42% treatment 39% comparison	
	Were all the subjects analysed in the groups to which they were randomly allocated (ie intention to treat analysis)?	Unclear	Not reported whether analyses were intention to treat or per protocol.
REPORT	Is the paper free of selective outcome reporting?	Yes	
CONFOUNDING	Were the groups similar at baseline with regard to key prognostic variables?	Yes	
	If confounding was present, was it controlled for?	Not applicable	
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	No	
	Was the study sufficiently powered to detect any differences between the groups?	Yes	
	If statistical analysis was undertaken, was this appropriate?	Yes	
COMMENTS		Lack of blinding of outcome assessors, concealment of allocation (opaque envelopes), high dropout rate, and unclear whether analyses were undertaken as per-protocol or as intention-to-treat are primary reasons for high risk classification.	
What is the overall risk of bias?		High	
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		No

Question 3.4.

In women with PCOS, are exercise interventions (compared to different exercises) effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes?

BACKGROUND:

In general populations, physical activity (any bodily movement produced by skeletal muscles that requires energy expenditure) and structured exercise (an activity requiring physical effort, carried out to sustain or improve health and fitness) delivers metabolic, cardiovascular, and psychosocial benefits, whether alone or combined with diet changes (1-2). Both aerobic exercise (cardiorespiratory fitness training) and resistance exercise (muscle strengthening) are proven beneficial to reduce cardiometabolic risk factors but combined training seems to be most efficient (1-2).

Exercise can be classified as continuous aerobic exercises characterized by a constant submaximal power output throughout an entire session or intermittent aerobic exercises which consist of alternating periods of greater and lower intensity within an exercise period. High intensity interval training or HIIT is a newer form of exercise that is defined by repeated short bouts of high-intensity exercise. In populations with type 2 diabetes and healthy populations, compared to moderate intensity continuous aerobic physical training (MICT), HIIT has shown superior benefits to cardiometabolic parameters (3-5).

In women with PCOS, there is a range of evidence from small randomized controlled trials (RCTs) and high-quality mechanistic studies (cohort and case control studies) that physical activity, including formal exercise training in the form of aerobic and/or resistance training improves metabolic features, body composition, reproductive features and psychological wellbeing compared to minimal or no interventions (6-10). However, there is minimal high quality RCT evidence exploring what exercise best targets clinical features of PCOS and the benefits of exercise in combination with improvements to diet.

The key clinical question and knowledge gap relates to establishing which physical activity and/or formal exercise program or intervention is most effective for improving anthropometric, metabolic, reproductive, fertility, quality of life and emotional wellbeing outcomes in women with PCOS. The evidence summary of our meta-analysis and/or descriptive analysis for the three different comparisons is summarized below:

Comparison 1. High-intensity interval training versus moderate-intensity continuous training

In the meta-analysis of 2-3 pooled studies comparing HIIT to MICT three times per week and ranging from 10 weeks to 6 months (11-13), there were no differences in any of the anthropometric, metabolic, reproductive or hormonal outcomes assessed, with most of the evidence being of low to very low certainty due primarily to imprecision (small sample sizes), unclear risk of bias and inconsistency of effect estimates and/or confidence intervals. In descriptive analysis, HIIT was more effective than MICT for menstrual regularity (OR [95%CI] = 7.8 [1.1, 56.1]) with very low certainty due to imprecision (being derived from a single small study (12) as well as inconsistency and risk of bias.

Comparison 2. High-intensity interval training versus resistance training

Based on only one study in 21 women with PCOS where HIIT was compared to resistance training three times per week for 10 weeks (14), there were no observed differences between HIIT and resistance training for metabolic, cardiovascular and hormonal outcomes.

Comparison 3. Diet plus combined aerobic and resistance training versus diet plus aerobic exercise

The systematic review identified only one study that compared diet combined with aerobic exercise and resistance training with diet combined with aerobic exercise only (15). There were no significant differences in cardiometabolic, hormonal and reproductive outcomes.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
○ **Comparison 1. High-intensity interval training versus moderate-intensity continuous training**	⨁◯◯◯ VERY LOW
○ **Comparison 2. High-intensity interval training versus resistance training**	⨁◯◯◯ VERY LOW
○ **Comparison 3. Diet plus combined aerobic and resistance training versus diet plus aerobic exercise**	⨁◯◯◯ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Comparison 1. High-intensity interval training (HIIT) versus moderate-intensity continuous training (MICT)

Comparison 2. HIIT versus resistance training (RT)

Comparison 3. Diet + combined aerobic and resistance training (CT) versus diet + aerobic exercise (AEx)

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** Health professionals and women could consider that, there is no evidence to support any one type and intensity of exercise being better than another for anthropometric, metabolic, hormonal, reproductive or psychological outcomes.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **CR:** Any physical activity consistent with population guidelines will have health benefits and within this, health professionals should advise any sustainable physical activity based on individual preferences and goals.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **CR:** Health professionals should encourage and advise the following in concordance with general population physical activity guidelines:
    - All adults should undertake physical activity asdoing some physical activity is better than none.
    - Adults should limit the amount of time spent being sedentary (e.g. sitting, screen time) asreplacing sedentary time with physical activity of any intensity (including light intensity) provides health benefits.
- For the prevention of weight gain and maintenance of health, adults (18-64 years) should aim for a minimum of 150 to 300 minutes of moderate intensity activities or 75 to 150 minutes per week of vigorous intensity aerobic activity or an equivalent combination of both spread throughout the week, plus muscle strengthening activities (e.g. resistance/flexibility) on two non-consecutive days per week.
- For promotion of greater health benefits including modest weight-loss and prevention of weight-regain, adults (18-64 years) should aim for a minimum of 250 min/week of moderate intensity activities or 150 min/week of vigorous intensities or an equivalent combination of both, plus muscle strengthening activities (e.g. resistance/flexibility), ideally on two non-consecutive days per week.
- Adolescents should aim for at least 60 minutes of moderate- to vigorous-intensity physical activity per day including activities that strengthen muscle and bone, at least three times per week.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

- Physical activity is any bodily movement produced by skeletal muscles that requires energy expenditure. It includes leisure time physical activity, transportation (e.g. walking or cycling), occupational (i.e. work), household chores, playing games, sports or planned exercise, or activities in the context of daily, family and community activities.
- Aerobic activity is best performed in bouts of at least 10 minutes duration, aiming to achieve at least 30 minutes daily on most days.
- Barriers and facilitators to optimise engagement and adherence to physical activity should be discussed, including psychological factors (e.g. body image concerns, fear of injury, fear of failure, mental health), personal safety concerns, environmental factors, physical limitations, socioeconomic factors, sociocultural factors, as well as personal motivators for change. The value of broader family engagement should be considered. Referral to suitably trained allied health professionals needs to be considered for optimising physical activity in women with PCOS.
- Self-monitoring including with fitness tracking devices and technologies for step count and exercise intensity, could be used as an adjunct to support and promote active lifestyles and minimise sedentary behaviours.

GRADE CONSIDERATIONS

Justifications:
With limited number and quality RCTs on optimal exercise programs for women with PCOS, we are referred to high quality mechanistic literature in PCOS and international exercise/physical activity recommendations for the general population.

COMPARISON 1. HIIT versus MICT
In the meta-analyses of 2-3 pooled studies (11-13), there were no differences in any of the outcomes assessed, with most of the evidence being of low to very low certainty due primarily to imprecision (small sample sizes), in addition to unclear risk of bias and inconsistency of effect estimates and/or confidence intervals. In descriptive analysis (studies

or outcomes not pooled in meta-analysis), HIIT was more effective than MICT for menstrual regularity (OR [95%CI] = 0.127 [0.017, 0.905]) with very low certainty due to imprecision (being derived from a single small study (12), as well as inconsistency and risk of bias.

COMPARISON 2. HIIT versus RT
One study compared HIIT with RT (14) on anthropometric, metabolic and hormonal/ reproductive outcomes. This study (14) was conducted in Norway with 21 participants and had an unclear risk of bias due to lack of blinding to participant group allocation by outcome assessors and insufficient information around allocation concealment. There were no differences between HIIT and RT for any of the outcomes. Certainty in these results is very low due to being derived from a single, relatively small study with an unclear risk of bias.

COMPARISON 3. Diet plus combined aerobic and resistance training versus diet plus aerobic exercise
One study compared diet plus combined aerobic and RT with diet and aerobic exercise (15) on anthropometric, metabolic and hormonal/ reproductive outcomes. This study (15) was conducted in Australia with 64 participants and had a high risk of bias due to lack of blinding to participant group allocation by outcome assessors and insufficient information around allocation concealment. There were no differences between diet plus combined aerobic and resistance training and diet and aerobic exercise for any of the outcomes. Certainty in these results is very low due to being derived from a single, relatively small study with a high risk of bias due to lack of blinding of outcome assessors, concealment of allocation (opaque envelopes), high dropout rate, and unclear whether analyses were undertaken as per-protocol or as intention-to-treat.

Subgroup considerations:
All studies were in adult populations.

Implementation considerations:
Recommendations may have cost implications especially in resource limited environment.

Monitoring and evaluation considerations:
As there is insufficient evidence for a specific type, mode or intensity of exercise being best for the management and treatment of PCOS, thus recommending gold-standard and expensive cardio-respiratory tests is unwarranted. Instead, simple easy to use tools would appropriate to monitor general fitness and exercise behaviours in women with PCOS.

Research priorities:
Clear clinical research gaps have been identified in this and prior extensive evidence syntheses (6-10), as well as stakeholder feedback including an international survey of 1592 women with PCOS and 1800 Health Professionals (2015–2017) (16). There is an urgent need to determine:

1) Exercise types, intensity, duration and duration of effect to optimise efficacy and efficiency.
2) Strategies to increase engagement and address barriers, cultural factors, acceptability, feasibility and sustainability of active lifestyles in PCOS management and treatment.
3) Medium to longer term exercise studies (6-12 months or greater)
4) Impact of improvements in cardiorespiratory fitness and/or strength on clinical features of clinical outcome of women with PCOS.
5) Assessing the impact of reducing sedentary behaviour on clinical outcomes.

Other priorities include:

- Across different life stages – adolescent, post-menopausal, pregnancy
- Cost effectiveness
- Sufficiently powered RCTs
- The contribution of social support

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

For comparison 1: Three trials of short duration (12 weeks to 6 months); HIIT vs MICT 3 times per week.

Menstrual regularity was reported in 2 studies of small sample size. A pilot study with feasibility as primary outcome and reproductive function as one of the preliminary efficacy outcomes showed no difference in menstrual regularity between the groups (11). Another study with menstrual cyclicity as one of the secondary outcomes showed benefits for HIIT in menstrual regularity (12).

_____

For comparison 2/3: meta-analysis was not possible. Only 1 study for each comparison.

Comparison 2 – 10 weeks long, 21 subjects

Comparison 3 – 20 weeks, lots of drop outs (64 enrolled, 38 completed/included in analysis)

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

For comparison 1: Three trials of short duration (12 weeks to 6 months); HIIT vs MICT 3 times per week.

Menstrual regularity was reported in 1 study, small sample size

_____

For comparison 2/3: meta-analysis was not possible. Only 1 study for each comparison.

Comparison 2 – 10 weeks long, 21 subjects

Comparison 3 – 20 weeks, lots of drop outs (64 enrolled, 38 completed/included in analysis)

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Small number of studies

Small numbers of subjects

High risk of bias

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Small number of studies

Small numbers of subjects

High risk of bias

Low quality evidence

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	X Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Women may prefer one type of exercise, intensity and duration over other types.

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☒ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

It is important to consider the cost and resource requirements at a health systems level and for the individual woman with many low cost options available. Irrespective of the exercise programme or physical activity recommendation, implementation of exercise therapy/physical activity programs may result in increased referral to health professionals. This is likely to increase health professional time demands.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

No evidence available.

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

No cost effectiveness analysis has been conducted for comparing different exercise therapies in PCOS.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

The implementation may be variable due to availability of local resources but recommendation is likely to improve equity.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Engagement of healthcare practitioners and healthcare funders, as well as the financial barriers for the woman may be an issue. Also, insufficient access to, as well as time constraint for, health professionals may be a barrier. Drop-out or non-adherence to physical activity recommendations may be a problem.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Likely feasible for health professionals to give general population physical activity advice but feasibility and sustainability for healthy physical activity in women may vary depending on socioeconomic, sociocultural, physical factors.

Question 3.5.

Why are women with PCOS at increased risk of weight gain?

1. STUDY SELECTION

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women with PCOS (NIH 1990, Rotterdam 2003 or AE-PCOS 2006 criteria). No exclusion of age. Note age subgroups, phenotypes or pathological categories (HA or IR).	None	Females without PCOS	1) Extrinsic factors potentially related to challenges with weight management (ie lifestyle factors) a. Dietary intake (energy, glycemic index, glycemic load, protein, fat, carbohydrate) b. Physical activity (Total PA) 2) Intrinsic factors potentially related to challenges with weight management (ie energy homeostasis) a. Energy intake Include - Post meal/OGTT - Ghrelin, GLP1, GIP, PYY, Amylin, appetite/satiety/hunger (please only include AUC data) Exclude - fasting, post clamp or post weight loss measures of any above b. Energy expenditure Include – REE, MIT Exclude – RER, metabolic flexibility	Intervention (randomized, non-randomized controlled trials, single arm intervention trials) or observational (i.e., cross-sectional, case-control, cohort) studies	English language. Human studies
Exclusion	None	None	None	None	case reports, commentaries, letters to editor, abstracts.	None

5. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year	Country	Study design	PCOS criteria	PCOS sample size Age and BMI mean	Control sample size Age and BMI mean	Dietary assessment tool	Physical activity assessment tool	RoB
Ahmadi 2013	Iran	Case-control	Rotterdam	65 Age = 25.11 BMI = 23.43	65 Age = 26.11 BMI = 23.14	three 24-hour dietary recall questionnaires (two weekdays and a weekend) by a trained dietition	NR	Low
Alipour *et al.,* 2019	Iran	Case-control	Rotterdam	45 Age = 26.64 BMI = 26.37	45 Age = 27.56 BMI = 25.29	3-day 24h food recall questionnaires (2 weekdays and 1 weekend day)	NR	Mod
Altieri *et al.,* 2013	Italy	Case-control	Rotterdam	100 Age = 27.7 BMI = 34.7	100 Age = 28.4 BMI = 34.8	7-day food diary (7 days of one week)	NR	Mod
Álvarez-Blasco *et al.*, 2011	Spain	Case-control	NIH	22 Age = 26.3 BMI = 35.2	59 Age = 32.2 BMI = 34.8	Modified (Spanish-population) semi-quantitative FFQ (Harvard Service FFQ)	Self-reported questionnaire (unspecified)	Mod
Amirjani 2019	Iran	Cross-sectional	Rotterdam	168	160 Age = 29.85 BMI = 33.32	FFQ	Lifestyle questionnaire	Low
Arusoglu 2020	Turkey	Case-control	Rotterdam	32 Age = 22.03 BMI = 22.64	31 Age = 21.71 BMI = 21.55	24 hours of food record	metabolic Holter equipment (SenseWear Armband, SWA)	Low
Badri-Fariman *et al.,* 2021	Iran	Case-control	Rotterdam	120 BMI = 29.55	120 BMI = 28.88	FFQ + 18-item USDA food security questionnaire	Metabolic equivalents (MET)-based questionnaire	Mod
Banting *et al.*, 2014	Australia	Cross-sectional	Self-reported	153 Age = 31.99 BMI = 31.32	64 Age = 31.5 BMI = 24.15	NR	Questionnaire (self-reported trans-theoretical model, developed based on NPAGA)	Mod
Barrea *et al.*, 2019	Italy	Cross-sectional	Rotterdam	112 Age = 24.21 BMI = 30.95	112 Age = 24.07 BMI = 30.76	14-item PREDIMED questionnaire used for Mediterranean diet assessment and 7-day food diary for dietary intake assessment (nutritionist-administered in the face to face interviews)	Questionnaire (self-reported habitual aerobic exercise engagement for a minimum of 30 min/day [yes/no])	Mod

Bialka-Kosiec 2019	Poland	Cross-sectional	Rotterdam	37 Age = 19.4 BMI = 23.3	48 Age = 20.0 BMI = 22.6	HBSC Questionnaire	HBSC Questionnaire	Low
Bykowska-Derda 2020 (included 17 yr olds)	Poland	Case-control	Rotterdam	122 Age = 27 BMI = 26.2	116 Age = 26 BMI = 22.8	the Dietary Habits and Nutrition Beliefs KomPAN Questionnaire	short version of the international physical activity questionnaire	Low
Cunha *et al.*, 2019	Brazil	Case-control	Rotterdam	39 Age = 25.17 BMI = 24.43	34 Age = 25.67 BMI = 23.95	7-day food report	NR	Mod
Cutillas-Tolin *et al.*, 2021	Spain	Case-control	Rotterdam	121	155	117-item FFQ (semiquantative, validated)	NR	Mod
Cutler *et al.,* 2019	Canada	Cross-sectional	Rotterdam	87 Age = 30.7 BMI = 29	50 Age = 35.7 BMI = 24.1	3-day 24h food recall questionnaires (2 weekdays and 1 weekend day)	3-day PA activity record (2 weekdays, 1 weekend), pedometer (SM-2000 Step Pedometer by Heart Rate Monitors USA) for daily steps	Mod
Dantas *et al.*, 2015	Brazil	NR	Rotterdam	15 Age = 24.8 BMI = 32.8	12 Age = 29.6 BMI = 30.3	NR	Actigraph GT3X accelerometer (freedson activity cut points were used to define the intensity of PA)	low
DeGiuseppe 2019 (lower age bound 16)	Italy	Case-control	Rotterdam	36 Age = 27.8 BMI = 31.5	37 Age = 28.3 BMI = 22.2	non-consecutive three-day dietary diary	BMR: basal metabolic rate	Mod
Douglas *et al.,* 2006	USA	Cohort	NIH	30 Age = 28.9 BMI = 29.7	27 Age = 28.9 BMI = 29.1	4-day food record (2 weekdays, 2 weekends), MC questionnaire	NR	Mod
Elefheridou et al, 2012	Greece	Cross-sectional	Rotterdam	35 Age = 15.1 BMI 23.8	46 Age = 14.6 BMI = 22.63	NR	Interview-administered lifestyle questionnaire	Mod
Elefheridou et al, 2012	Greece	Cross-sectional	Rotterdam	35 Age = 15.1 BMI 23.8	46 Age = 14.6 BMI = 22.63	Interview-administered lifestyle questionnaire	NR	High
Eslamian *et al.,* 2017	Iran	Case-control	Rotterdam	281 Age = 28.8 BMI = 31.2	472 Age = 29.4 BMI = 25.9	Validated semi-quantitative Food Frequency Questionnaire (consumption frequency asked on daily, weekly, or monthly basis)	Interviews using valid questionnaire (consisted of 9 different MET categories ranging from sleep to high intensity)	High

Forslund 2020	Sweden	Cohort	NIH	27 Age = 52.4 BMI = 30.7	94 Age = 52.4 BMI = 25.5	FFQ	Structured questionnaire not specified	Mod
Ganie *et al.*, 2019	India	Case-control	Rotterdam	144 Age = 26.06 BMI = 24.81	320 Age = 26.55 BMI = 23.97	FFQ, 72-hr dietary recall	NR	Low
Gargari 2015	Iran	Case-control	Rotterdam	30 Age = 25.83 BMI = 25	30 Age = 26.06 BMI = 23.68	3-day, 24-hour food recall and FFQ	NR	Mod
Gopalan et al. 2021	India	Case-control	Rotterdam	80 Age = 24.64 BMI = NR	80 Age = NR BMI = NR	detailed dietary history	NR	High
Graff 2013	Brazil	Cross-sectional	Rotterdam	61 Age = 22.7 BMI = 28.9	44 Age = 25 BMI = 27.1	FFQ	NR	Low
Graff 2017	Brazil	Cross-sectional	Rotterdam	84 Age = 23.5 BMI = 29.4	54 Age = 26.2 BMI = 27.2	FFQ	digital pedometer	Low
Hosseini *et al.* 2017	Iran	Case-control	AEPCOS	99 Age = 29 BMI = 26.6	198 Age = 29.2 BMI = 26	168-item semi-quantative FFQ	International interview-administered questionnaire	High
Huijgen *et al.* 2015	Netherlands	Case-cohort	Rotterdam	218 Age = 28.5 BMI = 25.6	799 Age = 33.1 BMI = 24.5	Questionnaire of 6 food groups to calculate Preconception Dietary Risk score (unspecified; self-reported)	NR	Mod
Jurewicz *et al.* 2021	Poland	Case-control	AEPCOS	199 Age = 26.6 BMI = 25.9	158 Age = 31.2 BMI = 25	Questionnaire for alcohol consumption	NR	Mod
Kazemi Jaliseh *et al.* 2017	Iran	Case-control	NIH	178 Age = 26.4 BMI = 26.1	1524 Age = 28.9 BMI = 25.4	NR	Lipid Research Clinic questionnaire	Low
Khademi *et al.* 2010	Iran	Case-control	Rotterdam	26 Age = 31 BMI = 23.8	268 Age = 33 BMI = 22.02	NR	Interviewer-administered questionnaire	Mod

Kulshreshtja et al., 2022	India	Cross sectional	Rotterdam	168 (lean 62, obese 106) Age = lean 23.1 Age = obese 24.23 BMI = lean = 20.44 BMI = obese 29.48	102 (lean 60, obese 42) Age = lean 23.22 Age = obese 28.2 BMI = lean 20.00 BMI = obese 27.6	2 day food recall	interview	Low
Larsson *et al.,* 2016	Sweden	Case-control	Rotterdam	72 Age = 30.2 BMI = 28.5	30 Age = 27.8 BMI = 24.6	FFQ (verified in Swedish youth)	NR	Mod
Lerchbaum *et al.,* 2021	Austria		Rotterdam	180 Age = 26 BMI = 27.6	150 Age = 35.8 BMI = 25.2	NR	NR	Mod
Liang *et al.,* 2021	China		Rotterdam	20	20	3-d 24-hr recall (interviewer-adminstrated)	NR	low
Lin *et al.,* 2019	USA	Case-control	Rotterdam	80 Age = 26.8 BMI = 31.5	44 Age = 29.5 BMI = 28	VioScreen (web based self-administered FFQ with ~1200 food images and branching questions)	Accelerometry (Actigraph triaxial accelerometer) and self-reported PA (Women's Health Initiative Physical Activity Questionnaire)	low
Lin *et al.*, 2021	USA	Cross-sectional	NIH	40 Age = 24.7 BMI = 25.5	529 Age = 25.4 BMI = 24.6	CARDIA diet history questionnaire (past 28 days; interviewer-administered)	CARDIA PA questionnaire (past year; self-reported)	Mod
Lu *et al*., 2021	China		Rotterdam	325 Age = 29.5 BMI = 21.8	325 Age = 30.2 BMI = 22.1	NR	NR	low
Mario-2012	Brazil	Case-control	Rotterdam	43	22 Age = 27.2 BMI = 27.6	FFQ	digital pedometer	Mod
Mario-2017 (exclusionary because of age 15)	Brazil	Cross-sectional	Rotterdam	84 Age = 24.6 BMI = 29.4	67 Age = 26.4 BMI = 28.4	NR	digital pedometer	Low
Melekoglu *et al*., 2020	Turkey	Cross-sectional	Rotterdam	65 Age = 26.45 BMI = 29.7	65 Age = 26.52 BMI = 22.6	3-day integrated food record (consecutive days)	3-day integrated PA record (consecutive days)	High
Misir *et al*., 2016	Croatia	Cross-sectional	Rotterdam	12 BMI = 27.4	16 BMI = 23.1	24-hr dietary recall	Survey on the Basic Data, Dietary Habits, and Physical Activity	Mod

Mizgier 2021 and Mizgier 2022	Poland	Cross-sectional	Rotterdam	61 Age = 16	35 Age = 15	3 day food record	NR	Low
Navarro-Lafuente *et al*., 2022	Spain		Rotterdam	121 Age = 27.3 BMI = 25.6	155 Age = 30.6 BMI = 23.3	NR	NR	High
Neubronner *et al*., 2021	Singapore	Cross-sectional	Rotterdam	134 Age = 29.84 BMI = 25.14	255 Age = 32.24 BMI = 23.08	NR	NR	Mod
Noormohammadi *et al*., 2021	Iran	Case-control	Rotterdam	303 Age = 29.1 BMI = 33.7	588 Age = 28.8 BMI = 24.2	Validated semi-quantitative FFQ (168 food items)	Validated self-reported physical activity scale	Mod
Orio *et al*., 2006	Italy	Case-control	Rotterdam	45 Age = 21.3 BMI = 29.4	45 Age = 21.6 BMI = 29	NR	Semiquantitative questionnaire, ergometer	High
Panjeshahin *et al*., 2020	Iran	Case-control	Rotterdam	108 Age = 28.95 BMI = 27.1	108 Age = 30.45 BMI = 26.63	178-item FFQ (Adjusted model of TLGS)	International Physical Activity Questionnaire -SH	Low
Pokorska-Niewiada *et al.,* 2021	Poland		Rotterdam	47 Age = 28.3 BMI = 29.95	16 Age = 29 BMI = 23.3	4-d dietary food record (2 weekdays and 2 weekend days)	NR	High
Sedighi *et al*., 2014	Iran	Case-control	Rotterdam	65 Age = 28.85 BMI = 24.02	65 Age = 29.57 BMI = 23.47	Diet questionnaire (28 items with 0 to 112 points, where higher score showed more appropriate diet)	International Physical Activity Questionnaire	High

6. FINDINGS

Comparisons included:

- **Comparison 1.** PCOS versus controls

Outcomes included:

- **Outcome 1.** Total energy intake
- **Outcome 2.** Total carbohydrate intake
- **Outcome 3.** Total protein intake
- **Outcome 4.** Total fat intake
- **Outcome 5.** Dietary glycemic index
- **Outcome 6.** Dietary glycemic load
- **Outcome 7.** Total physical activity level

▪ EVIDENCE SUMMARY:

Total energy intake: Forty studies examined total energy intake of women with and without PCOS and thirty-two studies were suitable to be included in the meta-analysis. Four studies were judged as high risk of bias (Eslamian et al. 2017, Hosseini et al. 2017, Melekoglu et al. 2020, Navarro-Lafuente et al. 2022) while the rest were of low to moderate risk of bias. Very low evidence shows that women with and without PCOS had similar dietary total energy intake.

Total carbohydrate intake: Thirty-seven studies examined total carbohydrate intake of women with and without PCOS and thirty studies were suitable to be included in the meta-analysis. Twenty-three studies were included in meta-analysis for total gram/day of carbohydrate intake while thirteen studies were included in the meta-analysis for percentage of carbohydrate intake over total energy intake. Only three studies were judged as high risk of bias (Eslamian et al. 2017, Melekoglu et al. 2020, Navarro-Lafuente et al. 2022) while the rest were of low to moderate risk of bias. Very low evidence shows that women with and without PCOS had similar dietary total carbohydrate intake.

Total protein intake: Thirty-seven studies examined total protein intake of women with and without PCOS and thirty studies were suitable to be included in the meta-analysis. Twenty-five studies were included in meta-analysis for total gram/day of protein intake while thirteen studies were included in the meta-analysis for percentage of protein intake over total energy intake. Only three studies were judged as high risk of bias (Eslamian et al. 2017, Melekoglu et al. 2020, Navarro-Lafuente et al. 2022) while the rest were of low to moderate risk of bias. Very low evidence shows that women with and without PCOS had similar dietary total protein intake.

Total fat intake: Thirty-six studies examined total fat intake of women with and without PCOS and twenty-eight studies were suitable to be included in the meta-analysis. Twenty-two studies were included in meta-analysis for total gram/day of fat intake while thirteen studies were included in the meta-analysis for percentage of fat intake over total energy intake. Only three studies were judged as high risk of bias (Eslamian et al. 2017, Melekoglu et al. 2020, Navarro-Lafuente et al. 2022) while the rest were of low to moderate risk of bias. Very low evidence suggests that women with PCOS had higher total fat intake than women without PCOS (MD 6.22 g/day (95% CI 3.71-8.73)).

Dietary glycemic index: Nine studies examined dietary glycemic index of women with and without PCOS and seven were included in the meta-analysis (Alipour et al. 2019, Eslamian et al. 2017, Melekoglu et al. 2020, Shishehgar et al. 2016, Shishehgar et al. 2019, Graff et al. 2013, Graff et al. 2017). Two studies were judged as high risk of bias (Eslamian et al. 2017, Melekoglu et al. 2020)

and the rest were of low to moderate risk of bias. Very low evidence shows that women with and without PCOS had similar dietary glycemic index food.

Diatary glycemic load: Eight studies examined dietary glycemic load of women with and without PCOS and four were included in the meta-analysis (Alipour et al. 2019, Eslamian et al. 2017, Melekoglu et al. 2020, Shishehgar et al. 2019). Two studies were judged as high risk of bias (Eslamian et al. 2017, Melekoglu et al. 2020), the other two studies were of moderate risk of bias. Very low evidence shows that women with and without PCOS had similar dietary glycemic load food.

Total physical activity: Forty-nine studies examined physical activity of women with and without PCOS and nine were included in the meta-analysis (Eslamian et al. 2017, Hosseini et al. 2017, Noormohammadi et al., 2021, Panjeshahin et al., 2020, Sedighi et al., 2014, Shahdadian et al., 2019, Shishehgar et al., 2019). Three studies were judged as high risk of bias (Eslamian et al. 2017, Hosseini et al. 2017, Sedighi et al., 2014), five were of moderate risk of bias and only one study had low risk of bias. Very low evidence suggest women with PCOS had lower total physical activity than women without PCOS.

1. STUDY SELECTION

Table 1. PICO Criteria for Inclusion	
Question	3.5 Why are women with PCOS at increased risk of weight gain? (Intrinsic factors)
Clinical leads (key contacts)	Lisa Moran
Allocation ranking	Level 1 – New systematic review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Women with PCOS (NIH 1990, Rotterdam 2003 or AE-PCOS 2006 criteria). No exclusion of age. Note age subgroups, phenotypes or pathological categories (HA or IR).	None	Females without PCOS	1) Extrinsic factors potentially related to challenges with weight management (ie lifestyle factors) a. Dietary intake (energy, glycemic index, glycemic load, protein, fat, carbohydrate) b. Physical activity (Total PA) 2) Intrinsic factors potentially related to challenges with weight management (ie energy homeostasis) a. Energy intake Include - Post meal/OGTT - Ghrelin, GLP1, PYY, Amylin, appetite/satiety/hunger (please only include AUC data) Exclude - fasting, post clamp or post weight loss measures of any above b. Energy expenditure Include – REE, MIT Exclude – RER, metabolic flexibility	Intervention (randomized, non-randomized controlled trials, single arm intervention trials) or observational (i.e., cross-sectional, case-control, cohort) studies	English language. Human studies
Exclusion	None	None	None	None	case reports, commentaries, letters to editor, abstracts.	None

Evidence processing: Studies were selected and appraised by two reviewers using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. **In total, 30 studies met inclusion criteria for this review.**

Postprandial response of ghrelin and PYY and indices of low-grade chronic inflammation in lean young women with polycystic ovary syndrome. J Physiol Pharmacol. 2008 Aug;59 Suppl 2:161-78. PMID: 18812636.

4.2 Excluded studies (after full text review)			
Title	**Authors**	**Year**	**Reasons**
The effect of bariatric surgery on inflammatory markers in women with polycystic ovarian syndrome	Abiad, F.; Khalife, D.; Safadi, B.; Alami, R.; Awwad, J.; Khalifeh, F.; Ghazeeri, G.	2018	Non energy homeostasis
Lipid Accumulation Product (LAP) and Visceral Adiposity Index (VAI) as Markers of Insulin Resistance and Metabolic Associated Disturbances in Young Argentine Women with Polycystic Ovary Syndrome	Abruzzese, G. A.; Cerrrone, G. E.; Gamez, J. M.; Graffigna, M. N.; Belli, S.; Lioy, G.; Mormandi, E.; Otero, P.; Levalle, O. A.; Motta, A. B.	2017	No outcomes of interest
Increased chemerin serum levels in hyperandrogenic and normoandrogenic women from Argentina with polycystic ovary syndrome	Abruzzese, G. A.; Gamez, J.; Belli, S. H.; Levalle, O. A.; Mormandi, E.; Otero, P.; Graffigna, M. N.; Cerrone, G. E.; Motta, A. B.	2020	No outcomes of interest
Normal metabolic flexibility despite insulin resistance women with polycystic ovary syndrome	Adamska, Agnieszka; Karczewska-Kupczewska, Monika; Nikolajuk, Agnieszka; Otziomek, Elzbieta; GÃ³rska, Maria; Kowalska, Irina; Straczkowski, Marek	2013	no outcome of interest
Plasma nesfatin-1 levels are increased in patients with polycystic ovary syndrome	Ademoglu, E. N.; Gorar, S.; Carlioglu, A.; Yazici, H.; Dellal, F. D.; Berberoglu, Z.; Akdeniz, D.; Uysal, S.; Karakurt, F.	2014	Non energy homeostasis
Metformin reduces arterial stiffness and improves endothelial function in young women with polycystic ovary syndrome: a randomized, placebo-controlled, crossover trial	Agarwal, N.; Rice, S. P.; Bolusani, H.; Luzio, S. D.; Dunseath, G.; Ludgate, M.; Rees, D. A.	2010	Non energy homeostasis
Hyperandrogenism, Insulin Resistance, and Acanthosis Nigricans (HAIR-AN) Syndrome Reflects Adipose Tissue Dysfunction ("Adiposopathy" or "Sick Fat") in Asian Indian Girls	Agrawal, K.; Mathur, R.; Purwar, N.; Mathur, S. K.; Mathur, D. K.	2021	Duplicate
Hyperandrogenism, Insulin Resistance, and Acanthosis Nigricans (HAIR-AN) Syndrome Reflects Adipose Tissue Dysfunction ("Adiposopathy" or "sick Fat") in Asian Indian Girls	Agrawal, K.; Mathur, R.; Purwar, N.; Mathur, S. K.; Mathur, D. K.	2021	Non energy homeostasis
Altered serum marker of adipokines profile in breast cancer women	Ahmed, S. E.; Sarhat, E. R.; Awni, N.; Sarhat, T.; Abass, K. S.	2021	Non energy homeostasis
Retinol-binding protein 4 in polycystic ovary syndrome-association with steroid hormones and response to pioglitazone treatment	Aigner, E.; Bachofner, N.; Klein, K.; De Geyter, C.; Hohla, F.; Patsch, W.; Datz, C.	2009	Non energy homeostasis
The effects of high intensity-interval training on vaspin, adiponectin and leptin levels in women with polycystic ovary syndrome	Aktas, H. S.; Uzun, Y. E.; Kutlu, O.; Pence, H. H.; Ozcelik, F.; Cil, E. O.; Irak, L.; Altun, O.; Ozcan, M.; Ozsoy, N.; Aydin Yoldemir, S.; Kalyon, S.; Arman, Y.; Tukek, T.	2019	Non energy homeostasis
The effects of high intensity-interval training on vaspin, adiponectin and leptin levels in women with polycystic ovary syndrome	Aktas, H. S.; Uzun, Y. E.; Kutlu, O.; Pence, H. H.; Ozcelik, F.; Cil, E. O.; Irak, L.; Altun, O.; Ozcan, M.; Ozsoy, N.; Aydin Yoldemir, S.; Kalyon, S.; Arman, Y.; Tukek, T.	2022	Non energy homeostasis

The high-molecular weight multimer form of adiponectin is a useful marker of polycystic ovary syndrome in Bahraini Arab women	Al-Awadi, A. M.; Sarray, S.; Arekat, M. R.; Saleh, L. R.; Mahmood, N.; Almawi, W. Y.	2016	Non energy homeostasis
Effects of supervised aerobic training on the levels of anti-Mullerian hormone and adiposity measures in women with normo-ovulatory and polycystic ovary syndrome	Al-Eisa, E.; Gabr, S. A.; Alghadir, A. H.	2017	Non energy homeostasis
Comparison of serum adiponectin and osteopontin levels along with metabolic risk factors between obese and lean women with and without PCOS	Alatas, Suleyman Erkan; Dogu, Sevilay Yavuz; Kilic, Derya; Guler, Tolga	2020	Non energy homeostasis
Is prolactin the missing link in adipose tissue dysfunction of polycystic ovary syndrome patients?	Albu, A.; Florea, S.; Fica, S.	2016	Non energy homeostasis
The association between serum nesfatin-1 level and bmi in iraqi patients with polycystic ovary syndrome (Pcos)	Ali, E. A.; Al-Jedda, W. A.; Al-Khateeb, S. M. J.; Al-Samarriae, A. Y.	2021	Non energy homeostasis
Serum irisin and leptin levels in obese and non-obese women with polycystic ovary syndrome with reference to glucose homeostasis	Ali, S. H.; Al-Nuaimi, A. M. A.; Al-Musawi, B. J.	2016	Non energy homeostasis
Roles of circulating WNT-signaling proteins and WNT-inhibitors in human adiposity, insulin resistance, insulin secretion, and inflammation	Almario, R. U.; Karakas, S. E.	2015	Non energy homeostasis
Effects of High Intensity Interval Training and Strength Training on Metabolic, Cardiovascular and Hormonal Outcomes in Women with Polycystic Ovary Syndrome: A Pilot Study	Almenning, I.; Rieber-Mohn, A.; Lundgren, K. M.; Shetelig Lovvik, T.; Garnaes, K. K.; Moholdt, T.	2015	Non energy homeostasis
Nesfatin-1 levels and metabolic markers in polycystic ovary syndrome	Alp, E.; Gormus, U.; Guducu, N.; Bozkurt, S.	2015	Non energy homeostasis
Nesfatin-1 levels in polycystic ovary syndrome	Alp, E.; Gormus, U.; Guducu, N.; Timirci Kahraman, O.; Bozkurt, S.	2014	Abstract
Serum leptin and body composition in polycystic ovarian syndrome	Alper, T.; Kahraman, H.; Cetinkaya, M. B.; Yanik, F.; Akcay, G.; Bedir, A.; Malatyalioglu, E.; Kokcu, A.	2004	Non energy homeostasis
Insulin sensitivity affects corticolimbic brain responses to visual food cues in polycystic ovary syndrome patients	Alsaadi, Hanin M.; Van Vugt, Dean A.	2015	no outcome of interest
Homocysteine and ghrelin link with polcystic ovary syndrome in relation to obesity	Altug Sen, T.; Koken, R.; Narci, A.; Yilmazer, M.	2011	Non energy homeostasis
Effects of oral contraceptives on serum concentrations of adipokines and adiposity indices of women with polycystic ovary syndrome: a randomized controlled trial	Amiri, M.; Rahmati, M.; Hedayati, M.; Nahidi, F.; Ramezani Tehrani, F.	2020	Non energy homeostasis
Effects of oral contraceptives on serum concentrations of adipokines and adiposity indices of women with polycystic ovary syndrome: a randomized controlled trial	Amiri, M.; Rahmati, M.; Hedayati, M.; Nahidi, F.; Ramezani Tehrani, F.	2021	Non energy homeostasis
Metformin treatment increases PYY levels in some women with PCOS	Anonymous,	2008	Wrong design
Plasma adiponectin and insulin resistance in women with polycystic ovary syndrome	Ardawi, M. S. M.; Rouzi, A. A.	2005	Non energy homeostasis
Serum resistin and adiponectin levels in young non-obese women with polycystic ovary syndrome	Arikan, S.; Bahceci, M.; Tuzcu, A.; Kale, E.; Gokalp, D.	2010	Non energy homeostasis
Metabolic and hormonal changes induced by pioglitazone in polycystic ovary syndrome: a randomized, placebo-controlled clinical trial	Aroda, V. R.; Ciaraldi, T. P.; Burke, P.; Mudaliar, S.; Clopton, P.; Phillips, S.; Chang, R. J.; Henry, R. R.	2009	Non energy homeostasis

Circulating and cellular adiponectin in polycystic ovary syndrome: relationship to glucose tolerance and insulin action	Aroda, V.; Ciaraldi, T. P.; Chang, S. A.; Dahan, M. H.; Chang, R. J.; Henry, R. R.	2008	Non energy homeostasis
Adiponectin gene expression in human granulosa cells of women with PCOS	Artimani, T.; Aflatoonian, R.; Saidijam, M.; Amiri, I.; Yavangi, M.; Shabab, N.; Ashrafi, M.; Mehdizadeh, M.	2013	Abstract
Downregulation of adiponectin system in granulosa cells and low levels of HMW adiponectin in PCOS	Artimani, T.; Saidijam, M.; Aflatoonian, R.; Ashrafi, M.; Amiri, I.; Yavangi, M.; SoleimaniAsl, S.; Shabab, N.; Karimi, J.; Mehdizadeh, M.	2016	Non energy homeostasis
Association between nuclear receptors of estrogen and progesterone with adiponectin receptors in granulosa cells of patients with poly cystic ovary syndrome	Artimani, T.; Saidijam, M.; Amiri, I.; Aflatoonian, R.; Ashrafi, M.; Shabab, N.; Soleimani Asl, S.; Mehdizadeh, M.	2015	Abstract
The Use of SenseWear Armband for Assessment of Daily Energy Expenditure and the Relation to Body Fat Distribution and Nutritional Intake in Lean Women with Polycystic Ovary Syndrome	Arusoglu, G.	2020	No outcomes of interest
Decreased levels of liver-expressed antimicrobial peptide-2 and ghrelin are related to insulin resistance in women with polycystic ovary syndrome	Aslanipour, B.; Alan, M.; Demir, I.	2020	Non energy homeostasis
Serum levels of leptin and homocysteine in women with polycystic ovary syndrome and its relationship to endocrine, clinical and metabolic parameters	Atamer, A.; Demir, B.; Bayhan, G.; Atamer, Y.; Ilhan, N.; Akkus, Z.	2008	Non energy homeostasis
Increase in subcutaneous adipose tissue and fat free mass in women with polycystic ovary syndrome is related to impaired insulin sensitivity	Aydogdu, A.; Tasci, I.; Kucukerdonmez, O.; Tapan, S.; Aydogdu, S.; Aydogan, U.; Sonmez, A.; Yazici, M.; Azal, O.	2013	Non energy homeostasis
Women with polycystic ovary syndrome have increased plasma chitotriosidase activity: a pathophysiological link between inflammation and impaired insulin sensitivity?	Aydogdu, A.; Tasci, I.; Tapan, S.; Sonmez, A.; Aydogan, U.; Akbulut, H.; Uckaya, G.; Aydogdu, S.; Basaran, Y.; Meric, C.; Taslipinar, A.; Kurt, I.; Azal, O.	2012	Non energy homeostasis
The relationship of epicardial adipose tissue thickness to clinical and biochemical features in women with polycystic ovary syndrome	Aydogdu, A.; Uckaya, G.; Tasci, I.; Baysan, O.; Tapan, S.; Bugan, B.; Serdar, M.; Akbulut, H.; Aydogan, U.; Sonmez, A.; Aydogdu, S.; Kutlu, M.	2012	Non energy homeostasis
Adverse metabolic phenotype of adolescent girls with non-alcoholic fatty liver disease plus polycystic ovary syndrome compared with other girls and boys	Ayonrinde, O. T.; Adams, L. A.; Doherty, D. A.; Mori, T. A.; Beilin, L. J.; Oddy, W. H.; Hickey, M.; Sloboda, D. M.; Olynyk, J. K.; Hart, R.	2016	Non energy homeostasis
Prevalence and significance of nonalcoholic fatty liver disease in adolescent girls with polycystic ovary syndrome	Ayonrinde, O. T.; Adams, L. A.; Doherty, D.; Olynyk, J. K.; Mori, T. A.; Beilin, L. J.; Oddy, W. H.; Hickey, M.; Sloboda, D.; Hart, R.	2011	Abstract
Cinnamon improves metabolic factors without detectable effects on adiponectin in women with polycystic ovary syndrome	Azam Borzoei; Maryam Rafraf; Mohammad Asghari-Jafarabadi	2018	No control group
Association between polycystic ovary syndrome and female-to-male transsexuality	Baba, T.; Endo, T.; Honnma, H.; Kitajima, Y.; Hayashi, T.; Ikeda, H.; Masumori, N.; Kamiya, H.; Moriwaka, O.; Saito, T.	2007	Non energy homeostasis
The contributions of resistin and adiponectin gene single nucleotide polymorphisms to the genetic risk for polycystic ovary syndrome in a Japanese population	Baba, T.; Endo, T.; Sata, F.; Nagasawa, K.; Honnma, H.; Kitajima, Y.; Hayashi, T.; Manase,	2009	Non energy homeostasis

	K.; Kanaya, M.; Moriwaka, O.; Kamiya, H.; Yamada, H.; Minakami, H.; Kishi, R.; Saito, T.		
Serum leptin levels in polycystic ovary syndrome and its relationship with metabolic and hormonal profile in Pakistani females	Baig, M.; Rehman, R.; Tariq, S.; Fatima, S. S.	2014	Non energy homeostasis
Type 2 diabetes and cardiovascular risks are present in adolescent girls with polycystic ovaries morphology	Bak, M. I.; Walewska-Wolf, M.; Szufladowicz-Wozniak, J.	2013	Abstract
Association of PPARG Pro12Ala polymorphism with insulin sensitivity and body mass index in patients with polycystic ovary syndrome	Baldani, D. P.; Skrgatic, L.; Cerne, J. Z.; Ferk, P.; Simunic, V.; Gersak, K.	2014	Non energy homeostasis
Altered leptin, adiponectin, resistin and ghrelin secretion may represent an intrinsic polycystic ovary syndrome abnormality	Baldani, D. P.; Skrgatic, L.; Kasum, M.; Zlopasa, G.; Kralik Oguic, S.; Herman, M.	2019	Non energy homeostasis
Serum visfatin and adiponectin - markers in women with polycystic ovarian syndrome	Bannigida, D. M.; Nayak, S. B.; R, V.	2020	Non energy homeostasis
Neuropeptide Y, leptin, galanin and insulin in women with polycystic ovary syndrome	Baranowska, B.; Radzikowska, M.; Wasilewska-Dziubinska, E.; Kaplinski, A.; Roguski, K.; Plonowski, A.	1999	Non energy homeostasis
Serum levels of retinol-binding protein 4 and adiponectin in women with polycystic ovary syndrome: associations with visceral fat but no evidence for fat mass-independent effects on pathogenesis in this condition	Barber, T. M.; Hazell, M.; Christodoulides, C.; Golding, S. J.; Alvey, C.; Burling, K.; Vidal-Puig, A.; Groome, N. P.; Wass, J. A.; Franks, S.; McCarthy, M. I.	2008	Non energy homeostasis
The impact of metformin treatment on adiponectin and resistin levels in women with polycystic ovary syndrome: a prospective clinical study	Basios, G.; Trakakis, E.; Chrelias, Ch; Panagopoulos, P.; Vaggopoulos, V.; Skarpas, P.; Kassanos, D.; Dimitriadis, G.; Hatziagelaki, E.	2015	Non energy homeostasis
The effect of combined oral contraceptives on adiponectin and resistin plasma levels in women with polycystic ovary syndrome	Basios, G.; Ytrakakis, E.; Panagopoulos, P.; Vaggopoulos, V.; Hatziagelaki, E.; Chrelias, C.; Dimitriadis, G.; Kassanos, D.	2014	Abstract
Il-6 serum levels and production is related to an altered immune response in polycystic ovary syndrome girls with insulin resistance	Batetta, B.; Fulghesu, A. M.; Sanna, F.; Uda, S.; Magnini, R.; Portoghese, E.	2011	Non energy homeostasis
Endothelial function varies according to insulin resistance disease type	Beckman, J. A.; Goldfine, A. B.; Dunaif, A.; Gerhard-Herman, M.; Creager, M. A.	2007	Non energy homeostasis
The associations between serum concentrations of irisin and glucose-dependent insulinotropic polypeptide with body mass index among women with and without polycystic ovary syndrome	Behboudi-Gandevani, S.; Hedayati, M.; Mansournia, M. A.; Nazemipour, M.; Rahmati, M.; Tehrani, F. R.	2021	Non energy homeostasis
The association between polycystic ovary syndrome, obesity, and the serum concentration of adipokines	Behboudi-Gandevani, S.; Ramezani Tehrani, F.; Bidhendi Yarandi, R.; Noroozzadeh, M.; Hedayati, M.; Azizi, F.	2017	Non energy homeostasis
Effect of rosiglitazone on insulin resistance, growth factors, and reproductive disturbances in women with polycystic ovary syndrome	Belli, S. H.; Graffigna, M. N.; Oneto, A.; Otero, P.; Schurman, L.; Levalle, O. A.	2004	Non energy homeostasis
Serum spexin, adiponectin and leptin levels in polycystic ovarian syndrome in association with FTO gene polymorphism	Beyazit, F.; Hiz, M. M.; Turkon, H.; Unsal, M. A.	2021	Non energy homeostasis
Circulating insulin-like peptide 5 levels and its association with metabolic and hormonal parameters in women with polycystic ovary syndrome	Bicer, M.; Alan, M.; Alarslan, P.; Guler, A.; Kocabas, G. U.; Imamoglu, C.; Aksit, M.;	2019	No outcomes of interest

	Bozkaya, G.; Isil, A. M.; Baloglu, A.; Aslanipoiur, B.; Calan, M.		
Elevated circulating levels of secreted frizzled-related protein 4 in relation to insulin resistance and androgens in women with polycystic ovary syndrome	Bicer, M.; Alarslan, P.; Guler, A.; Demir, I.; Aslanipour, B.; Calan, M.	2020	No outcomes of interest
Serum ghrelin, leptin and resistin levels in adolescent girls with polycystic ovary syndrome	Bideci, A.; Camurdan, M. O.; Yesilkaya, E.; Demirel, F.; Cinaz, P.	2008	Non energy homeostasis
Pro12Ala PPAR gamma2 gene polymorphism in PCOS women: the role of compounds regulating satiety	Bidzinska-Speichert, B.; Lenarcik, A.; Tworowska-Bardzinska, U.; Slezak, R.; Bednarek-Tupikowska, G.; Milewicz, A.	2012	Non energy homeostasis
The relationship between metabolic status and levels of adiponectin and ghrelin in lean women with polycystic ovary syndrome	Bik, W.; Baranowska-Bik, A.; Wolinska-Witort, E.; Chmielowska, M.; Martynska, L.; Baranowska, B.	2007	Non energy homeostasis
Plasma levels of Nesfatin-1 in patients with polycystic ovary sydrome	Binnetoglu, E.; Erbag, G.; Gencer, M.; Turkon, H.; Asik, M.; Gunes, F.; Sen, H.; Vural, A.; Ukinc, K.	2014	Non energy homeostasis
The effects of different therapeutic modalities on cardiovascular risk factors in women with polycyst[latin dotless i]c ovary syndrome: a random[latin dotless i]zed controlled study	Bodur, S.; Dundar, O.; Kanat-Pektas, M.; Kinci, M. F.; Tutuncu, L.	2018	Non energy homeostasis
Ovarian Expression of Adipokines in Polycystic Ovary Syndrome: A Role for Chemerin, Omentin, and Apelin in Follicular Growth Arrest and Ovulatory Dysfunction?	Bongrani, A.; Mellouk, N.; Rame, C.; Cornuau, M.; Guerif, F.; Froment, P.; Dupont, J.	2019	Non energy homeostasis
High androgen concentrations in follicular fluid of polycystic ovary syndrome women	Bongrani, A.; Plotton, I.; Mellouk, N.; Rame, C.; Guerif, F.; Froment, P.; Dupont, J.	2022	Non energy homeostasis
HPA axis function in obese women with PCOS	Bozic, I.; Macut, D.; Popovic, B.; Isailovic, T.; Bogavac, T.; Petakov, M.; Ognjanovic, S.; Damjanovic, S.	2010	Abstract
Metabolic and hormonal consequencies of the "obesity risk" MC4R variant (rs12970134) in Czech women	Bradnova, O.; Vejrazkova, D.; Vankova, M.; Lukasova, P.; Vcelak, J.; Stanicka, S.; Dvorakova, K.; Bendlova, B.	2015	Non energy homeostasis
Assessing Energy Requirements in Women With Polycystic Ovary Syndrome: A Comparison Against Doubly Labeled Water	Broskey, Nicholas T.; Klempel, Monica C.; Gilmore, L. Anne; Sutton, Elizabeth F.; Altazan, Abby D.; Burton, Jeffrey H.; Ravussin, Eric; Redman, Leanne M.	2017	no outcome of interest
Metabolic inflexibility in women with PCOS is similar to women with type 2 diabetes	Broskey, Nicholas T.; Tam, Charmaine S.; Sutton, Elizabeth F.; Altazan, Abby D.; Burton, Jeffrey H.; Ravussin, Eric; Redman, Leanne M	2018	no outcome of interest
Bidirectional Mendelian randomization to explore the causal relationships between body mass index and polycystic ovary syndrome	Brower, M. A.; Hai, Y.; Jones, M. R.; Guo, X.; Chen, Y. D. I.; Rotter, J. I.; Krauss, R. M.; Legro, R. S.; Azziz, R.; Goodarzi, M. O.	2019	No outcomes of interest
Effects of exercise and nutritional counseling in women with polycystic ovary syndrome	Bruner, Brenda; Chad, Karen; Chizen, Donna	2006	No control group

Serum immunoreactive leptin concentrations in women with polycystic ovary syndrome	Brzechffa, P. R.; Jakimiuk, A. J.; Agarwal, S. K.; Weitsman, S. R.; Buyalos, R. P.; Magoffin, D. A.	1996	Non energy homeostasis
The effects of drospirenone-ethinyl estradiol and drospirenone-ethinyl estradiol + metformin on ovarian ultrasonographic markers, body fat mass index, leptin, and ghrelin	Cakiroglu, Y.; Vural, B.; Isgoren, S.	2013	Non energy homeostasis
Association of decreased c1q/tumor necrosis factor-related protein-5 levels with metabolic and hormonal disturbance in polycystic ovary syndrome	Calan, M.; Alan, M.; Alarslan, P.; Kocabas, G. U.; Bozkaya, G.; Acara, A. C.; Aslanipour, B.; Fenercioglu, O.; Isil, A. M.; Guler, A.	2019	No outcomes of interest
Dlk1 and nesfatin-1 levels and the relationship with metabolic parameters in polycystic ovary syndrome: Prospective, controlled study	Caltekin, M. D.; Caniklioglu, A.; Yalcin, S. E.; Kirmizi, D. A.; Baser, E.; Yalvac, E. S.	2021	Non energy homeostasis
[Leptin in patients with polycystic ovary syndrome. Direct correlation with insulin resistance]	Calvar, C. E.; Intebi, A. D.; Bengolea, S. V.; Hermes, R.; Spinedi, E.	2003	Non English
M30 does not predict the severity of hepatosteatosis, whereas adiponectin level declined with increase of ALT and the severity of hepatic steatosis	Caner, S.; Altinbas, A.; Sayki, M.; Buyukcam, F.; Yilmaz, B.; Cakal, E.; Coban, S.; Delibasi, T.	2014	Non energy homeostasis
Insulin resistance and its relationship with high molecular weight adiponectin in adolescents with polycystic ovary syndrome and a maternal history of polycystic ovary syndrome	Cankaya, S.; Demir, B.; Aksakal, S. E.; Dilbaz, B.; Demirtas, C.; Goktolga, U.	2014	Non energy homeostasis
Polycystic ovary syndrome associated with increased adiposity interferes with serum levels of TNF-alpha and IL-6 differently from leptin and adiponectin	Cardoso, N. S.; Ribeiro, V. B.; Dutra, S. G. V.; Ferriani, R. A.; Gastaldi, A. C.; Araujo, J. E.; Souza, H. C. D.	2020	Non energy homeostasis
Circulating levels of adipose products and differences in fat distribution in the ovulatory and anovulatory phenotypes of polycystic ovary syndrome	Carmina, E.; Bucchieri, S.; Mansueto, P.; Rini, G.; Ferin, M.; Lobo, R. A.	2009	Non energy homeostasis
Subcutaneous and omental fat expression of adiponectin and leptin in women with polycystic ovary syndrome	Carmina, E.; Chu, M. C.; Moran, C.; Tortoriello, D.; Vardhana, P.; Tena, G.; Preciado, R.; Lobo, R.	2008	Non energy homeostasis
Evidence that insulin and androgens may participate in the regulation of serum leptin levels in women	Carmina, E.; Ferin, M.; Gonzalez, F.; Lobo, R. A.	1999	Non energy homeostasis
Evidence for altered adipocyte function in polycystic ovary syndrome	Carmina, E.; Orio, F.; Palomba, S.; Cascella, T.; Longo, R. A.; Colao, A. M.; Lombardi, G.; Lobo, R. A.	2005	Non energy homeostasis
Endothelial dysfunction in PCOS: role of obesity and adipose hormones	Carmina, E.; Orio, F.; Palomba, S.; Longo, R. A.; Cascella, T.; Colao, A.; Lombardi, G.; Rini, G. B.; Lobo, R. A.	2006	Non energy homeostasis
Biomarkers and insulin sensitivity in women with Polycystic Ovary Syndrome: Characteristics and predictive capacity	Cassar, S.; Teede, H. J.; Harrison, C. L.; Joham, A. E.; Moran, L. J.; Stepto, N. K.	2015	Non energy homeostasis
NUCB2/nesfatin-1 in the blood and follicular fluid in patients with polycystic ovary syndrome and poor ovarian response	Catak, Z.; Yavuzkir, S.; Kocdemir, E.; Ugur, K.; Yardim, M.; Sahin, I.; Agirbas, E. P.; Aydin, S.	2019	Non energy homeostasis
Serum FSH level is lower in dysovulating than in ovulating non-PCOS obese women, independently of body mass index	Catteau-Jonard, S.; Brunel, A.; Dumont, A.; Robin, G.; Pigny, P.; Dewailly, D.	2019	Wrong population
Evaluation of new adipocytokines and insulin resistance in adolescents with polycystic ovary syndrome	Cekmez, F.; Cekmez, Y.; Pirgon, O.; Canpolat, F. E.; Aydinoz, S.; Ipcioglu, O. M.; Karademir, F.	2011	Non energy homeostasis

Patatin-like phospholipase domain containing 3-gene (adiponutrin), preptin, kisspeptin and amylin regulates oocyte developmental capacity in PCOS	Celik, N.; Aydin, S.; Ugur, K.; Yardim, M.; Acet, M.; Yavuzkir, S.; Sahin, I.; Celik, O.	2018	Non energy homeostasis
Investigation of taste function and eating behavior in women with polycystic ovary syndrome.	Cetik S, Acikgoz A, Yildiz BO.		Non energy homeostasis
Investigation of taste function and eating behavior in women with polycystic ovary syndrome	Cetik, Sila; Acikgoz, Aylin; Yildiz, Bulent Okan	2022	No outcomes of interest
The prevalence of polycystic ovaries in Chinese women with a history of gestational diabetes mellitus	Chan, C. C.; Ng, E. H.; Tang, O. S.; Lee, C. P.; Ho, P. C.	2006	Wrong population
Polycystic ovarian syndrome and subclinical atherosclerosis among women of reproductive age in the Dallas heart study	Chang, A. Y.; Ayers, C.; Minhajuddin, A.; Jain, T.; Nurenberg, P.; de Lemos, J. A.; Wild, R. A.; Auchus, R. J.	2011	Non energy homeostasis
Circulating irisin underscores the development of polycystic ovary syndrome	Chang, C. L.; Huang, S. Y.; Soong, Y. K.; Cheng, P. J.; Wang, C. J.; Liang, I. T.	2014	Abstract
Circulating irisin and glucose-dependent insulinotropic peptide are associated with the development of polycystic ovary syndrome	Chang, C. L.; Huang, S. Y.; Soong, Y. K.; Cheng, P. J.; Wang, C. J.; Liang, I. T.	2014	Non energy homeostasis
Hypoadiponectinemia: a useful marker of dyslipidemia in women with polycystic ovary syndrome	Chang, C. Y.; Chen, M. J.; Yang, W. S.; Yeh, C. Y.; Ho, H. N.; Chen, S. U.; Yang, Y. S.	2012	Non energy homeostasis
Circulating leptin concentrations in polycystic ovary syndrome: relation to anthropometric and metabolic parameters	Chapman, I. M.; Wittert, G. A.; Norman, R. J.	1997	Non energy homeostasis
Regulation of adiponectin secretion by adipocytes in the polycystic ovary syndrome: role of tumor necrosis factor-{alpha}	Chazenbalk, G.; Trivax, B. S.; Yildiz, B. O.; Bertolotto, C.; Mathur, R.; Heneidi, S.; Azziz, R.	2010	Non energy homeostasis
Adiponectin and leptin in overweight/obese and lean women with polycystic ovary syndrome	Chen, C. I.; Hsu, M. I.; Lin, S. H.; Chang, Y. C.; Hsu, C. S.; Tzeng, C. R.	2015	Non energy homeostasis
[Effects of resolving method of Chinese medicine on the lipid metabolism in polycystic ovary syndrome accompanied with non-alcoholic fatty liver disease]	Chen, Y.; Wang, X. J.; Jin, H. L.; Jin, L.	2013	Non English
Association between levels of serum leptin and insulin resistance in patients with polycystic ovary syndrome. [Chinese]	Cheng, X.; Guo, J.; Xie, J.	2014	Non English
N-Acetylcysteine improves oocyte and embryo quality in polycystic ovary syndrome patients undergoing intracytoplasmic sperm injection: an alternative to metformin	Cheraghi, E.; Mehranjani, M. S.; Shariatzadeh, M. A.; Esfahani, M. H.; Ebrahimi, Z.	2016	Non energy homeostasis
Co-administration of metformin and N-acetyl cysteine fails to improve clinical manifestations in PCOS individual undergoing ICSI	Cheraghi, E.; Soleimani Mehranjani, M.; Shariatzadeh, M. A.; Nasr Esfahani, M. H.; Ebrahimi, Z.	2014	Non energy homeostasis
Effects of the administration of high-dose aspirin in the polysystic ovary syndrome patients	Chi, Ctr Trc	2014	Wrong design
Circulating irisin and GIP, but not asprosin, underscore the manifestation of polycystic ovary syndrome	Chin, T. H.; Huang, S. Y.; Hsu, Y. C.; Soong, Y. K.; Chang, C. L.	2017	Abstract
Plasma omentin-1 levels are reduced in non-obese women with normal glucose tolerance and polycystic ovary syndrome	Choi, J. H.; Rhee, E. J.; Kim, K. H.; Woo, H. Y.; Lee, W. Y.; Sung, K. C.	2011	Non energy homeostasis
Inflammatory cytokines and chemokines, skeletal muscle and polycystic ovary syndrome: effects of pioglitazone and metformin treatment	Ciaraldi, T. P.; Aroda, V.; Mudaliar, S. R.; Henry, R. R.	2013	Non energy homeostasis

Adiponectin and its receptors in the ovary: further evidence for a link between obesity and hyperandrogenism in polycystic ovary syndrome	Comim, F. V.; Hardy, K.; Franks, S.	2013	Non energy homeostasis
Localisation of adiponectin receptors in normal and polycystic ovaries	Comim, F.; Stubbs, S.; Hardy, K.; Franks, S.	2010	Abstract
Obesity and serum luteinizing hormone level have an independent and opposite effect on the serum inhibin B level in patients with polycystic ovary syndrome	Cortet-Rudelli, C.; Pigny, P.; Decanter, C.; Leroy, M.; Maunoury-Lefebvre, C.; Thomas-Desrousseaux, P.; Dewailly, D.	2002	Non energy homeostasis
Serum adiponectin levels in adolescents with polycystic ovary syndrome and its relation to clinical, metabolic and hormonal parameters. [Turkish]	Coskun, A. D. E.; Keven, M. C.; Idil, N. S.; Yasar, L.	2013	Non English
Polikistik over sendromlu adolesanlarda serum adiponektin duzeyleri ile klinik, metabolik ve hormonal belirteclerin iliskisi	Coşkun, Ayşe Deniz Ertürk; Keven, Mehmet Can; İdil, Nadire Sevda; Yaşar, Levent	2013	Non English
Early Predictors of Gestational Diabetes Mellitus in IVF-Conceived Pregnancies	Coussa, A.; Hasan, H. A.; Barber, T. M.	2021	Non energy homeostasis
Metabolic profiling of polycystic ovary syndrome reveals interactions with abdominal obesity	Couto Alves, A.; Valcarcel, B.; Makinen, V. P.; Morin-Papunen, L.; Sebert, S.; Kangas, A. J.; Soininen, P.; Das, S.; De Iorio, M.; Coin, L.; Ala-Korpela, M.; Jarvelin, M. R.; Franks, S.	2017	No outcomes of interest
Higher circulating leukocytes in women with PCOS is reversed by aerobic exercise	Covington, J. D.; Tam, C. S.; Pasarica, M.; Redman, L. M.	2016	Non energy homeostasis
Hepatic Steatosis is Common in Adolescents with Obesity and PCOS and Relates to De Novo Lipogenesis but not Insulin Resistance: Hepatic Steatosis in Girls with PCOS	Cree-Green, Melanie; Bergman, Bryan C.; Coe, Gregory V.; Newnes, Lindsey; Baumgartner, Amy D.; Bacon, Samantha; Sherzinger, Ann; Pyle, Laura; Nadeau, Kristen J.	2016	no outcome of interest
The preliminary association study of ADIPOQ, RBP4, and BCMO1 variants with polycystic ovary syndrome and with biochemical characteristics in a cohort of Polish women	Czeczuga-Semeniuk, E.; Galar, M.; Jarzabek, K.; Kozlowski, P.; Sarosiek, N. A.; Wolczynski, S.	2018	Non energy homeostasis
Can polyunsaturated fatty acids regulate Polycystic Ovary Syndrome via TGF-beta signalling?	D. Prabhu Y; Valsala Gopalakrishnan, A.	2021	Wrong design
Biomarker Profiles in Women with PCOS and PCOS Offspring; A Pilot Study	Daan, N. M.; Koster, M. P.; de Wilde, M. A.; Dalmeijer, G. W.; Evelein, A. M.; Fauser, B. C.; de Jager, W.	2016	Non energy homeostasis
Rs1799817 in INSR associates with susceptibility to polycystic ovary syndrome	Daghestani, M. H.	2019	Non energy homeostasis
Evaluation of biochemical, endocrine, and metabolic biomarkers for the early diagnosis of polycystic ovary syndrome among non-obese Saudi women	Daghestani, M. H.	2018	Non energy homeostasis
The influence of the rs1137101 genotypes of leptin receptor gene on the demographic and metabolic profile of normal Saudi females and those suffering from polycystic ovarian syndrome	Daghestani, M. H.; Daghestani, M. H.; Daghistani, M. H.; Bjorklund, G.; Chirumbolo, S.; Warsy, A.	2019	Non energy homeostasis
A study of ghrelin and leptin levels and their relationship to metabolic profiles in obese and lean Saudi women with polycystic ovary syndrome (PCOS)	Daghestani, M. H.; Daghestani, M.; Daghistani, M.; El-Mazny, A.; Bjorklund, G.; Chirumbolo, S.; Al Saggaf, S. H.; Warsy, A.	2018	Non energy homeostasis

Influence of b2 adrenergic receptor polymorphism (rs1042713 and rs1042714) on anthropometric, hormonal and lipid profiles in polycystic ovarian syndrome	Daghestani, M. H.; Omair, M.; Daghestani, M.; Abdel-Razeq, S. S.; Kaya, N.; Warsy, A.	2021	Non energy homeostasis
Adverse Effects of Selected Markers on the Metabolic and Endocrine Profiles of Obese Women With and Without PCOS	Daghestani, M. H.; Warsy, A.; El-Ansary, A.; Omair, M. A.; Hassen, L. M.; Alhumaidhi, E. M. H.; Al Qahtani, B.;Harrath, A. H.	2021	Non energy homeostasis
Contrasting association of Leptin receptor polymorphisms and haplotypes with polycystic ovary syndrome in Bahraini and Tunisian women: A case-control study	Dallel, M.; Douma, Z.; Finan, R. R.; Hachani, F.; Letaifa, D. B.; Mahjoub, T.; Almawi, W. Y.	2021	Non energy homeostasis
Contrasting association of Leptin receptor polymorphisms and haplotypes with polycystic ovary syndrome in Bahraini and Tunisian women: a case-control study	Dallel, M.; Douma, Z.; Finan, R. R.; Hachani, F.; Letaifa, D. B.; Mahjoub, T.; Almawi, W. Y.	2021	Non energy homeostasis
Circulating leptin concentration, LEP gene variants and haplotypes, and polycystic ovary syndrome in Bahraini and Tunisian Arab women	Dallel, M.; Sghaier, I.; Finan, R. R.; Douma, Z.; Hachani, F.; Letaifa, D. B.; Mahjoub, T.; Almawi, W. Y.	2019	Non energy homeostasis
Sitagliptin/metformin improves the fertilization rate and embryo quality in polycystic ovary syndrome patients through increasing the expression of GDF9 and BMP15: A new alternative to metformin (a randomized trial)	Daneshjou, D.; Mehranjani, M. S.; Zadehmodarres, S.; Shariatzadeh, S. M. A.; Mofarahe, Z. S.	2022	Non energy homeostasis
Circulating levels of Vitamin D<inf>3</inf> and leptin in lean infertile women with polycystic ovary syndrome	Dawood, A. S.; Elgergawy, A.; Elhalwagy, A.	2018	Non energy homeostasis
Dietary underreporting in women affected by polycystic ovary syndrome: A pilot study	De Giuseppe, R.; Braschi, V.; Bosoni, D.; Biino, G.; Stanford, F. C.; Nappi, R. E.; Cena, H.	2019	No outcomes of interest
Serum leptin levels in premature pubarche and prepubertal girls with and without obesity	de Jesus Teixeira, R.; Ginzbarg, D.; Rodrigues Freitas, J.; Fucks, G.; Silva, C. M.; Bordallo, M. A. N.	2004	Wrong population
Evidence for decreased expression of APPL1 associated with reduced insulin and adiponectin receptors expression in PCOS patients	Dehghan, R.; Saidijam, M.; Mehdizade, M.; Shabab, N.; Yavangi, M.; Artimani, T.	2016	Non energy homeostasis
Frequency of adiponectin gene polymorphisms in polycystic ovary syndrome and the association with serum adiponectin, androgen levels, insulin resistance and clinical parameters	Demirci, H.; Yilmaz, M.; Ergun, M. A.; Yurtcu, E.; Bukan, N.; Ayvaz, G.	2010	Non energy homeostasis
Serum leptin, oxidized low density lipoprotein and plasma asymmetric dimethylarginine levels and their relationship with dyslipidaemia in adolescent girls with polycystic ovary syndrome	Demirel, F.; Bideci, A.; Cinaz, P.; Camurdan, M. O.; Biberoglu, G.; Yesilkaya, E.; Hasanoglu, A.	2007	Non energy homeostasis
Nesfatin-1 and other hormone alterations in polycystic ovary syndrome	Deniz, R.; Gurates, B.; Aydin, S.; Celik, H.; Sahin, I.; Baykus, Y.; Catak, Z.; Aksoy, A.; Citil, C.; Gungor, S.	2012	Non energy homeostasis
Subfatin and asprosin, two new metabolic players of polycystic ovary syndrome	Deniz, R.; Yavuzkir, S.; Ugur, K.; Ustebay, D. U.; Baykus, Y.; Ustebay, S.; Aydin, S.	2020	No outcomes of interest
Sitagliptin Decreases Visceral Fat and Blood Glucose in Women With Polycystic Ovarian Syndrome	Devin, J. K.; Nian, H.; Celedonio, J. E.; Wright, P.; Brown, N. J.	2020	Non energy homeostasis
Metabolic Inflexibility Is a Feature of Women With Polycystic Ovary Syndrome and Is Associated With Both Insulin Resistance and Hyperandrogenism	Di Sarra, Daniela; Tosi, Flavia; Bonin, Cecilia; Fiers, Tom; Kaufman, Jean-Marc; Signori, Chiara; Zambotti, Francesca; Dall'Alda, Marlene; Caruso, Beatrice; Zanolin, Maria Elisabetta; Bonora, Enzo; Moghetti, Paolo	2013	No control group

Activating transcriptional factor 4 correlated with obesity and insulin resistance in polycystic ovary syndrome	Di, F.; Liu, J.; Li, S.; Hong, Y.; Chen, Z. J.; Du, Y.	2019	No outcomes of interest
Effect of testosterone on lipolysis in human pre-adipocytes from different fat depots	Dicker, A.; Ryden, M.; Naslund, E.; Muehlen, I. E.; Wiren, M.; Lafontan, M.; Arner, P.	2004	Wrong population
Plasma adiponectin and resistin levels in women with polycystic ovary syndrome: Relation to body mass index and insulin resistance	Dikmen, E.; Tarkun, I.; Ozturk, F.; Arslan, B.; Canturk, Z.	2011	Non energy homeostasis
The ameliorating effect of gut microbiota-targeted clinical intervention on metabolic disorders of impaired glucose tolerance women with PCOS	Ding, X.; Liu, R.; Shen, J.; Wang, X.; Yan, Q.; Greenberg, A. S.; Zhao, L.; Peng, Y.	2016	Abstract
Impact of Low Frequency Electro-acupuncture on Glucose and Lipid Metabolism in Unmarried PCOS Women: A Randomized Controlled Trial	Dong, Hao-xu; Wang, Qing; Wang, Zhi; Wu, Xiao-ke; Cheng, Ling; Zhou, Zhong-ming; Yang, Li; Yi, Ping; Huang, Dong-mei	2020	Non energy homeostasis
[Retrospective analysis on pregnancy outcomes and fat-related factors of treatment of endomorph PCOS infertility patients by acupuncture of 8 acupoints around umbilicus]	Dou, Z.; Ma, S. H.; Song, J. Y.; Xia, T.	2021	Non English
Difference in dietary intake between women with polycystic ovary syndrome and healthy controls	Douglas, C. C.; Norris, L. E.; Oster, R. A.; Darnell, B. E.; Azziz, R.; Gower, B. A.	2006	No outcomes of interest
Glucose-to-insulin ratio rather than sex hormone-binding globulin and adiponectin levels is the best predictor of insulin resistance in nonobese women with polycystic ovary syndrome	Ducluzeau, P. H.; Cousin, P.; Malvoisin, E.; Bornet, H.; Vidal, H.; Laville, M.; Pugeat, M.	2003	Non energy homeostasis
Adipose Insulin Resistance in Normal-Weight Women With Polycystic Ovary Syndrome	Dumesic, D. A.; Phan, J. D.; Leung, K. L.; Grogan, T. R.; Ding, X.; Li, X.; Hoyos, L. R.; Abbott, D. H.; Chazenbalk, G. D.	2019	Non energy homeostasis
Role of insulin and leptin in the pathogenesis of PCOS	E. L-Gharib M.N	2012	Non energy homeostasis
DNA methylation in promoter regions of genes involved in the reproductive and metabolic function of children born to women with PCOS	Echiburu, B.; Milagro, F.; Crisosto, N.; Perez-Bravo, F.; Flores, C.; Arpon, A.; Salas-Perez, F.; Recabarren, S. E.; Sir-Petermann, T.; Maliqueo, M.	2020	Wrong population
Enlarged adipocytes in subcutaneous adipose tissue associated to hyperandrogenism and visceral adipose tissue volume in women with polycystic ovary syndrome	Echiburu, B.; Perez-Bravo, F.; Galgani, J. E.; Sandoval, D.; Saldias, C.; Crisosto, N.; Maliqueo, M.; Sir-Petermann, T.	2018	Non energy homeostasis
Serum leptin as an additional possible pathogenic factor in polycystic ovary syndrome	El Orabi, H.; Abou Ghalia, A.; Khalifa, A.; Mahfouz, H.; El Shalkani, A.; Shoieb, N.	1999	Non energy homeostasis
Subclinical inflammation in obese women with polycystic ovary syndrome	Elkholi, D. G. E. Y.; Hammoudah, S. F.	2012	Non energy homeostasis
The effects of adipocytokines on the endocrino-metabolic features and obstetric outcome in pregnant obese women with polycystic ovary syndrome	Elkholi, D. G. E. Y.; Nagy, H. M.	2014	Non energy homeostasis
Comparison of single and combined treatment with exenatide and metformin on menstrual cyclicity in overweight women with polycystic ovary syndrome	Elkind-Hirsch, K.; Marrioneaux, O.; Bhushan, M.; Vernor, D.; Bhushan, R.	2008	Non energy homeostasis
Serum adiponectin levels and its association with insulin resistance and obesity in women with poly cystic ovarian syndrome	Emadi, Maryam; Tehrani, Fahimeh Ramezani; Yaghmaei, Parichehre; Sheikholeslami, Sara; Hedayati, Mehdi	2012	Non English

Role of kisspeptin in polycystic ovary syndrome (PCOS)	Emekci Ozay, O.; Ozay, A. C.; Acar, B.; Cagliyan, E.; Secil, M.; Kume, T.	2016	Non energy homeostasis
Leptin receptor variant in women with polycystic ovary syndrome	Erel, C. T.; Cine, N.; Elter, K.; Kaleli, S.; Senturk, L. M.; Baysal, B.	2002	Non energy homeostasis
Is serum leptin level regulated by thyroid functions, lipid metabolism and insulin resistance in polycystic ovary syndrome?	Erel, C. T.; Senturk, L. M.; Kaleli, S.; Gezer, A.; Baysal, B.; Tasan, E.	2003	Non energy homeostasis
Role of osteocalcin, tumor necrosis factor-alpha and adiponectin in polycystic ovary syndrome patients with insulin resistance	Erkan, GÃ¶nÃ¼l; Tayyar, Ahter Tanay; AÃ§maz, GÃ¶khan; MÃ¼derris, Ã°ptisam Ã°pek; BaÅŸkol, GÃ¼lden; Bayram, Fahri	2017	Non energy homeostasis
Decreased serum profile of the interleukin-36alpha in polycystic ovary syndrome	Eroglu, S.; Cakmakliogullari, E. K.	2021	Non energy homeostasis
Prediction of metabolic syndrome in women with polycystic ovary syndrome	Ersan, F.; Arslan, E.; Esmer, A. C.; Aydin, S.; Gedikbasi, A.; Alkis, I.; Ark, C.	2012	Non energy homeostasis
Serum leptin levels correlate with obesity parameters but not with hyperinsulinism in women with polycystic ovary syndrome	Erturk, Erdinc; Kuru, Nesrin; SavcÄ±, Vahide; Tuncel, Ercan; Ersoy, Canan; Imamoglu, Sazi	2004	No control group
Adiponectin and resistin in PCOS: a clinical, biochemical and molecular genetic study	Escobar-Morreale, H. F.; Villuendas, G.; Botella-Carretero, J. I.; Alvarez-Blasco, F.; Sanchon, R.; Luque-Ramirez, M.; San Millan, J. L.	2006	Non energy homeostasis
Effects on Endocrine-Metabolic Parameters and Body Composition of the Addition of Low-Dose Pioglitazone to Flutamide-Metformin Therapy in Young Women with Hyperinsulinemic Ovarian Hyperandrogenism and Cardiovascular Risk - Pioglitazone in PCOS	Euctr, E. S.	2005	Trial register
Alterations in plasma non-esterified fatty acid (NEFA) kinetics and relationship with insulin resistance in polycystic ovary syndrome	Ezeh, U.; Arzumanyan, Z.; Lizneva, D.; Mathur, R.; Chen, Y. H.; Boston, R. C.; Chen, Y. I.; Azziz, R.	2019	No outcomes of interest
Adiponectin (ADIPOQ) gene variants and haplotypes in Saudi Arabian women with polycystic ovary syndrome (PCOS): a case-control study	Ezzidi, I.; Mtiraoui, N.; Mohmmed Ali, M. E.; Al Masoudi, A.; Abu Duhier, F.	2020	Non energy homeostasis
Decreased serum levels of CTRP12/adipolin in patients with coronary artery disease in relation to inflammatory cytokines and insulin resistance	Fadaei, R.; Moradi, N.; Kazemi, T.; Chamani, E.; Azdaki, N.; Moezibady, S. A.; Shahmohamadnejad, S.; Fallah, S.	2019	Wrong population
Effect of Laparoscopic Sleeve Gastrectomy on Fasting Gastrointestinal, Pancreatic, and Adipose-Derived Hormones and on Non-Esterified Fatty Acids	Farey, J. E.; Preda, T. C.; Fisher, O. M.; Levert-Mignon, A. J.; Stewart, R. L.; Karsten, E.; Herbert, B. R.; Swarbrick, M. M.; Lord, R. V.	2017	Wrong population
Leptin and leptin binding activity in the preovulatory follicle of polycystic ovary syndrome patients	Fedorcsak, P.; Storeng, R.; Dale, P. O.; Tanbo, T.; Torjesen, P.; Urbancsek, J.; Abyholm, T.	2000	Non energy homeostasis
Antimullerian hormone levels and cardiometabolic risk in young women with polycystic ovary syndrome	Feldman, R. A.; O'Neill, K.; Butts, S. F.; Dokras, A.	2017	No outcomes of interest
Serum total L-carnitine levels in non-obese women with polycystic ovary syndrome	Fenkci, S. M.; Fenkci, V.; Oztekin, O.; Rota, S.; Karagenc, N.	2008	No outcomes of interest
Dpp4 Inhibitor Sitagliptin As A Potential Treatment Option In Metformin-Intolerant Obese Women With Polycystic Ovary Syndrome: A Pilot Randomized Study	Ferjan, Simona; Janez, Andrej; Jensterle, Mojca	2018	No control group

An impaired glucagon-like peptide-1 response is associated with prediabetes in polycystic ovary syndrome with obesity	Ferjan, Simona; Jensterle, Mojca; Oblak, Tjasa; Zitnik, Irena Prodan; Marc, Janja; Goricar, Katja; Dolzan, Vita; Janez, Andrej	2019	No control group
ORAL CONTRACEPTIVE USE in ADOLESCENTS with POLYCYSTIC OVARY SYNDROME and OBESITY IS ASSOCIATED with ALTERED FAT METABOLISM	Finn, E.; Severn, C.; Garcia-Reyes, Y.; Ware, M. A.; Rahat, H.; Cree-Green, M.	2021	Abstract
Ovarian function and metabolic factors in women with oligomenorrhea treated with metformin in a randomized double blind placebo-controlled trial	Fleming, R.; Hopkinson, Z. E.; Wallace, A. M.; Greer, I. A.; Sattar, N.	2002	Non energy homeostasis
Association between visceral adiposity index, hirsutism and cardiometabolic risk factors in women with polycystic ovarian syndrome: A cross-sectional study	Fonseka, S.; Subhani, B.; Wijeyaratne, C. N.; Gawarammana, I. B.; Kalupahana, N. S.; Ratnatunga, N.; Rosairo, S.; Vithane, K. P.	2019	Non energy homeostasis
Circulating levels of Meteorin-like protein in polycystic ovary syndrome: A case-control study	Fouani, F. Z.; Fadaei, R.; Moradi, N.; Zandieh, Z.; Ansaripour, S.; Yekaninejad, M. S.; Vatannejad, A.; Mahmoudi, M.	2020	Non energy homeostasis
Circulating vaspin levels and nutritional status and insulin resistance in polycystic ovary syndrome	Franik, G.; Plinta, R.; Madej, P.; Owczarek, A.; Bozentowicz-Wikarek, M.; Chudek, J.; Skrzypulec-Plinta, V.; Olszanecka-Glinianowicz, M.	2020	No outcomes of interest
Effect of liraglutide on ectopic fat in polycystic ovary syndrome: A randomized clinical trial	Frossing, S.; Nylander, M.; Chabanova, E.; Frystyk, J.; Holst, J. J.; Kistorp, C.; Skouby, S. O.; Faber, J.	2018	Non energy homeostasis
IL-6 serum levels and production is related to an altered immune response in polycystic ovary syndrome girls with insulin resistance	Fulghesu, A. M.; Sanna, F.; Uda, S.; Magnini, R.; Portoghese, E.; Batetta, B.	2011	Non energy homeostasis
Effects of ghrelin administration on endocrine and metabolic parameters in obese women with polycystic ovary syndrome	Fusco, A.; Bianchi, A.; Mancini, A.; Milardi, D.; Giampietro, A.; Cimino, V.; Porcelli, T.; Romualdi, D.; Guido, M.; Lanzone, A.; Pontecorvi, A.; De Marinis, L.	2007	Non energy homeostasis
Anti-androgen treatment increases circulating ghrelin levels in obese women with polycystic ovary syndrome	Gambineri, A.; Pagotto, U.; Tschop, M.; Vicennati, V.; Manicardi, E.; Carcello, A.; Cacciari, M.; De Iasio, R.; Pasquali, R.	2003	Non energy homeostasis
Comparative Evaluation of Biomarkers of Inflammation Among Indian Women With Polycystic Ovary Syndrome (PCOS) Consuming Vegetarian vs. Non-vegetarian Diet	Ganie, M. A.; Sahar, T.; Rashid, A.; Wani, I. A.; Nisar, S.; Sathyapalan, T.; Vishnubhatla, S.; Ramakrishnan, L.; Parvez, T.; Geer, I.	2019	Non energy homeostasis
The relationships of irisin with bone mineral density and body composition in PCOS patients	Gao, S.; Cheng, Y.; Zhao, L.; Chen, Y.; Liu, Y.	2016	Non energy homeostasis
Cardiovascular risk factors in non-obese PCOS patients	Garcia-Gamon, M.; Romeu, M.; Monzo, A.; Montanana, V.; Perez-Calvo, A.; Tresguerres, J.; Romeu, A.	2010	Abstract
Endometria from Obese PCOS Women with Hyperinsulinemia Exhibit Altered Adiponectin Signaling	Garcia, V.; Orostica, L.; Poblete, C.; Rosas, C.; Astorga, I.; Romero, C.; Vega, M.	2015	Non energy homeostasis
Relationship of serum leptin and ghrelin between insulin resistance and anthropometric indices in women with polycystic ovary syndrome. [Persian]	Gargari, B. P.; Houjeghani, S.; Mahboob, S.; Farzadi, L.; Safaeian, A.; Behzad, M. H.	2012	Non English

Relationship between Serum Leptin, Ghrelin and Dietary Macronutrients in Women with Polycystic Ovary Syndrome	Gargari, Bahram Pourghassem; Houjeghani, Shiva; Farzadi, Laya; Houjeghani, Sheyda; Safaeiyan, Abdolrasoul	2015	Non energy homeostasis
Ghrelin is independently associated with anti-mullerian hormone levels in obese but not non-obese women with polycystic ovary syndrome	Garin, M. C.; Butts, S. F.; Sarwer, D. B.; Allison, K. C.; Senapati, S.; Dokras, A.	2017	Non energy homeostasis
Association between follicular fluid leptin and serum insulin levels in nonoverweight women with polycystic ovary syndrome	Garruti, G.; de Palo, R.; Rotelli, M. T.; Nocera, S.; Totaro, I.; Nardelli, C.; Panzarino, M. A.; Vacca, M.; Selvaggi, L. E.; Giorgino, F.	2014	Non energy homeostasis
Follicular fluid leptin content correlates with insulinemia in normalweight women with polycystic ovary syndrome undergoing in vitro fertilization/embryo transfer	Garruti, G.; Vacca, M.; Rotelli, M. T.; Panzarino, M. A.; Nocera, S.; Cantatore, C.; Selvaggi, L. E.; Giorgino, F.; DePalo, R.	2011	Abstract
The counterregulatory response to hypoglycaemia in women with the polycystic ovary syndrome	Gennarelli, G.; Holte, J.; Stridsberg, M.; Niklasson, F.; Berne, C.; Backstrom, T.	1997	Non energy homeostasis
Is there a role for leptin in the endocrine and metabolic aberrations of polycystic ovary syndrome?	Gennarelli, G.; Holte, J.; Wide, L.; Berne, C.; Lithell, H.	1998	Non energy homeostasis
Adipocytokines, insulinresistance and androgen excess in women	Georgescu, C. E.; Goia-Socol, M.; Marian, I.; Ilie, I. R.	2015	Abstract
Effects of inositol on ovarian function and metabolic factors in women with PCOS: a randomized double blind placebo-controlled trial	Gerli, S.; Mignosa, M.; Di Renzo, G. C.	2003	Non energy homeostasis
Randomized, double blind placebo-controlled trial: effects of myo-inositol on ovarian function and metabolic factors in women with PCOS	Gerli, S.; Papaleo, E.; Ferrari, A.; Di Renzo, G. C.	2007	Non energy homeostasis
Association of -604G/A and -501A/C Ghrelin and Obestatin Prepropeptide Gene Polymorphisms with Polycystic Ovary Syndrome	Ghaleh, T. D.; Skandari, S. S.; Najafipour, R.; Rashvand, Z.; Darabi, M.; Sahmani, M.	2018	Non energy homeostasis
Evaluation of metabolic risk markers in polycystic ovary syndrome (PCOS). Adiponectin, ghrelin, leptin and body composition in hirsute PCOS patients and controls	Glintborg, D.; Andersen, M.; Hagen, C.; Frystyk, J.; Hulstrom, V.; Flyvbjerg, A.; Hermann, A. P.	2006	Non energy homeostasis
Evaluation of metabolic risk markers in polycystic ovary syndrome (PCOS). Adiponectin, ghrelin, leptin and body composition in hirsute PCOS patients and controls	Glintborg, D.; Andersen, M.; Hagen, C.; Frystyk, J.; Hulstrøm, V.; Flyvbjerg, A.; Hermann, A. P.	2006	Non energy homeostasis
Total and high molecular weight (HMW) adiponectin levels and measures of glucose and lipid metabolism following pioglitazone treatment in a randomized placebo-controlled study in polycystic ovary syndrome	Glintborg, D.; Frystyk, J.; Hojlund, K.; Andersen, K. K.; Henriksen, J. E.; Hermann, A. P.; Hagen, C.; Flyvbjerg, A.; Andersen, M.	2008	Non energy homeostasis
A randomized placebo-controlled study on the effects of pioglitazone on cortisol metabolism in polycystic ovary syndrome	Glintborg, D.; Hermann, A. P.; Hagen, C.; Jensen, L. T.; Frystyk, J.; Bennett, P.; Flyvbjerg, A.; Andersen, M.	2009	Non energy homeostasis
Adiponectin, interleukin-6, monocyte chemoattractant protein-1, and regional fat mass during 12-month randomized treatment with metformin and/or oral contraceptives in polycystic ovary syndrome	Glintborg, D.; Mumm, H.; Altinok, M. L.; Richelsen, B.; Bruun, J. M.; Andersen, M.	2014	Non energy homeostasis
Peritoneal fluid leptin concentration in infertile patients	Gogacz, M.; Polak, G.; Jakowicki, J.; Kotarski, J.	2001	Non energy homeostasis

Leptin-to-adiponectin, adiponectin-to-leptin ratios, and insulin are specific and sensitive markers associated with polycystic ovary syndrome: a case-control study from Bahrain	Golbahar, J.; Das, N. M.; Al-Ayadhi, M. A.; Gumaa, K.	2012	Non energy homeostasis
Lipoprotein Particles in Adolescents and Young Women With PCOS Provide Insights Into Their Cardiovascular Risk	Gourgari, E.; Lodish, M.; Shamburek, R.; Keil, M.; Wesley, R.; Walter, M.; Sampson, M.; Bernstein, S.; Khurana, D.; Lyssikatos, C.; Ten, S.; Dobs, A.; Remaley, A. T.; Stratakis, C. A.	2015	Non energy homeostasis
Adiponectin and leptin levels in normal weight women with polycystic ovary syndrome	Gozukucuk, M.; Yarcl Gursoy, A.; Destegul, E.; Taskln, S.; Satlroglu, H.	2020	Non energy homeostasis
Administration of exogenous ghrelin in obese patients with polycystic ovary syndrome: effects on plasma levels of growth hormone, glucose, and insulin	Guido, M.; Romualdi, D.; De Marinis, L.; Porcelli, T.; Giuliani, M.; Costantini, B.; Lanzone, A.	2007	Non energy homeostasis
Adiponectin is an independent determinant of insulin resistance in women with polycystic ovary syndrome	Gulcelik, N. E.; Aral, Y.; Serter, R.; Demir, Y.; Culha, C.	2006	Non energy homeostasis
Association of hypoadiponectinemia with metabolic syndrome in patients with polycystic ovary syndrome	Gulcelik, N. E.; Aral, Y.; Serter, R.; Koc, G.; Gulcelik, Nese Ersoz; Aral, Yalcin; Serter, Rustu; Koc, Gonul	2008	Non energy homeostasis
Decreased levels of spexin are associated with hormonal and metabolic disturbance in subjects with polycystic ovary syndrome	Guler, A.; Demir, I.	2020	No outcomes of interest
Examination of angiopoietin-like protein 4, neuropeptide Y, omentin-1 levels of obese and non-obese patients with polycystic ovary syndrome	Gunes, M.; Bukan, N.	2015	Non energy homeostasis
Endotrophin as a novel marker in PCOS and its relation with other adipokines and metabolic parameters: a pilot study	Guney, G.; Taskin, M. I.; Baykan, O.; Adali, E.l Gul Tezcan, S.; Sarikaya, S.; Kaya, C.; Tolu, E.	2021	Non energy homeostasis
Peritoneal fluid and serum leptin concentrations in women with primary infertility	Gungor, T.; Kanat-Pektas, M.; Karayalcin, R.; Mollamahmutoglu, L.	2009	Non energy homeostasis
L:A ratio, Insulin resistance and metabolic risk in women with polycystic ovarian syndrome	Gupta, V.; Mishra, S.; Mishra, S.; Gupta, V.	2017	Non energy homeostasis
Genetic determinants of insulin action in polycystic ovary syndrome	Haap, M.; Machicao, F.; Stefan, N.; Thamer, C.; Tschritter, O.; Schnuck, F.; Wallwiener, D.; Stumvoll, M.; Haring, H. U.; Fritsche, A.	2005	Non energy homeostasis
The peroxisome proliferator activated receptor gamma Pro12Ala polymorphism is associated with a lower hirsutism score and increased insulin sensitivity in women with polycystic ovary syndrome	Hahn, S.; Fingerhut, A.; Khomtsiv, U.; Khomtsiv, L.; Tan, S.; Quadbeck, B.; Herrmann, B. L.; Knebel, B.; Muller-Wieland, D.; Mann, K.; Janssen, O. E.	2005	Non energy homeostasis
The CC genotype of the GNAS T393C polymorphism is associated with obesity and insulin resistance in women with polycystic ovary syndrome	Hahn, S.; Frey, U. H.; Siffert, W.; Tan, S.; Mann, K.; Janssen, O. E.	2006	Non energy homeostasis
Decreased soluble leptin receptor levels in women with polycystic ovary syndrome	Hahn, S.; Haselhorst, U.; Quadbeck, B.; Tan, S.; Kimmig, R.; Mann, K.; Janssen, O. E.	2006	Non energy homeostasis
Low serum 25-hydroxyvitamin D concentrations are associated with insulin resistance and obesity in women with polycystic ovary syndrome	Hahn, S.; Haselhorst, U.; Tan, S.; Quadbeck, B.; Schmidt, M.; Roesler, S.; Kimmig, R.; Mann, K.; Janssen, O. E.	2006	Non energy homeostasis
The effects of flaxseed supplementation on metabolic status in women with polycystic ovary syndrome: a randomized open-labeled controlled clinical trial	Haidari, Fatemeh; Banaei-Jahromi, Nasrin; Zakerkish, Mehrnoosh; Ahmadi, Kambiz	2020	No control group

Role of adiponectin and its receptor in prediction of reproductive outcome of metformin treatment in patients with polycystic ovarian syndrome	Hamed, H. O.	2013	Non energy homeostasis
Association of Anti Mullerian Hormone with Biochemical markers in womens with and without Polycystic Ovarian disease	Hamid, S.; Qamar, I.; Malik, H.; Khan, S. R.; Jamil, H.; Iqbal, S.	2022	Non energy homeostasis
Molecular Mechanisms in Skeletal Muscle Underlying Insulin Resistance in Women Who Are Lean With Polycystic Ovary Syndrome	Hansen, S. L.; Svendsen, P. F.; Jeppesen, J. F.; Hoeg, L. D.; Andersen, N. R.; Kristensen, J. M.; Nilas, L.; Lundsgaard, A. M.; Wojtaszewski, J. F. P.; Madsbad, S.; Kiens, B.	2019	Non energy homeostasis
Molecular Mechanisms in Skeletal Muscle Underlying Insulin Resistance in Women Who Are Lean With Polycystic Ovary Syndrome	Hansen, Solvejg L.; Svendsen, Pernille F.; Jeppesen, Jacob F.; Hoeg, Louise D.; Andersen, Nicoline R.; Kristensen, Jonas M.; Nilas, Lisbeth; Lundsgaard, Anne-Marie; Wojtaszewski, Jørgen F. P.; Madsbad, Sten; Kiens, Bente	2018	Duplication
Association of serum adipsin levels with polycystic ovarian syndrome	Hashemi, Fatemeh; Yaghmaei, Parichehre; Saadati, Naghmeh; Haghighi Poodeh, Sepideh; Ramezani Tehrani, Fahimeh; Hedayati, Mehdi	2012	Non English
Association between insulin receptor gene and adiponectin gene polymorphism with polycystic ovary syndrome in Iranian population	Hashemi, S.; Ramezani Tehrani, F.; Daneshpour, M.; Zarkesh, M.; Azizi, F.	2012	Non English
Estimation of serum adiponectinirisin and apelin in iraqi obese women patients with polycystic ovary syndrome	Hashoosh, S. I.; Hussien, A. A.; Chalabi, S. A.	2020	Non energy homeostasis
Associations between TNF-alpha and interleukin-18 and ADIPOQ gene polymorphisms in iraqi obese women patients with polycystic ovary syndrome	Hashoosh, S. I.; Hussien, A. A.; Chalabi, S. A.	2020	Non energy homeostasis
Associations between two single nucleotide polymorphisms in the adiponectin gene and polycystic ovary syndrome	Heinonen, S.; Korhonen, S.; Helisalmi, S.; Koivunen, R.; Tapanainen, J.; Hippelainen, M.; Laakso, M.	2005	Non energy homeostasis
The relationship between NUCB2/Nesfatin-1 in the follicular fluid and the blood in iraqi women with polycystic ovary syndrome compared to poor ovarian response undergoing intracytoplasmic sperm injection	Helmi, Z.; Hussein, A. H.; Bad, A. H.; Alizzi, F. J.	2020	Non energy homeostasis
An retrospective audit of patients with polycystic ovary syndrome: the effects of a reduced glycaemic load diet	Herriot, A. M.; Whitcroft, S.; Jeanes, Y.	2008	No control group
The association between cord blood cardiometabolic and inflammatory markers and maternal PCOS status	Hodyl, N. A.; Stark, M. J.; Hague, W.; Rowan, J. A.; Coat, S.; Teede, H.; Moran, L. J.	2017	Abstract
Changes in Ghrelin and Glucagon following a Low Glycemic Load Diet in Women with PCOS	Hoover, Sarah E; Gower, Barbara A; Cedillo, Yenni E; Chandler-Laney, Paula C; Deemer, Sarah E; Goss, Amy M	2021	No control group
Changes in Ghrelin and Glucagon following a Low Glycemic Load Diet in Women with PCOS	Hoover, Sarah E.; Gower, Barbara A.; Cedillo, Yenni E.; Chandler-Laney, Paula C.; Deemer, Sarah E.; Goss, Amy M.; Cedillo, Yenni; Deemer, Sarah	2021	Non energy homeostasis
Serum leptin and ghrelin levels in women with polycystic ovary syndrome: Correlation with anthropometric, metabolic, and endocrine parameters	Houjeghani, S.; Gargari, B. P.; Farzadi, L.	2012	Non energy homeostasis

PCOS is associated with increased CD11c expression and crown-like structures in adipose tissue and increased central abdominal fat depots independent of obesity	Huang, Z. H.; Manickam, B.; Ryvkin, V.; Zhou, X. J.; Fantuzzi, G.; Mazzone, T.; Sam, S.	2013	Non energy homeostasis
Ethinylestradiol-drospirenone, flutamide-metformin, or both for adolescents and women with hyperinsulinemic hyperandrogenism: opposite effects on adipocytokines and body adiposity	Ibanez, L.; de Zegher, F.	2004	Non energy homeostasis
Flutamide-metformin plus ethinylestradiol-drospirenone for lipolysis and antiatherogenesis in young women with ovarian hyperandrogenism: the key role of metformin at the start and after more than one year of therapy	Ibanez, L.; de Zegher, F.	2005	Non energy homeostasis
Flutamide-metformin plus ethinylestradiol-drospirenone for lipolysis and antiatherogenesis in young women with ovarian hyperandrogenism: the key role of early, low-dose flutamide	Ibanez, L.; Valls, C.; Cabre, S.; De Zegher, F.	2004	Non energy homeostasis
Toward a Treatment Normalizing Ovulation Rate in Adolescent Girls With Polycystic Ovary Syndrome	Ibáñez, Lourdes; DÃaz, Marta; GarcÃa-BeltrÃ¡n, Cristina; Malpique, Rita; Garde, Edurne; LÃ³pez-Bermejo, Abel; Zegher, Francis de	2020	Non energy homeostasis
Evaluation of the Role of Ghrelin and Leptin as Biochemical Markers in Female with Polycystic Ovarian Syndrome	Ibrahim, M. K.; Alobaidi, A. H. A.	2021	Non energy homeostasis
The impact of follicular fluid adiponectin and ghrelin levels based on BMI on IVF outcomes in PCOS	Inal, H. A.; Yilmaz, N.; Gorkem, U.; Oruc, A. S.; Timur, H.	2016	Non energy homeostasis
Effect of metformin hydrochloride in correcting hyperinsulinemia and high leptin levels in treatment of infertile polycystic patients	Irfan, A.; Mughal, I. A.; Jalali, S.	2013	Non energy homeostasis
The role of serum adiponectin levels in women with polycystic ovarian syndrome	Itoh, H.; Kawano, Y.; Furukawa, Y.; Matsumoto, H.; Yuge, A.; Narahara, H.	2013	Non energy homeostasis
Leptin secretory burst mass correlates with body mass index and insulin in normal women but not in women with polycystic ovary syndrome	Iuorno, M. J.; Islam, L. Z.; Veldhuis, P. P.; Boyd, D. G.; Farhy, L. S.; Johnson, M. L.; Nestler, J. E.; Evans, W. S.	2007	Non energy homeostasis
Leptin and its association with polycystic ovary syndrome: a twin study	Jahanfar, S.; Maleki, H.; Mosavi, A. R.; Jahanfar, M.	2004	Non energy homeostasis
Subclinical eating disorder, polycystic ovary syndrome- is there any connection between these two conditions through leptin- a twin study	Jahanfar, Sh; Maleki, H.; Mosavi, A. R.	2005	Non energy homeostasis
Association of leptin and insulin resistance in PCOS: A case-controlled study	Jahromi, B. N.; Dabaghmanesh, M. H.; Parsanezhad, M. E.; Fatehpoor, F.	2017	Non energy homeostasis
[The effect of rosiglitazone on plasma adiponectin and resistin levels in obese PCO woman--preliminary report]	Jakubowska, J.; Bohdanowicz-Pawlak, A.; Milewicz, A.	2007	Non English
Plasma cytokines in obese women with polycystic ovary syndrome, before and after metformin treatment	Jakubowska, J.; Bohdanowicz-Pawlak, A.; Milewicz, A.; Szymczak, J.; Bednarek-Tupikowska, G.; Demissie, M.	2008	Non energy homeostasis
Genetic polymorphisms associated with polycystic ovary syndrome among Iranian women	Jamshidi, M.; Mohammadi Pour, S.; Bahadoram, M.; Mahmoudian-Sani, M. R.; Saeedi Boroujeni, A.	2021	Wrong design
Effects of empagliflozin on metabolic parameters in polycystic ovary syndrome: A randomized controlled study	Javed, Z.; Papageorgiou, M.; Deshmukh, H.; Rigby, A. S.; Qamar, U.; Abbas, J.; Khan, A. Y.; Kilpatrick, E. S.; Atkin, S. L.; Sathyapalan, T.	2019	No outcomes of interest

Short-term intervention with liraglutide improved eating behavior in obese women with polycystic ovary syndrome	Jensterle, M.; Kocjan, T.; Kravos, N. A.; Pfeifer, M.; Janez, A.	2015	No outcomes of interest
Genetic variability in GLP-1 receptor is associated with inter-individual differences in weight lowering potential of liraglutide in obese women with PCOS: a pilot study	Jensterle, M.; Pirs, B.; Goricar, K.; Dolzan, V.; Janez, A.	2015	Non energy homeostasis
Assessment of insulin resistance in young women with polycystic ovary syndrome	Jensterle, M.; Weber, M.; Pfeifer, M.; Prezelj, J.; Pfutzner, A.; Janez, A.	2008	Non energy homeostasis
Kisspeptin, leptin, and retinol-binding protein 4 in women with polycystic ovary syndrome	Jeon, Y. E.; Lee, K. E.; Jung, J. A.; Yim, S. Y.; Kim, H.; Seo, S. K.; Cho, S.; Choi, Y. S.; Lee, B. S.	2013	Non energy homeostasis
Accumulation of advanced glycation endproducts (AGE) are novel markers to detect women with poor IVF/ICSI outcomes independently of age and day-3-FSH levels: Possible novel therapy for poor responders by decreasing AGE	Jinno, M.; Takeuchi, M.; Watanabe, A.; Hirohama, J.; Eguchi, N.; Hatakeyama, N.	2010	Non energy homeostasis
Serum Anti-Mullerian hormone in polycystic ovary syndrome and its relationship with insulin resistance, lipid profile and adiponectin	Jun, T. J.; Jelani, A. M.; Omar, J.; Rahim, R. A.; Yaacob, N. M.	2020	Non energy homeostasis
Serum ghrelin, LH and FSH concentrations during menstrual cycle in non-obese PCOS women compared to healthy women	Kadhim, M. S.	2017	Non energy homeostasis
Clinical efficacy of metformin combined with clomiphene in patients with polycystic ovary syndrome and their effect on serum sex hormones	Kaiyun, X., Meiyan, Z., & Xiaolan, M	2018	Non energy homeostasis
Adiponectin, leptin and ghrelin levels in obese adolescent girls with polycystic ovary syndrome	Kale-Gurbuz, T.; Akhan, S. E.; Bastu, E.; Telci, A.; Iyibozkurt, A. C.; Topuz, S.	2013	Non energy homeostasis
Differential effects of walnuts vs almonds on improving metabolic and endocrine parameters in PCOS	Kalgaonkar, S; Almario, R U; Gurusinghe, D; Garamendi, E M; Buchan, W; Kim, K; Karakas, S E	2011	Kalgaonkar
Fasting plasma ghrelin in women with and without PCOS	Kamal, M.; Mohi, A.; Fawzy, M.; El-Sawah, H.	2010	Non energy homeostasis
Treatment effect of sibutramine compared to fluoxetine on leptin levels in polycystic ovary disease	Karabacak, I. Y.; Karabacak, O.; Toruner, F. B.; Akdemir, O.; Arslan, M.	2004	Non energy homeostasis
Determinants of impaired fasting glucose versus glucose intolerance in polycystic ovary syndrome	Karakas, S. E.; Kim, K.; Duleba, A. J.; Karakas, Sidika E.; Kim, Kyoungmi; Duleba, Antoni J.	2010	Non energy homeostasis
Association of leptin G2548A and leptin receptor Q223R polymorphisms and their serum levels with infertility and recurrent pregnancy loss in Iranian women with polycystic ovary syndrome	Kargasheh, F. B.; Ansaripour, S.; Borumandnia, N.; Moradi, N.; Zandieh, Z.; Maleki, M.; Mokhtar, S.; Karimi, A.; Fatemi, F.; Kheirollahi, A.; Vatannejad, A.	2021	Non energy homeostasis
Adiponectin levels reflect the different phenotypes of polycystic ovary syndrome: study in normal weight, normoinsulinemic patients	Karkanaki, A.; Piouka, A.; Katsikis, I.; Farmakiotis, D.; Macut, D.; Panidis, D.	2009	Non energy homeostasis
Relation of nutrients and hormones in polycystic ovary syndrome	Kasim-Karakas, Sidika E; Cunningham, Wendy M; Tsodikov, Alex	2007	Kalgaonkar
Leptin levels and adipose tissue percentage in adolescents with polycystic ovary syndrome	Kedikova, S. E.; Sirakov, M. M.; Boyadzhieva, M. V.	2013	Non energy homeostasis
Prevalence of hypovitaminosis D, and its association with hypoadiponectinemia and hyperfollistatinemia, in Saudi women with naive polycystic ovary syndrome	Kensara, O. A.	2018	Non energy homeostasis
Leptin levels in relation to marital status and neuroendocrine function in Iraqi females with polycystic ovary syndrome	Khalaf, B. H.	2010	Non energy homeostasis

The relevant hormonal levels and diagnostic features of polycystic ovary syndrome in adolescents	Khashchenko, E.; Uvarova, E.; Vysokikh, M.; Ivanets, T.; Krechetova, L.; Tarasova, N.; Sukhanova, I.; Mamedova, F.; Borovikov, P.; Balashov, I.; Sukhikh, G.	2020	Non energy homeostasis
Activation of systemic inflammation and oxidative stress in adolescent girls with polycystic ovary syndrome in combination with metabolic disorders and excessive body weight	Khashchenko, E.; Vysokikh, M.; Uvarova, E.; Krechetova, L.; Vtorushina, V.; Ivanets, T.; Volodina, M.; Tarasova, N.; Sukhanova, I.; Sukhikh, G.	2020	Non energy homeostasis
Impaired Lipolysis, Diminished Fat Oxidation, and Metabolic Inflexibility in Obese Girls With Polycystic Ovary Syndrome	Kim, Joon Young; Tfayli, Hala; Michaliszyn, Sara F; Arslanian, Silva	2018	no outcome of interest
Serum adiponectin is independently associated with the metabolic syndrome in Hong Kong, Chinese women with polycystic ovary syndrome	Ko, J. K.; Li, H. W.; Lam, K. S.; Tam, S.; Lee, V. C.; Yeung, T. W.; Ho, P. C.; Ng, E. H.	2016	Non energy homeostasis
Relationship between serum levels of anti-mullerian hormone, adiponectin and oxidative stress markers in patients with polycystic ovary syndrome	Kohzadi, M.; Khazaei, M. R.; Choobsaz, F.; Khazaei, M.	2020	Non energy homeostasis
Adipokine levels and carbohydrate metabolism in patients diagnosed de novo with polycystic ovary syndrome	Kolanska-Dams, E.; Boinska, J.; Socha, M. W.	2021	Non energy homeostasis
Adipokines, metabolic and atherogenic parameters in insulin resistant and non-insulin resistant women with polycystic ovary syndrome	Koleva, D. I. V.; Orbetzova, M. M.; Nyagolova, P. V.; Mitkov, M. D.	2016	Non energy homeostasis
Adipokines and soluble cell adhesion molecules in insulin resistant and non-insulin resistant women with polycystic ovary syndrome	Koleva, D. I.; Orbetzova, M. M.; Nikolova, J. G.; Tyutyundzhiev, S. B.	2016	Non energy homeostasis
Differences in the psychological and hormonal presentation of lean and obese patients with polycystic ovary syndrome	Komarowska, H.; Stangierski, A.; Warmuz-Stangierska, I.; Lodyga, M.; Ochmanska, K.; Wasko, R.; Wanic-Kossowska, M.; Ruchala, M.	2013	Non energy homeostasis
Ghrelin ovarian cell expression in patients with polycystic ovary syndrome: an immunohistochemical evaluation	Komarowska, H.; Wasko, R.; Iwanik, K.; Majewski, P.; Rafinska, L.; Warenik-Szymankiewicz, A.; Sowinski, J.	2006	Non energy homeostasis
Chemerin as a marker of body fat and insulin resistance in women with polycystic ovary syndrome	Kort, D. H.; Kostolias, A.; Sullivan, C.; Lobo, R. A.	2015	Non energy homeostasis
Plasma ghrelin concentrations in patients with polycystic ovary syndrome before and after 6months therapy: correlation with androgen levels	Kos-Kudla, B.; Malecka-Mikosz, O.; Foltyn, W.; Ostrowska, Z.; Kudla, M.; Mazur, B.	2006	Non energy homeostasis
Investigation of the relationship between insulin resistance and neuropeptide Y levels in polycystic ovary syndrome	Koseci, T.; Kaya, O.; Haksoyler, V.; Derici Yildirim, D.; Sezer, K.	2019	Non energy homeostasis
Insulin resistance Is associated with decreased circulating mannan-binding lectin concentrations in women with polycystic ovary syndrome	Kowalska, I.; Fernandez-Real, J. M.; Straczkowski, M.; Kozlowska, A.; Adamska, A.; Ortega, F.; Nikolajuk, A.; Karczewska-Kupczewska, M.; Wolczynski, S.; Gorska, M.	2008	Letter
Insulin, leptin, IGF-I and insulin-dependent protein concentrations after insulin-sensitizing therapy in obese women with polycystic ovary syndrome	Kowalska, I.; Kinalski, M.; Straczkowski, M.; Wolczynski, S.; Kinalska, I.	2001	Non energy homeostasis
[The influence of obesity on ovarian function. II. Plasma leptin concentration in women with polycystic ovary syndrome]	Kowalska, I.; Kinalski, M.; Wolczynski, S.; Straczkowski, M.; Kinalska, I.; Szamatowicz, M.	1999	Non English
Impact of the FTO gene variation on fat oxidation and its potential influence on body weight in women with polycystic ovary syndrome	Kowalska, Irina; Adamska, Agnieszka; T. Malecki, Maciej; Karczewska-Kupczewska, Monika;	2012	no outcome of interest

	Nikolajuk, Agnieszka; Szopa, Magdalena; Gorska, Maria; Straczkowski, Marek		
Leptin levels in patients with polycystic ovary syndrome in response to two different oral contraceptive treatments	Koyuncu, F. M.; Kuscu, N. K.; Var, A.; Onur, E.	2003	Non energy homeostasis
Fetuin-A levels in lean and obese women with polycystic ovary syndrome	Kozakowski, J.; Jeske, W.; Zgliczynski, W.	2014	Non energy homeostasis
Associations of vitamin D concentration with metabolic and hormonal indices in women with polycystic ovary syndrome presenting abdominal and gynoidal type of obesity	Kozakowski, J.; Kapuscinska, R.; Zgliczynski, W.	2014	Non energy homeostasis
Body composition, glucose metabolism markers and serum androgens - association in women with polycystic ovary syndrome	Kozakowski, J.; Zgliczynski, W.	2013	Non energy homeostasis
Leptin levels in women with polycystic ovary syndrome before and after treatment with diazoxide	Krassas, G. E.; Kaltsas, T. T.; Pontikides, N.; Jacobs, H.; Blum, W.; Messinis, I.	1998	Non energy homeostasis
Reduced serum ghrelin in a putative postmenopausal polycystic ovary syndrome phenotype	Krentz, A. J.; Barrett-Connor, E.	2009	Non energy homeostasis
Adipocytokine profiles in a putative novel postmenopausal polycystic ovary syndrome (PCOS) phenotype parallel those in premenopausal PCOS: the Rancho Bernardo Study	Krentz, A. J.; von Muhlen, D.; Barrett-Connor, E.	2012	Non energy homeostasis
The Î±2B and Î²3 Adrenergic Receptor Genes Polymorphisms in Women with Polycystic Ovarian Syndrome (PCOS) and their Association with Insulin Resistance and Basal Metabolic Rate (BMR)	Kritikou, Sosanna; Saltamavros, Alexandros D; Adonakis, George; Koufogiannis, Kleanthis; Spyropoulos, Kostas; Kourounis, George; Kyriazopoulou, Venetsana; Georgopoulos, Neoklis A; Flor, Christodoulos		no outcome of interest
Effect of two modes of antiandrogen treatment on insulin sensitivity and serum leptin in women with PCOS	Krotkiewski, M.; Landin, K.; Dahlgren, E.; Janson, P. O.; Holm, G.	2003	Non energy homeostasis
Proinsulin, adiponectin and hsCRP in reproductive age women with polycystic ovary syndrome (PCOS) - The effect of metformin treatment	Kruszynska, A.; Slowinska-Srzednicka, J.; Jeske, W.; Zgliczynski, W.	2014	Non energy homeostasis
Follicular fluid levels of anti-Mullerian hormone, insulin-like growth factor 1 and leptin in women with fertility disorders	Kucera, R.; Babuska, V.; Ulcova-Gallova, Z.; Kulda, V.; Topolcan, O.	2018	Wrong population
Effect of metformin-sustained release therapy on low-density lipoprotein size and adiponectin in the South Indian women with polycystic ovary syndrome	Kumar, D.; Seshadri, K.; Pandurangi, M.	2017	Non energy homeostasis
Association of serum leptin with anthropometric indices of obesity, blood lipids, steroidal hormones, and insulin resistance in polycystic ovarian syndrome	Kumawat, M.; Choudhary, P.; Aggarwal, S.	2021	Non energy homeostasis
Association between circulating neuregulin 4 levels and metabolic, aterogenic, and AMH profile of polycystic ovary syndrome	Kurek Eken, M.; Sahin Ersoy, G.; Yayla Abide, C.; Sanverdi, I.; Devranoglu, B.; Kutlu, T.; Cevik, O.	2019	No outcomes of interest
Plasma luteinizing hormone level affects the brain activity of patients with polycystic ovary syndrome	Lai, W.; Li, X.; Zhu, H.; Zhu, X.; Tan, H.; Feng, P.; Chen, L.; Luo, C.	2020	No outcomes of interest
Full-length visfatin levels are associated with inflammation in women with polycystic ovary syndrome	Lajunen, T. K.; Purhonen, A. K.; Haapea, M.; Ruokonen, A.; Puukka, K.; Hartikainen, A. L.; Savolainen, M. J.; Morin-Papunen, L.; Tapanainen, J. S.; Franks, S.; Jarvelin, M. R.; Herzig, K. H.		No outcomes of interest

Regional Cerebral Activation Accompanies Sympathoexcitation in Women With Polycystic Ovary Syndrome	Lansdown, A. J.; Warnert, E. A. H.; Sverrisdottir, Y.; Wise, R. G.; Rees, D. A.	2019	Non energy homeostasis
Serum leptin levels in women with polycystic ovary syndrome: the role of insulin resistance/hyperinsulinemia	Laughlin, G. A.; Morales, A. J.; Yen, S. S.	1997	Non energy homeostasis
Low plasma atrial natriuretic peptide: a new piece in the puzzle of polycystic ovary syndrome	Lauria, P. B.; Del Puerto, H. L.; Reis, A. M.; Candido, A. L.; Reis, F. M.	2013	Non energy homeostasis
Influence of adiposity on leptin, LH and androgen levels in lean, overweight and obese PCOS patients	LaZovic, G.; Radivojevic, U.; Milicevic, S.; Spremovic, S.	2007	Non energy homeostasis
Abdominal subcutaneous fat gene expression and circulating levels of leptin and adiponectin in polycystic ovary syndrome	Lecke, S. B.; Mattei, F.; Morsch, D. M.; Spritzer, P. M.	2011	Non energy homeostasis
Association between adipose tissue expression and serum levels of leptin and adiponectin in women with polycystic ovary syndrome	Lecke, S. B.; Morsch, D. M.; Spritzer, P. M.	2013	Wrong design
Adipokines, insulin-like growth factor binding protein-3 levels, and insulin sensitivity in women with polycystic ovary syndrome	Lee, H.; Oh, J. Y.; Sung, Y. A.	2013	Non energy homeostasis
Pericardial Fat Relates to Disturbances of Glucose Metabolism in Women with the Polycystic Ovary Syndrome, but Not in Healthy Control Subjects	Leutner, M.; Gobl, C.; Wolf, P.; Maruszczak, K.; Bozkurt, L.; Steinbrecher, H.; Just-Kukurova, I.; Ott, J.; Egarter, C.; Trattnig, S.; Kautzky-Willer, A.	2018	Non energy homeostasis
Adiponectin and resistin serum levels in women with polycystic ovary syndrome during oral glucose tolerance test: A significant reciprocal correlation between adiponectin and resistin independent of insulin resistance indices	Lewandowski, Krzysztof C.; Szosland, Konrad; Oâ€™Callaghan, Chris; Tan, Bee K.; Randeva, Harpal S.; Lewinski, Andrzej	2005	No control group
Changes in Resting-State Cerebral Activity in Women With Polycystic Ovary Syndrome: A Functional MR Imaging Study	Li, G.; Hu, J.; Zhang, S.; Fan, W.; Wen, L.; Wang, G.; Zhang, D.	2020	Non energy homeostasis
[A case-control study of correlation between serum adiponectin levels and polycystic ovary syndrome]	Li, H.; Chen, Y.; Li, Y.; Huang, J.; Zhao, X.; Chen, X.; Yang, D.	2015	Non English
Exploring the functional connectome in white matter. [References]	Li, Jiao; Biswal, Bharat B.; Wang, Pan; Duan, Xujun; Cui, Qian; Chen, Huafu; Liao, Wei	2019	Wrong population
Association study of +45G15G(T/G) and +276(G/T) polymorphisms in the adiponectin gene in patients with polycystic ovary syndrome	Li, L.; Yun, J. H.; Lee, J. H.; Song, S.; Choi, B. C.; Baek, K. H.	2011	Non energy homeostasis
Association of betatrophin with metabolic characteristics in overweight/obese and lean women with PCOS	Li, L.; Zhang, F.; Cui, J.; Shi, Y.; Xiang, J.; Wang, X.; Zhao, N.; Yan, Q.; Greenberg, A. S.; Peng, Y.; Ding, X.	2017	Non energy homeostasis
Association of serum and follicular fluid leptin concentrations with granulosa cell phosphorylated signal transducer and activator of transcription 3 expression in fertile patients with polycystic ovarian syndrome	Li, M. G.; Ding, G. L.; Chen, X. J.; Lu, X. P.; Dong, L. J.; Dong, M. Y.; Yang, X. F.; Lu, X. E.; Huang, H. F.	2007	Non energy homeostasis
[Correlations between adipocytokines and insulin resistance in women with polycystic ovary syndrome]	Li, X.; Li, X.; Huang, H. Y.; Ma, D.; Zhu, M. W.; Lin, J. F.	2009	Non English
Leptin down-regulates gamma-ENaC expression: a novel mechanism involved in low endometrial receptivity	Lin, X. H.; Liu, M. E.; Xu, H. Y.; Chen, X. J.; Wang, H.; Tian, S.; Sheng, J. Z.; Huang, H. F.	2015	Non energy homeostasis
Effects of Metformin Treatment on Soluble Leptin Receptor Levels in Women with Polycystic Ovary Syndrome	Liu, R. B.; Liu, Y.; Lv, L. Q.; Xiao, W.; Gong, C.; Yue, J. X.	2019	Non energy homeostasis

Dysbiosis of gut microbiota associated with clinical parameters in polycystic ovary syndrome	Liu, R.; Zhang, C.; Shi, Y.; Zhang, F.; Li, L.; Wang, X.; Ling, Y.; Fu, H.; Dong, W.; Shen, J.; Reeves, A.; Greenberg, A. S.; Zhao, L.; Peng, Y.; Ding, X.	2017	Non energy homeostasis
[On the relationship between serum total adiponectin and insulin resistance in polycystic ovary syndrome]	Liu, X.; Zhang, J.; Li, Y.; Xu, L.; Wei, D.; Qiu, D.; Han, D.	2010	Non English
Evidence of leptin expression in normal and polycystic human ovaries	Loffler, S.; Aust, G.; Kohler, U.; Spanel-Borowski, K.	2001	Non energy homeostasis
Predictive value of ovarian stroma measurement for cardiovascular risk in polycyctic ovary syndrome: A case control study	Loverro, G.; De Pergola, G.; Di Naro, E.; Tartagni, M.; Lavopa, C.; Caringella, A. M.	2010	Non energy homeostasis
Assessment of serum leptin levels in women with PCOS	Lovie, B. T.; Niveditha, P.; Padma, K.; Viji, D.; Umayal, C. C.; Anbuselvi, M. K. S.; Sumathi, V.	2016	Non energy homeostasis
[Expression of leptin mRNA in luteinized granulosa cells and leptin levels in serum and follicular fluid of non-obese infertile patients with polycystic ovary syndrome]	Lu, X. P.; Wang, B.; Huang, H. F.	2005	Non English
Influence of hypo- and hyperglycaemia on plasma leptin concentrations in healthy women and in women with polycystic ovary syndrome	Ludwig, A.K.; Weiss, J.M.; Tauchert, S.; Dietze, T.; Rudolf, S.; Diedrich, K.; Peters, A.; Oltmanns, K.M.	2007	no outcome of interest
Insulin resistance is a sufficient basis for hyperandrogenism in lipodystrophic women with polycystic ovarian syndrome	Lungu, A. O.; Zadeh, E. S.; Goodling, A.; Cochran, E.; Gorden, P.	2012	Wrong population
IGF-1 and IGFBP-1 in peripheral blood and decidua of early miscarriages with euploid embryos: comparison between women with and without PCOS	Luo, L.; Wang, Q.; Chen, M.; Yuan, G.; Wang, Z.; Zhou, C.	2016	Non energy homeostasis
Antiandrogenic contraceptives increase serum adiponectin in obese polycystic ovary syndrome patients	Luque-Ramirez, M.; Alvarez-Blasco, F.; Escobar-Morreale, H. F.	2009	Non energy homeostasis
Glucagon-like peptide-1 response to glucose challenge is not different in obese adolescents with PCOS, but girls with PCOS respond to acute glucagon-like peptide-1 agonist therapy	Lutchi, K.; Carreau, A.; Garcia-Reyes, Y.; Rahat, H.; Reusch, J. E.; Nadeau, K. J.; Cree-Green, M.	2019	Abstract
Nonobese women with polycystic ovary syndrome respond better than obese women to treatment with metformin	Maciel, G. A.; Soares Junior, J. M.; Alves da Motta, E. L.; Abi Haidar, M.; de Lima, G. R.; Baracat, E. C.	2004	Non energy homeostasis
The association of t45g polymorphism in the adiponectin gene with some hormonal parameters in iraqi women with polycystic ovary syndrome	Majeed, R. A.; Shihab, A. F.; Al-Assei, A. H.	2020	Non energy homeostasis
Rosiglitazone treatment increases plasma levels of adiponectin and decreases levels of resistin in overweight women with PCOS: A randomized placebo-controlled study	Majuri, A.; Santaniemi, M.; Kunnari, A.; Ruokonen, A.; Tapanainen, J. S.; Ukkola, O.; Morin-Papunen, L.	2007	Non energy homeostasis
Peritoneal fluid leptin level in women with unexplained infertility	Malhotra, N.; Tripathi, V.; Kumar, S.; Bahadur, A.; Mittal, S.	2010	Non English
Metabolic parameters in cord blood of newborns of women with polycystic ovary syndrome	Maliqueo, M.; Echiburu, B.; Crisosto, N.; Amigo, P.; Aranda, P.; Sanchez, F.; Sir-Petermann, T.	2009	Wrong population
Relationship of serum adipocyte-derived proteins with insulin sensitivity and reproductive features in pre-pubertal and pubertal daughters of polycystic ovary syndrome women	Maliqueo, M.; Galgani, J. E.; Perez-Bravo, F.; Echiburu, B.; de Guevara, A. L.; Crisosto, N.; Sir-Petermann, T.	2012	Wrong population
[Relationship between leptin and insulin sensitivity in patients with polycystic ovary syndrome]	Maliqueo, M.; Perez-Bravo, F.; Calvillan, M.; Piwonka, V.; Castillo, T.; Sir-Petermann, T.	1999	Non English

[Evaluation of acute effect of GnRH administration on leptin secretion in normal and hyperandrogenic women]	Maliqueo, M.; Piwonka, V.; Perez-Bravo, F.; Candia, M.; Contreras, B.; Contreras, J. M.; Sir-Petermann, T.	2000	Non English
Endothelial function and its relationship to leptin, homocysteine, and insulin resistance in lean and overweight eumenorrheic women and PCOS patients: a pilot study	Mancini, F.; Cianciosi, A.; Marchesini Reggiani, G.; Facchinetti, F.; Battaglia, C.; de Aloysio, D.	2009	Non energy homeostasis
Drospirenone and cardiovascular risk in lean and obese polycystic ovary syndrome patients: a pilot study	Mancini, F.; Cianciosi, A.; Persico, N.; Facchinetti, F.; Busacchi, P.; Battaglia, C.	2010	Non energy homeostasis
Gene expression in subcutaneous adipose tissue differs in women with polycystic ovary syndrome and controls matched pair-wise for age, body weight, and body mass index	Manneras-Holm, L.; Benrick, A.; Stener-Victorin, E.	2014	Non energy homeostasis
Adipose tissue has aberrant morphology and function in PCOS: enlarged adipocytes and low serum adiponectin, but not circulating sex steroids, are strongly associated with insulin resistance	Manneras-Holm, L.; Leonhardt, H.; Kullberg, J.; Jennische, E.; Oden, A.; Holm, G.; Hellstrom, M.; Lonn, L.; Olivecrona, G.; Stener-Victorin, E.; Lonn, M.	2011	Non energy homeostasis
Polycystic Ovary Syndrome and Insulin Physiology: An Observational Quantitative Serum Proteomics Study in Adolescent, Normal-Weight Females	Manousopoulou, A.; Al-Daghri, N. M.; Sabico, S.; Garay-Baquero, D. J.; Teng, J.; Alenad, A.; Alokail, M. S.; Athanasopoulos, N.; Deligeoroglou, E.; Chrousos, G. P.; Bacopoulou, F.; Garbis, S. D.	2019	No outcomes of interest
Predictive value of serum and follicular fluid leptin concentrations during assisted reproductive cycles in normal women and in women with the polycystic ovarian syndrome	Mantzoros, C. S.; Cramer, D. W.; Liberman, R. F.; Barbieri, R. L.	2000	Non energy homeostasis
Leptin concentrations in the polycystic ovary syndrome	Mantzoros, C. S.; Dunaif, A.; Flier, J. S.	1997	Non energy homeostasis
Oral contraceptive use increases risk of inflammatory and coagulatory disorders in women with Polycystic Ovarian Syndrome: An observational study	Manzoor, S.; Ganie, M. A.; Amin, S.; Shah, Z. A.; Bhat, I. A.; Yousuf, S. D.; Jeelani, H.; Kawa, I. A.; Fatima, Q.; Rashid, F.	2019	Non energy homeostasis
Changes and clinical significance of serum leptin levels in patients with polycystic ovarian syndrome. [Chinese]	Mao, X. Y.; Liu, W.; Tao, T.; Li, S. X.	2010	Non English
Correlation between serum adiponectin levels and hyperandrogenism in women with polycystic ovary syndrome	Maranhao, T. M. D. O.; Soares, E. M. M.; Silva, J.; Pontes, A.; Azevedo, G. D.; Lemos, T.; Micussi, M. T.; Pontes, A. G.	2011	Abstract
Relationship between adiponectin levels and measures of central obesity in women with PCOS	Maranhao, T. M.; Mafaldo, E.; Pontes, A.; Azevedo, G.; Lemos, T.; Silva, J.; Micussi, M.	2011	Abstract
Leptin concentrations in patients with polycystic ovary syndrome before and after metformin treatment depending on insulin resistance, body mass index and androgen concentrations - Introductory report	Marciniak, A.; Nawrocka-Rutkowska, J.; Brodowska, A.; Sienkiewicz, R.; Szydlowska, I.; Starczewski, A.	2009	Non energy homeostasis
Study of carbohydrate metabolism indices and adipocytokine profile and their relationship with androgens in polycystic ovary syndrome after menopause	Markopoulos, M. C.; Valsamakis, G.; Kouskouni, E.; Boutsiadis, A.; Papassotiriou, I.; Creatsas, G.; Mastorakos, G.	2013	Non energy homeostasis
Functional neuroimaging of emotional processing in women with polycystic ovary syndrome: a case-control pilot study	Marsh, C. A.; Berent-Spillson, A.; Love, T.; Persad, C. C.; Pop-Busui, R.; Zubieta, J. K.; Smith, Y. R.	2013	Non energy homeostasis

Association of Low Zinc Concentration and Hyperleptinemia with Overweight and Insulin Resistance in Polycystic Ovary Syndrome Women	Mazloomi, S.; Barartabar, Z.; Danesh, H.; Alizadeh, N.; Pilehvari, S.	2022	Non energy homeostasis
Association between Hypoadiponectinemia and Low Serum Concentrations of Calcium and Vitamin D in Women with Polycystic Ovary Syndrome	Mazloomi, Sahar; Sharifi, Faranak; Hajihosseini, Reza; Kalantari, Sadroddin; Mazloomzadeh, Saideh	2012	Non energy homeostasis
Hypoadiponectinemia and high TG/HDLc ratio as risk markers of insulin resistance in obese PCOS women	Meera, S.; Arul Senghor, K. A.; Vinodhini, V. M.; Samal, S.	2020	Non energy homeostasis
Plasma adiponectin in obese and non-obese women with polycystic ovary syndrome	Mejia-Montilla, J.; Alvarez-Mon, M.; Reyna-Villasmil, E.; Torres-Cepeda, D.; Reyna-Villasmil, N.; Fernandez-Ramirez, A.; Bravo-Henriquez, A.	2017	Non English
Supplementation with omega-3 fatty acids and plasma adiponectin in women with polycystic ovary syndrome	Mejia-Montilla, Jorly; Reyna-Villasmil, Eduardo; DomÃnguez-Brito, Lorena; Naranjo-RodrÃguez, Carmen; Noriega-Verdugo, Delia; Padilla-Samaniego, MarÃa; Vargas-Olalla, Vanessa	2018	No control group
Positive correlation of serum leptin with estradiol levels in patients with polycystic ovary syndrome	Mendonca, H. C.; Montenegro, R. M., Jr.; Foss, M. C.; Silva de Sa, M. F.; Ferriani, R. A.	2004	Non energy homeostasis
Polycystic ovary syndrome and nonalcoholic fatty liver in obese adolescents: association with metabolic risk profile	Michaliszyn, Sara F.; Lee, SoJung; Tfayli, Hala; Arslanian, Silva	2013	No control group
Clinical features in women with polycystic ovaries: Relationships to insulin sensitivity, insulin gene VNTR and birth weight	Michelmore, K.; Ken Ong, S. M.; Bennett, S.; Perry, L.; Vessey, M.; Balen, A.; Dunger, D.	2001	Non energy homeostasis
Leptin levels and insulin sensitivity in obese and non-obese patients with polycystic ovary syndrome	Micic, D.; Macut, D.; Popovic, V.; Sumarac-Dumanovic, M.; Kendereski, A.; Colic, M.; Dieguez, C.; Casanueva, F. F.	1997	Non energy homeostasis
Total ghrelin levels during acute insulin infusion in patients with polycystic ovary syndrome	Micic, D.; Sumarac-Dumanovic, M.; Kendereski, A.; Cvijovic, G.; Zoric, S.; Pejkovic, D.; Micic, J.; Milic, N.; Dieguez, C.; Casanueva, F. F.	2007	Non energy homeostasis
Growth-hormone response to combined stimulation with GHRH plus GH-releasing peptide-6 in obese patients with polycystic ovary syndrome before and after short-term fasting	Micic, D.; Sumarac-Dumanovic, M.; Macut, Dj; Kendereski, A.; Zoric, S.; Popovic, V.; Cvijovic, G.; Dieguez, C.; Casanueva, F. F.	2003	Non energy homeostasis
Basic and Meal Stimulated Plasma GIP Levels are Higher in Lean PCOS Women with FAI over 5	Milewicz, T.; Migacz, K.; KiaÅ‚ka, M.; Rogatko, I.; Kowalczuk, A.; Spalkowska, M.; MroziÅ„ska, S.; Czajkowska, Z.; Sztefko, K.	2016	No control group
Association between circulating adiponectin levels and polycystic ovarian syndrome	Mirza, S. S.; Shafique, K.; Shaikh, A. R.; Khan, N. A.; Anwar Qureshi, M.	2014	Non energy homeostasis
L:A ratio, Insulin resistance and metabolic risk in women with polycystic ovarian syndrome	Mishra, S.; Gupta, V.	2017	Non energy homeostasis
Serum markers off autoimmune thyroiditis in euthyroid women with polycystic ovary syndrome	Mitkov, M. D.; Nyagolova, P. V.; Orbetzova, M. M.	2015	Non energy homeostasis
Serum ghrelin level in women with polycystic ovary syndrome and its relationship with endocrine and metabolic parameters	Mitkov, M.; Pehlivanov, B.; Orbetzova, M.	2008	Non energy homeostasis

Expression of 11beta-hydroxysteroid dehydrogenase type 1 in visceral and subcutaneous adipose tissues of patients with polycystic ovary syndrome is associated with adiposity	Mlinar, B.; Marc, J.; Jensterle, M.; Bokal, E. V.; Jerin, A.; Pfeifer, M.	2011	No outcomes of interest
Decreased lipin 1 beta expression in visceral adipose tissue is associated with insulin resistance in polycystic ovary syndrome	Mlinar, B.; Pfeifer, M.; Vrtacnik-Bokal, E.; Jensterle, M.; Marc, J.	2008	Non energy homeostasis
The insulin resistance in women with hyperandrogenism is partially reversed by antiandrogen treatment: evidence that androgens impair insulin action in women	Moghetti, P.; Tosi, F.; Castello, R.; Magnani, C. M.; Negri, C.; Brun, E.; Furlani, L.; Caputo, M.; Muggeo, M.	1996	Non energy homeostasis
Serum levels of anti-mullerian hormone, leptin, T3, T4 and TSH in women with polycystic ovary syndrome in Iraq	Mohaisen, I. K.	2019	Non energy homeostasis
Effects of omegaâˆ’3 fatty acids supplementation on serum adiponectin levels and some metabolic risk factors in women with polycystic ovary syndrome	Mohammadi, Elahe; Rafraf, Maryam; Farzadi, Laya; Asghari-Jafarabadi, Mohammad; Sabour, Siamak		No control group
Relationships between free leptin and insulin resistance in women with polycystic ovary syndrome	Mohiti-Ardekani, J.; Tarof, N.; Aflatonian, A.	2009	Non energy homeostasis
Variations in alanine aminotransferase levels within the normal range predict metabolic and androgenic phenotypes in women of reproductive age	Mojiminiyi, O. A.; Safar, F. H.; Al Rumaih, H.; Diejomaoh, M.	2010	Non energy homeostasis
Gestational weight gain, appetite regulating hormones, and metformin treatment in polycystic ovary syndrome: A longitudinal, placebo-controlled study	Molin, J.; Vanky, E.; Lovvik, T. S.; Dehlin, E.; Bixo, M.	2022	Non energy homeostasis
Adiponectin levels and its relation with insulin secretion and insulin sensitivity in a group of sub-Saharan African women with polycystic ovary syndrome	Momo, A. S.; Ama Moor, V. J.; Tankeu, A. T.; Amazia, F.; Sadeu Wafeu, G.; Guewo-Fokeng, M.; Mbono Samba, E. A.; Nkeck, J. R.; Djieka, Y.; Chemaga Nkonpawa, C.; Djapa Tofeun, F.; Guifo, S.; Dohbit Sama, J.; Choukem, S. P.	2022	Non energy homeostasis
Novel inflammatory markers in overweight women with and without polycystic ovary syndrome and following pharmacological intervention	Moran, L. J.; Meyer, C.; Hutchison, S. K.; Zoungas, S.; Teede, H. J.	2010	Non energy homeostasis
The use of anti-mullerian hormone in predicting menstrual response after weight loss in overweight women with polycystic ovary syndrome	Moran, L. J.; Noakes, M.; Clifton, P. M.; Norman, R. J.	2007	Non energy homeostasis
Short-term meal replacements followed by dietary macronutrient restriction enhance weight loss in polycystic ovary syndrome	Moran, Lisa J; Noakes, Manny; Clifton, Peter M; Wittert, Gary A; Williams, Gemma; Norman, Robert J	2006	No control group
C-Reactive Protein before and after Weight Loss in Overweight Women with and without Polycystic Ovary Syndrome	Moran, Lisa J.; Noakes, Manny; Clifton, Peter M.; Wittert, Gary A.; Belobrajdic, Damien P.; Norman, Robert J.	2007	no outcome of interest
Decreased serum leptin concentrations during metformin therapy in obese women with polycystic ovary syndrome	Morin-Papunen, L. C.; Koivunen, R. M.; Tomas, C.; Ruokonen, A.; Martikainen, H. K.	1998	Non energy homeostasis
Metformin versus ethinyl estradiol-cyproterone acetate in the treatment of nonobese women with polycystic ovary syndrome: a randomized study	Morin-Papunen, L.; Vauhkonen, I.; Koivunen, R.; Ruokonen, A.; Martikainen, H.; Tapanainen, J. S.	2003	Non energy homeostasis
Peri-muscular adipose tissue may play a unique role in determining insulin sensitivity/resistance in women with polycystic ovary syndrome	Morrison, S. A.; Goss, A. M.; Azziz, R.; Raju, D. A.; Gower, B. A.	2017	Non energy homeostasis
Serum kisspeptin levels correlated with anti-mullerian hormone levels in women with and without polycystic ovarian syndrome	Mut, A.; Erel, C. T.; Inan, D.; Oner, Y. O.	2020	No outcomes of interest

Effect of Omega-3 Supplementation on Visfatin, Adiponectin, and Anthropometric Indices in Women with Polycystic Ovarian Syndrome	Nadjarzadeh, Azadeh; Dehghani-Firouzabadi, Razieh; Daneshbodi, Hoorieh; Lotfi, Mohammad Hassan; Vaziri, Niloofar; Mozaffari-Khosravi, Hassan	2015	No control group
Association of adiponectin and resistin gene polymorphisms in South Indian women with polycystic ovary syndrome	Nambiar, V.; Vijesh, V. V.; Lakshmanan, P.; Sukumaran, S.; Suganthi, R.	2016	Non energy homeostasis
The effect of leptin receptor gene polymorphisms (R223Q and P1019P) in susceptibility to polycystic ovarian syndrome in Kurdish women	Naseri, R.; Barzingarosi, E.; Sohrabi, M.; Alimoradi, Y.; Fard, M. C.; Jalili, C.	2021	Non energy homeostasis
Study of Association of Leptin and Insulin Resistance Markers in Patients of PCOS	Nasrat, H.; Patra, S. K.; Goswami, B.; Jain, A.; Raghunandan, C.	2016	Non energy homeostasis
Evaluating the Role of High Molecular Weight Adiponectin in Women with Polycystic Ovary Syndrome Treated with Omega-3 Fatty Acids	Nasser 2020	2020	No control group
Androgen Excess as a Cause for Adipogenic Dysfunction in PCOS Women	Nct,	2013	Trial register
Incretin Effect in PCOS Women	Nct,	2013	Trial register
Metformin for Ectopic Fat Deposition and Metabolic Markers in Polycystic Ovary Syndrome (PCOS)	Nct,	2015	Trial register
The Effect Of Vitamin D Replacement Therapy On Serum Leptin And Follicular Growth Pattern In Women With Resistant Polycystic Ovary	Nct,	2019	Trial register
The Effects of Semaglutide on Taste, Tongue Tissue Transcriptome, Gastric Emptying and Central Neural Response in Women With PCOS and Obesity	Nct,	2020	Trial register
Effects of metformin on ovulation rate, hormonal and metabolic profiles in women with clomiphene-resistant polycystic ovaries: a randomized, double-blinded placebo-controlled trial	Ng, E. H.; Wat, N. M.; Ho, P. C.	2001	Non energy homeostasis
Adiponectin as serum biomarker of insulin resistance in patients with polycystic ovarian syndrome	Niafar, M.; Nader, N. D.	2015	Non energy homeostasis
Changes of serum vitamin D levels in infertile patients with polycystic ovarian syndrome and its significance	Niu, Y.; Wang, X.; Wang, D.; Jiang, X.	2020	Non energy homeostasis
Adiponectin Gene Polymorphism (rs17300539) Has No Influence on the Occurrence of Metabolic Syndrome in Women with Polycystic Ovary Syndrome	Nowak, I.; Ciecwiez, S.; Loj, B.; Brodowski, J.; Brodowska, A.	2021	Non energy homeostasis
High-molecular-weight adiponectin is selectively reduced in women with polycystic ovary syndrome independent of body mass index and severity of insulin resistance	O'Connor, A.; Phelan, N.; Tun, T. K.; Boran, G.; Gibney, J.; Roche, H. M.	2010	Non energy homeostasis
Assessing the variability and predictability of adipokines (adiponectin, leptin, resistin and their ratios) in non-obese and obese women with anovulatory polycystic ovary syndrome	Obirikorang, C.; Owiredu, Wkba; Adu-Afram, S.; Acheampong, E.; Asamoah, E. A.; Antwi-Boasiakoh, E. K.; Owiredu, E. W.	2019	Non energy homeostasis
No evidence for mutations of the leptin or leptin receptor genes in women with polycystic ovary syndrome	Oksanen, L.; Tiitinen, A.; Kaprio, J.; Koistinen, H. A.; Karonen, S. L.; Kontula, K.	2000	Non energy homeostasis
Effects of short term metformin treatment on brown adipose tissue activity and plasma irisin levels in women with polycystic ovary syndrome: A randomized controlled trial	Oliveira, F. R.; Mamede, M.; Bizzi, M. F.; Rocha, A. L. L.; Ferreira, C. N.; Gomes, K. B.; Candido, A. L.; Reis, F. M.	2020	No outcomes of interest

Serum adiponectin and resistin in relation to insulin resistance and markers of hyperandrogenism in lean and obese women with polycystic ovary syndrome	Olszanecka-Glinianowicz, M.; Kuglin, D.; Dabkowska-Huc, A.; Skalba, P.	2011	Non energy homeostasis
Circulating apelin level in relation to nutritional status in polycystic ovary syndrome and its association with metabolic and hormonal disturbances	Olszanecka-Glinianowicz, M.; Madej, P.; Nylec, M.; Owczarek, A.; Szanecki, W.; Skalba, P.; Chudek, J.	2013	Non energy homeostasis
Circulating anti-Mullerian hormone levels in relation to nutritional status and selected adipokines levels in polycystic ovary syndrome	Olszanecka-Glinianowicz, M.; Madej, P.; Owczarek, A.; Chudek, J.; Skalba, P.	2015	Non energy homeostasis
Effect of short-term standard therapeutic regimens on neuropeptide Y and adipose tissue hormones in overweight insulin-resistant women with polycystic ovary syndrome	Orbetzova, M. M.; Pehlivanov, B. K.; Mitkov, M. M.; Atanassova, I. B.; Kamenov, Z. A.; Kolarov, G. B.; Genchev, G. D.	2011	Non energy homeostasis
Circulating ghrelin concentrations in the polycystic ovary syndrome	Orio, F., Jr.; Lucidi, P.; Palomba, S.; Tauchmanova, L.; Cascella, T.; Russo, T.; Zullo, F.; Colao, A.; Lombardi, G.; De Feo, P.	2003	Non energy homeostasis
Exon 6 and 2 peroxisome proliferator-activated receptor-gamma polymorphisms in polycystic ovary syndrome	Orio, F., Jr.; Matarese, G.; Di Biase, S.; Palomba, S.; Labella, D.; Sanna, V.; Savastano, S.; Zullo, F.; Colao, A.; Lombardi, G.	2003	Non energy homeostasis
Lack of an association between peroxisome proliferator-activated receptor-gamma gene Pro12Ala polymorphism and adiponectin levels in the polycystic ovary syndrome	Orio, F., Jr.; Palomba, S.; Cascella, T.; Di Biase, S.; Labella, D.; Russo, T.; Savastano, S.; Zullo, F.; Colao, A.; Vettor, R.; Lombardi, G.	2004	Non energy homeostasis
Adiponectin levels in women with polycystic ovary syndrome	Orio, F., Jr.; Palomba, S.; Cascella, T.; Milan, G.; Mioni, R.; Pagano, C.; Zullo, F.; Colao, A.; Lombardi, G.; Vettor, R.	2003	Non energy homeostasis
Plasma omentin and adiponectin levels as markers of adipose tissue dysfunction in normal weight and obese women with polycystic ovary syndrome	Orlik, B.; Madej, P.; Owczarek, A.; Skalba, P.; Chudek, J.; Olszanecka-Glinianowicz, M.	2014	Non energy homeostasis
Metformin Treatment Regulates the Expression of Molecules Involved in Adiponectin and Insulin Signaling Pathways in Endometria from Women with Obesity-Associated Insulin Resistance and PCOS	Orostica, M. L.; Astorga, I.; Plaza-Parrochia, F.; Poblete, C.; Carvajal, R.; Garcia, V.; Romero, C.; Vega, M.	2022	Non energy homeostasis
Relationship between adipocytokines and angiotensin converting enzyme gene insertion/deletion polymorphism in lean women with and without polycystic ovary syndrome	Ozegowska, K.; Bartkowiak-Wieczorek, J.; Bogacz, A.; Seremak-Mrozikiewicz, A.; Duleba, A. J.; Pawelczyk, L.	2020	Non energy homeostasis
C-Reactive Protein, Fibrinogen, Leptin, and Adiponectin Levels in Women with Polycystic Ovary Syndrome	Ozgokce, C.; Elci, E.; Yildizhan, R.	2020	Non energy homeostasis
Dipeptidyl peptidase-4 and adenosine deaminase enzyme levels in polycystic ovary syndrome	Ozturk, B.; Gurbuz, A. S.; Durak, Z. E.; Ozturk, H. S.	2019	No outcomes of interest
Plasma ghrelin, obesity, and the polycystic ovary syndrome: correlation with insulin resistance and androgen levels	Pagotto, U.; Gambineri, A.; Vicennati, V.; Heiman, M. L.; Tschop, M.; Pasquali, R.	2002	Non energy homeostasis
Correlates of food craving and quality of life in polycystic ovary syndrome	Painold, A.; Milz, P.; Kapfhammer, H. P.; Pieber, T.; Obermayer-Pietsch, B.; Lerchbaum, E.	2012	Abstract
Serum adiponectin and resistin in relation to insulin resistance and markers of hyperandrogenism in lean and obese women with polycystic ovary syndrome	Pangaribuan, B.; Yusuf, I.; Mansyur, M.; Wijaya, A.	2011	Non energy homeostasis
Study on the influence of adiponectin genetic variants and adiponectin levels among Indonesian women with polycystic ovary syndrome	Pangaribuan, B.; Yusuf, I.; Mansyur, M.; Wijaya, A.	2012	Non energy homeostasis

Decrease in adiponectin levels in women with polycystic ovary syndrome after an oral glucose tolerance test	Panidis, D; Farmakiotis, D; Rousso, D; Koliakos, G; Kaltsas, T; Krassas, G	2005	no outcome of interest
The influence of long-term administration of conjugated estrogens and antiandrogens to serum leptin levels in women with polycystic ovary syndrome	Panidis, D. K.; Rousso, D. H.; Matalliotakis, I. M.; Kourtis, A. I.; Stamatopoulos, P.; Koumantakis, E.	2000	Non energy homeostasis
Decreased active, total and altered active to total ghrelin ratio in normal weight women with the more severe form of polycystic ovary syndrome	Panidis, D.; Asteriadis, C.; Georgopoulos, N. A.; Katsikis, I.; Zournatzi, V.; Karkanaki, A.; Saltamavros, A. D.; Decavalas, G.; Diamanti-Kandarakis, E.	2010	Non energy homeostasis
Comparative study of plasma ghrelin levels in women with polycystic ovary syndrome, in hyperandrogenic women and in normal controls	Panidis, D.; Farmakiotis, D.; Koliakos, G.; Rousso, D.; Kourtis, A.; Katsikis, I.; Asteriadis, C.; Karayannis, V.; Diamanti-Kandarakis, E.	2005	Non energy homeostasis
Serum adiponectin levels in women with polycystic ovary syndrome	Panidis, D.; Kourtis, A.; Farmakiotis, D.; Mouselech, T.; Rousso, D.; Koliakos, G.	2003	Non energy homeostasis
Association of the T45G polymorphism in exon 2 of the adiponectin gene with polycystic ovary syndrome: role of Delta4-androstenedione	Panidis, D.; Kourtis, A.; Kukuvitis, A.; Farmakiotis, D.; Xita, N.; Georgiou, I.; Tsatsoulis, A.	2004	Non energy homeostasis
Serum leptin levels in normal-weight and overweight women with polycystic ovary syndrome	Panidis, D.; Rousso, D.; Kourtis, A.; Tsimas, V.; Papathanasiou, K.; Makedos, G.	2003	Non energy homeostasis
Effect of meal frequency on glucose and insulin levels in women with polycystic ovary syndrome: a randomised trial	Papakonstantinou, E; Kechribari, I; Mitrou, P; Trakakis, E; Vassiliadi, D; Georgousopoulou, E; Zampelas, A; Kontogianni, M D; Dimitriadis, G	2016	No control group
Effect of meal frequency on glucose levels in women with polycystic ovary syndrome: A randomized trial	Papakonstantinou, E.; Kechribari, I.; Mitrou, P.; Trakakis, E.; Vassiliadi, D.; Georgousopoulou, E.; Zampelas, A.; Kontogianni, M. D.; Dimitriadis, G.	2015	Abstract
Association of insulin resistance with anti-Mullerian hormone levels in women without polycystic ovary syndrome (PCOS)	Park, H. T.; Cho, G. J.; Ahn, K. H.; Shin, J. H.; Kim, Y. T.; Hur, J. Y.; Kim, S. H.; Lee, K. W.; Kim, T.	2010	Wrong population
Effect of long-term treatment with metformin added to hypocaloric diet on body composition, fat distribution, and androgen and insulin levels in abdominally obese women with and without the polycystic ovary syndrome	Pasquali, R.; Gambineri, A.; Biscotti, D.; Vicennati, V.; Gagliardi, L.; Colitta, D.; Fiorini, S.; Cognigni, G. E.; Filicori, M.; Morselli-Labate, A. M.	2000	Non energy homeostasis
Serum leptin levels correlate with clinical and biochemical indices of insulin resistance in women with polycystic ovary syndrome	Pehlivanov, B.; Mitkov, M.	2009	Non energy homeostasis
Elevated Serum Leptin Levels as a Predictive Marker for Polycystic Ovary Syndrome	Peng, Y.; Yang, H.; Song, J.; Feng, D.; Na, Z.; Jiang, H.; Meng, Y.; Shi, B.; Li, D.	2022	Non energy homeostasis
Evidence for visfatin as an independent predictor of endothelial dysfunction in polycystic ovary syndrome	Pepene, C. E.	2012	Non energy homeostasis
Are circulating leptin and luteinizing hormone synchronized in patients with polycystic ovary syndrome?	Petermann, T.; Piwonka, V.; Perez, F.; Maliqueo, M.; Recabarren, S. E.; Wildt, L.	1999	Non energy homeostasis
Adiponectin levels in adolescent girls with polycystic ovary syndrome (PCOS)	Pinhas-Hamiel, O.; Singer, S.; Pilpel, N.; Koren, I.; Boyko, V.; Hemi, R.; Pariente, C.; Kanety, H.	2009	Non energy homeostasis

Association of anti-mullerian hormone and adiponectin in normal weight and overweight plus obese women with polycystic ovary syndrome	Piouka, A.; Karkanaki, A.; Katsikis, I.; Delkos, D.; Mousatat, T.; Daskalopoulos, G.; Panidis, D.	2011	Abstract
Circulating leptin concentrations and ovarian function in polycystic ovary syndrome	Pirwany, I. R.; Fleming, R.; Sattar, N.; Greer, I. A.; Wallace, A. M.	2001	Non energy homeostasis
Visfatin and leptin levels in women with polycystic ovaries undergoing ovarian stimulation	Plati, E.; Kouskouni, E.; Malamitsi-Puchner, A.; Boutsikou, M.; Kaparos, G.; Baka, S.	2010	Non energy homeostasis
Effect of a low-starch/low-dairy diet on fat oxidation in overweight and obese women with polycystic ovary syndrome	Pohlmeier, Ali M.; Phy, Jennifer L.; Watkins, Phillip; Boylan, Mallory; Spallholz, Julian; Harris, Kitty S.; Cooper, Jamie A.	2014	No control group
The association of serum levels of leptin and ghrelin with the dietary fat content in non-obese women with polycystic ovary syndrome	Polak, A. M.; Krentowska, A.; Lebkowska, A.; Buczynska, A.; Adamski, M.; Adamska-Patruno, E.; Fiedorczuk, J.; Kretowski, A. J.; Kowalska, I.; Adamska, A.	2020	Non energy homeostasis
Changes of body composition and circulating neopterin, omentin-1, and chemerin in response to thylakoid-rich spinach extract with a hypocaloric diet in obese women with polycystic ovary syndrome: A randomized controlled trial	Pourteymour Fard Tabrizi, F.; Abbasalizad Farhangi, M.; Vaezi, M.; Hemmati, S.	2020	No outcomes of interest
Metformin induces lipid changes on sphingolipid species and oxidized lipids in polycystic ovary syndrome women	Pradas, I.; Rovira-Llopis, S.; Naudi, A.; Banuls, C.; Rocha, M.; Hernandez-Mijares, A.; Pamplona, R.; Victor, V. M.; Jove, M.	2019	No outcomes of interest
The effects of 8 months of metformin on circulating GGT and ALT levels in obese women with polycystic ovarian syndrome	Preiss, D.; Sattar, N.; Harborne, L.; Norman, J.; Fleming, R.	2008	Non energy homeostasis
Polycystic ovary syndrome: Dietary intervention needed while fertility treatment. [German]	Pruckler, J.; Leitner, G.; Klein, M.; Gruber, I.	2013	Non English
Circulating ANGPTL8 Is Associated with the Presence of Metabolic Syndrome and Insulin Resistance in Polycystic Ovary Syndrome Young Women	Pu, D.; Li, L.; Yin, J.; Liu, R.; Yang, G.; Liao, Y.; Wu, Q.	2019	Non energy homeostasis
Obesity and polycystic ovary syndrome: association with androgens, leptin and its genotypes	Pusalkar, M.; Meherji, P.; Gokral, J.; Savardekar, L.; Chinnaraj, S.; Maitra, A.	2010	Non energy homeostasis
The natural logarithm of zinc-alpha2-glycoprotein/HOMA-IR is a better predictor of insulin sensitivity than the product of triglycerides and glucose and the other lipid ratios	Qu, C.; Zhou, X.; Yang, G.; Li, L.; Liu, H.; Liang, Z.	2016	Non energy homeostasis
Effect of the use of L-Arginine, Caffeine or Creatine supplements associated with physical activity in women with Polycystic Ovary Syndrome with Metabolic Syndrome	R. B. R. jt	9832	Trial register
Haplotype TGTG from SNP 45T/G and 276G/T of the adiponectin gene contributes to risk of polycystic ovary syndrome	Radavelli-Bagatini, S.; de Oliveira, I. O.; Ramos, R. B.; Santos, B. R.; Wagner, M. S.; Lecke, S. B.; Gigante, D. P.; Horta, B. L.; Spritzer, P. M.	2013	Non energy homeostasis
Serum levels of angiopoietin-like protein 2 and obestatin in iranian women with polycystic ovary syndrome and normal body mass index	Rahmani, E.; Akbarzadeh, S.; Broomand, A.; Torabi, F.; Motamed, N.; Zohrabi, M.	2018	No outcomes of interest
Expression of leptin (Ob gene product) in reproductive system with special reference to polycystic ovary syndrome	Ram, M. R.; Shanthi, P.; Malathi, R.	2010	Non energy homeostasis
Body fat distribution and leptin correlation in women with polycystic ovary syndrome: Endocrine and biochemical evaluation in south Indian population	Ram, M. R.; Sundararaman, P. G.; Malathi, R.	2005	Non energy homeostasis

Influence of gene variants related to calcium homeostasis on biochemical parameters of women with polycystic ovary syndrome	Ranjzad, F.; Mahban, A.; Irani Shemirani, A.; Mahmoudi, T.; Vahedi, M.; Nikzamir, A.; Zali, M. R.	2011	Non energy homeostasis
A common variant in the adiponectin gene and polycystic ovary syndrome risk	Ranjzad, F.; Mahmoudi, T.; Irani Shemirani, A.; Mahban, A.; Nikzamir, A.; Vahedi, M.; Ashrafi, M.; Gourabi, H.	2012	Non energy homeostasis
Metabolic effects of short-term whey protein supplementation in polycystic ovary syndrome	Rao, M.; Zumbro, E.; Broughton, K. S.; LeMieux, M.	2019	Abstract
Differential Impact of Insulin Sensitizers vsAnti-Androgen on Serum Leptin Levels in Vitamin D Replete PCOS Women: A Six Month Open Labeled Randomized Study	Rashid, A.; Ganie, M. A.; Bhat, G. A.; Shaheen, F.; Wani, I. A.; Shrivastava, M.; Shah, Z. A.	2020	Non energy homeostasis
Endocrine and metabolic effects of rosiglitazone in overweight women with PCOS: a randomized placebo-controlled study	Rautio, K.; Tapanainen, J. S.; Ruokonen, A.; Morin-Papunen, L. C.	2006	Non energy homeostasis
Cytokines and leptin correlation in patients with polycystic ovary syndrome: Biochemical evaluation in south Indian population	Ravishankar Ram, M.; Sundararaman, P. G.; Mahadevan, S.; Malathi, R.	2005	Non energy homeostasis
Central arterial stiffness and diastolic dysfunction are associated with insulin resistance and abdominal obesity in young women but polycystic ovary syndrome does not confer additional risk	Rees, E.; Coulson, R.; Dunstan, F.; Evans, W. D.; Blundell, H. L.; Luzio, S. D.; Dunseath, G.; Halcox, J. P.; Fraser, A. G.; Rees, D. A.	2014	Non energy homeostasis
Does adiponectin protect against the cardiovascular dysfunction associated with central adiposity in young women with polycystic ovary syndrome?	Rees, E.; Hocking, R.; Dunstan, F.; Lewis, M.; Tunstall, K.; Halcox, J. P.; Fraser, A. G.; Rees, D. A.	2013	Abstract
Evidence for competing effects of body mass, hyperinsulinemia, insulin resistance, and androgens on leptin levels among lean, overweight, and obese women with polycystic ovary syndrome	Remsberg, K. E.; Talbott, E. O.; Zborowski, J. V.; Evans, R. W.; McHugh-Pemu, K.	2002	Non energy homeostasis
Oral quercetin supplementation enhances adiponectin receptor transcript expression in polycystic ovary syndrome patients: A randomized placebo-controlled double-blind clinical trial	Rezvan, N.; Moini, A.; Gorgani-Firuzjaee, S.; Hosseinzadeh-Attar, M. J.	2018	Non energy homeostasis
Effects of Quercetin on Adiponectin-Mediated Insulin Sensitivity in Polycystic Ovary Syndrome: A Randomized Placebo-Controlled Double-Blind Clinical Trial	Rezvan, N.; Moini, A.; Janani, L.; Mohammad, K.; Saedisomeolia, A.; Nourbakhsh, M.; Gorgani-Firuzjaee, S.; Mazaherioun, M.; Hosseinzadeh-Attar, M. J.	2017	Non energy homeostasis
Leptin as well as free leptin receptor is associated with polycystic ovary syndrome in young women	Rizk, N. M.; Sharif, E.	2015	Non energy homeostasis
Low validity of predictive equations for calculating resting energy expenditure in overweight and obese women with polycystic ovary syndrome	Rodrigues, A. M. dos S.; Costa, A. B. P.; Campos, D. L.; Silva, M. P. S.; CÃ¢ndido, A. L.; Santos, L. C. dos; Ferreira, A. V. M.	2018	No control group
Altered multihormone synchrony in obese patients with polycystic ovary syndrome	Roelfsema, Ferdinand; Kok, Petra; Veldhuis, Johannes D.; Pijl, Hanno	2011	no outcome of interest
Metformin treatment does not affect total leptin levels and free leptin index in obese patients with polycystic ovary syndrome	Romualdi, D.; Campagna, G.; Selvaggi Jr, L.; Cento, R.; Proto, C.; Lanzone, A.; Guido, M.	2008	Non energy homeostasis
Alteration of ghrelin-neuropeptide Y network in obese patients with polycystic ovary syndrome: role of hyperinsulinism	Romualdi, D.; De Marinis, L.; Campagna, G.; Proto, C.; Lanzone, A.; Guido, M.	2008	Non energy homeostasis

The resting metabolic rate in women with polycystic ovary syndrome and its relation to the hormonal milieu, insulin metabolism, and body fat distribution: a cohort study	Romualdi, D.; Versace, V.; Tagliaferri, V.; De Cicco, S.; Immediata, V.; Apa, R.; Guido, M.; Lanzone, A.	2019	No outcomes of interest
Serum leptin concentrations in women with polycystic ovary syndrome	Rouru, J.; Anttila, L.; Koskinen, P.; Penttila, T. A.; Irjala, K.; Huupponen, R.; Koulu, M.	1997	Non energy homeostasis
Serum metabolomics of Indian women with polycystic ovary syndrome using ¹H NMR coupled with a pattern recognition approach	RoyChoudhury, S.; Mishra, B. P.; Khan, T.; Chattopadhayay, R.; Lodh, I.; Datta Ray, C.; Bose, G.; Sarkar, H. S.; Srivastava, S.; Joshi, M. V.; Chakravarty, B.; Chaudhury, K.	2016	No outcomes of interest
Comparative studies of the role of hormone-sensitive lipase and adipose triglyceride lipase in human fat cell lipolysis	Ryden, M.; Jocken, J.; van Harmelen, V.; Dicker, A.; Hoffstedt, J.; Wiren, M.; Blomqvist, L.; Mairal, A.; Langin, D.; Blaak, E.; Arner, P.	2007	No outcomes of interest
The levels and ratios of adipokines in the follicular fluid as promising prognostic factors for in vitro fertilization outcomes	Ryzhov, J.; Shpakov, A.; Tkachenko, N.; Mahmadalieva, M.; Kogan, I.; Gzgzyan, A.	2021	Abstract
Association of SerumOmentin Levels in Women with PolyCystic Ovarian Syndrome	Saadati, N.; Yaghmaei, P.; Haghighi, S.; Hashemi, F.; Ramezani, Tehrani F.; Hedayati, M.	2012	Non English
Serum homocysteine is associated with polycystic ovarian syndrome in Jordan	Saadeh, N.; Alfaqih, M. A.; Mansour, H.; Khader, Y. S.; Saadeh, R.; Al-Dwairi, A.; Nusier, M.	2018	Non energy homeostasis
Serum homocysteine is associated with polycystic ovarian syndrome in Jordan	Saadeh, N.; Alfaqih, M. A.; Mansour, H.; Khader, Y. S.; Saadeh, R.; Al-Dwairi, A.; Nusier, M.	2018	Non energy homeostasis
Circulating levels of C1q/TNF-alpha-related protein 6 (CTRP6) in polycystic ovary syndrome	Sadeghi, A.; Fadaei, R.; Moradi, N.; Fouani, F. Z.; Roozbehkia, M.; Zandieh, Z.; Ansaripour, S.; Vatannejad, A.; Doustimotlagh, A. H.	2020	Non energy homeostasis
Computational methods are significant determinants of the associations and definitions of insulin resistance using the homeostasis model assessment in women of reproductive age	Safar, F. H.; Mojiminiyi, O. A.; Al-Rumaih, H. M.; Diejomaoh, M. F.	2011	Non energy homeostasis
The Effects of Raw Red Onion Consumption on Serum Levels of Adiponectin, Leptin, and hs-CRP in Overweight/Obese Females with Polycystic Ovarian Syndrome: A Randomized Controlled-Clinical Trial	Saghafi-Asl, Maryam; Ebrahimi-Mameghani, Mehranghiz	2017	No control group
The effects of oral contraceptives including low-dose estrogen and drospirenone on the concentration of leptin and ghrelin in polycystic ovary syndrome	Sagsoz, N.; Orbak, Z.; Noyan, V.; Yucel, A.; Ucar, B.; Yildiz, L.	2009	Non energy homeostasis
Nesfatin-1 and Vitamin D levels may be associated with systolic and diastolic blood pressure values and hearth rate in polycystic ovary syndrome	Sahin, F. K.; Sahin, S. B.; Ural, U. M.; Cure, M. C.; Senturk, S.; Tekin, Y. B.; Balik, G.; Cure, E.; Yuce, S.; Kirbas, A.	2015	Non energy homeostasis
Leptin levels increase during flutamide therapy in women with polycystic ovary syndrome	Sahin, I.; Serter, R.; Karakurt, F.; Demirbas, B.; Guler, S.; Culha, C.; Taskapan, C.; Aral, Y.	2003	Non energy homeostasis
Insulin levels, insulin resistance, and leptin levels are not associated with the development of ovarian hyperstimulation syndrome	Salamalekis, E.; Makrakis, E.; Vitoratos, N.; Chassiakos, D.; Baka, S.; Creatsas, G.	2004	Non energy homeostasis
Serum leptin elevation in obese women with PCOs: a continuing controversy	Saleh, H. A.; El-Nwaem, M. A.; El-Bordiny, M. M.; Maqlad, H. M.; El-Mohandes, A. A.; Eldaqaq, E. M.	2004	Non energy homeostasis

Evaluation of some physiological parameters for obese women suffering from pregnant disturbance in Basrah Governorate, Iraq-Case Study	Salman, S. A.; Yser, H. T.	2022	Non energy homeostasis
Assesment of relationships between the HMWAdiponectin and insulin resistance in normal weight adolescents with PCOS	Saltek, S.; Demir, B.; Dilbaz, B.; Demirtas, C.	2013	Abstract
Exaggerated glucagon responses to hypoglycemia in women with polycystic ovary syndrome	Sam, S.; Vellanki, P.; Yalamanchi, S. K.; Bergman, R. N.; Dunaif, A.	2017	No outcomes of interest
Association of the polycystic ovary syndrome with genomic variants related to insulin resistance, type 2 diabetes mellitus, and obesity	San Millan, J. L.; Corton, M.; Villuendas, G.; Sancho, J.; Peral, B.; Escobar-Morreale, H. F.	2004	Non energy homeostasis
Validity of adiponectin-to-leptin and adiponectin-to-resistin ratios as predictors of polycystic ovary syndrome	Sarray, S.; Madan, S.; Saleh, L. R.; Mahmoud, N.; Almawi, W. Y.	2015	Non energy homeostasis
Effect of rimonabant and metformin on glucose-dependent insulinotropic polypeptide and glucagon-like peptide-1 in obese women with polycystic ovary syndrome	Sathyapalan, T.; Cho, L.; Kilpatrick, E. S.; Le Roux, C. W.; Coady, A. M.; Atkin, S. L.	2010	Non energy homeostasis
Serum 25-Hydroxyvitamin D Levels, Phosphoprotein Enriched in Diabetes Gene Product (PED/PEA-15) and Leptin-to-Adiponectin Ratio in Women with PCOS	Savastano, S.; Valentino, R.; Di Somma, C.; Orio, F.; Pivonello, C.; Passeretti, F.; Brancato, V.; Formisano, P.; Colao, A.; Beguinot, F.; Tarantino, G.	2011	Non energy homeostasis
Circulating ghrelin levels in patients with polycystic ovary syndrome	Schofl, C.; Horn, R.; Schill, T.; Schlosser, H. W.; Muller, M. J.; Brabant, G.	2002	Non energy homeostasis
Does homocysteine and ghrelin link in polcystic ovary syndrome relate to obesity?	Sen, T. A.	2012	Non English
Effect of brisk walking on adiponectin levels in women with polycystic ovarian syndrome	Senghor, K. A. A.; Meera, S.; Vinodhini, V. M.; Anuradha, M.	2021	Abstract
Serum Preptin and Amylin Levels with Respect to Body Mass Index in Polycystic Ovary Syndrome Patients	Senturk, S.; Hatirnaz, S.; Kanat-Pektas, M.	2018	Non energy homeostasis
Expression levels of haem oxygenase-1 in the omental adipose tissue and peripheral blood mononuclear cells of women with polycystic ovary syndrome	Seow, K. M.; Hwang, J. L.; Wang, P. H.; Ho, L. T.; Lin, Y. H.; Juan, C. C.	2011	Non energy homeostasis
Omental fat expression of adiponectin and adiponectin receptors in non-obese women with PCOS: a preliminary study	Seow, K. M.; Tsai, Y. L.; Juan, C. C.; Lin, Y. H.; Hwang, J. L.; Ho, L. T.	2009	Non energy homeostasis
Adiponectin levels in women with polycystic ovary syndrome and severe insulin resistance	Sepilian, V.; Nagamani, M.	2005	Non energy homeostasis
Serum soluble leptin receptor levels and free leptin index in women with polycystic ovary syndrome: relationship to insulin resistance and androgens	Sepilian, Vicken P.; Crochet, John R.; Nagamani, Manubai	2006	no outcome of interest
The effect of vitamin D supplementation on insulin resistance, visceral fat and adiponectin in vitamin D deficient women with polycystic ovary syndrome: a randomized placebo-controlled trial	Seyyed Abootorabi, Maryam; Ayremlou, Parvin; Behroozi-Lak, Tahereh; Nourisaeidlou, Sakineh	2018	No control group
Effects of Oral Contraception and Lifestyle Modification on Incretins and TGF-s Superfamily Hormones in PCOS	Shah, A.; Dodson, W. C.; Kris-Etherton, P. M.; Kunselman, A. R.; Stetter, C. M.; Gnatuk, C. L.; Estes, S. J.; Allison, K. C.; Sarwer, D. B.; Sluss, P. M.; Coutifaris, C.; Dokras, A.; Legro, R. S.	2021	Duplicate
Effects of Oral Contraception and Lifestyle Modification on Incretins and TGF-ß Superfamily Hormones in PCOS	Shah, Aesha; Dodson, William C.; Kris-Etherton, Penny M.; Kunselman, Allen R.; Stetter, Christy M.; Gnatuk, Carol L.; Estes, Stephanie J.; Allison,	2021	Non energy homeostasis

	Kelly C.; Sarwer, David B.; Sluss, Patrick M.; Coutifaris, Christos; Dokras, Anuja; Legro, Richard S.		
Effect of treatment with metformin on omentin-1, ghrelin and other biochemical, clinical features in PCOS patients	Shaker, M.; Al-Mashhadani, Z. I.; Mehdi, A. A.	2010	Non energy homeostasis
Lower circulating levels of CTRP12 and CTRP13 in polycystic ovarian syndrome: Irrespective of obesity	Shanaki, M.; Moradi, N.; Fadaei, R.; Zandieh, Z.; Shabani, P.; Vatannejad, A.	2018	Non energy homeostasis
Decreased adiponectin levels in polycystic ovary syndrome, independent of body mass index	Sharifi, F.; Hajihosseini, R.; Mazloomi, S.; Amirmogaddami, H.; Nazem, H.	2010	Non energy homeostasis
Obesity and inflammatory biomarkers in women with polycystic ovary syndrome	Shen, S. H.; Shen, S. Y.; Liou, T. H.; Hsu, M. I.; Chang, Y. C.; Cheng, C. Y.; Hsu, C. S.; Tzeng, C. R.	2015	Non energy homeostasis
Insulin resistance and high molecular weight adiponectin in obese and non-obese patients with Polycystic Ovarian Syndrome (PCOS)	Shirazi, F. K. H.; Khodamoradi, Z.; Jeddi, M.	2022	Non energy homeostasis
High-molecular-weight adiponectin is inversely associated with sympathetic activity in polycystic ovary syndrome	Shorakae, S.; Abell, S. K.; Hiam, D. S.; Lambert, E. A.; Eikelis, N.; Jona, E.; Sari, C. I.; Stepto, N. K.; Lambert, G. W.; de Courten, B.; Teede, H. J.	2019	Non energy homeostasis
Brown adipose tissue thermogenesis in polycystic ovary syndrome	Shorakae, S.; Jona, E.; de Courten, B.; Lambert, G. W.; Lambert, E. A.; Phillips, S. E.; Clarke, I. J.; Teede, H. J.; Henry, B. A.	2019	No outcomes of interest
Inter-related effects of insulin resistance, hyperandrogenism, sympathetic dysfunction and chronic inflammation in PCOS	Shorakae, S.; Ranasinha, S.; Abell, S.; Lambert, G.; Lambert, E.; de Courten, B.; Teede, H.	2018	Non energy homeostasis
Young obese women with polycystic ovary syndrome have evidence of early coronary atherosclerosis	Shroff, R.; Kerchner, A.; Maifeld, M.; Van Beek, E. J.; Jagasia, D.; Dokras, A.	2007	Non energy homeostasis
Serum adiponectin in women with polycystic ovarian syndrome and its relation to clinical, metabolic and endocrine parameters	Sieminska, L.; Marek, B.; Kos-Kudla, B.; Niedziolka, D.; Kajdaniuk, D.; Nowak, M.; Glogowska-Szelag, J.	2004	Non energy homeostasis
Plasma adiponectin levels in women with polycystic ovary syndrome: impact of metformin treatment in a case-control study	Singh, S.; Akhtar, N.; Ahmad, J.	2012	Non energy homeostasis
Serum adiponectin and lipid concentrations in pregnant women with polycystic ovary syndrome	Sir-Petermann, T.; Echiburu, B.; Maliqueo, M. M.; Crisosto, N.; Sanchez, F.; Hitschfeld, C.; Carcamo, M.; Amigo, P.; Perez-Bravo, F.	2007	Non energy homeostasis
Secretory pattern of leptin and LH during lactational amenorrhoea in breastfeeding normal and polycystic ovarian syndrome women	Sir-Petermann, T.; Recabarren, S. E.; Lobos, A.; Maliqueo, M.; Wildt, L.	2001	Non energy homeostasis
The level of adiponectin in the obese women with menstruation disorders and insulin resistance. [Polish, English]	Skalba, P.; Kuglin, D.; Dabkowska-Huc, A.	2009	Non energy homeostasis
Analysis of leptin pulses in serum in women with polycystic ovary syndrome. [Polish]	Skalba, P.; Rudzki, K.; Mroczka, W.; Dabkowska-Huc, A.; Chelmicki, A.; Czech, E.	2006	Non English
Gherlin expression in women with polycystic ovary syndrome - A preliminary study	Skommer, J.; Katulski, K.; Poreba, E.; Meczekalski, B.; Slopien, R.; Plewa, R.; Gozdzicka-Jozefiak, A.; Warenik-Szymankiewicz, A.	2005	Non energy homeostasis

Pioglitazone enhances mitochondrial biogenesis and ribosomal protein biosynthesis in skeletal muscle in polycystic ovary syndrome	Skov, V.; Glintborg, D.; Knudsen, S.; Tan, Q.; Jensen, T.; Kruse, T. A.; Beck-Nielsen, H.; Hojlund, K.	2008	Non energy homeostasis
Assessment of leptin levels in the different genotypes and leptin receptor genes in the women with polycystic ovary syndrome and diabetes mellitus type 2 in Iraq population	Smaism, M. F.	2016	Non energy homeostasis
The effect of metformin and myoinositol on metabolic outcomes in women with polycystic ovary syndrome: role of body mass and adiponectin in a randomized controlled trial.	Soldat-Stanković V, Popović-Pejičić S, Stanković S, Prtina A, Malešević G, Bjekić-Macut J, Livadas S, Ognjanović S, Mastorakos G, Micić D, Macut D.	2022	Non energy homeostasis
Does polycystic ovary syndrome affect cognition? A functional magnetic resonance imaging study exploring working memory	Soleman, R. S.; Kreukels, B. P. C.; Veltman, D. J.; Cohen-Kettenis, P. T.; Hompes, P. G. A.; Drent, M. L.; Lambalk, C. B.	2016	Non energy homeostasis
Effects of pioglitazone on serum adipocytokines in polycystic ovary syndrome patients with insulin resistance. [Chinese]	Song, Q.; Gou, W. L.	2010	Non English
Effects of pioglitazone on serum leptin and adiponectin in polycystic ovary syndrome patients with insulin resistance	Song, Q.; Gou, W. L.; Ding, X. J.	2010	Non English
Adipokines, Insulin Resistance and Hyperandrogenemia in Obese Patients with Polycystic Ovary Syndrome: Cross-Sectional Correlations and the Effects of Weight Loss	Spanos, Nikolaos; Tziomalos, Konstantinos; Macut, Djuro; Koiou, Ekaterini; Kandaraki, Eleni A.; Delkos, Dimitrios; Tsourdi, Elena; Panidis, Dimitrios	2012	no outcome of interest
Adiponectin is independently associated with insulin sensitivity in women with polycystic ovary syndrome	Spranger, J.; Mohlig, M.; Wegewitz, U.; Ristow, M.; Pfeiffer, A. F.; Schill, T.; Schlosser, H. W.; Brabant, G.; Schofl, C.	2004	Non energy homeostasis
Influence of leptin, androgens and insulin sensitivity on increased GH response to clonidine in lean patients with polycystic ovary syndrome	Spritzer, P. M.; Comim, F. V.; Capp, E.; D'Avila, A.	2005	Non energy homeostasis
Leptin concentrations in hirsute women with polycystic ovary syndrome or idiopathic hirsutism: influence on LH and relationship with hormonal, metabolic, and anthropometric measurements	Spritzer, P. M.; Poy, M.; Wiltgen, D.; Mylius, L. S.; Capp, E.	2001	Non energy homeostasis
Effects of the insulin sensitizer pioglitazone on menstrual irregularity, insulin resistance and hyperandrogenism in young women with polycystic ovary syndrome	Stabile, G.; Borrielli, I.; Artenisio, A. C.; Bruno, L. M.; Benvenga, S.; Giunta, L.; La Marca, A.; Volpe, A.; Pizzo, A.	2014	Non energy homeostasis
A randomized trial of the effects of two types of short-term hypocaloric diets on weight loss in women with polycystic ovary syndrome	Stamets, Kelly; Taylor, Denise S; Kunselman, Allen; Demers, Laurence M; Pelkman, Christine L; Legro, Richard S	2004	No control group
Association between Circulating Adiponectin and Heart Rate Recovery in Women with Polycystic Ovarian Syndrome	Sun, W.; Liu, G.; Liu, B.	2022	Non energy homeostasis
Family-Based Association Study of rs17300539 and rs12495941 Polymorphism in Adiponectin Gene and Polycystic Ovary Syndrome in a Chinese Population	Sun, X.; Wu, X.; Duan, Y.; Liu, G.; Yu, X.; Zhang, W.	2017	Non energy homeostasis
Adipose expression of adipocytokines in women with polycystic ovary syndrome	Svendsen, P. F.; Christiansen, M.; Hedley, P. L.; Nilas, L.; Pedersen, S. B.; Madsbad, S.	2012	Non energy homeostasis
Incretin hormone secretion in women with polycystic ovary syndrome: roles of obesity, insulin sensitivity, and treatment with metformin	Svendsen, P. F.; Nilas, L.; Madsbad, S.; Holst, J. J.	2009	Non energy homeostasis

Obesity, body composition and metabolic disturbances in polycystic ovary syndrome	Svendsen, P. F.; Nilas, L.; Norgaard, K.; Jensen, J.-E. B.; Madsbad, S.	2008	no outcome of interest
Activity Of Dipeptidyl Peptidase-4 (Dpp-4) In Polycystic Ovary Syndrome And Its Association With Insulin Resistance	Syabakhash, R. A.; Alwasiti, E.; Adnan, E.	2020	No outcomes of interest
Basal leptin concentrations in women with normal and dysfunctional ovarian conditions	Takeuchi, T.; Tsutsumi, O.	2000	Non energy homeostasis
Assessment of the predictive value of follicular fluid insulin, leptin and adiponectin in assisted reproductive cycles	Takikawa, S.; Iwase, A.; Goto, M.; Harata, T.; Umezu, T.; Nakahara, T.; Kobayashi, H.; Suzuki, K.; Manabe, S.; Kikkawa, F.	2010	Non energy homeostasis
Correlation of serum amylin level to polycystic ovarian syndrome	Talaq, A. M.; Ahmed, S. S.	2019	Non energy homeostasis
Upregulation of adiponectin receptor 1 and 2 mRNA and protein in adipose tissue and adipocytes in insulin-resistant women with polycystic ovary syndrome	Tan, B. K.; Chen, J.; Digby, J. E.; Keay, S. D.; Kennedy, C. R.; Randeva, H. S.	2006	Non energy homeostasis
Expression of the CD11c gene in subcutaneous adipose tissue is associated with cytokine level and insulin resistance in women with polycystic ovary syndrome	Tao, T.; Li, S.; Zhao, A.; Zhang, Y.; Liu, W.	2012	Non energy homeostasis
Role of adiponectin/peroxisome proliferator-activated receptor alpha signaling in human chorionic gonadotropin-induced estradiol synthesis in human luteinized granulosa cells	Tao, T.; Wang, Y.; Xu, B.; Mao, X.; Sun, Y.; Liu, W.	2019	Non energy homeostasis
Distribution of adiponectin multimeric forms in Chinese women with polycystic ovary syndrome and their relation to insulin resistance	Tao, T.; Wickham, E. P., 3rd; Fan, W.; Yang, J.; Liu, W.	2010	Non energy homeostasis
Ovarian HMW adiponectin is associated with folliculogenesis in women with polycystic ovary syndrome	Tao, T.; Xu, B.; Liu, W.	2013	Non energy homeostasis
Impact of treatment with metformin on adipokines in patients with polycystic ovary syndrome	Tarkun, I.; Dikmen, E.; Cetinarslan, B.; Canturk, Z.	2010	Non energy homeostasis
Treatment of obstructive sleep apnea improves cardiometabolic function in young obese women with polycystic ovary syndrome	Tasali, E.; Chapotot, F.; Leproult, R.; Whitmore, H.; Ehrmann, D. A.	2011	Non energy homeostasis
NUCB2 gene polymorphism and its relationship with nesfatin-1 levels in polycystic ovary syndrome	Taskin, M. I.; Eser, B.; Adali, E.; Kara, H.; Cuce, C.; Hismiogullari, A. A.	2016	Non energy homeostasis
Acetyl-L-Carnitine Ameliorates Metabolic and Endocrine Alterations in Women with PCOS: A Double-Blind Randomized Clinical Trial	Tauqir, S.; Israr, M.; Rauf, B.; Malik, M. O.; Habib, S. H.; Shah, F. A.; Usman, M.; Raza, M. A.; Shah, I.; Badshah, H.; Ehtesham, E.; Shah, M.	2021	Non energy homeostasis
Post-prandial thermogenesis and insulin sensitivity in the polycystic ovary syndrome	Taylor, R.	1992	Wrong design
Relationship between polymorphism of insulin receptor gene, and adiponectin gene with PCOS	Tehrani, F. R.; Daneshpour, M.; Hashemi, S.; Zarkesh, M.; Azizi, F.	2013	Non energy homeostasis
Serum leptin levels in patients with polycystic ovary syndrome	Telli, M. H.; Yildirim, M.; Noyan, V.	2002	Non energy homeostasis
Serum nonesterified fatty acids, ghrelin, and homocysteine levels in women with polycystic ovary syndrome. [Turkish]	Temel, I.; Celik, O.; Hascalik, S.; Celik, N.; Sahin, I.; Aydin, S.	2010	Non energy homeostasis
Drospirenone/ethinyl estradiol versus rosiglitazone treatment in overweight adolescents with polycystic ovary syndrome: comparison of metabolic, hormonal, and cardiovascular risk factors	Tfayli, H.; Ulnach, J. W.; Lee, S.; Sutton-Tyrrell, K.; Arslanian, S.	2011	Non energy homeostasis

Differences in low-grade chronic inflammation and insulin resistance in women with previous gestational diabetes mellitus and women with polycystic ovary syndrome	Thomann, R.; Rossinelli, N.; Keller, U.; Tirri, B. F.; De Geyter, C.; Ruiz, J.; Kranzlin, M.; Puder, J. J.	2008	Non energy homeostasis
The predictive effect of inflammatory markers and lipid accumulation product index on clinical symptoms associated with polycystic ovary syndrome in nonobese adolescents and younger aged women	Tola, E. N.; Yalcin, S. E.; Dugan, N.	2017	No outcomes of interest
Adiponectin levels in women with polycystic ovary syndrome: impact of metformin treatment in a randomized controlled study	Trolle, B.; Lauszus, F. F.; Frystyk, J.; Flyvbjerg, A.	2010	Non energy homeostasis
Metformin increases fasting plasma peptide tyrosine tyrosine (PYY) in women with polycystic ovarian syndrome (PCOS)	Tsilchorozidou, T.; Batterham, R. L.; Conway, G. S.	2008	Non energy homeostasis
Lipid lipoprotein profile alterations in Greek infertile women with polycystic ovaries: influence of adipocytokines levels	Tsouma, I.; Kouskouni, E.; Demeridou, S.; Boutsikou, M.; Hassiakos, D.; Chasiakou, A.; Hassiakou, S.; Gennimata, V.; Baka, S.	2014	Non energy homeostasis
Leptin levels in women with polycystic ovaries undergoing ovarian stimulation: relation to lipoprotein profiles	Tsouma, I.; Kouskouni, E.; Gennimata, V.; Demeridou, S.; Boutsikou, M.; Grigoriou, V.; Chasiakou, A.; Hassiakou, S.; Baka, S.	2014	Non energy homeostasis
LEPR gene polymorphism and plasma soluble leptin receptor levels are associated with polycystic ovary syndrome in Han Chinese women	Tu, X.; Yu, C.; Gao, M.; Zhang, Y.; Zhang, Z.; He, Y.; Yao, L.; Du, J.; Sun, Y.; Sun, Z.	2017	Non energy homeostasis
Dietary intake, eating behaviors, and quality of life in women with polycystic ovary syndrome who are trying to conceive	Turner-McGrievy, G.; Davidson, C. R.; Billings, D. L.	2015	Non energy homeostasis
Glucagon-Like Peptide-1 (GLP-1) Receptor Agonists in the Treatment of Obese Women with Polycystic Ovary Syndrome	Tzotzas, T.; Karras, S. N.; Katsiki, N.	2017	Wrong design
Phoenixin-14 concentrations are increased in association with luteinizing hormone and nesfatin-1 concentrations in women with polycystic ovary syndrome	Ullah, K.; Ur Rahman, T.; Wu, D. D.; Lin, X. H.; Liu, Y.; Guo, X. Y.; Leung, P. C. K.; Zhang, R. J.; Huang, H. F.; Sheng, J. Z.	2017	Non energy homeostasis
Serum leptin changes with metformin treatment in polycystic ovarian syndrome: Correlation with ovulation, insulin and testosterone levels	Upadhyaya, P.; Rehan, H. S.; Seth, V.	2011	Non energy homeostasis
Increase in daily LH secretion in response to short-term calorie restriction in obese women with PCOS	Van Dam, Eveline W. C. M.; Roelfsema, Ferdinand; Veldhuis, Johannes D.; Helmerhorst, Frans M.; FrÃ¶lich, Marijke; Meinders, A. Edo; Krans, H. Michiel J.; Pijl, Hanno	2002	no outcome of interest
Disorders of the glucose metabolism correlate with the phenotype and the severity in women with polycystic ovary syndrome	van Helden, J.; Evliyaoglu, O.; Kuberl, A.; Weiskirchen, R.	2020	Non energy homeostasis
Glucose-induced inhibition of the appetitive brain response to visual food cues in polycystic ovary syndrome patients	Van Vugt, Dean A.; Krzemien, Alicja; Alsaadi, Hanin; Frank, Tamar C.; Reid, Robert L.	2014	No control group
Effect of Insulin Sensitivity on Corticolimbic Responses to Food Picture in Women with Polycystic Ovary Syndrome: Insulin Sensitivity and Brain Activation	Van Vugt, Dean A.; Krzemien, Alicja; Alsaadi, Hanin; Palerme, Stephanie; Reid, Robert L.	2013	No control group
Metabolic and endocrine effects of long-chain versus essential omega-3 polyunsaturated fatty acids in polycystic ovary syndrome	Vargas, M. Luisa; Almario, Rogelio U.; Buchan, Wendy; Kim, Kyoungmi; Karakas, Sidika E.	2011	No control group
Plasma Complement C1q/tumor necrosis factor-related protein 15 concentration is associated with polycystic ovary syndrome	Vatannejad, A.; Fadaei, R.; Salimi, F.; Fouani, F. Z.; Habibi, B.; Shapourizadeh, S.; Eivazi, S.; Eivazi, S.; Sadeghi, A.; Moradi, N.	2022	Non energy homeostasis

Evaluation of angiopoietin-like protein 3 (ANGPTL3) levels in polycystic ovary syndrome	Vatannejad, A.; Salimi, F.; Moradi, N.; Fouani, F. Z.; Zandieh, Z.; Ansaripour, S.; Sadeghi, A.; Fadaei, R.	2020	Non energy homeostasis
Distinct response of fat and gastrointestinal tissue to glucose in gestational diabetes mellitus and polycystic ovary syndrome	Vejrazkova et al 2017		no outcome of interest
Disruption of the synchronous secretion of leptin, LH, and ovarian androgens in nonobese adolescents with the polycystic ovarian syndrome	Veldhuis, J. D.; Pincus, S. M.; Garcia-Rudaz, M. C.; Ropelato, M. G.; Escobar, M. E.; Barontini, M.	2001	Non energy homeostasis
Obesity and risk of female reproductive conditions: A mendelian randomisation study	Venkatesh, S. S.; Ferreira, T.; Benonisdottir, S.; Rahmioglu, N.; Becker, C. M.; Granne, I.; Zondervan, K. T.; Holmes, M. V.; Lindgren, C. M.; Wittemans, L. B. L.	2021	Abstract
Serum leptin in obese women with polycystic ovary syndrome is correlated with body weight and fat distribution but not with androgen and insulin levels	Vicennati, V.; Gambineri, A.; Calzoni, F.; Casimirri, F.; Macor, C.; Vettor, R.; Pasquali, R.	1998	no outcome of interest
Sam68 mediates leptin signaling and action in human granulosa cells: Possible role in leptin resistance in PCOS	Vilarino-Garcia, T.; Perez-Perez, A.; Santamaria-Lopez, E.; Prados, N.; Fernandez-Sanchez, M.; Sanchez-Margalet, V.	2020	Non energy homeostasis
Subtle metabolic alterations in adolescents with obesity and polycystic ovarian syndrome	Vital-Reyes, V. S.; Lopez-Alarcon, M. G.; Inda-Icaza, P.; Marquez-Maldonado, C.	2017	Non English
Determinants of circulating adiponectin in women with polycystic ovary syndrome	Vrbikova, J.; Dvorakova, K.; Hill, M.; Vcelak, J.; Stanicka, S.; Vankova, M.; Sramkova, D.; Vondra, K.; Bendlova, B.; Starka, L.	2005	Non energy homeostasis
Metabolic and endocrine effects of treatment with peroral or transdermal oestrogens in conjuction with peroral cyproterone acetate in women with polycystic ovary syndrome	Vrbikova, J.; Stanicka, S.; Dvorakova, K.; Hill, M.; Vondra, K.; Bendlova, B.; Starka, L.	2004	Non energy homeostasis
Association between serum adipocyte factor level and insulin resistance in polycystic ovarian syndrome	Wang Q.; Guo T.; Tao Y.; Wang Q.; Song Y.; Huang W.	2011	Non energy homeostasis
The clinical and biochemical characteristics associated with insulin resistance in non-obese young women	Wang, C. C.; Chang, C. J.; Hsu, M. I.	2016	Non energy homeostasis
Impact of metabolic disorders on endometrial receptivity in patients with polycystic ovary syndrome	Wang, C.; Wen, Y. X.; Mai, Q. Y.	2022	Non energy homeostasis
Serum concentrations of fibroblast growth factors 19 and 21 in women with gestational diabetes mellitus: association with insulin resistance, adiponectin, and polycystic ovary syndrome history	Wang, D.; Zhu, W.; Li, J.; An, C.; Wang, Z.	2013	Non energy homeostasis
Correlation between leptin and IFN-gamma involved in granulosa cell apoptosis in PCOS	Wang, J.; Gong, P.; Li, C.; Pan, M.; Ding, Z.; Ge, X.; Zhu, W.; Shi, B.	2020	Non energy homeostasis
Relationship between proinflammatory cytokines and clomiphene resistance in patients with polycystic ovary syndrome	Wang, J.; Teng, F.; Wu, Q.; Wu, Y.; Hu, L.	2021	Non energy homeostasis
No association of the Arg51Gln and Leu72Met polymorphisms of the ghrelin gene and polycystic ovary syndrome	Wang, K.; Wang, L.; Zhao, Y.; Shi, Y.; Wang, L.; Chen, Z. J.	2009	Non energy homeostasis
The expression of sex steroid synthesis and inactivation enzymes in subcutaneous adipose tissue of PCOS patients	Wang, L.; Li, S.; Zhao, A.; Tao, T.; Mao, X.; Zhang, P.; Liu, W.	2012	Non energy homeostasis
Effects of kisspeptin on pathogenesis and energy metabolism in polycystic ovarian syndrome (PCOS)	Wang, T.; Han, S.; Tian, W.; Zhao, M.; Zhang, H.	2019	No outcomes of interest

Variation analysis of Ghrelin gene in Chinese patients with obesity, having polycystic ovarian syndrome	Wang, X.; Qu, F.; Wang, C.; Wang, Y.; Wang, D.; Zhao, M.; Yun, X.; Zheng, Q.; Xu, L.	2020	Non energy homeostasis
High-Fiber Diet or Combined With Acarbose Alleviates Heterogeneous Phenotypes of Polycystic Ovary Syndrome by Regulating Gut Microbiota	Wang, Xuejiao; Xu, Ting; Liu, Rui; Wu, Guojun; Gu, Liping; Zhang, Yahui; Zhang, Feng; Fu, Huaqing; Ling, Yunxia; Wei, Xiaohui; Luo, Yunchen; Shen, Jian; Zhao, Liping; Peng, Yongde; Zhang, Chenhong; Ding, Xiaoying	2022	No control group
Evaluation of Adiponectin, Resistin, IL-6, TNF-alpha in Obese and Non-obese Women with Polycystic Ovary Syndrome	Wang, Y. X.; Zhu, W. J.	2012	Non energy homeostasis
Expression of Serum PSA, Nesfatin-1, and AMH in Patients with Polycystic Ovary Syndrome	Wang, Y.; Ma, X.; Luo, J.; Wang, X.; Han, L.	2021	Non energy homeostasis
Serum adiponectin and resistin levels in patients with polycystic ovarian syndrome and their clinical implications	Wang, Y.; Xie, X.; Zhu, W.	2010	Non energy homeostasis
[Clinical significance and changes of serum visfatin, adiponectin and leptin levels in patients with polycystic ovarian syndrome]	Wang, Y.; Yu, P.	2009	Non English
Elevated ghrelin plasma levels in patients with polycystic ovary syndrome	Wasko, R.; Komarowska, H.; Warenik-Szymankiewicz, A.; Sowinski, J.	2004	Non energy homeostasis
Prevalence of the metabolic syndrome in Asian women with polycystic ovary syndrome: using the International Diabetes Federation criteria	Weerakiet, S.; Bunnag, P.; Phakdeekitcharoen, B.; Wansumrith, S.; Chanprasertyothin, S.; Jultanmas, R.; Thakkinstian, A.	2007	Non energy homeostasis
Can adiponectin predict abnormal glucose tolerance in Thai women with polycystic ovary syndrome?	Weerakiet, S.; Tingthanatikul, Y.; Boonnag, P.; Wansumrith, S.; Rattanasiri, S.; Leelaphiwat, S.	2008	Non energy homeostasis
Women with polycystic ovary syndrome have modified resting metabolic rate relative to fat-free mass	Whigham, L. D.; Schoeller, D.; Lindheim, S. R.; Abbott, D. H.	2011	Abstract
Total and high-molecular weight adiponectin in women with the polycystic ovary syndrome	Wickham, E. P., 3rd; Cheang, K. I.; Clore, J. N.; Baillargeon, J. P.; Nestler, J. E.	2011	Non energy homeostasis
Differences of the association of anti-Mullerian hormone with clinical or biochemical characteristics between women with and without polycystic ovary syndrome	Woo, H. Y.; Kim, K. H.; Rhee, E. J.; Park, H.; Lee, M. K.	2012	Non energy homeostasis
Effects of laparoscopic ovarian drilling on young adult women with polycystic ovarian syndrome	Wu, M. H.; Huang, M. F.; Tsai, S. J.; Pan, H. A.; Cheng, Y. C.; Lin, Y. S.	2004	Non energy homeostasis
Alteration of ghrelin/obestatin ratio in adolescence with polycystic ovarian syndrome	Wu, W.; Fan, X.; Yu, Y.; Wang, Z.; Wang, Y.	2018	Non energy homeostasis
Peritoneal fluid leptin concentration and endocrine hormone in patients with polycystic ovarian syndrome. [Chinese]	Xiao, S. S.; Xue, M.; Deng, X. L.; Wan, Y. J.	2006	Non English
Effect of adiponectin gene polymorphisms on circulating adiponectin and insulin resistance indexes in women with polycystic ovary syndrome	Xita, N.; Georgiou, I.; Chatzikyriakidou, A.; Vounatsou, M.; Papassotiriou, G. P.; Papassotiriou, I.; Tsatsoulis, A.	2005	Non energy homeostasis
The adiponectin-to-leptin ratio in women with polycystic ovary syndrome: relation to insulin resistance and proinflammatory markers	Xita, N.; Papassotiriou, I.; Georgiou, I.; Vounatsou, M.; Margeli, A.; Tsatsoulis, A.	2007	Non energy homeostasis
Association between ghrelin gene variations, body mass index, and waist-to-hip ratio in patients with polycystic ovary syndrome	Xu, L.; Shi, Y.; Gu, J.; Wang, Y.; Wang, L.; You, L.; Qi, X.; Ye, Y.; Chen, Z.	2014	Non energy homeostasis

Untargeted metabolomics analysis of serum and follicular fluid samples from women with polycystic ovary syndrome	Xu, W. L.; Liu, G. Y.; Zhang, N.; Ren, J.; Li, X. Y.; Li, Y. Q.; Chen, Y.; Liu, J. Y.	2020	No outcomes of interest
Adiponectin/(FBGâ€šÃ—â€šFIns) as a predictor of insulin sensitivity and metabolic syndrome in patients with polycystic ovary syndrome	Xu, Xiaohui; Yerui, Lai; Gangyi, Yang; Mengliu, Yang; Ling, Li; Qin, Zhang; Hua, Liu; Hongting, Zheng; Danping, Zhu; Xu, Xiaohui; Lai, Yerui; Yang, Gangyi; Yang, Mengliu; Li, Ling; Zhang, Qin; Liu, Hua; Zheng, Hongting; Zhu, Danping	2016	Non energy homeostasis
Zinc-alpha2-glycoprotein is associated with insulin resistance in humans and is regulated by hyperglycemia, hyperinsulinemia, or liraglutide administration: cross-sectional and interventional studies in normal subjects, insulin-resistant subjects, and subjects with newly diagnosed diabetes	Yang, M.; Liu, R.; Li, S.; Luo, Y.; Zhang, Y.; Zhang, L.; Liu, D.; Wang, Y.; Xiong, Z.; Boden, G.; Chen, S.; Li, L.; Yang, G.	2013	Non energy homeostasis
Are serum chemerin levels different between obese and non-obese polycystic ovary syndrome women?	Yang, S.; Wang, Q.; Huang, W.; Song, Y.; Feng, G.; Zhou, L.; Tan, J.	2015	Non energy homeostasis
[Study on the relationship between serum adiponectin and insulin resistance in women with polycystic ovary syndrome]	Yang, X. F.; Ren, F. R.; Guo, S. P.	2006	Non English
Association between adiponectin receptor 1 gene polymorphism and insulin resistance in Chinese patients with polycystic ovary syndrome	Yang, Z.; Yang, X.; Xu, J.; Sun, Y.; Shi, Y.; Fang, S.	2013	Non energy homeostasis
Serum adiponectin levels in high school girls with polycystic ovary syndrome and hyperandrogenism	Yasar, L.; Ekin, M.; Gedikbasi, A.; Erturk, A. D.; Savan, K.; Ozdemir, A.; Temur, M.	2011	Non energy homeostasis
Quality of life specified for polycystic ovary syndrome and its relationship with nutritional attitude and behavior	Yavarikia, P.; Dousti, S.; Ostadrahimi, A.; Mobasseri, M.; Farshbaf-Khalili, A.	2019	No outcomes of interest
Serum adiponectin level and clinical, metabolic, and hormonal markers in patients with polycystic ovary syndrome	Yildiz, Y.; Ozaksit, G.; Serdar Unlu, B.; Ozgu, E.; Energin, H.; Kaba, M.; Ugur, M.	2014	Non energy homeostasis
Serum retinol-binding protein 4, leptin, and plasma asymmetric dimethylarginine levels in obese and nonobese young women with polycystic ovary syndrome	Yildizhan, R.; Ilhan, G. A.; Yildizhan, B.; Kolusari, A.; Adali, E.; Bugdayci, G.	2011	Non energy homeostasis
Serum resistin and adiponectin levels in women with polycystic ovary syndrome	Yilmaz, M.; Bukan, N.; Demirc, H.; Ozturk, C.; Kan, E.; Ayvaz, G.; Arslan, M.	2009	Non energy homeostasis
Glucose intolerance, insulin resistance and cardiovascular risk factors in first degree relatives of women with polycystic ovary syndrome	Yilmaz, M.; Bukan, N.; Ersoy, R.; Karakoc, A.; Yetkin, I.; Ayvaz, G.; Cakir, N.; Arslan, M.	2005	Wrong population
Expression of leptin long-form receptor mRNA in luteinized granulosa cells of obese women with polycystic ovary syndrome	Yin, J.; Liu, Y.; Lv, L.; Wang, D.; Gong, C.; Xiao, W.; Sheng, H.	2007	Non energy homeostasis
Association of single nucleotide polymorphisms in adiponectin and its receptor genes with polycystic ovary syndrome	Yoshihara, K.; Yahata, T.; Kashima, K.; Mikami, T.; Tanaka, K.	2009	Non energy homeostasis
Effects of electroacupuncture and Chinese kidney-nourishing medicine on polycystic ovary syndrome in obese patients	Yu, L.; Liao, Y.; Wu, H.; Zhao, J.; Wu, L.; Shi, Y.; Fang, J.	2013	Non energy homeostasis
Methylation of leptin promoter in ovarian granulosa cells of polycystic ovary syndrome-metabolic syndrome patients. [Chinese]	Yuan, H.; Niu, Z. H.	2018	Non English
A comparative study between serum leptin and follicular fluid leptin levels in women with polycystic ovary syndrome. [Japanese]	Yuki, H.; Murakami, T.; Watanabe, T.; Yokomizo, R.; Okamura, K.; Yajima, A.	2000	Non English
Metabolic abnormalities in young Egyptian women with polycystic ovary syndrome and their relation to ADIPOQ gene variants and body fat phenotype	Zaki, M.; Kholoussi, S.; Raouf, H. A.; Helwa, I.; Hassan, N.; Youness, E.; Mohamed, N. A.; Kamal,	2015	Non energy homeostasis

	S.; Yousef, W.; Shaker, M.; Ezzat, W.; Elhosary, Y. A.; Saleh, O. M.; El Gammal, M.; El-Bassyouni, H.; Ismail, S.; Bibars, M.; Azmy, O.		
A potential determinant role of adiponectin and receptors for the early embryo development in PCOS patients with obesity hinted by quantitative profiling	Zhang, N.; Hao, C.; Liu, X.; Zhang, S.; Zhang, F.; Zhuang, L.; Zhao, D.	2017	Non energy homeostasis
Association of +45G15G(T/G) and +276(G/T) polymorphisms in the ADIPOQ gene with polycystic ovary syndrome among Han Chinese women	Zhang, N.; Shi, Y. H.; Hao, C. F.; Gu, H. F.; Li, Y.; Zhao, Y. R.; Wang, L. C.; Chen, Z. J.	2008	Non energy homeostasis
[Effect of Qingre Yangyin Recipe on Endocrine and Metabolism of Polycystic Ovary Syndrome Patients]	Zhang, T.	2015	Non English
Family-based analysis of the adiponectin gene polymorphisms and polycystic ovary syndrome. [Chinese]	Zhang, W.; Sun, L.; Guo, J.; Yu, X.; Shi, Y.	2014	Non English
[Case-control based study between polymorphisms in the adiponectin gene and polycystic ovary syndrome]	Zhang, W.; Wu, X.; Ding, M.; Yu, X.; Liu, G.; Shi, Y.	2015	Non English
Family-based analysis of adiponectin gene polymorphisms in Chinese Han polycystic ovary syndrome	Zhang, Wenjuan; Wei, Daimin; Sun, Xianchang; Li, Jing; Yu, Xinyan; Shi, Yuhua; Chen, Zi-Jiang	2014	Non energy homeostasis
Decreased SFRP5 correlated with excessive metabolic inflammation in polycystic ovary syndrome could be reversed by metformin: implication of its role in dysregulated metabolism	Zhang, Y.; Ran, Y.; Kong, L.; Geng, L.; Huang, H.; Zhang, H.; Hu, J.; Qi, H.; Chen, Y.	2021	Non energy homeostasis
[Effects of metformin on gonadotropin-induced ovulation in patients with polycystic ovary syndrome]	Zhao, J. Z.; Ye, B. L.; Lin, J. J.; Lin, W. Q.; Chi, H. H.	2003	Non English
[Effect of rosiglitazone on insulin resistance and hyperandrogenism in polycystic ovary syndrome]	Zheng, Z.; Li, M.; Lin, Y.; Ma, Y.	2002	Non English
Effects of Combined Resveratrol and Myo-inositol on Altered Metabolic, Endocrine Parameters and Perceived Stress in Patients With Polycystic Ovarian Syndrome		2021	Trial register
The effect of metformin and myoinositol in women with polycystic ovary syndrome: role of body mass and adiponectin		2021	Duplicate

5. STUDY CHARACTERISTICS TABLE FOR INCLUDED STUDIES

Author, year	Country	Study design	PCOS criteria	Sample size	Age	BMI	Intervening factor	Description of intervening factor	Outcomes measured	RoB
Energy intake homeostasis										
Arusoglu, 2013	Turkey	Cross Sectional	Rotterdam	p: 18 c: 18 (BMI and age matched)	P = 22.1 (4.2) C = 21.7 (3.4) mean and sd	p = 22.2 (3.3) c = 21.9 (2.3) mean and sd	Meal tolerance test	meal tolerance test (Abbott standard oral enteral solution in 200ml package) as a complete balanced nutrition in a tetrapack 200 mL package. The nutritional energy content was 300 kcal, including 12.5 g protein (16% of energy), 9.84 g fat (29.2% of energy, polyun saturated/ saturated/ monounsaturated proportion fat), and 40.4 g carbohydrate (53.8% of energy).	Ghrelin, PYY, Satiety index	Low
Aydin 2014	Turkey	Cross Sectional	Rotterdam	P: 14 C: 11	P = 21.1 ±2.7 C = 21.1 ±2.0 not stated	P = 21.4 ± 3.0 C = 22.1 ± 2.4 not stated	Meal tolerance test	Oral enteral solution (Ensure plus), 300 kcal, 54% CHO, 30% fat, 16% protein; blood samples 0, 15, 30, 45, 60, 90, 120, 180 mins	GLP-1	Low
Barber 2008	UK	case control	Rotterdam	P: 50 C: 28	P = 29.1 ±5.8 C = 33.2 ±5.4	P = 35.3 ±2.7 C = 34.6 ±2.8	OGTT	OGTT 75g; blood samples 0, 30 mins	Ghrelin	Low

6. FINDINGS

Comparison included:

- **Comparison 1:** PCOS versus controls

Outcomes included:

- **Outcome 1.** Energy intake homeostasis: Appetite stimulating gut hormones
- **Outcome 2.** Energy intake homeostasis: Appetite supressing gut hormones
- **Outcome 3.** Energy intake homeostasis: Subjective hunger
- **Outcome 4.** Energy intake homeostasis: Subjective satiety
- **Outcome 5.** Energy expenditure homeostasis: Meal induced thermogenesis
- **Outcome 6.** Energy expenditure homeostasis: Resting energy expenditure

▪ EVIDENCE SUMMARY:

A total of twenty studies compared energy intake homeostasis in women with and without PCOS. Outcomes examined included appetite stimulating gut hormones, appetite suppressing gut hormones, subjective hunger and subjective satisty post meal or glucose intake. Four studies were judged as being moderate risk of bias (Lin 2015, Ozgen 2017, Rao 2021 and Zwirska-Korczala 2008) while the rest were judged as being low risk of bias.

A total of nine studies examined energy expenditure homeostasis in women with and without PCOS. Outcomes examined included meal induced thermogenesis and resting energy expenditure, the latter of which was the only outcome amenable to meta-analysis (for five of the nine studies).

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Appetite stimulating gut hormones

Adiponectin and ghrelin were compared between women with and without PCOS post oral glucose tolerance test (OGTT) or mixed meal test (MMT). Meta-analysis was not possible due to heterogeneity between the studies and narrative evidence synthesis was conducted.

Two out of two studies which examined post stimulation adiponectin area under the curve (AUC) both reported significantly lower AUC in women with PCOS than controls (Verrazkova 2017 and Zwirska-Korvzala 2008).

Three out of seven studies reported lower ghrelin AUC post MMT in women with PCOS than controls (Arusoglu 2013, Moran 2007b, Zwirska-Korczala 2008). All three studies post OGTT reported lower ghrelin AUC in women with PCOS than controls (Barber 2008, Ozgen 2010, Vejrazkova 2017).

Overall, women with PCOS may have lower increase in appetite stimulating gut hormones (adiponectin and ghrelin) after meal or glucose intake than women without PCOS; however the evidence is of very low certainty due to the observational nature of the studies, as well a inconsistency and imprecision.

Appetite supressing gut hormones

GLP-1, PYY and amylin were compared between women with and without PCOS post oral glucose tolerance test (OGTT) or mixed meal test (MMT). Meta-analysis was not possible due to heterogeneity between the studies and narrative evidence synthesis was conducted.

Nine studies examined post OGTT or MMT GLP-1 AUC in women with and without PCOS. Three studies reported GLP-1 AUC was lower in women with than without PCOS (Aydin 2014, 2014, Vejrazkova 2017, Vrbikova 2008), one study reported GLP-1 AUC was higher in women with than without PCOS (Lin 2015) while the rest did not show any significant difference.

Four studies examined post OGTT or MTT PYY AUC in women with and without PCOS. Only one study reported that PYY AUC was lower in women with than without PCOS (Zwirska-Korczala 2008), the rest did not show any significant difference.

Only one study examined post OGTT or MMT amylin AUC in women with and without PCOS and it reported higher AUC in women with than without PCOS (James 2010).

Overall, results of studies comparing appetite supressing gut hormones (GLP-1, PYY and amylin) after meal or glucose intake in women with and without PCOS are conflicting, with very low certainty evidence supporting no difference between the groups.

Subjective hunger

One study examined subjective hunger post MMT in women with and without PCOS and found that women with PCOS had more hunger than women without PCOS. Overall quality for this evidence is very low due to being only one study and low sample size.

Subjective satiety

Four studies examined subjective satiety post MMT in women with and without PCOS and only one study reported that women with PCOS had lower satiety than women without PCOS (Moran 2004). The other three did not find any significant difference (Arusoglu 2013, Ozgen 2017, Moran 2007b). Overall, evidence suggest that women with and without PCOS do not have any difference in subjective satiety post meal intake. Certainty of evidence for this finding is very low due to conflicting results.

Meal induced thermogenesis (MIT)

Two studies examined MIT in women with and without PCOS (Robinson 1992, Segal 1990) and their results were conflicting. It is unclear if meal induced thermogenesis differs between women with and without PCOS.

Resting energy expenditure (REE)

Nine studies examined REE in women with and without PCOS, of which five were suitable for meta-analysis. The remaining studies either did not report results for REE, or they reported outcomes in median (IQR) or using inconsistent units. In meta-analysis, there was no difference in REE between women with PCOS and controls (WMD=-38.61 [95%CI= -301.48, 224.26]; p=0.8). Certainty in the evidence was very low due to high and statistically significant heterogeneity (I^2= 98%, p<0.0001), inconsistent direction of effect and variable effect sizes, and imprecision evidences by the wide CI. The observational nature of the data precludes causality and we cannot rule out residual confounding, further downgrading certainty in the evidence.

Question 3.5.

Why are women with PCOS at increased risk of weight gain?

BACKGROUND:

Increased risk of weight gain in women with PCOS

In initial surveys conducted with women with PCOS for prioritising clinical questions for the 2023 PCOS guideline update, when asking which PCOS symptoms concerned them the most, 27% of responders ranked difficulty losing weight as the #1 symptom of concern and 16% ranked it as the second. When asking women to rank the top 5 areas they would like more research to focus on, 21% ranked difficulty losing weight as the top priority and 12% ranked it as the second.

Insulin resistance is a key aetiological feature of PCOS, which occurs in the majority of women in a form mechanistically distinct from obesity-associated insulin resistance [1]. Obesity then further worsens insulin resistance and exacerbates clinical features of PCOS [2]. Given the strong relationships between insulin resistance, obesity and PCOS, weight management through lifestyle interventions is the primary treatment strategy for PCOS, according to international evidence-based guidelines, and improves the presentation [3]. Of note, bidirectional relationship is hypothesised between PCOS and weight such that PCOS may result in greater weight gain which in turn increases the prevalence and severity of PCOS [4].

Excess weight is a common feature of PCOS and over half of women with PCOS are either overweight or obese [5]. This means women with PCOS commonly experience the additional burden of obesity-associated insulin resistance. In a comprehensive systematic review and meta-analysis of the prevalence of overweight, obesity and central obesity in women with and without PCOS in clinic-based women [6], women with PCOS had a significantly increased risk for adiposity when compared with controls with pooled estimated prevalence of overweight, obesity and central in PCOS being 61% (95% CI: 54–68%), 49% (95% CI: 42–55%) and 54% (95% CI: 43– 62%) respectively. The risk of overweight, obesity and central obesity were relative risk (RR) 1.95 (95% CI: 1.52-2.50), 2.77 (1.88, 4.10) and 1.73 (95% CI 1.31, 2.30) respectively. This increased risk was independent of the PCOS diagnostic criteria (NIH *versus*. Rotterdam), age and geographic region of the affected subjects. Caucasian women with PCOS had a greater prevalence of obesity than Asian women with PCOS, whether using the same criteria for overweight and obesity or ethnic specific criteria. The temporal trends of the prevalence of obesity among women with PCOS show an increase from 51% in the 90s to 74% in the following decades [5]. Weight gain is also a common presenting complaint of PCOS. The long-term weight gain over 10 years among women with PCOS is significantly greater than unaffected women in longitudinal community-based studies (mean difference 2.6kg 95% CI 1.2-4.0) [7] as is central obesity with a progressive increase in waist hip ratio between 20-25 years and 40-45 years [8]. This is consistent with reports from a prospective birth cohort of increased weight gain in early adulthood in women with symptoms of or a diagnosis of PCOS compared with controls [9]. Furthermore, a community-based longitudinal cohort study reported adverse lifestyle factors (higher energy intake, glycaemic index and sitting time and lower physical activity) had a greater impact on weight gain in women with PCOS compared to those without PCOS [10].

In keeping with this evidence, the 2018 International evidence-based guidelines for the assessment and management of polycystic ovary syndrome [11], the clinical consensus recommendations stated that ‘Health professionals and women should be aware that women with PCOS have a higher prevalence of weight gain and obesity, presenting significant concerns for women, impacting on health and emotional wellbeing, with a clear need for prevention’ and that ‘All those with PCOS should be offered regular monitoring for weight changes and excess weight.’ Following on from the 2018 guidelines, İnitial surveys were conducted with women with PCOS for prioritising clinical questions for the 2022 PCOS guideline update. When asking which PCOS symptoms concerned them the most, 27% of responders ranked difficulty losing weight as the #1 symptom of concern and 16% ranked it as the second. When asking women to rank the top 5 areas they would like more research to focus on, 21% ranked difficulty losing weight as the top priority and 12% ranked it as the second. As such, the focus of the clinical question in these guidelines was to examine why women with PCOS may have challenges with weight management.

Extrinsic factors potentially contributing to increased risk of weight gain in women with PCOS

Suboptimal diet and physical activity are modifiable environmental factors (extrinsic factors) that contribute to weight gain. Poorer dietary intake (including excess energy intake or poor diet quality including reduced core food group and increased discretionary food intake) and reduced physical activity have been proposed to contribute to increased weight in PCOS. However, this evidence is currently conflicting with worsened lifestyle behaviours [12-16], improved lifestyle behaviours [17] or no differences in lifestyle behaviours groups [18-21] reported between women with and without PCOS. It is crucial to understand differences in lifestyle behaviours (extrinsic factors) in women with and without PCOS that could be related to the observed increased weight gain and higher obesity prevalence in PCOS and therefore be targeted for lifestyle interventions to optimise weight management.

Intrinsic factors potentially contributing to increased risk of weight gain in women with PCOS

In addition to potential differences in extrinsic factors, potential mechanisms for excess weight gain in PCOS may be related to underlying hormonal abnormalities including insulin resistance and hyperandrogenism or specific barriers which are intrinsic to maintaining healthy weight, such as appetite dysregulation [22], altered metabolic rate [23], or postprandial thermogenesis [24]. However, the research to date is limited and inconsistent. It is crucial to understand the pathophysiological mechanisms that may be altered in PCOS and associated with impaired weight management to aid understanding and guiding of realistic weight management goals and to aid investigation of future pharmacological targets.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
○ Intrinsic factors in women with PCOS versus controls	⊕◯◯◯ VERY LOW
○ Extrinsic factors in women with PCOS versus controls	⊕◯◯◯ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Women (any age) with PCOS versus women (any age) without PCOS

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Health professionals and women with PCOS could consider that there is no clear evidence of physiological or behavioural lifestyle differences, related to weight, in women with PCOS compared to women without PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

Whilst the specific mechanisms are unclear, it is recognised that many women with PCOS will have underlying mechanisms that drive greater longitudinal weight gain and higher BMI whichmay:

- Underpin greater challenges with weight management.
- Highlight the importance of lifelong healthy lifestyle strategies and prevention of excess weight gain.
- Assist women with PCOS and health professionals in forming realistic, tailored lifestyle goals.

GRADE CONSIDERATIONS

Justifications:

There is very low-quality evidence that women with PCOS may have some differences in lifestyle behaviours (higher total dietary fat intake and lower physical activity on self-report) and have may have some differences in appetite related hormones after a MMTT. There is no evidence of certainty for other outcomes including energy intake (on pooled analysis), other macronutrients (carbohydrate, protein), glycaemic index, glycaemic load, subjective hunger or satiety, meal induced thermogenesis or resting energy expenditure.

Most outcomes are self-reported and prone to recall bias and misreporting.

It is acknowledged that women with PCOS have higher rates of weight gain and obesity. A community-based longitudinal cohort study reported adverse lifestyle factors (higher energy intake, glycaemic index and sitting time and lower physical activity) had a greater impact on weight gain in women with PCOS compared to those without PCOS [10]; however, more research is needed.

Subgroup considerations: Evidence assessing differences across methodologies, age, BMI range, reproductive life stage and pathophysiological subgroups (eg hyperandrogenism or insulin resistance) is warranted in future research.
Implementation considerations: A focus on weight gain prevention will be important in implementation.
Monitoring and evaluation considerations: Audit of clinical practice and longitudinal population-based cohort studies
Research priorities: Examine more precise quantification of diet, physical activity, appetite hormone regulation, appetite, insulin and energy expenditure in women with and without PCOS and examine relationships with weight and weight change across the BMI spectrum. Specifically: Primary longitudinal studies assessing physiological, behavioural and psychosocial predictors of weight gain in PCOS, from early life and across different ethnic groups. Primary studies assessing food or nutrient intake on adipokines, gastrointestinal appetite hormones, functional MRI, meal induced thermogenesis, metabolic flexibility and neuropeptide responses in women with PCOS to better capture the accurate relationship with energy homeostasis. Primary studies characterising the total energy expenditure of women with PCOS using doubly labelled water, dietary intake using objective measures and physical activity using accelerometry.

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

May reduce personal blame women with PCOS feel if experiencing challenges with weight management and improve understanding of health professionals of these potential challenges

Allow provision of additional support for women for weight management and potential improved weight management.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

There are no identified undesirable options related to favouring the option.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Very low evidence for all outcomes

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

A weight inclusive approach identifies lifestyle change rather than weight change as a primary treatment priority. For women and health professionals following this approach, these intrinsic and extrinsic outcomes would still likely be of importance as they relate to how women can achieve changes in lifestyle behaviour.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

There are no identified undesirable options related to favouring the option.

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☒ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Clinical requirements for longer consultation times or increased referrals to allied health would confer additional time and resource requirements and costs. In some settings there may be subsidised costs for this and referral to community-based lifestyle management programs may be possible.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

● EQUITY

What would be the impact on health equity?

Judgement:

☒ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

Dietary intake and physical activity can be different in women based on their socio-economic status. Access to appropriate health care services with sufficient time for assessment and consideration of barriers to weight management may vary depending on locality and women's socio-economic status.

Considering social determinants of health including support to maintain affordable healthy diet and exercise to assist weight management may have the potential for increased benefit to groups that experience increased socioeconomic disadvantage or discrimination.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

In initial surveys conducted with women with PCOS for prioritising clinical questions for the 2022 PCOS guideline update, when asking which PCOS symptoms concerned them the most, 27% of responders ranked difficulty losing weight as the #1 symptom of concern and 16% ranked it as the second. When asking women to rank the top 5 areas they would like more research to focus on, 21% ranked difficulty losing weight as the top priority and 12% ranked it as the second.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Improving consultation times or referral to allied health professionals or community-based lifestyle management could be implemented in some settings. The cost and resource implications of this are acknowledged. It may also be important to address psychosocial issues that enable behaviour change.

5. STUDY CHARACTERISTICS TABLE

Author, year, country	Population/ Setting, Recruitment Techniques	Study Type	Age Range	Sample Age	Source of Weight Stigma	Summary of findings
Amiri et al., (2014), Iran	Clinical: women with PCOS attending the reproductive Endocrinology Research Centre	Qualitative (semi structured interviews)	18-40	18-24: 8 (34.8%) 25-34: 13 56.5%) 35-40: 2 (8.7%)	Unclear: could be a stranger, a healthcare administrator, or a doctor	A 25-year old participant reports an experience of weight stigma: *"… Last time I visited my doctor, a woman asked me, 'are you single?' After I answered, 'yes' she said, 'a single girl shouldn't have such a big belly', and I got so embarrassed. Although I put on the veil, she could see my big belly."*
Chopra et al., (2021), USA	Community: snowballing and purposive sampling using word of mouth and FB/listerv)	Qualitative (semi structured interviews)	22-55	Frequencies reported: 22 | 2 23 | 4 24 | 2 25 | 1 ... 55 | 1	Family Self (internalised societal ideals)	A participant describes experiences of weight stigma from family members: *"My family doesn't support me at all. I'm tired of receiving comments about how fat and hairy (which forces me to shave!) I am. I did not ask to have PCOS!... I just want to feel self-confident again but hearing their horrible comments doesn't let me feel so... Every time I try doing a diet, they say that I will give up."* A Reddit poster describes internalised weight stigma: *"I still find myself as unattractive, unworthy, not confident, and have serious body image issues. Some nights, I get anxious, feeling that I'm never going to lose weight and will remain fat forever. I'm TIRED of feeling like this, I'm TIRED"*
Ismayilova and Yaya (2022), Canada	Community: FB, Reddit, online forums, posts from PCOS Awareness Association	Qualitative (semi structured interviews)	18-63	Age rage: no (%) 18–24 | 5 (20) 25–30 | 10 (40) 31–36 | 4 (16) 37–40 | 2 (8) 41–50 | 2 (8) 51–66 | 1 (4)	Doctor Doctor Doctor	Zara, a 24-year old participant, describes her doctor assuming she was sedentary b/c of her weight: *"Totally negative. Kind of like without necessarily asking. Like I walk an hour and a half twice a day, every day. I'm not sedentary. But you just assuming is just very frustrating, especially when you're told that it's very hard for you to lose weight when you have PCOS. It's just like, oh my god, you need to talk about this better."* Lucy, a 47 year old participant, recalls an instance of perceived/experienced weight stigma: *"They just said 'Lose weight', which is really useless. You don't need to tell people to lose weight. None of my doctors have ever offered valuable advice. Not only with PCOS but with lifestyle or nutrition or anything, ever."* 11 of 25 (44%) of participants were told to lose weight by their doctors.

Jones et al. (2021), England	Clinical: out-patient gynaecology clinics by clinician	Qualitative (semi structured interviews)	17-21	20.1 (NR)	Self-Perceived judgement from general public	Reports of internalised weight stigma: "Participants reported feeling “upset,” “worried,” “horrible,” “depressed,” “unattractive,” and “not very feminine” because of their weight and/or body shape." Reports of anticipating weight-based stigma, summarised by the authors: Many felt self-conscious and lacked self-confidence, feelings that were enhanced in certain social situations due to the fear of being judged, such as shopping for clothes, going to pubs or nightclubs, lying on the beach, or swimming. (Unspecific participant): "*My friend asked me if I wanted to go swimming a couple of weeks ago, and I didn’t even let her finish the sentence. I just said no. I won’t let anybody see me in my swimming costume, well practically naked. I just don’t like it. If I don’t like it then nobody else is going to like it".*
Moran et al., (2021), Australia	Allied HCPs (dietetics, exercise physiology, psychology) / Purposive sampling via professional association newsletters and snowballing	Qualitative (semi structured interviews)	NR	Years of practice: <5 y | 5 5-10 y | 3 11-15 y | 3 16-20 y | 3 > 20 y | 1	HCPs	Psychologist talks about experiences of patients in the healthcare system with other health professionals that have a very weight-centric approach: *". . . many have experienced weight stigma associated with being overweight. Unfortunately that often comes from medical professionals. (participant 12, psychologist)*" Weight stigma identified by the authors as a barrier to care
Tomlinson et al., (2017), England	Clinical: various health settings in those with PCOS concerns By research nurse through various clinics	Qualitative (focus groups of 2-6 ps)	18-45	NR (NR)	Doctor Doctor	Participants report experienced/perceived weight stigma, as well as refusal of treatment, from doctors: *"I worked on a building site… a very active job … but all my weight it’s always around my middle. I just couldn’t lose it and he just basically told me I was fat so I just got up walked out. (Gemma)"* and *"My symptoms were never really taken seriously by my GP or I felt by the hospital… …I was more or less told that you're chubby, you're overweight, there's nothing we can do, we're not giving you any fertility treatment because you're overweight, that would be a danger to a baby, um and ‘bye bye’ and I was quite traumatised by that. (Jess)".*
Williams et al., (2016), UK	Community: online via PCOS charity website, Verity	Qualitative (daily diary)	20-45	NR (NR)	Self	A participant reports internalisation of weight stigma - not feeling feminine/like a woman because of her weight: *"makes me feel im not a woman… [carrying] fat around the middle like a man’s beer belly even though I go gym or swimming every week (Linda, 45)".*

6. SUMMARY OF FINDINGS AND GRADE ASSESSMENTS/ EVIDENCE PROFILE

▪ EVIDENCE SUMMARY

We systematically reviewed all published studies that assessed the burden of weight stigma in women with PCOS. We also reviewed studies that assessed healthcare professionals and weight stigma.

Seven studies met our inclusion criteria; all were qualitative. Three major sources of stigma were identified: healthcare professionals/doctors, family members, and societal. There were *five* central findings – women with PCOS reported: (1) experiencing weight stigma from doctors, (2) experiencing weight stigma from family members, (3) internalising weight stigma from a variety of societal sources, and (4) anticipating weight stigma from the general public. Finally, both women with PCOS *and* healthcare professionals report weight stigma in healthcare contexts from various sources.

Because all studies were qualitative, we used the GRADE CERQual (Lewin et al., 2015, 2018) to assess the quality of studies in this systematic review. This assessment estimated that we can have a high degree of confidence from findings 1 and 4, and moderate confidence in findings 2, 3, and 5.

▪ META-ANAYLSIS/DESCRIPTIVE SUMMARY ANALYSIS

Our review is limited in that there were few existing studies that report instances of weight stigma, and thus, these findings were descriptive and preliminary for this cohort (i.e., women with PCOS). However, the findings are consistent with those in other cohorts (e.g., community, clinical, and student; Emmer et al., 2020) – that is, weight stigma is (a) pervasive, (b) detrimental to mental health, (c) profoundly affected by societal attitudes toward weight, and (d) perpetrated in everyday settings – by family members in the home and doctors in healthcare settings.

Table 6.1. Table of Findings

Synthesis of Review Finding	Quality assessment					
	Methodological Limitations	**Coherence**	**Adequacy**	**Relevance**	**GRADE-CERQual Assessment of Confidence**	**Papers Supporting Finding**
Finding 1 Women with PCOS report experiences of weight stigma from doctors	no/very minor concerns	no/very minor concerns	no/very minor concerns	no/very minor concerns	⊕⊕⊕⊕ High confidence	Ismayilova and Yaya (2022) Tomlinson et al. (2017)
Finding 2 HCPs and women with PCOS report weight stigma in healthcare settings, from several sources	no/very minor concerns	no/very minor concerns	minor concerns	no/very minor concerns	⊕⊕⊕◯ Moderate confidence	Amiri et al. (2014) Moran et al. (2021)
Finding 3 Women with PCOS report experiences of weight stigma from family members	no/very minor concerns	no/very minor concerns	minor concerns	no/very minor concerns	⊕⊕⊕◯ Moderate confidence	Chopra et al. (2021)
Finding 4 Women with PCOS report internalisation of weight stigma (variety of societal sources)	no/very minor concerns	no/very minor concerns	no/very minor concerns	no/very minor concerns	⊕⊕⊕⊕ High confidence	Chopra et al. (2021) Jones et al. (2021) Williams et al. (2016)
Finding 5 Women with PCOS report anticipating weight stigma and changing their behaviour based on perceived, expected judgement	no/very minor concerns	no/very minor concerns	minor concerns	no/very minor concerns	⊕⊕⊕◯ Moderate confidence	Jones et al. (2021)

APPENDIX. QUALITY APPRAISAL TEMPLATES

Study ID	*Amiri et al. (2014)*	
Study Citation	*Amiri, F. N., Tehrani, F. R., Simbar, M., Montazeri, A., & Thamtan, R. A. M. (2014). The experience of women affected by polycystic ovary syndrome: a qualitative study from Iran. International journal of endocrinology and metabolism, 12(2). https://doi.org/10.5812/ijem.13612*	
Study Country	*Iran*	
CHARACTERISTICS AND EXTERNAL VALIDITY – IS THIS STUDY AND ITS RESULTS GENERALIZABLE TO MY SYSTEMATIC REVIEW QUESTION?		
Patient/population/ participants	*25 individuals diagnosed with PCOS according to Rotterdam criteria*	
Control population	*NA*	
PCOS diagnostic criteria	*Rotterdam – 2003*	
N per group	*No subgroups*	
Setting	*Clinical – women attending RERC clinic*	
Outcomes (primary and other) with definition/tool (eg. self-reported, fasting etc.)	*Self-reported weight stigma*	
Does the study have a clearly focused question and/or PICO?	Yes Partial No Not reported	*Yes - "explore the experiences of QoL in Iranian women with PCOS."*
Inclusion criteria	Yes Partial No Not reported	*Yes, "18-40 years of age, met the Rotterdam criteria for diagnosis of PCOS (i.e., 2003), and [consented] to participate and share their experiences"*
Exclusion criteria	Yes Partial No Not reported	*Yes, coexisting illness, inability to read and speak Farsi, and having conditions similar to PCOS at presentation such as congenital adrenal hyperplasia.*
If there were specified inclusion/ exclusion criteria, were these appropriate?	Yes Partial No Not reported	*Yes*
Is a cross sectional or case-control study the appropriate design to answer this question?	Yes Partial No Not reported	*Yes, qualitative (cross-sectional) studies are appropriate as preliminary investigations to understand the burden of weight stigma in women with PCOS*
Was there sufficient duration of follow-up for outcomes to occur?	Yes Partial No Not reported	*Not relevant*
Was matching performed?	Yes Partial No	*Not relevant*

		Not reported	
Summary Result/s		*Experience of weight stigma reported by 1 participant. Source of weight stigma were unclear based on quote (see Study Characteristics Table).*	
INTERNAL VALIDITY – HAS THIS STUDY BEEN CONDUCTED RIGOROUSLY IN ORDER TO REDUCE BIAS?			
SELECTION BIAS	Were the cases and controls taken from comparable populations?	Yes Partial No Not reported	*Not relevant*
	Was the case definition adequate and established in a standard, valid and reliable way?	Yes Partial No Not reported	*Not relevant*
	Was the control status established in a standard, valid and reliable way?	Yes Partial No Not reported	*Not relevant*
PERFORMANCE BIAS	Aside from the exposure/ intervention, were the groups treated the same?	Yes Partial No Not reported	*Not relevant*
DEDETECTION BIAS	Were measurements (for exposures or outcomes) carried out and calculated in a standard, valid and reliable way?	Yes Partial No Not reported	*Not relevant*
	Were outcome assessors blind to case and control status?	Yes Partial No Not reported	*Not relevant*
	Were all outcomes measured in a standard, valid and reliable way?	Yes Partial No Not reported	*Not relevant*
	Were outcomes assessed objectively and independently?	Yes Partial No Not reported	*Yes, interviews transcribed verbatim*
ATTRITION BIAS	What percentage of the individuals recruited into each arm of the study were lost to follow up?	X% treatment X% control/ comparison Not reported	*Not relevant to cross-sectional study*
	What percentage of the individuals were not included in the analysis?	X% treatment X% control/ comparison Not reported	*Not applicable*

REPORT BIAS	Is the paper free of selective outcome reporting?	Yes Partial No Not reported	*Not applicable*
CONFOUNDING	Are the cohorts comparable on the basis of design or analysis?	Yes Partial No Not reported	*Not relevant*
OTHER BIAS	Were there any conflicts of interest in the writing or funding of this study?	Yes Partial No Not reported	*No*
	Was the study sufficiently powered to detect any differences between the groups?	Yes Partial No Not reported	*Not relevant*
	If statistical analysis was undertaken, was this appropriate?	Yes Partial No Not reported	*Not relevant*
COMMENTS			
What is the overall risk of bias?		Low Moderate High Insufficient information	*Insufficient information*
Did risk of bias differ by outcome *(eg. primary outcome was low risk but rest were high)?*		*No*

Question 3.6.

What is the burden of weight stigma in PCOS?

BACKGROUND:

Weight stigma is the social devaluation of individuals because of their weight (1). Weight stigma is the combination of negative attitudes, stereotypes, and prejudice about high body weight. Weight stigma can be studied from the perspective of the perpetrator or the target. Research presented here will focus on the target's perspective and their weight stigma experiences/perceptions (e.g., being called names or being stared at in public), anticipation (e.g., expecting poor treatment at the doctors), and internalisation (i.e., applying negative stereotypes about weight to the self – e.g., believing you are not worthy of a job or love because of your weight). Weight stigma is particularly pervasive, in part because it is arguably the last form of acceptable stigma (2). Charlesworth and Banaji (3) found implicit weight-related attitudes are negative and have been worsening over time, a trend that runs contrary to other stigmatised groups (e.g., based on race or sexual orientation, which are trending to neutrality).

Weight stigma is common in many settings, including healthcare, the workplace, in education, and in the home (4). A systematic review on studies that estimated the prevalence of weight stigma found that between 19-41% of individuals with higher weight have experienced blatant weight discrimination, and that women more commonly experience this than men. Across the weight spectrum in a U.S. sample, weight-related mistreatment has been reported by ~40% of adults (5). Perpetration of weight stigma is common in healthcare professionals (and students), including those in nursing, clinical psychology, dietetics, and even those who specialise in obesity (1). Data collected by Puhl et al. (6) from a weight management program from the US, the UK, Australia, Canada, France, and Germany (*n* = 13,996) shows, of those participants who reported a history of weight stigma (over half the participants of all samples), 67% had experienced weight stigma from doctors. Similar results for healthcare professionals (i.e., doctors, nurses, healthcare providers) have been found in other, smaller studies (*n* = 85; 71% experienced weight stigma at least once in the last year; (7).

We systematically reviewed all published studies that assessed the burden of weight stigma in women with PCOS. We also reviewed studies that assessed healthcare professionals and weight stigma. Seven studies met our inclusion criteria; all were qualitative. Three major sources of stigma were identified: healthcare professionals/doctors, family members, and societal. There were four central findings – women with PCOS reported: (1) experiencing weight stigma from doctors, (2) experiencing weight stigma from family members, (3) internalising weight stigma from a variety of societal sources, and (4) anticipating weight stigma from the general public. Finally, both women with PCOS *and* healthcare professionals report weight stigma in healthcare contexts from various sources (see Table for a full list of findings). Our review is limited in that there were few existing studies that report instances of weight stigma, and thus, these findings were descriptive and preliminary for this cohort (i.e., women with PCOS). However, the findings are consistent with those in other cohorts (e.g., community, clinical, and student; (8)) – that is, weight stigma is (a) pervasive, (b) detrimental to mental health, (c) profoundly affected by societal attitudes toward weight, and (d) perpetrated in everyday settings – by family members in the home and health and medical professionals in healthcare settings.

Weight stigma is associated with negative biopsychosocial outcomes, including poorer health behaviours. Specifically, weight stigma is associated with exercise avoidance in undergraduate women (controlling for BMI; (9)), and experimental evidence shows that those exposed to weight stigmatising material had greater food consumption in higher weight individuals (compared to controls; (10). Further, weight stigma is associated with many of the negative biopsychosocial

outcomes associated with higher weight. Longitudinal evidence from the U.K. (*n* = 3,609) found that, from baseline to a 4-year follow up, weight stigma accounted for 27% of the prospective association between BMI and physiological dysregulation (i.e., biomarkers of health, e.g., inflammation, cardiovascular health, lipid/metabolic regulation; (11)). In other words, weight stigma explained nearly a quarter of the relationship between weight and physiological health. Experienced/perceived weight stigma is also moderately and significantly (*r* = -0.33; *k* = 241) associated with adverse mental health correlates (e.g., depression, anxiety, disordered eating, body image disturbance; (8)). There are proposed mechanisms that may explain the relationship between experienced weight stigma and adverse psychosocial correlates, such as the extent to which individuals *internalise* weight stigma (12, 13). A recent systematic review found that internalised weight stigma mediated the relationship between experienced/perceived weight stigma and biopsychosocial correlates, such as disordered eating, body shame, and exercise behaviour (14).

Whilst, it is acknowledged that weight is a risk factor for developing PCOS and exacerbates the features of PCOS, it is also important to recognise that higher weight is not a personal choice nor under the primary control of the individual. Indeed, weight stigma is thought to be perpetuated by the belief that body weight is controllable – that weight is a sum of poor choices (i.e., insufficient exercise and poor diet) and that sustainable weight loss can be achieved via behaviour change. Research has shown that the belief that weight is controllable is associated with negative attitudes toward individuals with higher weight (15). The popular narrative that weight is under personal control is not supported by research. Rubino et al. (4) summarised this body of evidence and provides a joint international consensus from a multidisciplinary research team. The review indicates that there are multiple factors outside an individual's control that affect weight, such as genetics, basal metabolic rate, and gut microbiota. It was also noted that diet and exercise account for a much smaller proportion of body weight compared to genetics, metabolic rate, and the food environment (4), and thus body weight is largely outside the individual's control. The consensus recommends healthcare professionals evaluate their role in the perpetuation of weight stigma.

In women with a significantly higher weight, where lifestyle intervention has failed, or is inappropriate (e.g. eating disorders), relying on lifestyle modification alone for sustainable weight loss is likely to be ineffective, and may induce weight stigma.

Hence, weight-neutral/weight-inclusive care has been proposed as an alternative to traditional weight-centric/weight-normative care. This approach promotes acceptance of and respect for body size diversity and improvement of health behaviours and health outcomes for people of all sizes, without promoting intentional weight loss. There is some evidence that engaging in health-promoting behaviours (i.e., sufficient fruit and vegetable intake, not smoking, regular exercise, and minimal to moderate alcohol consumption) are better predictors of morbidity and mortality than weight alone in the general population, and that improving health behaviours results in improved health outcomes even without weight loss (16, 17 18, 19, 20). A systematic review on the effectiveness of Health at Every Size (HAES) approaches, one example of weight-neutral/weight-inclusive care, on health-related outcomes (*n* = 14) found that compared to controls, those in HAES interventions had significantly improved physical activity and overall well-being, and reduced symptoms of disordered eating. Some studies showed improvements in body image and cardiovascular health, though some did not (21). Weight-neutral/weight-inclusive care targeting health behaviours and outcomes, rather than weight loss, is less likely to result in weight stigma.

Health care practices consistent with weight-neutral/weight-inclusive care include:

- Being aware of language in verbal and written communication. The terms “overweight” and “obese/obesity” are generally considered stigmatising and suggested alternatives include “higher body weight” and “person in a larger body”.
- Ensuring appropriate equipment (e.g., gown, blood pressure cuffs, needles, tables etc) are available for women of all sizes.
- Outlining weight-centric/weight-normative care and weight-neutral/weight-inclusive care including the short- and long-term outcomes of each, and providing the option of weight-neutral/weight-inclusive care for all women.
- Conducting comprehensive measures of biopsychosocial health for all women, rather than relying on weight/BMI as an indicator of health.
- If it is necessary to weigh a woman, the health professional should explain how weight information will be used to inform treatment decisions and how not knowing weight will impact on care. The health professional should then request the woman’s informed consent to weigh them and ask how this can be done in a way to minimise any discomfort.
- Not using weight/BMI to determine eligibility for care and/or requiring weight loss to be eligible for care. Offering all women best-practice assessment, treatment and support regardless of weight, unless there are treatments that have been found to be superior for women with higher weights.

Health professionals are encouraged to review the Rudd Centre Preventing Weight Bias: Helping Without Harming in Clinical Practice Toolkit http://biastoolkit.uconnruddcenter.org/index.html. The toolkit is designed to help clinicians improve delivery of care for patients.

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

N/A

EVIDENCE-BASED RECOMMENDATION(S)

EBR: Many women with PCOS experience weight stigma in healthcare and other settings and the negative biopsychosocial impacts of this should be recognised.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **CR:** Health professionals should be aware of their weight biases and the impact this has on their professional practice and on women with PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

- **CR:** Health policy makers, managers and educators should promote awareness of weight stigma and invest in weight stigma education and minimisation strategies.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☐ Conditional (weak) recommendation for the option	☒ Strong recommendation for the option

PRACTICE POINT(S)

- Health professionals should be aware of weight-inclusive practices which promote acceptance of and respect for body size diversity and focus on improvement of health behaviours and health outcomes for people of all sizes In PCOS this includes:
    - Acknowledging that whilst higher weight is a risk factor for PCOS and its complications, it is only one indicator of health and broader factors should be assessed.Asking permission to discuss and measure weight and using strategies to minimise discomfort (e.g. blind weighing). Recognising that the terms “overweight” and “obese/obesity” can be stigmatising with suggested alternatives including “higher weight”..
    - If weighing, explaining how weight information will be used to inform risks, prevention and treatment and how not knowing may impact on recommendations.
    - Ensuring appropriate equipment are available for women of all sizes.
    - Offering options of weight-centric care (promoting intentional weight loss) or weight-inclusive care (promoting healthy lifestyle change without intentional weight loss) tailored to women’s goals and preferences.
    - Offering all women best-practice assessment, treatment and support regardless of weight, acknowledging that weight may be a non-modifiable risk factor when using lifestyle modification alone.
- Increasing awareness of weight stigma among family members of women and adolescents with PCOS should be considered.

GRADE CONSIDERATIONS

Justifications:
Available evidence indicates that women with PCOS experience

- weight stigma from health professionals and family members
- internalise weight stigma
- anticipate weight stigma

Weight stigma is associated with negative biopsychosocial outcomes, including poorer health behaviours (e.g., exercise avoidance, higher food consumption). Further, weight stigma is independently associated with many of the negative biopsychosocial outcomes associated with higher weight. Weight-neutral/weight-inclusive care targeting health behaviours and outcomes, rather than weight loss, and providing best-practice care regardless of weight, is less likely to result in weight stigma.

Subgroup considerations:
Most studies are conducted in Caucasian population.
The following subgroups needs to be considered (but are not considered in existing research)

- Cultural and ethnic subgroups
- Subgroups across the lifespan – including adolescents (only considered in one study), pre-pregnancy, pregnancy, post-partum, menopause

Implementation considerations:
Weight stigma is pervasive and entrenched. Weight-centric/weight-normative care is the norm in most health services. Many health professionals are unaware of their own weight-stigmatising beliefs and behaviours. Even health professionals who are aware of weight stigma and its impacts can find it difficult to provide weight-neutral/weight-inclusive care.

Monitoring and evaluation considerations:
Ongoing monitoring of weight bias by health professionals and experienced by women with PCOS.
Healthcare environment evaluation by using validated tools, for example: Rudd Centre Preventing Weight Bias: Helping Without Harming in Clinical Practice Toolkit Checklist for Assessing Office Environments
http://biastoolkit.uconnruddcenter.org/toolkit/Module-4/4-02-ChecklistForAssessing.pdf

Research priorities:
Extent of weight-stigma towards women with PCOS (across the weight spectrum) demonstrated by health professionals, family members, workplace and community.
Health professionals' awareness of their own weight-stigmatising beliefs and behaviours.
Health professional's implementation of weight-neutral/weight-inclusive care for women with PCOS.
The impacts of weight-neutral/weight-inclusive care on the biopsychosocial wellbeing of women with PCOS.
Consideration of other sources of stigma for women with PCOS (e.g. infertility, acanthosis nigricans, hirsutism, alopecia etc.)

GRADE framework

GRADE DECIDE Interactive Evidence to Decision Framework

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☐ Very low	☐ Low	☒ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☒ Possibly important uncertainty or variability	☐ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Weight stigma is pervasive and entrenched. Weight-centric/weight-normative care is the norm in most health services. Many health professionals are unaware of their own weight-stigmatising beliefs and behaviours. Even health professionals who are aware of weight stigma and its impacts can find it difficult to provide weight-neutral/weight-inclusive care.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☒ Favours this option	☐ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

● COSTS

How large are the resource requirements (costs)?

Judgement:

☐ Don't know	☒ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

Weight stigma is pervasive and entrenched. Weight-centric/weight-normative care is the norm in most health services. Many health professionals are unaware of their own weight-stigmatising beliefs and behaviours. Even health professionals who are aware of weight stigma and its impacts can find it difficult to provide weight-neutral/weight-inclusive care.

Practicing weight-inclusive care will likely require increasing consultation time. Other potential causes for increased cost are training, education, equipment, resources, furniture. Increased allied health referral to assist with weight-inclusive interventions may also increase cost.

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☐ Probably favours this option	☒ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

Practicing weight-inclusive care will likely require increasing consultation time. Other potential causes for increased cost are training, education, equipment, resources, furniture. Increased allied health referral to assist with weight-inclusive interventions may also increase cost.

No evidence on cost effectiveness.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☐ Probably increased	☒ Increased

Research evidence:

No research evidence was identified

Panel discussion:

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Women with PCOS are likely to find this acceptable.

Health professional used to working within a weight-centre/weight-normative paradigm are not likely to find this acceptable.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☒ Varies	☐ No	☐ Probably No	☐ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Will require paradigm shift to move the focus off weight-centric care.

Management of non-fertility features

	Clinical Questions
4.2	Is the oral contraceptive pill alone or in combination effective for management of hormonal and clinical PCOS features in adolescents and adults with PCOS?
4.3	Is metformin alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
4.5	Are anti-obesity pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
4.6	Are anti-androgen pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
4.7	In adolescents and adults with PCOS, is inositol alone or in combination with other therapies, effective for management of hormonal and clinical PCOS features, weight and reproductive outcomes?
4.8	Is permanent hair reduction alone or in combination with other therapies, effective for management of hirsutism in adolescents and adults with PCOS?
4.9	In adults and adolescents with PCOS, is bariatric surgery effective for management of hormonal and clinical PCOS features and weight?
4.10	Are women with PCOS at increased risk of adverse pregnancy outcomes? *CLINICAL PRACTICE POINT:* *Should women with PCOS (preconception, early or late pregnancy) undergo screening or additional monitoring for adverse pregnancy outcomes and related risk factors?*
4.11	In women with PCOS in pregnancy, is metformin compared to placebo/standard care effective in reducing pregnancy complications and adverse neonatal outcomes?

PHARMACOLOGICAL TREATMENT PRINCIPLES IN PCOS

In reviewing the literature on pharmacological treatments, general principles emerged that apply across all pharmacological therapies. These have been extracted into a set of clinical practice points to inform women and guide health professionals when considering or recommending pharmacological therapy in PCOS. These practice points apply to all pharmacological treatments prioritised and addressed in the guideline.

Recommendations

4.1	**Pharmacology treatment principles in PCOS**
CPP	Shared decision-making between the patient (and parent/s or guardian/s, if the patient is a child) and the healthcare professional is required
CPP	An individual's characteristics, preferences and values must be considered when recommending any intervention alone or in combination.
CPP	Understanding how individual adults and adolescents value treatment outcomes is essential when prescribing medications.
CPP	Medical therapy is generally not approved for use specifically in PCOS and recommended use is therefore evidence-based, but off label. Health professionals need to inform adults, adolescents and their parents/s or guardian/s and discuss the evidence, possible concerns and side effects. Regulatory agencies should consider approval of evidence-based medications for use in PCOS.

'Off label' prescribing occurs when a drug is prescribed for an indication, a route of administration, or a patient group that is not included in the approved product information for that drug by the relevant regulatory body. Prescribing off label is often unavoidable and common and does not mean that the regulatory body has rejected the indication; more commonly there has not been a submission to request evaluation of a indication or patient group for any given drug.

No upper age limit.	Oral contraceptive pill alone or in combination with metformin, lifestyle, anti-androgens, anti-obesity agents. All types OCPs, low 20ug estrogens or less vs standard or high 30ug or more. Different generation progestins. Possible comparisons: OCP alone v combination 20ug and below v 30-35ug (Jas = 15ug estradiol in Europe); Progestins based on anti-androgenic activity; Estradiol and natural; For hirsutism, min 6 months At least 3 months for all other outcomes	Placebo or any other intervention (listed in intervention) or combinations of those listed in intervention.	Androgenicity: Hirsutism- FG score (ethnicities), FAI, testosterone and SHBG, DHEAS, androstenedione, Irregular cycles Metabolic: insulin resistance HOMA, Clamp, OGTT Chol LDL, HDL TG, CRP, Psychological: Qol, depression Adverse effects: Anthropometric: weight BMI, WHR Thromboembolic events, PAI-1 levels	Evidence based guidelines, systematic reviews, RCTs	English language. **New search.** Limit to last 20 years given change in doses and progestins over time.
Exclusion criteria	Females without PCOS. Less than 2 years post menarche. Women with DM2, co-morbidities or major depression.	Non oral formulation of contraceptives.	Agent or combination used in the intervention.		Non-evidence based GLs, non-SRs, any study lower than a RCT.	

2. SEARCH STRATEGY

Table 2.1. Search details	
Search strategy source: Technical report p 788-789	
Evidence source	**Date of search 2022-07-08** **Results:**
Medline (Ovid)	688
PsychInfo (Ovid)	3
EMBASE (Ovid)	370
All EBM (Ovid)	185
CINAHL	114
Any subsequent updates - enter database and date:	

Table 2.2. Questions addressed by this search *(add more rows as needed)*:		
GDG	Q#	Question
4	4.2	Is the oral contraceptive pill alone or in combination effective for management of hormonal and clinical PCOS features in adolescents and adults with PCOS?
4	4.3	Is metformin alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
4	4.6	Are anti-androgen pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?

Table 2.3. Search strings used in OVID or other database/s –
See page 3864-3865 under Q.4.6. on anti-androgens (the same search string was used for all three questions above)

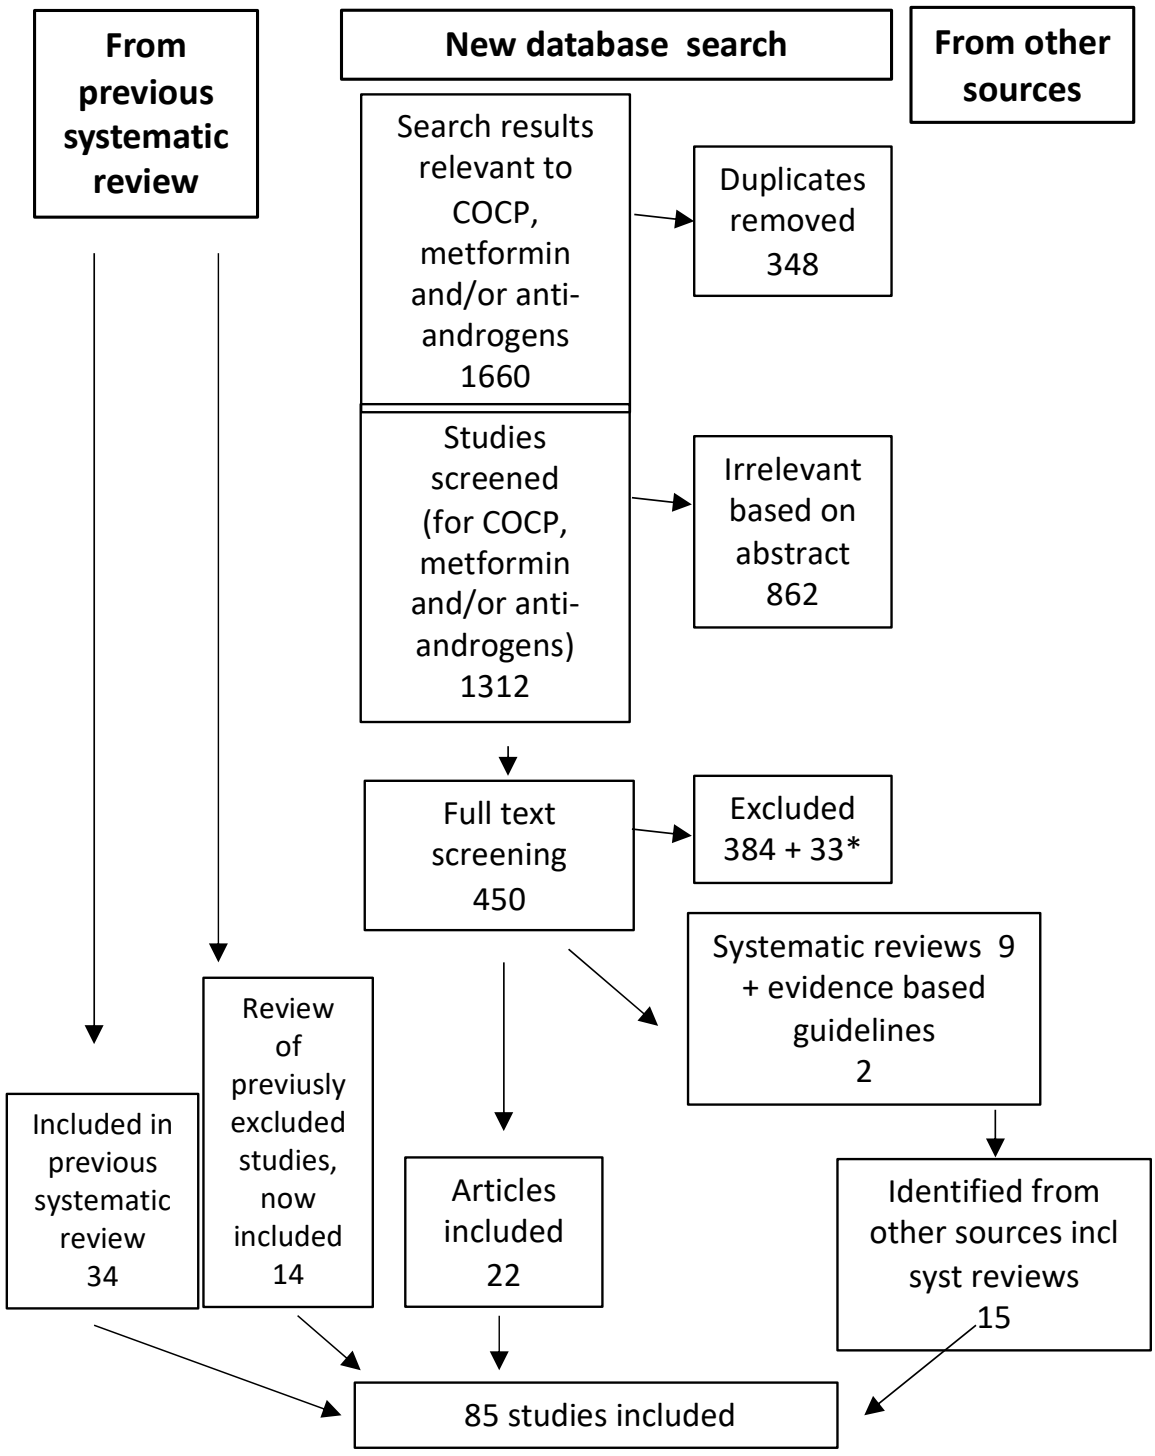
Evidence processing: Studies were selected and appraised by two reviewer/s using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. Only studies that did not fit PICO for Q4.2, 4.3 or 4.6 were excluded. Full text screening was done by two reviewers. Conflicts were resolved by discussion and if needed, through contact with the evidence team/ key contacts. Included studies were double checked and approved by the clinical leads/ key contacts.

In addition to the studies included in previous guidelines, the excluded list from that search was reviewed, and studies were included if they met the current PICO.

Identified systematic reviews and evidence-based guidelines were screened manually for additional references.

In total, **84 RCTs met inclusion criteria for this review.**

3. SEARCH RESULTS - PRISMA flowchart



* Included for Q4.3 and/or Q4.6, excluded for Q4.2

4. STUDY INCLUSION

Table 4.2. Excluded studies (on full-text assessment)

Reference	Reason
Unknown. Effect of green tea pills and metformin versus placebo on the Nrf2-antioxidant system and proinflammatory cytokines, including IL-6 and TNF-a, in peripheral blood mononuclear cells of women with polycystic ovary syndrome: a single blind randomized clinica 2017.	**Wrong publication type.**
Effect of supplementation in treatment of women with polycystic ovary syndrome. Clinical trial of the effect of inofolic supplementation compared with metformin on parameters of mental health and oxidative stress in women with polycystic ovary syndrome 2017.	**Wrong publication type.**
Effect of inofolic supplementation in treatment of women with polycystic ovary syndrome. Clinical trial of the effect of inofolic supplementation compared with metformin on metabolic profiles and gene expression related to insulin and lipid in women with polycystic ovary syndrome 2017.	**Full text not obtainable.**
Comparison of oral contraceptives including Contrasmine, Etisterone and Desoceptive with Ovustop-L (LD) on clinical, biochemical and metabolic findings, and quality of life in women with polycystic ovary syndrome. A Randomized cross-over clinical trial to assess the effectiveness of oral contraceptives including Contrasmine, Etisterone and Desoceptive with Ovustop-L (LD) on clinical, biochemical and metabolic findings, and quality of life in women with polycystic o 2017.	**Full text not obtainable.**
The efficacy of Fennel infusion and cupping on ovarian failure. Comparison of ovarian cupping and fennel infusion with Metformin on oligomenorrhea and ovulation in women with polycystic ovarian syndrome: a clinical trial 2017.	**Full text not obtainable.**
Scientific Impact Paper No. 13: Metformin Therapy for the Management of Infertility in Women with Polycystic Ovary Syndrome. Obstetrician & Gynaecologist 2017, 19, 339-339, doi:10.1111/tog.12436.	**Wrong study design.**
Effect of using metformin on the incidence of gestational diabetes and preeclampsia in pregnant women with polycystic ovary. Effect of using metformin versus not using on the incidence of gestational diabetes and preeclampsia in pregnant women with polycystic ovary: A randomized clinical trial 2018.	**Wrong publication type**
?Effects of myo-inositol on induction of ovulation. Comparison the effects of myo-inositol plus clomiphene citrate with metformin plus clomiphene citrate on induction of ovulation among patients with polycystic ovarian syndrome. 2018.	**Wrong publication type**
New strategies to lose weight for women with polycystic ovary syndrome. Novel strategies in weight loss in women with polycystic ovary syndrome: does the gut microbiome play a role? 2018.	**Wrong publication type**
A study to compare the efficacy of two drugs on the success of assisted reproductive therapy in women with polycystic ovarian syndrome and undergoing treatment with IVF. Randomised Control Trial comparing the effects of Metformin to Myoinositol on ART outcome in women with PCOS undergoing IVF cycles 2018.	**Wrong publication type**
A study to compare the efficacy and adverse effects of metformin versus myoinositol plus d-chiroinositol combination therapy in polycystic ovarian syndrome. A prospective randomised comparative study of metformin versus myoinositol plus d-chiroinositol combination therapy in polycystic ovarian syndrome 2019.	**Wrong publication type**
Effect of combined electroacupuncture and medical therapy on insulin resistance in polycystic ovary syndrome patients. Combination of electroacupuncture and pharmacological treatment in improving insulin resistance (HOMA-IR) in polycystic ovary syndrome patients: a double-blind randomized clinical trial 2020.	**Wrong study design**
Study to find Effects of Chandraprabha Vati(Ayurvedic Medicine) in Polycystic Ovarian Syndrome Characterised by Small cysts in ovary with irregular,Scanty menses and excess/unwanted hairs on Face,Thighs,Abdomen etc. â??Randomized controlled clinical trial to study the efficacy OF Chandraprabha vati in PCOS.â?? 2020.	**Wrong study design**
A clinical trial to study the effect of exercise and metformin on mitochondrial health in patients with polycystic ovarian syndrome (PCOS). To assess the efficacy of moderate-intensity exercise training and metformin on mitophagy and mitochondrial phenotype in patients with polycystic ovarian syndrome (PCOS) 2020.	**Wrong publication type**
ffect of oral contraceptives on levels of adipokines, and adiposity indices in women with polycystic ovary syndrome. A randomized clinical trial to compare the effectiveness of oral contraceptives containing levonorgestrel, desogestrel, cyproterone acetate, and drospirenone on levels of adipokines, and adiposity indices in women with polycystic ovary syndrome. 2020.	**Wrong publication type**
Effect of treatment by OCP on infertility in PCOD patients. The randomized, single -blinded clinical trial comparing OCP effect before frozen embryo transfer versus gonadotropin â“ releasing hormone agonist injection on improving the outcome of pregnancy in infertile patients with hyper androgenic poly 2020.	**Fulltext not obtainable**
Expression of concern: Comparison of myo-inositol and metformin on mental health parameters and biomarkers of oxidative stress in women with polycystic ovary syndrome: a randomized, double-blind, placebo-controlled trial The effects of fish oil omega-3 fatty acid supplementation on mental health parameters and metabolic status of	**Wrong publication type**

patients with polycystic ovary syndrome: a randomized, double-blind, placebo-controlled trial. Journal of Psychosomatic Obstetrics & Gynecology 2020, 41, I-I, doi:10.1080/0167482X.2020.1842508	
Evaluation of therapeutic effects of crocina (saffron tablets) in patients with polycystic ovary syndrome: a randomized double-blind clinical trial. 2021.	**Wrong publication type**
A clinical study in women suffering from polycystic ovary syndrome (PCOS) to test the drug LPRI-424 (dienogest/ethinyl estradiol) during 9 months of treatment. A multicentre, phase III, double-blind, randomised clinical trial to assess the efficacy and safety of LPRI-424 (dienogest 2.00 mg / ethinyl estradiol 0.02 mg) in the treatment of polycystic ovary syndrome (PCOS) versus placebo during 9 cycles 2021.	**Wrong publication type**
A clinical trial to study the effect of myoinositol based therapy in combination with metformin as compared to metformin alone in women with polycystic ovarian syndrome. A Randomized Controlled Trial comparing Myoinositol based therapy in combination with Metformin versus Metformin monotherapy on the clinical, metabolic and hormonal parameters in Obese reproductive age women with Polycystic Ovarian Syndrome 2021.	**Wrong publication type**
Efficacy of very low carbohydrate diet combined with metformin in overweight / obese PCOS patients on changing of clinical phenotype, gut microbiota and plasma metabolome after treatment: a randomized, controlled clinical trial. 2021.	**Fulltext not obtainable**
A Phase II, randomised, multi-centric, multi-national clinical trial to evaluate the efficacy, tolerability, and safety of a fixed dose combination of Spironolactone, Pioglitazone & Metformin (SPIOMET) for adolescent girls and young adult women (AYAs) with polycystic ovary syndrome (PCOS). 2021.	**Wrong publication type**
Investigation on the efficacy and safety of Ceylon cinnamon (Cinammomum zeylanicum) compared to metformin in ameliorating symptoms of Polycystic Ovary Syndrome (PCOS): A randomized controlled trial. Investigation on the Efficacy and Safety of Ceylon Cinnamon (Cinammomum zeylanicum) and Metformin in Ameliorating Polycystic Ovary Syndrome (PCOS): A Randomized Controlled Trial 2022.	**Wrong comparator**

5. FINDINGS

Comparisons included:

- **Comparison 1:** COCP with high vs. COCP with low levels of estrogen
- **Comparison 2:** COCP with 1st vs. COCP with 2nd generation progestin
- **Comparison 3:** COCP with 1st vs. COCP with 3rd generation progestin
- **Comparison 4:** COCP with 1st vs. COCP with 4th generation progestin
- **Comparison 5:** COCP with 2nd vs. COCP with 3rd generation progestins
- **Comparison 6:** COCP with 2nd vs. COCP with 4th generation progestins
- **Comparison 7:** COCP with 3rd vs. COCP with 4th generation progestins
- **Comparison 8:** COCP vs. EE/CPA
- **Comparison 9:** COCP vs. progestin
- **Comparison 10:** COCP vs. controls
- **Comparison 11:** COCP vs. placebo
- **Comparison 12:** COCP vs lifestyle
- **Comparison 13:** COCP vs. lifestyle ± anti-obesity treatment
- **Comparison 14:** COCP vs. combination of COCP and lifestyle with/without anti-obesity treatment
- **Comparison 15:** lifestyle ± anti-obesity treatment vs. combination of COCP and lifestyle ± anti-obesity treatment
- **Comparison 16:** COCP vs. anti-obesity
- **Comparison 17:** COCP vs. COCP + anti-obesity
- **Comparison 18:** COCP + metformin vs. COCP + anti-obesity
- **Comparison 19:** COCP vs. COCP + metformin + anti-obesity
- **Comparison 20:** COCP vs. metformin (also incl. in Q4.3)
- **Comparison 21:** COCP vs. COCP + metformin
- **Comparison 22:** COCP vs. anti-androgen (also in Q4.6, but their time limit 6 m treatment)
- **Comparison 23:** COCP vs. COCP + antiandrogen androgen (also in Q4.6, with time limit of 6m)
- **Comparison 24:** COCP vs. metformin + antiandrogen androgen (also in Q4.6, with time limit of 6m)
- **Comparison 25:** COCP + anti-androgen vs. metformin androgen (also in Q4.6, with time limit of 6m)
- **Comparison 26:** COCP + anti androgen vs. COCP + anti androgen + met androgen
- **Comparison 27:** COCP + anti-androgen vs. COCP + metformin androgen
- **Comparison 28:** COCP vs. COCP + metformin + anti-androgen androgen (also in Q4.6)
- **Comparison 29:** COCP vs. SPIOMET (=metformin + anti-androgen + glucose sensitizer) (also in Q4.6)
- **Comparison 30:** COCP + AA1 vs. COCP + AA2
- **Comparison 31:** Metformin vs COCP + metformin (reported in Q4.3)
- **Comparison 32:** COCP + met vs. EE/CPA + met

COCP: combined oral contraceptive pills

Abbrevations and classifications of progestins identified and included in the systematic review:

Generation of progestin	Progestin type	Abbrevation
1st generation	Chlormadinone acetate	CMA
2nd generation	Levonorgestrel	LNG
3rd generation	Desogestrel	DSG
	Gestodene	GSD
4th generation	Drospirenone	DRSP
	Dienogest	DNG
Other	Cyproterone acetate	CPA

Comparison 1: COCP with low vs. high EE

- **EVIDENCE SUMMARY:**

Two RCTs compared COCPs with high (30µg) vs. low (20µg) EE. Both studies had a low risk of bias and both had a duration of 12 m. Information about the included studies is shown in the table below.

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:**

A meta-analysis could not be performed. The only outcome reported by both studies was hirsutism (FG score), where no difference was seen between groups, with a moderate certainty of evidence. Other outcomes (BMI, WHR, FAI, total testosterone and SHBG), were only reported by Bhattacharya. High level EE COCP treatment resulted in a greater increase in SHBG levels, with a low certainty of evidence. No difference was seen between groups regarding other reported outcomes with a low certainty of evidence.

Included studies

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Outcomes
Bhattacharya 2016 (1)	Low	1) 30µg EE + 3mg DRSP 21/7 2) 20µg EE + 3mg DRSP 24/4	ndia 12 months	1: 46 2: 48	1: 21.47±4.27 2: 22.28±3.91	1: 26.21±5.15 2: 26.38±5.70	Rott	21 (<18 years) >3y since menarche	Non-smokers	BMI, WHR, FG score, TT, SHBG, FAI,
Fonseka 2020 (2)	Low	1: 35µg EE + 2 mg CPA (Diane-35, 2: 20µg EE + 0.15 mg DSG (Fermion) 3: metformin + EE/CPA 4: metformin + EE/DSG	Sri Lanka 12 months	1:20 2:23 3: 26 6: 30	1: 23.35± 5.10 2: 22.39 ± 6.45 3: 24.81 ± 6.24 4. 27.90 ± 6.89	1: 28.27 ±6.94 2: 26.74 ±4.88 3: 27.93 ±4.89 4: 27.20 ± 4.28	Rott	NR	NR	mFG score

Results are presented descriptively in the table below as *change from baseline*, if not otherwise stated.

Outcome	Study ID	N	High EE	Low EE	P value	Favours	Certainty	Importance
BMI	Bhattacharya 2016	H 46 L 48	0.52±2.83	−0.01±4.11	0.42	No difference	⊕⊕◯◯ LOW[1]	CRITICAL
WHR	Bhattacharya 2016	H 46 L 48	0.01±0.06	−0.0004±0.05	0.32	No difference	⊕⊕◯◯ LOW[1]	IMPORTANT
Hirsutism (mFG score)	Bhattacharya 2016	H 46 L 48	2.12±3.50	1.54±4.73	0.46	No difference	⊕⊕⊕◯ MODERATE[2]	CRITICAL
	Fonseka 2020	H 20 L 23	Mean ± SD 14.25 ± 8.26	Mean ± SD 15.09 ± 5.26	NR			
SHBG (nmol/L)	Bhattacharya 2016	H 46 L 48	−167.38±89.0	−125.54±124.6	0.043	High EE	⊕⊕◯◯ LOW[1]	IMPORTANT
FAI	Bhattacharya 2016	H 46 L 48	5.23±5.79	4.99±5.86	0.82	No difference	⊕⊕◯◯ LOW[1]	IMPORTANT
Testosterone (nmol/L)	Bhattacharya 2016	H 46 L 48	0.00±0.01	0.00±0.01	NR	No difference	⊕⊕◯◯ LOW[1]	IMPORTANT

1. low certainty of evidence due to imprecision
2. moderate certainty of evidence due to indirectness (assessed differently)

Comparison 2: COCP with 1st vs. COCP with 2nd generation progestin

- **EVIDENCE SUMMARY:**

No studies were identified for this comparison.

Comparison 3: COCP with 1st vs. COCP with 3rd generation progestin

- **EVIDENCE SUMMARY:**

One study with a high risk of bias was identified. This study (DeLeo 2010) with a duration of 3 months had four arms. Relevant for this comparison, chlormadinone acetate (CMA), a 1st generation progestin was compared with two different 3rd generation progestins, desogestrel (DSG) and gestodene (GSD). Information about the included study is shown in the table below.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

A meta-analysis could not be performed. Results from the individual study showed a greater decrease in TT and androstenedione, and a greater increase in SHBG, after treatment with the 1st generation progestin, with a very low certainty of evidence. For the other reported outcomes, free testosterone and DHEAS, no difference was seen between the groups, with a very low certainty of evidence.

Included study:

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Outcomes
De Leo 2010 (3)	High	1: 30 μg EE + DRSP 2: 30 μg EE + CMA 3: 30 μg EE + GSD 4: 30 μg EE +DSG	Italy 3 months	10/ group	age 16–35 years. Mean not reported	All lean, mean not reported	Rott	NR	NR	Free T, TT, A4, SHBG, DHEAS, adverse effects

Results shown in the table below. The "favours" are statements from the author, p values between groups were not reported. EE/CMA=1st gen.

Outcome	Unit	EE/CMA Mean	EE/CMA SD	EE/GSD Mean	EE/GSD SD	EE/DSG Mean	EE/DSG SD	Favours	Certainty[1]	Importance
TT	Pg/ml	380	85	420	110	560	120	1st gen (p value not reported)	⊕◯◯◯ VERY LOW	IMPORTANT
fT	Pg/ml	1.0	0.2	1.1	0.5	1.1	0.5	No difference	⊕◯◯◯ VERY LOW	IMPORTANT
SHBG	Nmol/L	140	10	131	11	129	13	1st gen larger increase (p value not reported)	⊕◯◯◯ VERY LOW	IMPORTANT
A4	Pg/ml	975	235	1100	325	1400	330	1st gen (p value not reported)	⊕◯◯◯ VERY LOW	IMPORTANT
DHEAS	μg/ml	1.08	0.6	1.35	0.6	1.37	0.5	No difference	⊕◯◯◯ VERY LOW	IMPORTANT

[1] All outcomes were judged as of very low certainty of evidence due to very high risk of bias, and very serious imprecision.

Comparison 4: COCP with 1st vs. COCP with 4th generation progestins

- **EVIDENCE SUMMARY:**

  Four RCTs were identified, all with a high risk of bias. DeLeo had four arms. Relevant for this comparison, chlormadinone acetate (CMA), a 1st generation progestin was compared with the 4th generation progestins drospirenone(DRSP). Both Morgante, Podfigurna and Yildizhan used the same progestins in their RCTs. Study duration of included studies 3-24 months.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Results from the meta-analysis showed a greater decrease in DHEAS (low certainty) and androstenedione (very low certainty) after treatment with the 4th generation progestin. There was no difference between treatments in SHBG and total testosterone levels. For the other reported outcomes, a meta-analysis could not be performed. With very low certainty of evidence, free testosterone,cholesterol and CRP levels were lower after treatment with the 4th generation progestin, compared with the 1st generation. There were no differences in other outcomes, with very low certainty of evidence.

Included studies, COCP with 1st vs 4th generation progestins:

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Outcomes
De Leo 2010 (3)	High	1: 30 μg EE + DRSP 2: 30 μg EE + CMA 3: 30 μg EE + GSD 4: 30 μg EE +DSG	Italy 3 months	10/group	age 16–35 years. Mean not reported	All lean, mean not reported	Rott	NR	NR	Free T, TT, A4, SHBG, DHEAS, adverse effects

Comparison 5: COCP with 2nd vs. COCP with 3rd generation progestins

- **EVIDENCE SUMMARY:**

Two RCTs were identified, both with a high risk of bias. Amiri 2020 was a crossover study, involving four arms. Treatment was ongoing for 6 months, then a 6-8 week washout period was allowed before change of treatment to a COCP with a different progestin. The results from this study are only presented as estimation of treatment, period, sequence and carry over effect using GEE models. Amiri 2021 was a 6 months four arm trial comparing COCPs with four different progestins regarding effects on lipid profiles and adiponectins. The progestins compared relevant for this comparison were the 2nd generation levonorgestrel (LNG) vs. 3rd generation desogestrel (DSG) in both studies

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:**

A meta-analysis could not be performed. Results from the crossover study showed a greater decrease in FAI, and a greater increase in SHBG, after treatment with the 3rd generation progestin, with a very low certainty of evidence. For the other reported outcomes, no difference was seen between the groups, with a very low certainty of evidence.

Included studies:

Comparison 6: COCP with 2nd vs. COCP with 4th generation progestins

▪ EVIDENCE SUMMARY:

Two RCTs were identified, the same studies as in comparison 5. Both studies had a high risk of bias. The progestins compared relevant for this comparison were the 2nd generation levonorgestrel (LNG) vs. 4th generation drospirenone (DRSP) in both studies.

▪ META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:

A meta-analysis could not be performed. Results from the crossover study showed a greater decrease in FAI, and a greater increase in SHBG, after treatment with the 4th generation progestin, with a very low certainty of evidence. For the other reported outcomes, free testosterone and DHEAS, no difference was seen between the groups, with a very low certainty of evidence.

Comparison 7: COCP with 3rd vs. COCP with 4th generation progestins

- **EVIDENCE SUMMARY:**

Five RCTs were identified. The progestins used in these studies were the 3rd generations desogestrel (DSG) and gestodene (GSD), and the 4th generations drospirenone (DRSP) and dienogest (DNG).
Amiri 2020 (7) included a 3rd and 4th generation progestin, but reported results as estimation of treatment, period, sequence and carry over effect using GEE models, and as the COCP with a second generation progestin was reference, the study is not reported here..
Amiri 2021 (8) was a 6 months four arm trial comparing COCPs with four different progestins regarding effects on lipid profiles and adiponectins. Relevant for this comparison was EE/DSG (n=20) and EE/DRSP (n=17). The study had a high risk of bias.
Bhattacharya 2012 (9) was a 12 months trial with three arms. Relevant for this comparison EE/DSG (n=49) and EE/DRSP (n=50). The study had a low risk of bias.
DeLeo 2010 (3) was a four-arm study with 3 months duration. The arms relevant to this comparison was EE/GSD (n=10); EE/DSG (n=10) and EE/DRSP (n=10. This study had thus two 3rd generation COCPs, and if possible to include in a meta-analysis, the EE/DSG group was chosen, since this combination was used in the other studies. The study had a high risk of bias. Kriplani 2010 (10) compared EE/DSG (n=29) with EE/DRSP (n=29), the treatments were used for 6 months. This study had a high risk of bias.
No studies were identified in adolesents.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

The meta-analysis showed a lower BMI after treatment with 4th compared with 3rd generation progestins with a low certainty of evidence. Total testosterone levels and LDL were lower, and HDL higher, after treatment with a 4th generation progestin, with a very low certainty of evidence. For other outcomes, no differences were seen between 3rd and 4th generations, with very low certainty of evidence.

Other outcomes, that could not be included in the meta-analysis, are reported narratively:

Outcome	Results	Favours
WHR	Bhattacharya 2012 reported mean change from baseline, 0.00 ± 0.08 for third generation vs. 0.02 ± 0.09 for 4th generation, p value not reported. Amiri 2021 reported mean 0.8 ± 0.07 vs. 0.8 ± 0.09.	No difference
Hirsutism	Bhattacharya 2012 reported mean change in FG score from baseline, -1.69 ± 5.69 for third generation vs. -2.12 ± 6.58 for 4th generation, p value not reported. Kriplani 2010 reports a reduction in FG score of 36.5% from baseline in the 4th generation treatment group, but no change in FG score in the 3rd generation group, figures or p values not reported.	No difference
FAI	Bhattacharya 2012 reported mean change in FAI from baseline, -5.58 ± 9.15 for third generation vs. -7.89 ± 9.13 for 4th generation, p value not reported. Kriplani 2010 reported means, 3.9 ± 1.9 vs. 2.8 ± 4.9, p=0.12.	No difference
Free testosterone	DeLeo reported means, 3.81 ± 1.73 pmol/L for 3rd generation EE/DSG; 4.16 ± 1.73 pmol/L for 3rd generation EE/GSD, and 2.77 ± 0.69 pmol/L for 4th generation EE/DRSP, p value not reported, but author reports significantly greater reduction after EE/DRSP.	4th
Androstenedione	DeLeo reported means, 8.27 ± 1.95 pmol/L for 3rd generation EE/DSG; 46.50 ± 1.92 pmol/L for 3rd generation EE/GSD, and 5.02 ± 1.24 pmol/L for 4th generation EE/DRSP, p value not reported, but author reports significantly greater reduction after EE/DRSP.	4th
DHEAS	.DeLeo reported means, 3.72 ± 1.36 µmol/L for 3rd generation EE/DSG; 3.66 ± 1.63 µmol/L for 3rd generation EE/GSD, and 2.44 ± 1.36 µmol/L for 4th generation EE/DRSP, p value not reported, but author reports no significant difference.	No difference
Insulin	Bhattacharya 2012 reported mean change in from baseline, -0.02 ± 17.35 for third generation vs. 2.78 ± 17.27 for 4th generation, p value not reported. Kriplani 2010 reported means, 11.7 ± 6.2 for 3rd generation vs. 8.7 ± 3.6 µU/ml for 4th generation, p=0.07.	No difference
Glucose	Bhattacharya 2012 reported mean change in from baseline, -4.28 ± 11.66 for third generation vs. -2.11 ± 14.02 for 4th generation, p value not reported. Kriplani 2010 reported means after treatment, 81.9 ± 6.1 mg/dl for 3rd generation vs. 80.6 ± 6.2 mg/dl for 4th generation, p=0.22.	No difference
HOMA	Bhattacharya 2012 reported mean change in from baseline, -0.28 ± 3.98 for third generation vs. 0.42 ± 3.82 for 4th generation, p value not reported.	No difference

	Kriplani 2010 reported means after treatment, 1.8 ± 1.3 for 3rd generation vs. 1.7 ± 0.7 for 4th generation, p=0.1.	
OGTT	No studies	
Triglycerides	Amiri 2021 reported medians (IQR), 1.3 (0.8-1.4) for 3rd generation vs. 1.1 (0.8-1.3) mmol/L for 4th generation, p value not reported. Kriplani 2010 reported means, 1.17 ± 0.33 for 3rd generation vs. 1.33 ± 0.35 for 4th generation, p=0.07.	No difference
CRP	No studies

	Amiri 2021	0/30	0/30

Comparison 8: COCP vs. EE/CPA

- **EVIDENCE SUMMARY:**

Ten studies were identified comparing convention COCPs and EE/CPA. Six had a high risk of bias, one moderate and three low risk of bias. Two of the studies involved adolescents, Mastorakos 2012 and Mastorakos 2016, the rest included adults. Study duration of the included studies were 3-12 months. The included studies are described in the table below.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

The meta-analysis showed that the combination EE/CPA, compared with convention COCPs, had a beneficial effect with lower BMI and lower total testosterone levels with a low certainty of evidence in the overall analysis. Regarding metabolic parameters, EE/CPA treatment resulted in higher cholesterol and LDL (very low certainty). The systematic review favoured EE/CPA in treatment of hirsutism, with low certainty of evidence.
In the subgroup analysis, total testosterone levels were lower after EE/CPA treatment in adults (low certainty) but not in adolescents (very low certainty). For androstenedione, EE/CPA resulted in lower levels compared with COCP in adults, but not in adolescents, with a very low certainty of evidence. Regarding adverse effects, the outcome was not assessed systematically, but no major adverse effects were reported.

Included studies:

Outcomes where a meta-analysis could not be performed are reported narratively:

Outcome	Results	Favours	Certainty	Importance
Weight	No studies			CRITICAL

Hirsutism	Bhattacharya 2012 reported mean change in FG score, -1.69 ± 5.69 for a 3rd generation COCP vs. -5.29 ± 5.88 for EE/CPA, p=0.003. Kahraman 2014 reported median change in % from baseline, −18 (−72 to 30) for a 4th generation COCP vs −35 (−71 to 10)), p=0.04. Fonseka reported mean (SD) 15.09 (5.26) vs. 14.25 (8.26)	EE/CPA	⊕⊕◯◯ LOW [2,4]	CRITICAL
Free testosterone	Kahraman 2014 reported median % change, −50 (−77 to 85) for a 4th generation COCP vs −42 (−79 to 164 for EE/CPA, p=0.286. Mastorakos 2002 reported means after treatment, 5.79 ± 2.58 for COCP vs. 6.03 ± 1.12 pmol/L for EE/CPA, p value not reported.	Unable to make judgement	⊕◯◯◯ VERY LOW [1,2,3]	IMPORTANT
OGTT	Kahraman 2014 reported median % change (range) 5 (−42 to 66) vs. 17 (−23 to 76), p=0.339 at 2h glucose levels. Mastorakos 2006 reported ΔAUCI as mean ± SE for COCP 7,856.25 ± 1,083.34 vs. 10,567.27 ± 849.18, p not reported.	No difference	⊕◯◯◯ VERY LOW [1,2]	IMPORTANT
Triglycerids	Amiri 2021 reported median (IQR) for COCP 1.3 (0.8-1.4) vs. 1.6 (1.2-2.1) after EE/CPA, p value not reported. Kahraman reported median % change +43 (−60 to 180) after COCP and +53 (−49 to 502) after EE/CPA, p=0.361.	No difference	⊕◯◯◯ VERY LOW [1,2]	IMPORTANT
CRP	Christakou 2014 reported mean ± SD after COCP 1.93 ± 1.44 mg/l vs. 2.63 ± 0.73 after EE/CPA. Kahraman reported median % change +31 (−91 to 8,662) vs. +174 (−96 to 2,656), p=0.610.	Unable to make judgement	⊕◯◯◯ VERY LOW [1,2]	IMPORTANT

1. Downgraded twice due to high risk of bias
2. Downgraded once for indirectness since outcomes reported in different ways, not possible to combine
3. Downgraded once for imprecision, few study participants
4. Downgraded once for risk of bias

Adverse effects: No serious adverse effects were reported.

	Study	COCP	EE/CPA
Spottings	Amiri 2020 (at 6 months)	1/33	5/34

Comparison 9: COCP vs. Progestin

- **EVIDENCE SUMMARY:**

Two studies were identified, one in adolescents (Chung 2014) with a moderate risk of bias, and one in adults (Ozdemir 2008) with a high risk of bias. The study duration was 4-6 months. The studies are shown in the table below.

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:**

In the meta-analysis, only the outcomes BMI, WHR and total testosterone could be included. There was no difference in any of these outcomes with low certainty of evidence. The other outcomes, with results only from one study, showed lower FAI and higher SGBG levels after COCP treatment and lower insulin and triglyceride levels, all with very low certainty of evidence. Regarding other outcomes, theses did differ between the treatments, with very low certainty of evidence.

Included studies COCP vs. progestin

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Comments	Outcomes

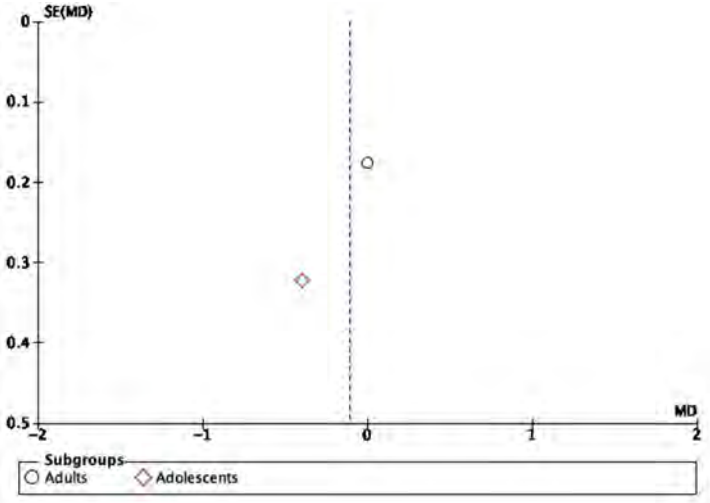
9.3.3. Funnel plot for assessment of publication bias



Comparison 10: COCP vs. controls

▪ EVIDENCE SUMMARY:

Three RCTs compared COCPs with controls. All studies had a high risk of bias. In Dorgham 2021, all groups, including the control group received laser treatment, and in this study fascial hirsutism was an additional inclusion criterion. One study, El Maghraby 2015, involved adolescents. The study duration was 6-24 months. Information about the included studies is shown in the table below.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

A meta-analysis could not be performed. All outcomes were reported in only one study. COCP was superior to controls regarding improvement in cycle regularity with low certainty of evidence. HRQoL overall measured by VAS improved after COCP treatment, as well as in a dermatologic HRQoL questionnaire and a hirsutism HRQoL questionnaire, with very low certainty of evidence. Weight, testosterone, insulin levels were lower after COCP treatment, compared with controls, with very low certainty of evidence. The control group had lower after load insulin levels after an OGTT, and also had lower levels of CRP and PAI-1 compared with the group treated with COCP, with very low certainty of evidence. For all other outcomes, no difference was seen between groups with very low certainty of evidence. COCP treatment was associated with more minor adverse effects than controls.

Comparison 11: COCP vs. placebo

- **EVIDENCE SUMMARY:**

One RCT involving adolescents, Hoeger 2008, was included. No studies were identified involving adults. This study had a moderate risk of bias.

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:**

COCP treatment resulted in lower levels of testosterone, higher SHBG and lower FAI, with very low certainty of evidence. The placebo group had lower CRP levels compared with the COCP treated group, very low certainty of evidence.

Included studies:

Study ID	ROB	Comparisons	Country, duration	N	Mean age	Mean BMI	PCOS	Menarche age	Smokers	Comments	Outcomes relevant to this review

Comparison 12: COCP vs lifestyle

- **EVIDENCE SUMMARY:**

One study was found, that addressed this comparison, Hoeger 2008, with no additional studies included since the last systematic review. This RCT included adolescents and had a moderate risk of bias.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

A meta-analysis could not be performed. LDL and triglycerides were lower after lifestyle treatment compared with COCP, with very low certainty of evidence. Total testosterone levels were lower after COCP treatment, compared with lifestyle, with very low certainty. For other outcomes, no difference was seen, with very low certainty of evidence.

Included studies:

PAI-1	29.5	20.6	45.0	25.6	0.17	No difference	IMPORTANT

All outcomes were judged as of very low certainty of evidence due to risk of bias (-1), indirectness (-1, only one study involving one population) and imprecision (-2, very few patients for each outcome).

Comparison 13: COCP vs. lifestyle ± anti-obesity treatment

Comparison 14: COCP vs. combination of COCP and lifestyle ± anti-obesity treatment

Comparison 15: Lifestyle ± anti-obesity treatment vs. combination of COCP and lifestyle ± anti-obesity treatment

- **EVIDENCE SUMMARY:**

One RCT with five publications (23-27) was identified addressing these comparisons. Legro 2015 (24) compared 20 µg EE+1mg NA (n=45) versus lifestyle intervention (n=44), and versus a combination of COCP and lifestyle (n=43). This was part of a larger study, and the interventions were part of a preconception treatment before infertility treatment. The lifestyle intervention included caloric restriction and exercise, and anti-obesity treatment if BMI>30 kg/m2. The medication used differed during the study period, initially sibutramine was used, but during the second part of the trial this was replaced with orlistat. The initial publication focused on reproductive outcomes and had a moderate risk of bias. Additional publications from this RCT, where additional outcomes could be extracted, focused on HRQoL (Dokras 2016 (27)), cholesterol efflux and lipoproteins (Dokras 2017 (23)), incretins and TNF-β (Shah 2021 (25)) and sexual dysfunction (Steinberg Weiss 2021 (26)). Steinberg Weiss reported sexual function measured with two different questionnaires. Female Sexual Function Index (FSFI) includes 19 questions grouped in six domains, the total score ranges from 2-36, and a higher score indicates a better sexual function. Female Sexual Distress Scale-Revised (FSDS-R) includes 13 questions, the total score ranges from 0-52, with a higher score corresponding to higher levels of sexual distress.

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:**

Lifestyle and combination of lifestyle + COCP resulted in lower weight compared with COCP alone with a very low certainty of evidence. COCP and the combined group had lower total testosterone and higher SHBG, compared with lifestyle alone, with a very low certainty of evidence. Triglycerides were higher after COCP treatment compared with lifestyle, but not compared with the combination COCP + lifestyle treatment, with a very low certainty of evidence. OGTT showed higher glucose levels after COCP compared with lifestyle and compared with the combined group, with a very low certainty of evidence.
There were no direct comparisons between the groups regarding sexual function scores, but in the combined treatment arm, patients improved in sexual desire, a tendency towards this was seen in the lifestyle arm, but no difference was seen in the COCP arm. Overall, there was no difference in HRQoL or prevalence of depression after treatments, with very low certainty of evidence.
Regarding adverse effects, lifestyle +/- anti-obesity treatment and the combined group had significantly more diarrhea compared with COCP treatment, and COCP and combination treatment was associated with more abnormal uterine bleeding than lifestyle +/- anti-obesity treatment alone.

Comparison 16: COCP vs. anti-obesity treatment

- **EVIDENCE SUMMARY:**

One study, with a high risk of bias, was found to address this comparison. Sabuncu 2003 (28) compared COCP with 35 µg EE + 2 mg CPA (n=14) vs. sibutramine 10 mg/day (n=12) for 6 months.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

A meta-analysis could not be performed. Anti-obesity medication resulted in lower BMI, lower triglycerides and lower insulin levels, compared with COCP treatment, with very low certainty. Regarding other outcomes, no difference was seen between the treatments, with very low certainty of evidence. Adverse effects were not reported.

Included study:

Study ID	ROB	Comparisons	Country, duration	N	Mean age	Mean BMI	PCOS	Menarche age	Smokers	Comments	Outcomes relevant to this review

Comparison 17: COCP vs. COCP + anti-obesity

- **EVIDENCE SUMMARY:**

Three RCTs with four publications were found for this comparison. Sabuncu 2003 (28) compared 35 µg EE + 2 mg CPA (n=14) vs. 35 µg EE + 2 mg CPA + sibutramine 10 mg/day (n= 14) for 6 months. In this cohort all women with PCOS were obese. This study had a high risk of bias. Song 2017 (29) compared 35 µg EE + 2 mg CPA (n=60) vs. 35 µg EE + 2 mg CPA + Orlistat 120 mgx3 (n=60), a secondary publication from this RCT came from Ruan 2018 (30) on androgens. The duration of the study was 3 months. Gu 2022 studied DRSP 3 mg/EE 20 µg (n=33) vs. DRSP 3 mg/EE 20 µg + Orlistat 120 mg x 3 (n=33) for 3 months. This study had a high risk of bias. Thus, all included studies had a high risk of bias, and they included only adults.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

The meta-analysis showed lower DHEAS levels after treatment with the combination COCP + anti-obesity drugs, with a low certainty of evidence. COCP + anti-obesity treated women had lower FAI after treatment, with a low certainty of evidence. For all other outcomes, there were no difference between treatments, with low or very low certainty of evidence.

Adverse effects
Sabuncu 2003 did not report on adverse effects, neither did Gu 2022. Ruan/Song reported that 21 of the patients treated with COCP (as single treatment or in combination, total n=180)) experienced side effects including headaches, nausea, weight gain, breast tenderness, and loss of libido. There were no cases of venous thrombosis. Five patients who received anti obesity treatment (orlistat, together with COCP or a combination of COCP and metformin, total n=120) experienced gastrointestinal adverse effects (mainly flatulence and oily spotting) during the first 2 weeks of treatment, which decreased in frequency with ongoing treatment. No subject stopped treatment or required any dose reduction. Gu 2022 did not report adverse effects.

Comparison 18: COCP + metformin vs. COCP + anti-obesity

- **EVIDENCE SUMMARY:**

One RCT, with a high risk of bias, and with two publications, Song 2017 (29) and Ruan 2018 (30), were identified. COCP containing EE/CPA were given to both groups. One group had orlistat 120 mgx3, and one group had metformin 1500 mg/day, in addition to the COCP treatment, n=60 in both groups. The study had a duration for 3 months and had a high risk of bias.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Results are reported narratively. Triglycerides and cholesterol levels were lower and HDL levels higher after treatment with COCP + anti-obesity, compared with COCP + metformin, with very low certainty of evidence. For other outcomes, there were no certain differences between the groups, with very low certainty of evidence.

Included studies:

Comparison 19: COCP vs. COCP + metformin + anti-obesity

- **EVIDENCE SUMMARY:**

One RCT, with a high risk of bias, with two publications, Song 2017 (29) and Ruan 2018 (30), were identified. EE/CPA treatment alone was compared with the combination of EE/CPA + orlistat + metformin, n=60 in both groups. The study had a duration for 3 months.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

The combination of COCP + metformin + anti-obesity treatment resulted in higher SHBG, lower free testosterone, higher HDL and lower insulin and HOMA-IR compared with COCP alone, with very low certainty of evidence. However, triglycerides were lower after COCP alone, with very low certainty. No difference was seen for other outcomes, with very low certainty.

One RCT with two publications, Song 2017 (29) and Ruan 2018 (30), were identified.:

ADVERSE EFFECTS

The RCT described above (29, 30) had four arms, COCP vs. COCP + metformin vs. COCP + anti-obesity vs. COCP + metformin + anti-obesity, n=60 per arm. Adverse effects are described for the whole group:

Twenty-one patients who took **COCP** experienced side effects including headaches, nausea, weight gain, breast tenderness, and loss of libido. However, in general, COCP was well tolerated and no cases of venous thrombosis was observed.

Five patients who received **anti-obesity** treatment (orlistat) experienced gastrointestinal adverse effects (mainly flatulence and oily spotting) during the first 2 weeks of treatment, which decreased in frequency with ongoing treatment. No subject stopped treatment or required any dose reduction.

Nine patients taking **metformin** 1500 mg/day reported side-effects such as mild nausea and abdominal pain. Four patients tolerated the dose gradually, while in another five patients the tolerated dose was 1000 mg/day.

Comparison 20: COCP vs. metformin

- **EVIDENCE SUMMARY:**

In total 25 RCTs with 33 publications were included in this comparison, 21 RCTs (29 publications) involved adults and 4 RCTs studied adolescents.

Glintborg 2014a (32) was the first publication from an RCT comparing COCP (n=23), metformin (n=19) or a combination (not included in this comparison). Three further publications from the same RCT followed, Glintborg 2014b (33), Glintborg 2017 (34), Altinok 2018 (35).

Meyer 2007 (36) was the first publication from an Australian RCT comparing COCP (n=31) and metformin (n=36) (an arm with COCP + anti-androgens was also included in the RCT, not reported under this outcome). Later publications from the same RCT includes Hutchison 2008 (37), Moran 2010 (38) and Burchall 2017 (39). In some of the publications, only mean change is reported. When possible, publications reporting mean ± SD have been chosen to allow inclusion in meta-analyses.

Two of the included studies, Kilic 2011 (40) and Wu 2008 (41), are reported on subgroup level (thus reported as two), since the authors in the publications only report outcomes in that way.

Both Panidis 2011 (15) and Christakou 2014 (12) included two COCP groups and one metformin group. For both studies, the COCP containing EE/DRSP was used in the meta-analysis, not the group with EE/CPA, since CPA is not a progestin per se.

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:**

A meta-analysis, including subgroup analysis for adults and adolescents, was performed. In the overall analysis, there were no differences between treatments regarding BMI, weight or WHR, with very low certainty of evidence. No differences were seen in the subgroups. Menstrual cycle duration became shorter after COCP treatment compared with metformin, with moderate certainty of evidence.

Regarding hyperandrogenism, there was no difference in hirsutism (very low certainty of evidence), but COCP treatment resulted in lower FAI, total testosterone and higher SHBG levels, all with a low certainty of evidence, and in lower free testosterone with a very low certainty. Both androstenedione and DHEAS were lower after COCP treatment, with low and very low certainty, respectively.

In adolescents, similar results were seen regarding hyperandrogenism, but with very low certainty of evidence, except for total testosterone, which was lower after COCP treatment with moderate certainty of evidence. For free testosterone, no difference was seen in between treatments, with very low certainty of evidence. There were no studies in the adolescent cohort with androstenedione or DHEAS as outcomes for this comparison.

In adults, there was no difference in hirsutism with a very low certainty. FAI and total testosterone levels were lower after COCP treatment with low certainty and free testosterone lower with very low certainty. SHBG levels were higher (low certainty), androstenedione lower (moderate certainty) and DHEAS lower (very low certainty) after COCP treatment.

Regarding metabolic outcomes, insulin was lower overall (low certainty), and in adults (moderate certainty) after metformin. In adolescents there was no difference (very low certainty of evidence). Glucose levels did not differ, overall or in the subgroups. HOMA-IR was lower after metformin treatment bort overall and in adults, very low and low certainty of evidence, respectively. Cholesterol levels were lower after metformin both overall (very low certainty) and in subgroups (low certainty). There were no differences in LDL, HDL or triglyceride levels, except for adiolescents, where lower LDL levels were seen after metformin treatment (low certainty).

CRP levels were lower after metformin treatment, both overall (low certainty), in adults (low certainty), and in adolescents (very low certainty).

No difference was seen regarding PAI-1 levels.

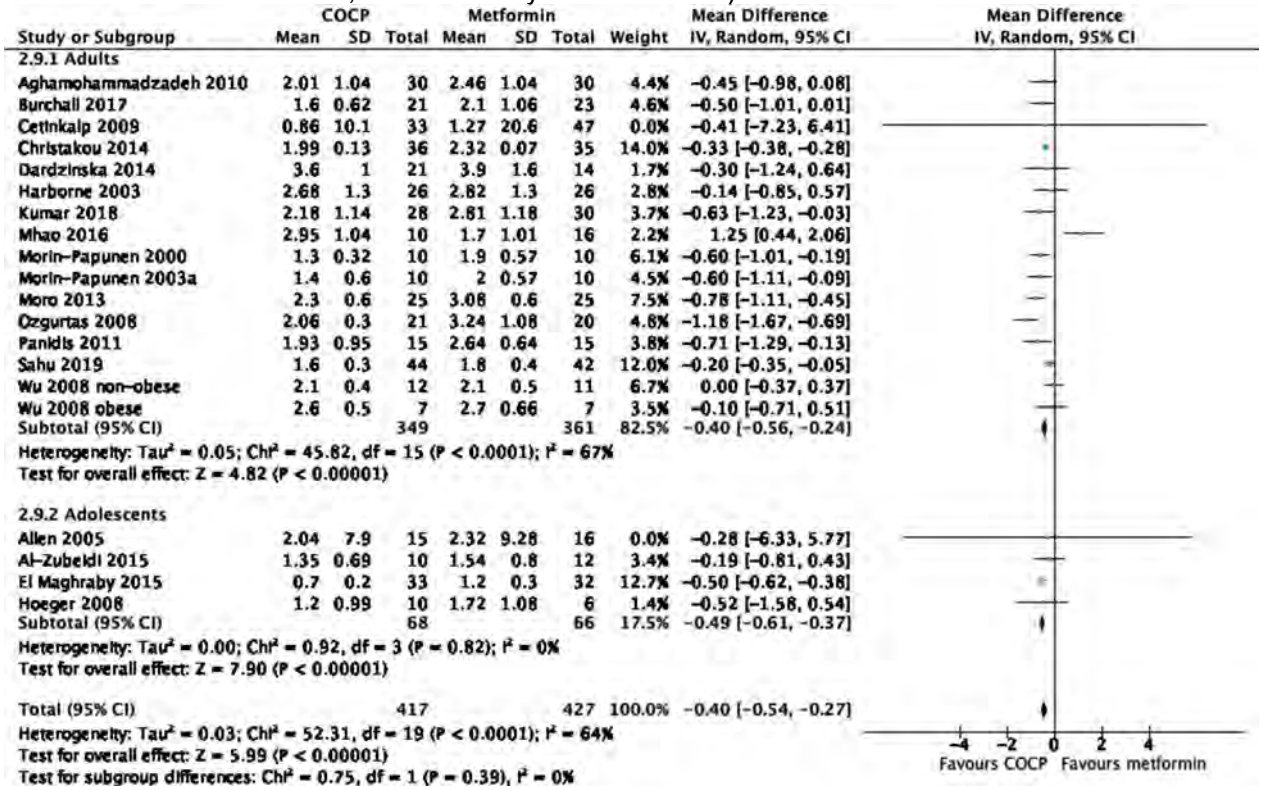
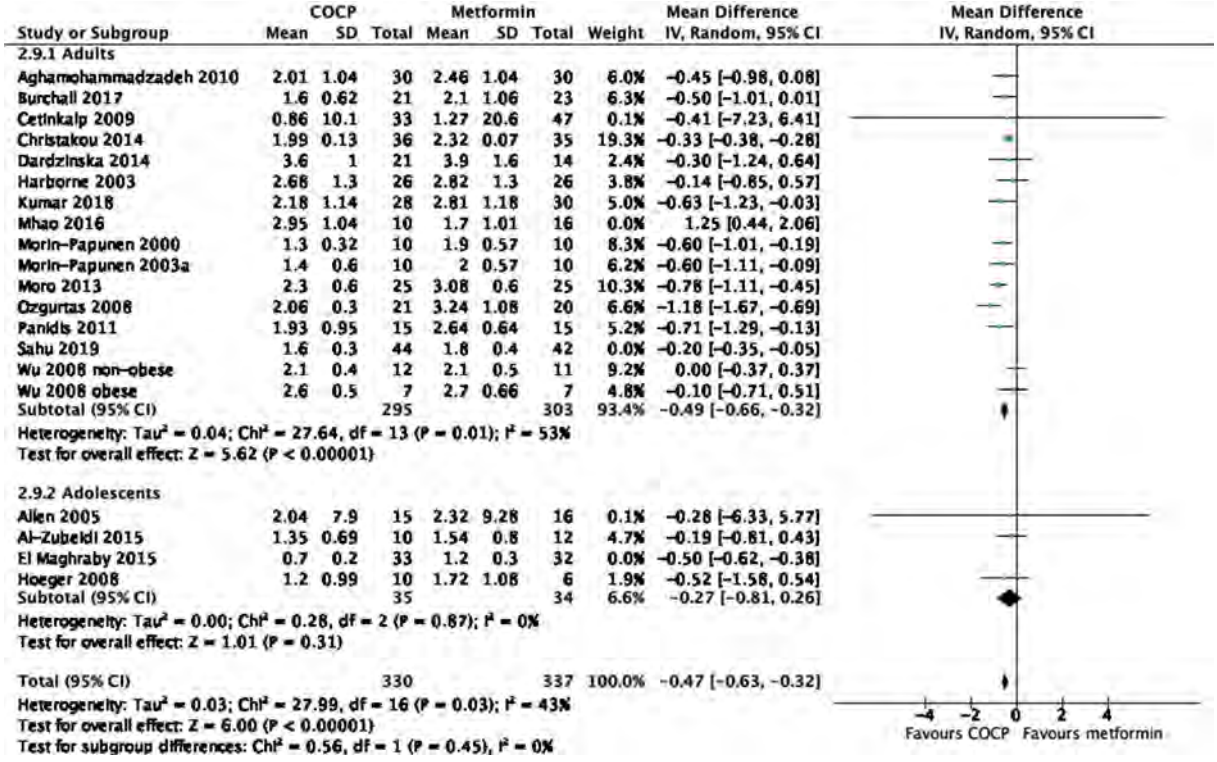
20.9.2.1. Forest Plot COCP vs metformin for total testosterone (nmol/L)

Version 1 – all studies included. (Mhao 2016 reported TT as mg/dl, this was considered a reporting error and that the unit reported should have been ng/ml, the study was included with this correction. Sahu 2019 reported TT as ng/dl, this too was considered a reporting error, the unit is presumed to be nmol/L, and the study was included with this assumption. El Maghraby reported TT as µg/ml, it was assumed that nmol/L was the unit meant, and the study was included.)

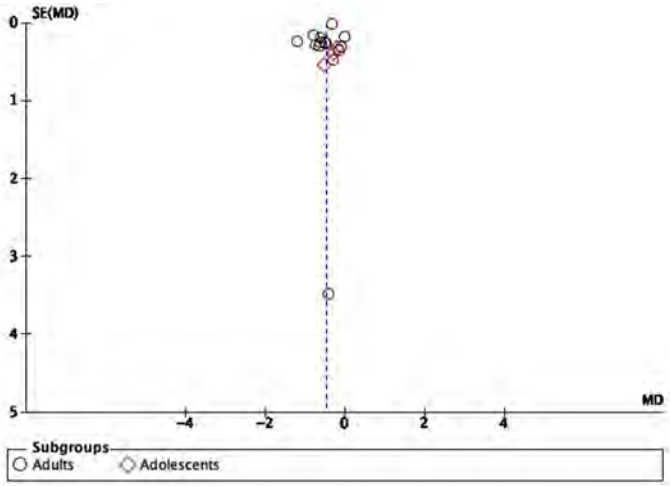


20.9.2.2. Forest Plot COCP vs metformin for total testosterone (nmol/L)

Version 2 - A sensitivity analysis was performed, without Mhao, Sahu and El Maghraby (due to unclear reporting). This did not change the results overall or for adults but became non-significant (no difference) for adolescents.



20.9.3. Funnel plot for assessment of publication bias
Version 1 , all studies included



OUTCOME 20.10 FREE TESTOSTERONE
20.10.1 Individual Study Data Table

OUTCOME 20.26 Adverse events

Due to the lack of systematic reporting, where many studies do not report adverse effects at all, and the ones that do, not report in a similar manner, it is difficult to draw strong conclusions, but the reports suggest more gastrointestinal side effects with metformin.

Comparison 21: COCP vs. COCP + metformin

- **EVIDENCE SUMMARY:**

A total of 18 RCTs with 22 publications were identified for this comparison. There were no studies involving adolescents. Wu 2008 is reported as two studies in the meta-analysis since the results are reported stratified for obese and non-obese women. Fonseka 2020 compared EE/DRSP ± metformin and EE/CPA ± metformin and are thus also reported in two separates in the meta-analysis. The studies are shown in the table below.

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY**

Results are described for adults, since there were no studies in adolescents. COCP + metformin treatment resulted in lower FAI and higher SHBG levels, compared with COCP alone, with moderate and low certainty of evidence respectively. The combination COCP + metformin resulted in lower androstenedione and DHEAS levels, very low and low certainty. After treatment with the combination COCP + metformin, insulin and HOMA-IR were lower compared with after COCP, very low and low certainty.
With moderate certainty, the effect on total testosterone do not differ between treatments. There were no differences in blood lipids, CRP or anthropometry (low or very low certainty). There was no difference in HRQoL, very low certainty. Adverse effects are difficult to compare since this is an outcome assessed differently, but the combination COCP + metformin seems to be associated with more gastrointestinal side effects.

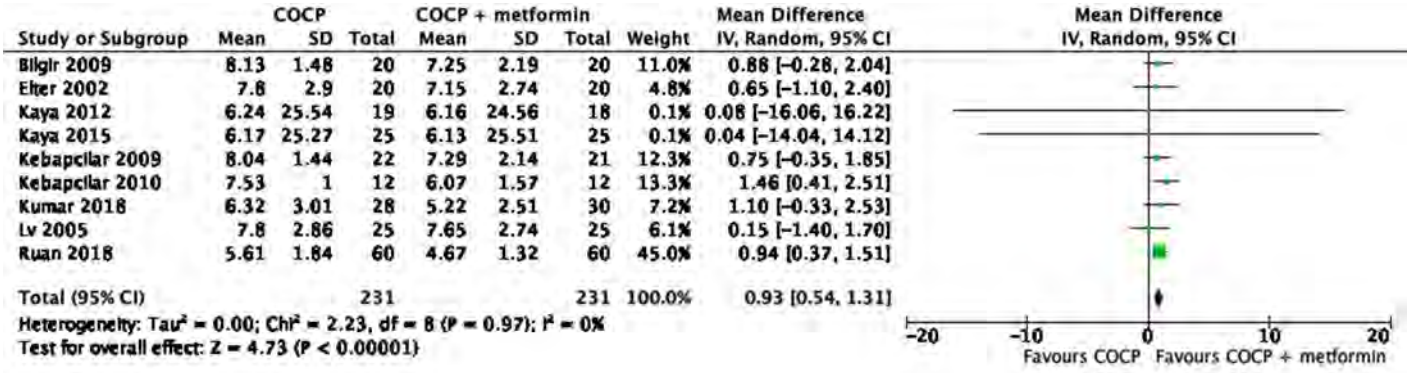
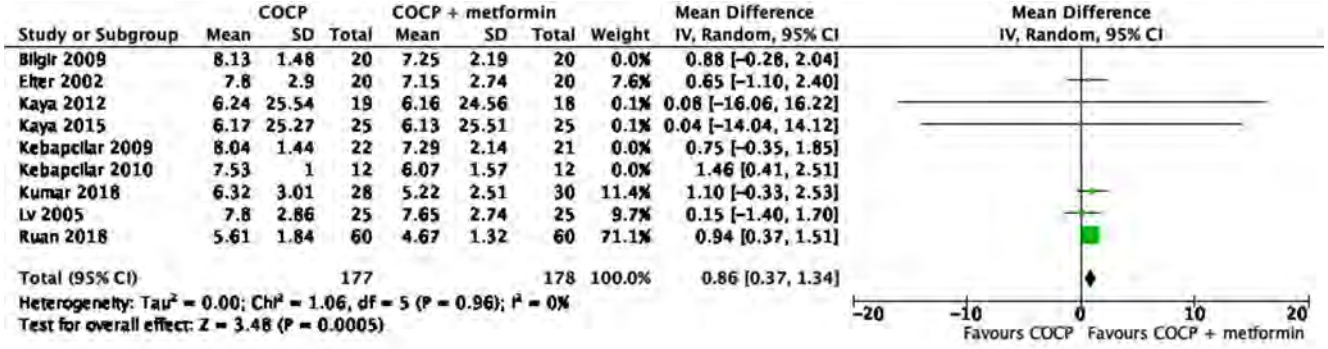
21.10.2.1. Forest Plot COCP vs COCP + metformin for DHEAS (μmol/L)

Version 1 – Bilgir, Kebapcilar 2009 and Kebapcilar 2010 all report DHEAS as μg/ml, this is considered a reporting error, and assumed meaning μg/dl. The studies were included with this assumption.



21.10.2.2. Forest Plot COCP vs COCP + metformin for DHEAS (μmol/L)

Version 2 – Sensitivity analysis without Bilgir, Kebapcilar 2009 and Kebapcilar 2010 did not change the overall results.



21.10.3. Funnel plot for assessment of publication bias, all studies included (version 1).

*COCP + metformin or metformin alone

Comparison 22: COCP vs. anti-androgen

- **EVIDENCE SUMMARY:**

One RCT with a moderate risk of bias compared EE/CPA with spironolactone 200 mg/day. No additional studies since last guideline.

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:**

The only outcome reported was hirsutism (FG score), where lower scores were seen after COCP treatment, very low certainty of evidence.

Included study:

Study ID	ROB	Comparisons	Country, duration	N	Mean age	Mean BMI	PCOS	Menarche age	Smokers	Comments	Outcomes relevant to this review
Spritzer 2000 (70)	Mod	1: EE/CPA 2: spironolactone 200 mg/day	Brazil 12 m	C: 9 AA: 10	22 ± 9 for all	24 ± 5 for all	NIH	NR	NR		FG score

Result from individual study:

Spritzer 2000	Certainty				**Very low** (serious risk of bias, very serious risk of imprecision)			
Outcome	Time	N	COCP Mean	COCP SD	Anti-androgen Mean	Anti-androgen SD	P value	Favours
Hirsutism /FG score)	12 m	C: 9 AA: 10	12	3	16	3.2	0.009	COCP

Comparison 23: COCP vs. COCP + antiandrogen

EVIDENCE SUMMARY:

Seven RCTs with eight publications were identified for this outcome. Four had a moderate risk of bias, and three a high risk of bias. No studies involved adolescents.
The anti-androgens used in these studies was spironolactone (Hagag, Kebapcilar 2010, Leelaphiwat, and Meyer including the follow-up publication from the same RCT by Burchall 2017, bicalutamide (Moretti), finasteride (Tartagni 2000) and cyproterone acetate (Hagag).
Since Hagag had two arms with COCP + anti-androgens, but only one arm with COCP, the combination COCP + spironolactone was used in the meta-analysis, since this was the most used combination in other studies. Information about included studies are shown below.

META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:

For adults, with moderate certainty, weight was lower after COCP treatment, compared with COCP + anti-androgen treatment. There was no difference in BMI between treatments, with moderate certainty. There were no differences in biochemical hyperandrogenism, glucose metabolism or blood lipids with very low certainty.

Included studies:

Comparison 24: COCP vs. metformin + antiandrogen

▪ EVIDENCE SUMMARY:

One study was identified, Ibanez 2004 (76), including adolescents. No additional studies could be included since the last guideline.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

After COCP treatment, SHBG levels are higher compared with the combination of metformin + anti-androgen, with very low certainty of evidence. The combination of metformin and anti-androgen results in lower triglycerides and LDL levels, compared with COCP, with very low certainty of evidence.

Comparison 25: COCP + anti-androgen vs. metformin

- **EVIDENCE SUMMARY:**

Four different RCTs were included with five publications (36, 39, 48, 77, 78) were included. None involved adolescents. Two RCTs had a high risk of bias, one moderate and one low risk of bias. Meyer 2007 compared 20µg EE + 100µg LVG + 50mg spironolactone (n=33) with metformin 2000 mg/day (n=36) during a 6 month period (36), this study had a moderate risk of bias. A secondary publication from this RCT is Burchall 2017 (39), where hemostatic markers were examined (n= 16 vs. 23), additional outcomes could be extracted from this publication. Kebapciliar 2010 compared 35 µg EE/2mg CPA + 100mg spironolactone (n=12) with metformin 1700 mg/day (n=12) for 3 months (48). Mehrabian 2016 compared EE 30 µg + 0.15 mg LGS + 62.5 mg flutamide (n=34) with metformin 1000 mg/day (n=34) during 6 months (78). Alpanes 2017 compared 30 ug EE+ 150 ug DG + 100 mg spironolactone (n= 18) with metformin 1700 mg/day (n=13) for 12 months (77). The studies are shown below.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Only two outcomes could be included in the meta-analysis. No differences were seen in BMI or HDL, with very low certainty of evidence. Other outcomes are reported narratively. FAI and androstenedione levels were lower after COCP + AA treatment compared with metformin, with very low certainty. Fasting glucose levels were lower after metformin, with very low certainty. In all other outcomes, there were no differences, with very low certainty.

Included studies, COCP + anti-androgen vs. metformin:

1. Serious risk of bias
2. Serious risk of indirectness
3. Serious risk of imprecision
4. Very serious risk of bias

Adverse effects:

Alpanes 2017: No major adverse effects. In the metformin group, two patients dropped out because of mild but persistent gastrointestinal disturbances. One patient on COCP plus spironolactone dropped out due to a mild urticarial skin rash that resolved after stopping the medication.
Meyer 2007: One patient in the COCP plus spironolactone group withdrew due to mood swings. No adverse effects reported for metformin.
Mehrabian 2016: Reports no adverse effects. Prevalence of hypertension (BP>130/85) did not increase from baseline in any of the groups.
Kebapciliar 2010: 8/24 patients treated with metformin or metformin + COCP reported mild nausea and vomiting but this did not make patients stop the treatment. 0 side effects reported for COCP + AA.

Comparison 26: COCP + anti androgen vs. COCP + anti androgen + met

- **EVIDENCE SUMMARY:**

One RCT, Ibanez 2005, with a moderate risk of bias, was included. This study compared COCPs containting EE/DRSP + antiandrogen (flutamide) treatment with and without metformin 850 mg/day, for 3 months. The study had two subgroups, adolescents, and young adults, and the results were reported separately.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Results from the two subgroups were combined in a meta-analysis. Overall, there was no difference between treatments regarding BMI, SHBG, total testosterone, androstenedione, DHEAS, LDL or HDL with very low certainty of evidence.

Included studies:

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Comments	Outcomes
Ibanez 2005 (79)	Mod	1: EE 30 μg + 0.3 mg DRSP + flutamide 62.5 mg 2: : EE 30 μg + 0.3 mg DRSP + flutamide 62.5 mg + met 850 mg/day	Spain 3 months	1: 15 2:16	Mean± sem; age, 16.0 ±0.3 yr	1: 21.9 ±0.7 2: 22.4 ±0.5	Author defined	NR	NR	Adolescents, 2-6 yrs post menarche	BMI, Fasting glucose/insulin ratio, SHBG, Testosterone, A4, DHEAS, TG, HDL, LDL,

Comparison 27: COCP + anti-androgen vs. COCP + metformin

- **EVIDENCE SUMMARY:**

Only one RCT was identified. The study, with a high risk of bias, compared COCP (containing CPA) + 100 mg spironolactone with COCP + metformin 1700 mg/day. The study had a duration of 3 m.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Outcomes from this individual study are presented below. DHEAS levels were lower after COCP + metformin than after COCP + anti-androgen, with very low certainty. There were no differences in other reported outcomes, with very low certainty of evidence.

Included studies:

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Outcomes
Kebapcilar 2010 (48)	High	1: 35 µg EE/2mg CPA 2: 35 µg EE/2mg CPA + met 1700 mg/day 3: metformin 1700 mg/day 4: EE/CPA + spiro 100 mg/day	Turkey 3 months	12/ group	24.0±5.4 years; for all	1: 28.7 ±6 2: 27.6 ± 3 3: 27.8 ± 4 4: 27.6 ± 4	Rott	NR	Excluded	BMI, fT, DHEAS, insulin, HOMA, TG, LDL, HDL,

Results from the individual study:

Kebapcilar 2010			⊕◯◯◯ VERY LOW (very high risk of bias, indirectness, very serious impreceion)			
Outcome	COCP + AA (n=12)		COCP + met (n=12)		P value	**Favours**

TG (mg/dl)	74	39	69	22	0.70	No difference

Comparison 28: COCP vs. COCP + metformin + anti-androgen

▪ EVIDENCE SUMMARY:

One study with a moderate risk of bias, was identified. This Spanish study included young women and adolescents. Details are shown below.

▪ META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:

Outcomes from this individual study are presented below. SHBG levels were higher after COCP + metformin + anti-androgen, with very low certainty of evidence. There were no other differences, with very low certainty of evidence.

Included studies:

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Comments	Outcomes
Ibanez 2004 (76)	Mod	1: EE 30 μg + 0.3 mg DRSP 2: EE 30 μg + 0.3 mg DRSP + Met 850 mg + flutamide 62.5 mg	Spain 9 moths	1: 11 2: 11	Mean age for all: 18.6±0.3 years	1: *21.8 ±0.7* *2: 21.7 ±0.6*	Author defined	NR	NR	Young women/adolescents 4-8 yrs post menarche	BMI, FG score, Fasting glucose/insulin ratio, SHBG, Testosterone, TG, HDL, LDL,

Results from the individual study:

Ibanez 2004	⊕◯◯◯ VERY LOW (risk of bias, indirectness, very serious imprecision)

Triglycerides (mg/dl)	115	56	107	36	0.69	No difference

Comparison 29: COCP vs. SPIOMET (=metformin + anti-androgen+glucose sensitizer)

- **EVIDENCE SUMMARY:**

Two RCTs, with results pooled and with, in total, five publications were identified. COCP (EE 20 µg – LNG 100 mg) was compared with spironolactone 50 mg/d + pioglitazone 7.5 mg/d + metformin 850 mg/d (SPIOMET). The first RCT was published by Ibanez 2017 (80), with one additional publication on the same cohort by Diaz 2018 (81). Another RCT, with the same comparison, and from the same research group, was done to increase power, with no separate publication. The pooled results were published by Malpique 2019 (82), Ibanez 2020 (83) and de Zegher 2021 (84). The publication by Ibanez 2020 has the highest number of participants, as results for the primary outcome S100A4 in Malpique, not were available for all. Thus, Ibanez 2020 has been considered the main publication. FAI could be extracted from de Zegher as an additional outcome. Risk of bias was moderate. The study had a duration of 12 months.

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:**

Outcomes are presented in table below. With very low certainty of evidence, SPIOMET treatment results in lower BMI, FG score, insulin, HOMA, LDL and CRP levels compared with COCP. COCP treatment results in higher SHBG and lower FAI and androstenedione levels, compared with SPIOMET, with very low certainty of evidence.

Included studies

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Comments	Outcomes

Comparison 30: COCP + AA1 vs. COCP + AA2

- **EVIDENCE SUMMARY:**

One RCT was identified. Hagag 2014 compared COCP (35 μg EE + 250 μg NOR) + spironolactone 100 mg with COCP (35 μg EE + 2 mg CPA) + extra 10 mg CPA. The study had a duration of 12 months and had a moderate risk of bias.

- **META-ANALYSIS/DESCRIPTIVE ANALYSIS SUMMARY:**

Outcomes are presented in table below. The combination of COCP + spironolactone resulted in a greater reduction of hirsutism compared with COCP + extra CPA, with a low certainty of evidence. Other reported outcomes (free and total testosterone, DHEAS, androstenedione) did not differ between treatments, with low certainty of evidence.

Included studies

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Comments	Outcomes
Hagag 2014 (71)	Mod	CA1) [250ug NOR + 35ug EE] + 100mg SPL CA2) [2mg CPA + 35ug EE] + 10mg CPA added	srael 12 months	CA1: 72 CA2: 70	CA1: 22±0.4 CA2: 21±0.3	CA1: 24±0.6 CA2: 23.5±0.5	Rott	NR	NR		FG score, fT, TT, DHEAS, A4, side efffects

Outcomes are reported as percent change versus baseline, mean ± SE.

Outcome	COCP + sprio	COCP + extra CPA	P value	Favours
Hirsutism (FG score)	-57% ± 2.4	-39% ± 2.4	<0.001	COCP + spiro
Free testosterone (pmol/L)	-47% ± 8.7	-45% ± 3.8	NS	No difference
Total testosterone (nmol/L)	-31% ± 3.6	-29% ± 2.6	NS	No difference
DHEAS (μmol/L)	-29% ± 4.6	-31% ± 4.1	NS	No difference
Androstenedione (nmol/L)	-19% ± 5	-21% ± 6	NS	No difference

Comparison 31: Metformin vs COCP + metformin

Results are presented under Q4.3 in the technical report.

Comparison 32: COCP + metformin + lifestyle vs EE/CPA + metformin + lifestyle

- **EVIDENCE SUMMARY:**

One study, Wang 2016, with a high risk of bias was identified for this comparison. Major reasons for high risk of bias was no blinding and high attrition rate. Wang included overweight insulin-resistant women with PCOS. All women received metformin and lifestyle modification and were randomized to receive either conventional COCP (EE/DRSP) or EE/CPA for 6 months.

- **META-ANALYSIS/ DESCRIPTIVE ANALYSIS SUMMARY:**

Results from the single study showed no difference between treatment in any of the reported outcomes, with very low certainty of evidence.

Included study:

Study ID	ROB	Interventions	Setting Duration	N	Mean age	Mean BMI	PCOS	Age at menarche	Smokers	Comments	Outcomes

Adults	1	RCT	very serious[2]	NA	NA	serious[10]	none	59	58	Not applicable – see narrative summary	**4th generation**	⊕◯◯◯ VERY LOW	IMPORTANT

1. One additional study that could not be included in the meta-analysis, Yildizhan 2015, reported mean change from baseline, -0.34 (0.14) for first generation vs. -0.36 (0.15) nmol/L for 4th generation, p=0.42.
2. Downgraded twice as all of evidence is at high risk of bias
3. Downgraded once due to I^2 >50%
4. Downgraded twice due to I^2>50% and CIs not overlapping
5. Downgraded once due to wide CI
6. Downgraded twice due being derived from a single study with very few patients
7. One additional study, that could not be included in the meta-analysis, Yildizhan 2015 reported mean change from baseline, 9.24 (3.36) vs. 13.29 (4.7) nmol/L, p=0.001.
8. One additional study, that could not be included in the meta-analysis. Yildizhan 2015 reported mean change from baseline, -17.34 (8.74) vs. -21.43 (21.57) ug/dl, p=0.65
9. Downgraded once due to outcomes being presented in different ways
10. Downgraded once due to the evidence being derived from a single study

COMPARISON 5: COCP with 2nd vs. COCP with 3rd generation progestin													
Population	Quality assessment							No. participants		Effect estimate	Favours	Certainty	Importance
	No. studies	Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other	COCP + 2nd gen	COCP + 3rd gen				
Outcome: Weight

[1.] Two additional studies, not incl in the meta-analysis: Bhattacharya 2012 reported mean change, -0.45 ± 6.75 for a 3rd generation COCP vs. -0.59 ± 4.76 kg/m^2 for EE/CPA, p value not reported; Kahraman 2014 reported median change, −1 (−9 to 17) for a 4th generation COCP vs. −1 (−12 to 6), p=0.789.
[2.] Downgraded twice since majority of studies had a high risk of bias.
[3.] Two additional studies, not incl in the meta-analysis: Bhattacharya 2012 reported mean change, 0.00 ± 0.08 for a 3rd generation COCP vs. -0.02 ± 0.08 for EE/CPA, p value not reported; Kahraman 2014 reported median change, −4 (−31 to 35) for a 4th generation COCP vs. 0 (−11 to 14), p=0.03.
[4.] Two additional studies, not incl in the meta-analysis: Bhattacharya 2012 reported mean change in FG score, -1.69 ± 5.69 for a 3rd generation COCP vs. -5.29 ± 5.88 for EE/CPA, p=0.003.; Kahraman 2014 reported median change in % from baseline, −18 (−72 to 30) for a 4th generation COCP vs −35 (−71 to 10)), p=0.04.
[5.] Downgraded once, when also considering the results not included in the meta-analysis.
[6.] One additional study, not included in the meta-analysis: Bhattacharya 2012 reported mean change in FAI, -5.58 ± 9.15 for a 3rd generation COCP vs. -10.57 ± 7.93 for EE/CPA, p=0.001.
[7.] Two studies not included in the meta-analysis: Bhattacharya 2012 reported mean change in TT, -0.10 ± 0.39 ng/ml for a 3rd generation COCP vs. -0.03 ± 0.42 for EE/CPA, p value not reported; Kahraman 2014 reported median % change, −39 (−84 to 43) for a 4th generation COCP vs −16 (−78 to 125) for EE/CPA, p=0.087.
[8.] Two additional studies not included in the meta-analysis: Bhattacharya 2012 reported mean change, 99.53 ± 67.52 nmol/L for a 3rd generation COCP vs. -142.91 ± 60.71 for EE/CPA, p=0.02; Kahraman 2014 reported median % change (range) 178 (−57 to 897) vs. 270 (31 to 1,062) nmol/L, p=0.238.
[9.] Downgraded once since some studies had moderate or high risk of bias.
[10.] One additional study, not included in the meta-analysis: Kahraman 2014 reported median % change (range) −29 (−100 to 25) for COCP vs. −18 (−47 to 52) for EE/CPA, p=0.052.
[11.] Downgraded twice since I2>50% and CIs not overlapping
[12.] Downgraded twice due to wide CI and few patients
[13.] One additional study, not included in the meta-analysis: Kahraman 2014 reported median % change (range) −32 (−53 to 15) for COCP vs. −10 (−49 to 63) for EE/CPA, p=0.046.
[14.] Downgraded twice due to very few patients
[15.] Two additional studies, not included in the meta-analysis: Bhattacharya 2012 reported mean change, -0.02 ± 17.35 for a 3rd generation COCP vs. 6.38 ± 15.22 for EE/CPA, p value not reported; Kahraman 2014 reported median % change (range) 7 (−85 to 223) vs. 0 (−82 to 128), P=0.603.
[16.] Downgraded once due to few participants
[17.] Two additional studies not included in the meta-analysis: Bhattacharya 2012 reported mean change, -4.28 ± 11.66 for a 3rd generation COCP vs. -2.46 ± 16.86 for EE/CPA, p value not reported; Kahraman 2014 reported median % change (range) 0 (−15 to 6) vs. 0 (−10 to 18), p=0.397.
[18.] Downgraded once since CIs are not overlapping
[19.] Two additional studies, not included in the meta-analysis. Bhattacharya 2012 reported mean change, -0.28 ± 3.98 for a 3rd generation COCP vs. 1.21 ± 4.03 for EE/CPA, p value not reported; Kahraman 2014 reported median % change (range) 2 (−71 to 216) vs. −18 (−80 to 462), p=0.227.
[20.] Downgraded once since studies show results favoring different outcomes.
[21.] One additional study, not included in the meta-analysis. Kahraman 2014 reported median % change (range) 7 (−13 to 59) for COCP vs. 11 (−17 to 79) for EE/CPA, p=0.673.
[22.] One additional study, not included in the meta-analysis. Kahraman 2014 reported median % change (range) 2 (−30 to 68) vs. 5 (−16 to 63) p=0.555.
[23.] Two additional studies not included in the meta-analysis. Kahraman 2014 reported median % change (range) +5 (−42 to 45) after COCP treatment vs. +16 (−45 to 46) after EE/CPA, p=0.070. Wang 2016 reported medians, 1.67 (1.45, 1.98) mmol/L after COCP and 1.59 (1.36, 1.89) mmol/L after EE/CPA, p=0.322.
[24.] Downgraded once due to I^2>50%
[25.] Downgraded once due to wide CI

COMPARISON 9: Any COCP vs. progestogen													
Population	No. studies	Quality assessment						No. participants		Effect, random [95% CI]	Favours	Certainty	Importance
		Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other	COCP	PROG				
Outcome: BMI													
Overall	2	RCT	very serious[1]	no serious inconsistency	no serious indirectness	no serious imprecision	None	68	69	MD 0.20 kg/m^2 (-1.40; 1.81)	No difference	⊕⊕◯◯ LOW	CRITICAL
Adults	1	RCT	very serious[1]	NA	NA	very serious[2]	None	32	31	MD 0.30 kg/m^2 (-1.92; 2.52)	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Adolescents	1	RCT	serious[3]	NA	NA	very serious[2]	None	36	38	MD 0.10 kg/m^2 (-2.23; 2.43)	No difference	⊕◯◯◯ VERY LOW	CRITICAL
Outcome: WHR

Adults	1	RCT	very serious[1]	NA	NA	serious[8]	none	60	60	MD 0.26 (-1.56; 2.08)	No difference	⨁◯◯◯ VERY LOW	IMPORTANT

1. Downgraded twice as all of evidence is derived from studies at high risk of bias
2. Downgraded once for imprecision due to small sample sizes
3. Downgraded twice due to I^2>50% and CIs not overlapping
4. Downgraded once for imprecision due to wide CIs
5. Downgraded once due to I^2>50%
6. Ruan et al. 2018 not included, reported extreme values
7. Downgraded twice due to very few participants and only one study
8. Downgraded once due to the evidence being derived from a single study

COMPARISON 18: Any COCP + metformin vs. any COCP + anti-obesity													
Population	No. studies	Quality assessment						No. participants		Effect, narrative summary	Favours	Certainty	Importance
		Design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other	COCP + MET	COCP + anti-obesity				
Outcome: Total testosterone													
Adults	1	RCT	Very serious	NA	no serious	serious	None	60	60	Not applicable – see narrative summary	No difference	⊕◯◯◯ VERY LOW	IMPORTANT
Outcome: DHEAS													
Adults	1	RCT	Very serious	NA	no serious	serious	None	60	60	Not applicable – see narrative summary	No difference	⊕◯◯◯ VERY LOW	IMPORTANT
Outcome: Androstenedione

Question 4.2. & 4.3.

Is the oral contraceptive pill alone or in combination effective for management of hormonal and clinical PCOS features in adolescents and adults with PCOS?

BACKGROUND:

Polycystic ovary syndrome (PCOS) is a common familial endocrine disorder associated with obesity and metabolic syndrome (1). Whilst the multicomponent healthy lifestyle interventions are the core of the management, combined oral contraceptive pills (COCPs) are also required to ameliorate the clinical symptoms such as irregular menstrual cycles and hyperandrogenism in adult women and adolescents with PCOS (2, 3). COCP are also required for some adolescents who present with one PCOS feature (irregular menstrual cycles or hyperandrogenism) soon after menarche and do not full fill the adolescent diagnostic criteria for PCOS. These adolescents are considered “at risk of PCOS” and require management of their symptoms (4).

The effects of COCPs on menstrual cycle, hirsutism, androgen levels, weight, lipid profile and blood glucose levels are variably reported and depend on type of COCP used, duration of use, severity of presentation/ phenotype and adherence to the regimen, among other factors.

Different combinations of COCPs are available with heterogeneous estrogen and progestin preparations and variable pharmacological and clinical properties. Thus, the efficacy and consequences of COCPs in PCOS may vary. There is inadequate evidence to suggest the optimal COCP formulation, or dosing regimen (3, 5).

Consideration of possible adverse effects must be made before prescribing any COCPs. Absolute contraindications for COCP use include women with history of migraine with aura, deep vein thrombosis (DVT)/ pulmonary emboli (PE), known thrombogenic mutations, multiple risk factors for arterial cardiovascular disease, history of ischemic heart disease or stroke, complicated valvular heart disease, breast cancer, neuropathy, severe cirrhosis and malignant liver tumours. Women up to 6 weeks postpartum with other risk factors for venous thromboembolism (VTE) (e.g. immobility, transfusion at delivery, BMI > 30 kg/m2, postpartum haemorrhage, immediately post-caesarean delivery, preeclampsia, smoking), are also considered at high risk (6).

In the appraisal of the comparisons between different progestogens, the following needs to be considered. Progestins are classified as first to fourth generation based on when they were first available, but different generations also have some different characteristics. Current evidence suggests that COCPs containing levonorgestrel, norethisterone and norgestimate (1st, 2nd and 3rd generation progestins) are associated with the lowest relative risk of DVT/PE of the COCP preparations available. The 4th generation includes anti-androgenic progestins like drospirenone and dienogest, but also preparations with natural estrogens instead of EE, thus increasing variation when results are pooled under “4th generation preparations” Recent evidence also suggests lower VTE risk for preparations with natural estrogens. Also, according to international recommendations COCPs with 35ug EE and cyproterone acetate (CPA) should not be used first line, due to higher risk for DVT. Thus, for contraception and other indications including irregular menstrual cycles, other preparations with lower risk profiles are recommended.

Metformin is an insulin sensitizer that is used to treat impaired glucose tolerance and PCOS symptoms in adolescents and women. As metformin is cheap and available it is commonly used to treat adolescents and women with PCOS. Metformin has mild side effects of nausea, vomiting, diarrhoea, flatulence and rarely in those with renal impairment of other illnesses can have serious adverse effects such as lactic acidosis. Metformin can be used alone or in combination with COCP for PCOS (7).

The evidence of anti-obesity medications in the management of adult women with PCOS is emerging and this to be considered in addition to COCP (8).

While considering the question of effectiveness of COCP in adolescents and adult women with PCOS, all evidence was evaluated for all comparisons available within different COCP and COCP in addition to other treatments including metformin, anti-obesity medications and antiandrogens. Eighty-four studies were evaluated, 20 published after 2017 and 13 including adolescents. The relevant prioritised clinical questions were also addressed in this section.

GRADE EVIDENCE CERTAINTY	
Comparison	**GRADE for critical outcomes**
○ Comparison 1: COCP with high vs. COCP with low levels of estrogen	⊕⊕○○ LOW
○ Comparison 2: COCP with 1st vs. COCP with 2nd generation progestin	No evidence
○ Comparison 3: COCP with 1st vs. COCP with 3rd generation progestin	⊕○○○ VERY LOW
○ Comparison 4: COCP with 1st vs. COCP with 4th generation progestin	⊕○○○ VERY LOW
○ Comparison 5: COCP with 2nd vs. COCP with 3rd generation progestins	⊕○○○ VERY LOW
○ Comparison 6: COCP with 2nd vs. COCP with 4th generation progestins	⊕○○○ VERY LOW
○ Comparison 7: COCP with 3rd vs. COCP with 4th generation progestins	⊕○○○ VERY LOW
○ Comparison 8: Any COCP vs. EE/CPA	⊕⊕○○ LOW
○ Comparison 9: Any COCP vs. progestin	⊕○○○ VERY LOW
○ Comparison 10: Any COCP vs. controls	⊕○○○ VERY LOW
○ Comparison 11: Any COCP vs. placebo	⊕○○○ VERY LOW
○ Comparison 12: Any COCP vs lifestyle	⊕○○○ VERY LOW
○ Comparison 13: Any COCP vs. lifestyle +/- anti-obesity treatment	⊕○○○

	VERY LOW
○ Comparison 14: Any COCP vs. combination of COCP and lifestyle with/without anti-obesity treatment	⊕○○○ VERY LOW
○ Comparison 15: lifestyle +/- anti-obesity treatment vs. combination of COCP and lifestyle +/- anti-obesity treatment	⊕○○○ VERY LOW
○ Comparison 16: Any COCP vs. anti-obesity	⊕○○○ VERY LOW
○ Comparison 17: Any COCP vs. COCP + anti-obesity	⊕○○○ VERY LOW
○ Comparison 18: Any COCP + metformin vs. COCP + anti-obesity	⊕○○○ VERY LOW

○ Comparison 20: Any COCP vs. metformin (also incl. in Q4.3)	⊕○○○ VERY LOW
○ Comparison 21: Any COCP vs. COCP + metformin	⊕⊕○○ LOW
○ Comparison 22: Any COCP vs. anti-androgen (also in Q4.6, but their time limit 6 m treatment)	⊕○○○ VERY LOW
○ Comparison 23: Any COCP vs. COCP + anti-androgen androgen (also in Q4.6, with time limit of 6m)	⊕⊕⊕○ MODERATE
○ Comparison 24: Any COCP vs. metformin + anti-androgen androgen (also in Q4.6, with time limit of 6m)	⊕○○○ VERY LOW
○ Comparison 25: Any COCP + anti-androgen vs. metformin androgen (also in Q4.6, with time limit of 6m)	⊕○○○ VERY LOW
○ Comparison 26: Any COCP + anti androgen vs. COCP + anti androgen + met androgen	⊕○○○ VERY LOW

○ Comparison 27: Any COCP + anti-androgen vs. COCP + metformin androgen	⊕○○○ VERY LOW
○ Comparison 28: Any COCP vs. COCP + metformin + anti-androgen androgen (also in Q4.6)	⊕○○○ VERY LOW
○ Comparison 29: Any COCP vs. SPIOMET (=metformin + anti-androgen + glucose sensitizer) (also in Q4.6)	⊕○○○ VERY LOW
○ Comparison 30: Any COCP + AA1 vs. COCP + AA2 (reported in Q4.6)	See Q.4.6.
○ Comparison 31: Metformin vs Any COCP + metformin (reported in Q4.3)	See Q.4.3
○ Comparison 32: Any COCP + met vs. EE/CPA + met	⊕○○○ VERY LOW

Evidence to Recommendations Framework

COMPARISONS (option versus other option)

Comparison excluded due to lack of evidence:
Comparison 2: COCP with 1st vs. COCP with 2nd generation progestin
Comparisons included:
o Comparison 1: COCP with high vs. COCP with low levels of estrogen
o Comparison 3: COCP with 1st vs. COCP with 3rd generation progestin
o Comparison 4: COCP with 1st vs. COCP with 4th generation progestin
o Comparison 5: COCP with 2nd vs. COCP with 3rd generation progestins
o Comparison 6: COCP with 2nd vs. COCP with 4th generation progestins
o Comparison 7: COCP with 3rd vs. COCP with 4th generation progestins
o Comparison 8: COCP vs. EE/CPA
o Comparison 9: COCP vs. progestin
o Comparison 10: COCP vs. controls
o Comparison 11: COCP vs. placebo
o Comparison 12: COCP vs lifestyle
o Comparison 13: COCP vs. lifestyle +/- anti-obesity treatment
o Comparison 14: COCP vs. combination of COCP and lifestyle with/without anti-obesity treatment
o Comparison 15: lifestyle +/- anti-obesity treatment vs. combination of COCP and lifestyle +/- antiobesity treatment
o Comparison 16: COCP vs. anti-obesity
o Comparison 17: COCP vs. COCP + anti-obesity
o Comparison 18: COCP + metformin vs. COCP + anti-obesity
o Comparison 19: COCP vs. COCP + metformin + anti-obesity
o Comparison 20: COCP vs. metformin (also incl. in Q4.3)
o Comparison 21: COCP vs. COCP + metformin
o Comparison 22: COCP vs. anti-androgen (also in Q4.6, but their time limit 6 m treatment)
o Comparison 23: COCP vs. COCP + antiandrogen androgen (also in Q4.6, with time limit of 6m)
o Comparison 24: COCP vs. metformin +anti-androgen androgen (also in Q4.6, with time limit of 6m)
o Comparison 25: COCP +anti-androgen vs.metformin androgen (also in Q4.6, with time limit of 6m)
o Comparison 26: COCP + anti androgen vs. COCP + anti androgen + metformin + androgen
o Comparison 27: COCP + anti-androgen vs. COCP + metformin androgen
o Comparison 28: COCP vs. COCP + metformin + anti-androgen androgen (also in Q4.6)
o Comparison 29: COCP vs. SPIOMET (=metformin + anti-androgen + glucose sensitizer) (also in Q4.6)
o Comparison 30: COCP + AA1 vs. COCP + AA2 (reported in Q4.6)
o Comparison 31: Metformin vs COCP + metformin (reported in Q4.3)
o Comparison 32: COCP + met vs. EE/CPA + met

EVIDENCE-BASED RECOMMENDATION(S)

- **EBR:** The COCP could be recommended in reproductive aged adults with PCOS for management of hirsutism and/or irregular menstrual cycles.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **EBR:** The COCP could be considered in adolescents at risk or with a clear diagnosis of PCOS for management of hirsutism and/or irregular menstrual cycles.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **EBR:** Health professionals could consider that there is no clinical advantage of using high dose ethinylestradiol (≥ 30 µg) versus low dose ethinylestradiol (< 30 µg) when treating hirsutism in adults with PCOS.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **EBR:** General population guidelines should be considered when prescribing COCP in adults and adolescents with PCOS as specific types or doses of progestins, estrogens or combinations of COCP cannot currently be recommended.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **EBR:** The 35 microgram ethinyl estradiol plus cyproterone acetate preparations should be considered as second-line therapy over other COCPs, balancing benfits and adverse effects, including venous thromboembolic risks.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

- **EBR:** Progestin only oral contraceptives may be considered for endometrial protection, based on general population guidelines, acknowledging that evidence in women with PCOS is limited.

GRADE Direction and Strength of Recommendation:

☐ Strong recommendation against the option	☐ Conditional (weak) recommendation against the option	☐ Conditional (weak) recommendation for either the option or the comparison	☒ Conditional (weak) recommendation for the option	☐ Strong recommendation for the option

PRACTICE POINT(S)

When prescribing COCPs in adults and adolescents with PCOS, and adolescents at risk of PCOS:

● It is important to address main presenting symptoms and consider other treatments such as cosmetic therapies.

● Shared decision-making (including accurate information and reassurance on the efficacy and safety of COCP) is recommended and likely improve adherence

- Natural estradiol preparations and the lowest effective estrogen doses (such as 20-30 micrograms of ethinyl estradiol or equivalent), need consideration, balancing efficacy, metabolic risk profile, side effects, cost and availability.
- The relatively limited evidence on COCPs specifically in PCOS needs to be appreciated with practice informed by general population guidelines.

● the relative and absolute contraindications and side effects of COCPs need to be considered and be the subject of individualised discussion

● PCOS specific risk factors such as higher weight and cardiovascular risk factors, need to be considered

GRADE CONSIDERATIONS

Justifications:

Justification for Comparison 1: COCP with high vs. COCP with low levels of estrogen

Two low risk of bias RCTs over 12 months in 193 adult women compared COCPs high (30 µg [one study]-35µg [one study) vs. low (20µg) EE. COCPs with high EE (30µg) resulted in higher SHBG levels with low certainty and no significant difference in other outcomes including hirsutism. EE was combined with DRSP in the study that evaluated more outcomes (BMI, WHR, FAI, TT). Side effects were not reported in these studies. One study was published in 2020.

Justification on Comparison 2: COCP with 1st vs 2nd generation progestin

We are unable to provide a recommendation about effectiveness of COCP with 1st vs COCP with 2nd generation progestin due to no evidence being identified.

Justification on Comparison 3: COCP with 1st vs. COCP with 3rd generation progestin

We are unable to provide a recommendation about effectiveness of COCP with 1st vs COCP with 3rd generation progestin as the available data are inconclusive and with high risk of bias.
One RCT with a high risk of bias over 3 months in 40 women (16-35 years and mean age was not reported). The study had four arms. Relevant for this comparison, chlormadinone acetate (CMA), a 1st generation progestin was compared with two different 3rd generation progestins, desogestrel (DSG) and gestodene (GSD) and was favourable for TT, SHBG and androstenedione with very low certainty. Side effects were not reported in this study.

Justification for Comparison 4: COCP with 1st vs. COCP with 4th generation progestin

We are unable to provide a recommendation about effectiveness of COCP with 1st vs COCP with 4th generation progestin to treat PCOS symptoms as the available data come from high risk of bias studies and have very low certainty.
Four RCTs with a high risk of bias over 3-24 months in 283 adult women (one study has women who were 16-35 years old). DeLeo (9) had four arms. Relevant for this comparison, chlormadinone acetate (CMA), a 1st generation progestin was compared with the 4th generation progestins drospirenone (DRSP). Both Morgante (10), Podfigurna (11) and Yildizhan (12) used the same progestins in their RCTs (DRSP).
Results from the meta-analysis showed a greater decrease in androstenedione (very low certainty) and in DHEAS (low certainty) after treatment with the 4th generation progestin. There was no difference between treatments in SHBG and total testosterone levels. With very low certainty of evidence, cholesterol and CRP levels were lower after treatment with the 4th generation progestin, compared with the 1st generation. There were no differences in other outcomes, with very low certainty of evidence.
Side effects were not reported in these studies.

Justification for Comparison 5: COCP with 2nd vs. COCP with 3rd generation progestins

3rd or 2nd generation could be considered equally effective when treating clinical hyperandrogenism.
No data assessing menstrual cycle irregularities. No specific recommendation for this comparison and will be incorporated into general recommendation.

Two RCTs with a high risk of bias over 6 months in 176 adult women. Amiri 2020 (13) was a crossover study, involving four arms. Treatment was ongoing for 6 months, then a 6-8 week washout period was allowed before change of treatment to a COCP with a different progestin. Amiri 2021 (14) was a 6 months four arm trial comparing COCPs with four different progestins. The progestins relevant for this comparison were the 2nd generation levonorgestrel (LNG) vs. 3rd generation desogestrel (DSG) in both studies.
The crossover study showed a greater decrease in FAI, and a greater increase in SHBG, after treatment with the 3rd generation progestin, with a very low certainty of evidence. There was no difference between the groups for other outcomes, including hirsutism, with a very low certainty of evidence.
Side effects were not reported in these studies.

Justification for Comparison 6: COCP with 2nd vs. COCP with 4th generation progestins
4rd or 2nd generation could be considered equally effective when treating hirsutism.
No data assessing menstrual cycle irregularities.
Two RCTs with a high risk of bias over 6 months in 176 adult women. The progestins relevant for this comparison were the 2nd generation levonorgestrel (LNG) vs. 4th generation drospirenone (DRSP) in both studies.
Results from the crossover study showed a greater decrease in FAI, and a greater increase in SHBG, after treatment with the 4th generation progestin (very low certainty of evidence) and no difference for free testosterone and DHEAS (very low certainty of evidence).
Side effects were not reported in these studies.

Justification for Comparison 7: COCP with 3rd vs. COCP with 4th generation progestins
COCP with 4th generation vs 3rd generation progestins could be considered equally effective when treating hirsutism.
Five RCTs over 3-12 months in 403 adult women were identified. One study included women 16-35 years. 4 studies have a high risk of bias and one low risk of bias. The progestins used in these studies were the 3rd generations desogestrel (DSG) and gestodene (GSD), and the 4th generations drospirenone (DRSP) and dienogest (DNG).
Total testosterone levels, androstenedione and LDL were lower, and HDL higher, after treatment with a 4th generation progestin (very low certainty of evidence) compared to 3rd generation. These differences were not clinically significant. The meta-analysis showed no difference in other outcomes, including BMI, when 4th compared with 3rd generation progestins (very low certainty of evidence).
Side effects were reported in under 60 subjects. One major adverse event reported with 3rd generation one, a case of severe lower limb pain, where Doppler showed no sign of thrombosis, but the patient discontinued treatment. Other mild side effects reported included spotting (more cases in 4th) and mastalgia and bloating (more cases with 3rd generation).

Justification for Comparison 8: Any COCP vs. EE/CPA
COCP preparations with 35 ug EE and 2 mg CPA should not be considered first line over other COCP in PCOS due to potential adverse effects and contraindications as outlined in general population guidelines.

Ten RCTs over 3-12 months were identified comparing conventional COCPs and EE/CPA including 703 subjects. Six had a high risk of bias, one moderate and three low risk of bias. Two out of 10 studies involved adolescents (use NIH criteria) and were over 12 months, one with high risk of bias and one with low. 9 out of 10 had the combination of 35 ug EE and CPA 2 mg.
Hirsutism was improved with the combination EE/CPA (very low certainty) and only reported in 2 RCT.
The meta-analysis showed that the combination EE/CPA, compared with conventional COCPs, had a beneficial effect with lower BMI, lower total testosterone. EE/CPA treatment resulted in higher levels of LDL with a low certainty of evidence and higher cholesterol (very low certainty)). In the subgroup analysis, total testosterone levels were lower after EE/CPA treatment in adults (low certainty) but not in adolescents (very low certainty). For SHBG, there were no significant differences between treatments in the adult or the adolescent subgroups, with a very low certainty of evidence.
Adverse effects were not assessed systematically. No major adverse effects were reported. Side effects were not reported in adolescent trials. Individuals on EE/CPA reported spotting, nausea and headache; and individuals on COCP reported breast tenderness. This is taking into account only reports of 50 subjects.

Justification of Comparison 9: COCP vs. progestin only
We are unable to provide a recommendation about effectiveness of COCP vs progestin only as the available data comes from moderate to high risk of bias studies and have very low certainty.

Two RCTs over 4-6 months were identified (137 subjects). One in adolescents (Chung 2014 (15)- that used Rotterdam diagnostic criteria) with a moderate risk of bias, and one in adults (16) with a high risk of bias.

In the meta-analysis, there was no difference in BMI, WHR and total testosterone (very low certainty of evidence). The other outcomes, with results only from one study, showed lower FAI and higher SHBG levels after COCP treatment and lower insulin and triglyceride levels (very low certainty of evidence). No side effects were reported. Side effects were not reported in the studies.

Justification of Comparison 10: COCP vs. controls/placebo

COCP should be recommended in women and adolescents with PCOS for the management of hyperandrogenism and/or irregular menstrual cycles.

Three RCTs (including 301 subjects, one in adolescents) compared COCPs with controls and all had a high risk of bias. There was one study published after 2017.

No meta-analysis was available. All outcomes were reported in only one study. COCP was superior to controls regarding improvement in cycle regularity (low certainty of evidence). HRQoL overall after COCP treatment, as well as in a dermatologic HRQoL questionnaire and a hirsutism HRQoL questionnaire (very low certainty of evidence). Weight, testosterone, insulin levels were lower after COCP treatment, compared with controls (very low certainty of evidence). The control group had lower after load insulin levels after an OGTT, and also had lower levels of CRP and PAI-1 compared with the group treated with COCP (very low certainty of evidence). For all other outcomes, no difference was seen between groups (very low certainty of evidence).

COCP treatment was associated with more minor adverse effects than controls. Controls reported worsening of symptoms. Adolescents using COCP complain of weight gain.

Justification of Comparison 11: COCP vs. placebo

One 6-month RCT with a moderate risk of bias including 34 adolescents diagnosed by Rotterdam criteria (17). No studies involved adults. COCP treatment resulted in lower levels of testosterone, higher SHBG and lower FAI (very low certainty of evidence). The placebo group had lower CRP levels compared with the COCP treated group (very low certainty of evidence). Mild side effects reported.

Justification of Comparison 12: COCP vs lifestyle

We are unable to provide a recommendation about effectiveness of COCP vs lifestyle as the available data come from a moderate risk of bias study and have very low certainty.

One 6-month RCT with a moderate risk of bias including 34 adolescents diagnosed by Rotterdam criteria (17). No studies involving adults.

LDL and triglycerides were lower after lifestyle treatment compared with COCP (very low certainty of evidence). Total testosterone levels were lower after COCP treatment, compared with lifestyle (very low certainty). For other outcomes, no difference was seen, with very low certainty of evidence.

Mild side effects reported.

Justification of Comparison 13: COCP vs. lifestyle +/- anti-obesity treatment

We are unable to provide a recommendation about effectiveness of COCP vs lifestyle +/- anti-obesity treatment as the available data come from a moderate risk of bias study and have very low certainty.

One RCT over 16 weeks with moderate risk of bias in 132 adult women. Anti-obesity used was sibutramine and orlistat.

Lifestyle +/-anti-obesity resulted in lower weight compared with COCP alone (very low certainty of evidence). COCP had lower total testosterone and higher SHBG, compared with lifestyle alone (very low certainty of evidence). Triglycerides were higher after COCP treatment compared with lifestyle. OGTT was better after lifestyle +/-anti-obesity (very low certainty of evidence). No report of side effects.

Justification of Comparison 14: COCP vs. combination of COCP and lifestyle with/without anti-obesity treatment

We are unable to provide a recommendation about effectiveness of COCP vs COCP and lifestyle +/- anti-obesity treatment as the available data come from a moderate risk of bias study and have very low certainty.

One RCT over 16 weeks with moderate risk of bias in 132 adult women. Anti-obesity used was sibutramine and orlistat. Combination favours weight and 2-hour OGTT (very low certainty). No report of side effects.

Justification of Comparison 15: lifestyle +/- anti-obesity treatment vs. combination of COCP and lifestyle +/- antiobesity treatment

We are unable to provide a recommendation about effectiveness of lifestyle +/- anti-obesity treatment vs COCP and lifestyle +/- anti-obesity treatment as the available data come from a moderate risk of bias study and have very low certainty.

One RCT over 16 weeks with moderate risk of bias in 132 adult women. Anti-obesity used was sibutramine and orlistat. COCP and lifestyle +/-anti-obesity favours testosterone and increases SHBG (very low certainty). No report of side effects.

Justification of Comparison 16: COCP vs. anti-obesity

We are unable to provide a recommendation about effectiveness of COCP vs anti-obesity treatment as the available data come from a high risk of bias study and have very low certainty.

One RCT with a high risk of bias compared COCP with 35 µg EE + 2 mg CPA (n=14) vs. sibutramine 10 mg/day (n=12) for 6 months in 53 adult women.

Anti-obesity medication resulted in lower BMI, lower triglycerides and lower insulin levels, compared with COCP treatment (very low certainty). No report of side effects.

Justification of Comparison 17: COCP vs. COCP + anti-obesity

Three RCTs with high risk of bias in 346 adult women (some with a BMI over 30) over 3-6 months. Sabuncu 2003 (17) compared 35 µg EE + 2 mg CPA (n=14) vs. 35 µg EE + 2 mg CPA + sibutramine 10 mg/day (n= 14) for 6 months. Song 2017 (19) compared 35 µg EE + 2 mg CPA (n=60) vs. 35 µg EE + 2 mg CPA + Orlistat 120 mgx3 (n=60). Gu 2022 (20) studied DRSP 3 mg/EE 20 µg (n=33) vs. DRSP 3 mg/EE 20 µg + Orlistat 120 mg x 3 (n=33) for 3 months.

The meta-analysis showed lower DHEAS, FAI levels and HOMA-IR after treatment with the combination COCP + anti-obesity drugs (low certainty of evidence). For all other outcomes, there were no differences between treatments (low or very low certainty of evidence).

2 RCT did not report side effects. One RCT reported mild side effects with COCP with no DVT and mild GI side effects with anti-obesity agents.

Justification of Comparison 18: COCP + metformin vs. COCP + anti-obesity

We are unable to provide a recommendation about effectiveness of COCP + metformin vs COCP + anti-obesity treatment as the available data come from a high risk of bias study and have very low certainty.

One RCT with a high risk of bias in 240 adult women over 3 months. COCP containing EE/CPA were given to both groups. One group had orlistat 120 mgx3, and one group had metformin 1500 mg/day, in addition to the COCP treatment, n=60 in both groups.

Triglycerides and cholesterol levels were lower and HDL levels higher after treatment with COCP + anti-obesity, compared with COCP + metformin (very low certainty of evidence). For other outcomes, there were no certain differences between the groups (very low certainty of evidence).

Mild side effects with COCP with no DVT and mild GI side effects with anti-obesity and metformin.

Justification of Comparison 30: COCP + AA1 vs. COCP + AA2 (reported in Q4.6)

We are unable to provide a recommendation about effectiveness of COCP plus antiandrogen 1 vs COCP antiandrogen 2 as the available data come from 1 moderate risk of bias study and have low certainty.

One 12-month RCT was identified in 142 adult women with moderate risk of bias. Hagag 2014 compared COCP (35 µg EE + 250 µg NOR) + spironolactone 100 mg with COCP (35 µg EE + 2 mg CPA) + extra 10 mg CPA.

The combination of COCP + spironolactone resulted in a greater reduction of hirsutism compared with COCP + extra CPA (low certainty of evidence). Other reported outcomes (free and total testosterone, DHEAS, androstenedione) did not differ between treatments (low certainty of evidence).

Study did not report on side effects.

Subgroup considerations:

Adolescent data is variable across the comparisons.

BMI and ethnic subgroups need to be considered.

Implementation considerations:

Potential barriers to implementation of the recommendations relate to the availability of different COCP combinations and costs of the COCP to women and health systems.

Monitoring and evaluation considerations:

Metabolic risk in particular, in adult women and adolescents with high BMI and specific ethnicities

Assess risk for impaired glucose tolerance, diabetes, dyslipidemia recognizing that risks for these consequences are higher in individuals with high BMI or specific ethnic backgrounds.

Research priorities:
Large scale population-based studies are required to capture side effects and risks in individuals with PCOS.
Large scale comparative studies in particular in adolescents are required to determine the optimal COCP preparation in relation to progestins and doses.
Efficacy on acne, hair loss and psychological outcomes.
Adverse events including weight, metabolic effects and psychological outcomes.
Progestin only preparations (including intrauterine system, implant, pill etc.)

GRADE framework

GRADE DECIDE **Interactive Evidence to Decision Framework**

● DESIRABLE EFFECTS

How substantial are the desirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Extensive review and discussion on multiple preparation combinations supported the GRADE justification.

● UNDESIRABLE EFFECTS

How substantial are the undesirable anticipated effects?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Panel discussion:

Side effects are not systematically reported but overall no major side effects were reported and very few subjects did withdrew treatment due to side effects even with combinations

COCP can cause mild side effects such as spotting and breast tenderness.

● CERTAINTY OF THE EVIDENCE

What is the overall certainty of the evidence of effects?

Judgement:

☐ No included studies	☒ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

See Part 1- Evidence Summary and GRADE document.

Overall certainty of evidence is low to very low.

Panel discussion:

The certainty of evidence ranges from very low to moderate (menstrual cycles, BMI, hirsutism). However evidence for hirsutism is ranked moderate and this is the main recommendation. Other outcomes have very low evidence and influenced this rating.

● VALUES

Is there important uncertainty about, or variability in, how much people value the main outcomes?

Judgement:

☐ Important uncertainty or variability	☐ Possibly important uncertainty or variability	☒ Probably no important uncertainty or variability	☐ No important uncertainty or variability

Research evidence:

No research evidence was identified

Panel discussion:

Value to both Health professionals and consumers are likely high.

● BALANCE OF EFFECTS

Does the balance between desirable and undesirable effects favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Panel discussion:

Individual preferences need to be considered

● COSTS

How large are the resource requirements (costs)?

Judgement:

☒ Don't know	☐ Varies	☐ Large costs	☐ Moderate costs	☐ Negligible costs or savings	☐ Moderate savings	☐ Large savings

Research evidence:

No research evidence was identified

Panel discussion:

COCP costs vary according to preparations, countries and health care systems

COCP availability might be an issue in some countries

● CERTAINTY OF COST EVIDENCE

What is the certainty of the evidence of resource requirements (costs)?

Judgement:

☒ No included studies	☐ Very low	☐ Low	☐ Moderate	☐ High

Research evidence:

No research evidence was identified

Panel discussion:

There is no evidence to comment on certainty

● COST-EFFECTIVENESS

Does the cost-effectiveness of the option favour the option or the comparison?

Judgement:

☐ Favours this option	☒ Probably favours this option	☐ Neither favours this option or other options	☐ Probably favours other options	☐ Favours other options

Research evidence:

No research evidence was identified

Panel discussion:

There is no evidence on cost effectiveness on COCP for management of PCOS, the cost of COCP to women and healthcare systems is generally low.

● EQUITY

What would be the impact on health equity?

Judgement:

☐ Don't know	☐ Varies	☐ Reduced	☐ Probably reduced	☐ Probably no impact	☒ Probably increased	☐ Increased

Research evidence:

No research evidence was identified

Panel discussion:

No preferred COCP preparation and general COCP availability and low cost will increase equity.

● ACCEPTABILITY

Is the option acceptable to key stakeholders?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☒ Probably Yes	☐ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Majority of the key stakeholders (health care system, Health professionals and consumers) will find the recommendations acceptable. However, there will be subgroups for various reasons who will find the recommendations less acceptable.

● FEASIBILITY

Is the option feasible to implement?

Judgement:

☐ Don't know	☐ Varies	☐ No	☐ Probably No	☐ Probably Yes	☒ Yes

Research evidence:

No research evidence was identified

Panel discussion:

Despite the variability in acceptance, guidelines could help address the barriers to implementation to ensure patients who are eligible for the treatment will receive it.

Education of health care professionals is essential.

GDG 4

Question 4.4.

Is metformin alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?

1. SELECTION CRITERIA

Table 1. PICO Criteria for Inclusion

Question	Q 4.3) Is metformin alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
Clinical leads (key contacts)	**Prof Poli Mara Spritzer** Endocrinologist Universidade Federal do Rio Grande do Sul, Brazil spritzer@ufrgs.br **Dr Daniela Romualdi** Obstetrician-gynaecologist Fondazione Policlinico Universitario Agostino Gemelli, Rome, Italy daniela.romualdi@policlinicogemelli.it **A/Prof Alexia Pena Vargas** Paediatric endocrinologist The Robinson Research Institute at the University of Adelaide, Australia alexia.pena@adelaide.edu.au **Prof Selma Witchel** Paediatric endocrinologist Children's Hospital of Pittsburgh of UPMC, University of Pittsburg, USA witchelsf@upmc.edu
Allocation ranking	Level 1- New systematic review

	Participants (P)	Intervention (I)	Comparison (C)	Outcomes (O)	Study type (S)	Limits *(language, year)*
Inclusion	Females with PCOS (diagnosed by Rotterdam, NIH or AES) of any age, ethnicity and weight. Subgroups: adolescents (10-19y), adults, pregnancy, post-menopausal. BMI subgroups informed by the most frequent presentation of the data.	Metformin alone or in combination with lifestyle, OCP, anti-androgens, anti-obesity agents. Any dose, duration of more than 6 months for hirsutism and 3 months for all other outcomes.	Placebo or any other intervention (listed in intervention) or combinations of those listed in intervention.	**Androgenicity**: Hirsutism- FG score (ethnicities), FAI, SHBG, DHEAS, testosterone, androstenedione, Irregular cycles **Metabolic**: insulin resistance HOMA, Clamp, OGTT Lipids: Chol LDL, HDL TG, CRP **Psychological**: Qol, depression **Arthropometric**: weight BMI, WHR Thromboembolic events, PAI-1 Gastrointestinal effects Vit B12 deficiency Lactic acidosis	Evidence based guidelines, systematic reviews, randomised controlled trials	English language. **New search.** No time limit
Exclusion	Females without PCOS. Use of medications for DM2, high cholesterol, serious mental illness. Statin therapy.		Agent or combination used in the intervention		Non-evidence based guidelines, non-systematic reviews, any study lower than a RCT.	

2. SEARCH STRATEGY

Table 2.1. Search details	
Search strategy source: Technical report p 788-789	
Evidence source	**Date of search 2022-07-08** **Results:**
Medline (Ovid)	688
PsychInfo (Ovid)	3
EMBASE (Ovid)	370
All EBM (Ovid)	185
CINAHL	114
Any subsequent updates - enter database and date:	

Table 2.2. Questions addressed by this search *(add more rows as needed)*:		
GDG	Q#	Question
4	4.2	Is the oral contraceptive pill alone or in combination effective for management of hormonal and clinical PCOS features in adolescents and adults with PCOS?
4	4.3	Is metformin alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?
4	4.6	Are anti-androgen pharmacological agents alone or in combination, effective for management of hormonal and clinical PCOS features and weight in adolescents and adults with PCOS?

Table 2.3. Search strings used in OVID or other database/s –
See page 3864-3865 under Q.4.6. on anti-androgens (the same search string was used for all three questions above)

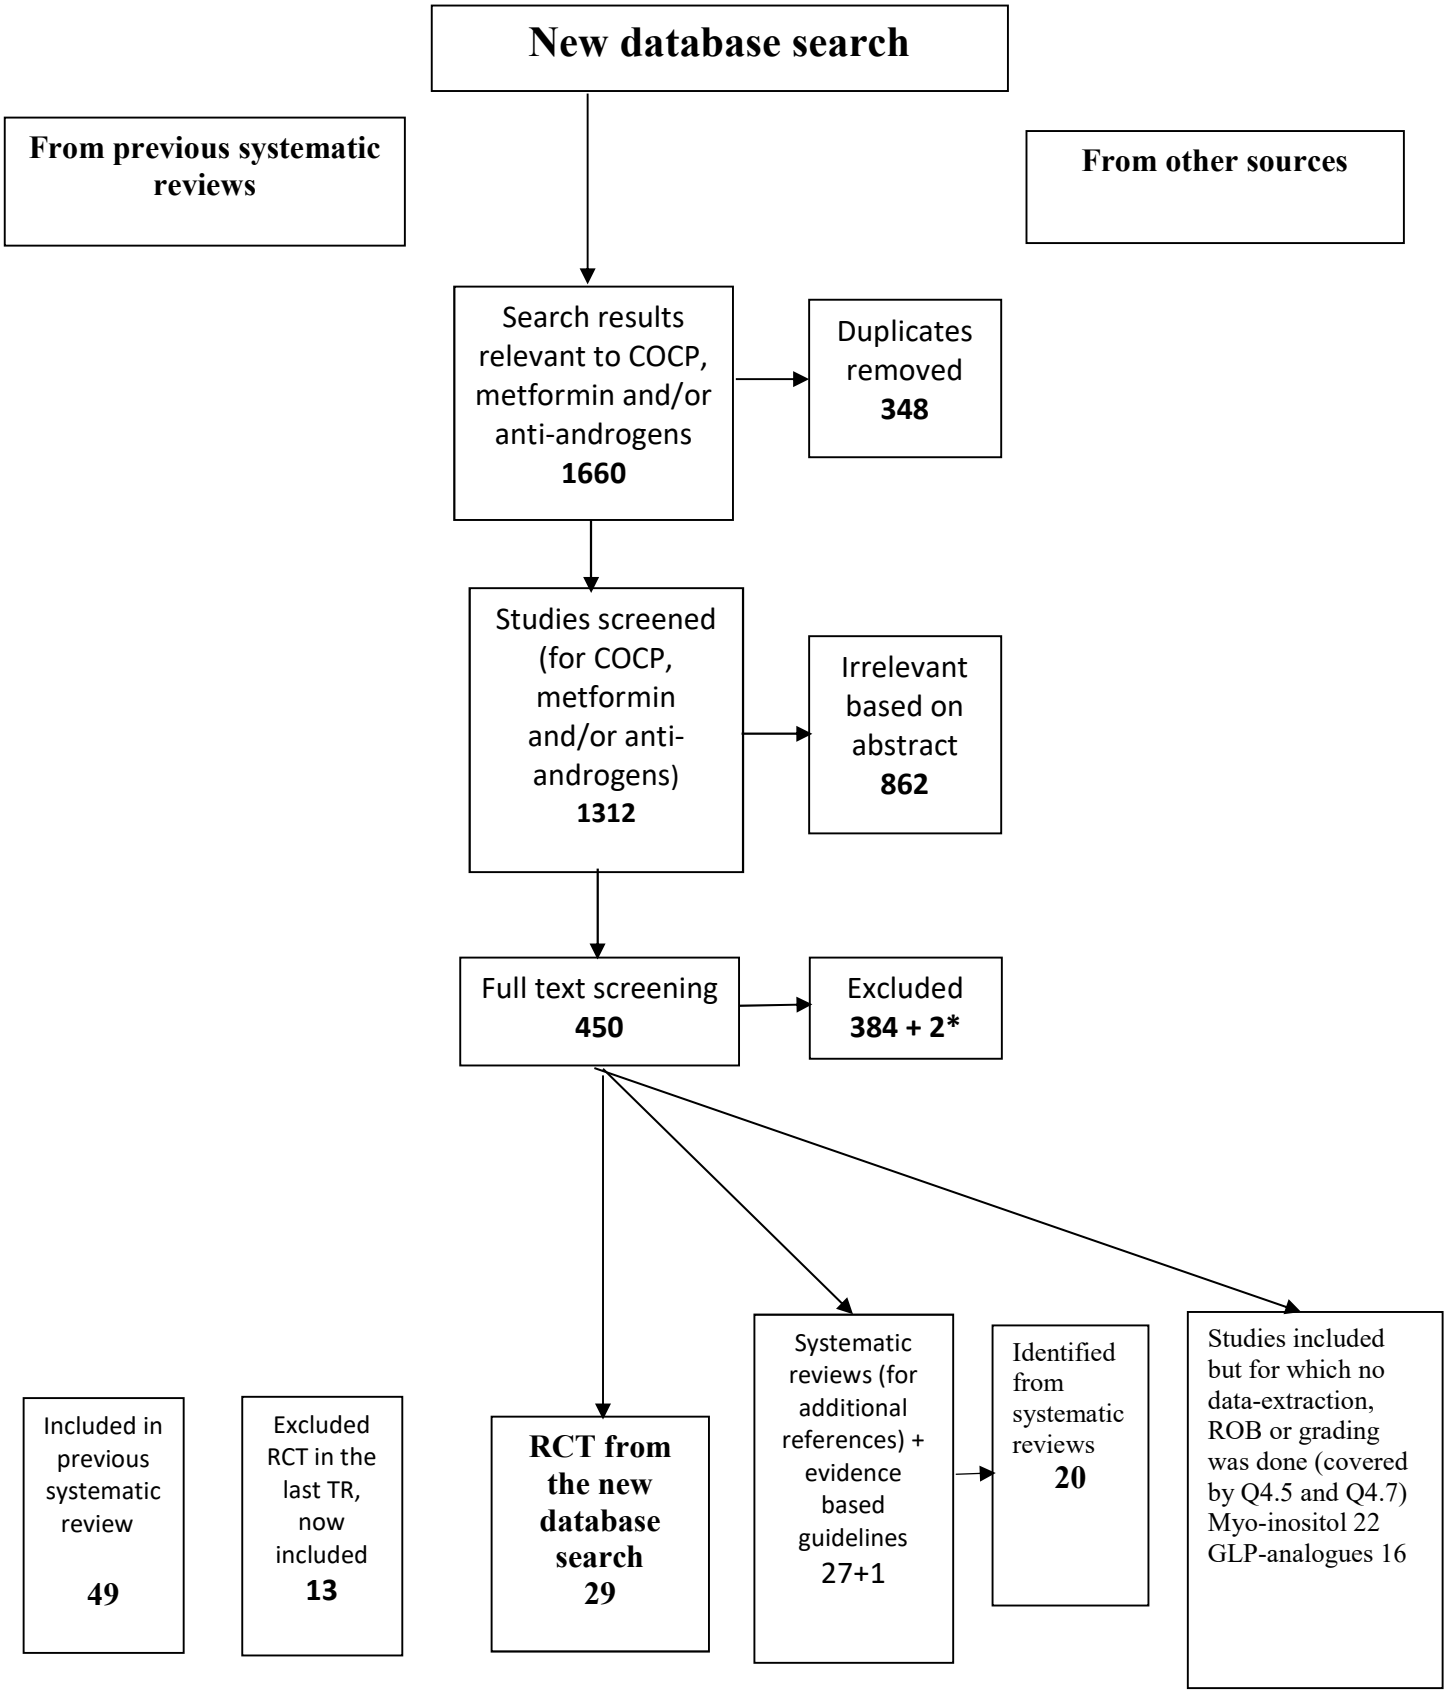
Evidence processing: Studies were selected and appraised by two reviewer/s using study selection and appraisal criteria (PICO above) established a priori. The articles were reviewed by title and abstract by two reviewers. When a decision could not be made based on title and abstract alone, full text was retrieved. Only studies that did not fit PICO for Q4.2, 4.3 or 4.6 were excluded. Full text screening was done by two reviewers. Conflicts were resolved by discussion and if needed, through contact with the evidence team/ key contacts. Included studies were double checked and approved by the clinical leads/ key contacts.

In addition to the studies included in previous guidelines, the excluded list from that search was reviewed, and studies were included if they met the current PICO.

Identified systematic reviews and evidence-based guidelines were screened manually for additional references.

In total, **111 RCTs met inclusion criteria for this review.**

3. SEARCH RESULTS - PRISMA flowchart



*Ferjan et al. 2017 and Paredes Palma et al. 2018

Altogether 49+13+29+20=111 included RCT

Dipeptidyl Peptidase-4 Inhibitor Sitagliptin Prevented Weight Regain in Obese Women with Polycystic Ovary Syndrome Previously Treated with Liraglutide: A Pilot Randomized Study
Metabolic syndrome and related disorders 2017 Excluded due to pretreatment with liraglutide
2. Paredes Palma, J. C.; Lopez Byhen, E.; Ibanez, L.; Balladares Macedo, L.; Paredes Palma, C.; Ramirez Velazquez, C.
Comparative treatment between sitagliptin vs. metformin, alone or in combination, in patients with polycystic ovary syndrome. A clinical entity at high risk for developing diabetes mellitus and gestational diabetes: a pilot study
Tratamiento comparativo entre sitagliptina vs. metformina, solas o en combinación, en pacientes con síndrome de ovario poliquístico. Una entidad clínica con alto riesgo para desarrollar diabetes mellitus y diabetes gestacional: 2018;81(1):15
Elsevier Doyma 2018 (met versus sitagliptin versus met+sitagliptin). Outcomes reported only in figures, no specific numbers. Randomization also not described. Appears that medication was used only 6-10 weeks

Table 4.2. Excluded studies (on full-text assessment)

Reference	Reason
Unknown. Effect of green tea pills and metformin versus placebo on the Nrf2-antioxidant system and proinflammatory cytokines, including IL-6 and TNF-a, in peripheral blood mononuclear cells of women with polycystic ovary syndrome: a single blind randomized clinica 2017.	**Wrong publication type.**
Effect of supplementation in treatment of women with polycystic ovary syndrome. Clinical trial of the effect of inofolic supplementation compared with metformin on parameters of mental health and oxidative stress in women with polycystic ovary syndrome 2017.	**Wrong publication type.**
Effect of inofolic supplementation in treatment of women with polycystic ovary syndrome. Clinical trial of the effect of inofolic supplementation compared with metformin on metabolic profiles and gene expression related to insulin and lipid in women with polycystic ovary syndrome 2017.	**Full text not obtainable.**
Comparison of oral contraceptives including Contrasmine, Etisterone and Desoceptive with Ovustop-L (LD) on clinical, biochemical and metabolic findings, and quality of life in women with polycystic ovary syndrome. A Randomized cross-over clinical trial to assess the effectiveness of oral contraceptives including Contrasmine, Etisterone and Desoceptive with Ovustop-L (LD) on clinical, biochemical and metabolic findings, and quality of life in women with polycystic o 2017.	**Full text not obtainable.**
The efficacy of Fennel infusion and cupping on ovarian failure. Comparison of ovarian cupping and fennel infusion with Metformin on oligomenorrhea and ovulation in women with polycystic ovarian syndrome: a clinical trial 2017.	**Full text not obtainable.**
Scientific Impact Paper No. 13: Metformin Therapy for the Management of Infertility in Women with Polycystic Ovary Syndrome. Obstetrician & Gynaecologist 2017, 19, 339-339, doi:10.1111/tog.12436.	**Wrong study design.**
Effect of using metformin on the incidence of gestational diabetes and preeclampsia in pregnant women with polycystic ovary. Effect of using metformin versus not using on the incidence of gestational diabetes and preeclampsia in pregnant women with polycystic ovary: A randomized clinical trial 2018.	**Wrong publication type**

?Effects of myo-inositol on induction of ovulation. Comparison the effects of myo-inositol plus clomiphene citrate with metformin plus clomiphene citrate on induction of ovulation among patients with polycystic ovarian syndrome. 2018.	**Wrong publication type**
New strategies to lose weight for women with polycystic ovary syndrome. Novel strategies in weight loss in women with polycystic ovary syndrome: does the gut microbiome play a role? 2018.	**Wrong publication type**
A study to compare the efficacy of two drugs on the success of assisted reproductive therapy in women with polycystic ovarian syndrome and undergoing treatment with IVF. Randomised Control Trial comparing the effects of Metformin to Myoinositol on ART outcome in women with PCOS undergoing IVF cycles 2018.	**Wrong publication type**
A study to compare the efficacy and adverse effects of metformin versus myoinositol plus d-chiroinositol combination therapy in polycystic ovarian syndrome. A prospective randomised comparative study of metformin versus myoinositol plus d-chiroinositol combination therapy in polycystic ovarian syndrome 2019.	**Wrong publication type**
Effect of combined electroacupuncture and medical therapy on insulin resistance in polycystic ovary syndrome patients. Combination of electroacupuncture and pharmacological treatment in improving insulin resistance (HOMA-IR) in polycystic ovary syndrome patients: a double-blind randomized clinical trial 2020.	**Wrong study design**
Study to find Effects of Chandraprabha Vati(Ayurvedic Medicine) in Polycystic Ovarian Syndrome Characterised by Small cysts in ovary with irregular,Scanty menses and excess/unwanted hairs on Face,Thighs,Abdomen etc. â??Randomized controlled clinical trial to study the efficacy OF Chandraprabha vati in PCOS.â?? 2020.	**Wrong study design**
A clinical trial to study the effect of exercise and metformin on mitochondrial health in patients with polycystic ovarian syndrome (PCOS). To assess the efficacy of moderate-intensity exercise training and metformin on mitophagy and mitochondrial phenotype in patients with polycystic ovarian syndrome (PCOS) 2020.	**Wrong publication type**
ffect of oral contraceptives on levels of adipokines, and adiposity indices in women with polycystic ovary syndrome. A randomized clinical trial to compare the effectiveness of oral contraceptives containing levonorgestrel, desogestrel, cyproterone acetate, and drospirenone on levels of adipokines, and adiposity indices in women with polycystic ovary syndrome. 2020.	**Wrong publication type**
Effect of treatment by OCP on infertility in PCOD patients. The randomized, single -blinded clinical trial comparing OCP effect before frozen embryo transfer versus gonadotropin â“ releasing hormone agonist injection on improving the outcome of pregnancy in infertile patients with hyper androgenic poly 2020.	**Fulltext not obtainable**
Expression of concern: Comparison of myo-inositol and metformin on mental health parameters and biomarkers of oxidative stress in women with polycystic ovary syndrome: a randomized, double-blind, placebo-controlled trial The effects of fish oil omega-3 fatty acid supplementation on mental health parameters and metabolic status of patients with polycystic ovary syndrome: a randomized, double-blind, placebo-controlled trial. Journal of Psychosomatic Obstetrics & Gynecology 2020, 41, I-I, doi:10.1080/0167482X.2020.1842508	**Wrong publication type**
Evaluation of therapeutic effects of crocina (saffron tablets) in patients with polycystic ovary syndrome: a randomized double-blind clinical trial. 2021.	**Wrong publication type**
A clinical study in women suffering from polycystic ovary syndrome (PCOS) to test the drug LPRI-424 (dienogest/ethinyl estradiol) during 9 months of treatment. A multicentre, phase III, double-blind, randomised clinical trial to assess the efficacy and safety of LPRI-424 (dienogest 2.00 mg / ethinyl estradiol 0.02 mg) in the treatment of polycystic ovary syndrome (PCOS) versus placebo during 9 cycles 2021.	**Wrong publication type**
A clinical trial to study the effect of myoinositol based therapy in combination with metformin as compared to metformin alone in women with polycystic ovarian syndrome. A Randomized Controlled Trial comparing Myoinositol based therapy in combination with Metformin versus Metformin monotherapy on the clinical, metabolic and hormonal parameters in Obese reproductive age women with Polycystic Ovarian Syndrome 2021.	**Wrong publication type**
Efficacy of very low carbohydrate diet combined with metformin in overweight / obese PCOS patients on changing of clinical phenotype, gut microbiota and plasma metabolome after treatment: a randomized, controlled clinical trial. 2021.	**Fulltext not obtainable**
A Phase II, randomised, multi-centric, multi-national clinical trial to evaluate the efficacy, tolerability, and safety of a fixed dose combination of Spironolactone, Pioglitazone & Metformin (SPIOMET) for adolescent girls and young adult women (AYAs) with polycystic ovary syndrome (PCOS). 2021.	**Wrong publication type**
Investigation on the efficacy and safety of Ceylon cinnamon (Cinammomum zeylanicum) compared to metformin in ameliorating symptoms of Polycystic Ovary Syndrome (PCOS): A randomized controlled trial. Investigation on the Efficacy and Safety of Ceylon Cinnamon (Cinammomum zeylanicum) and Metformin in Ameliorating Polycystic Ovary Syndrome (PCOS): A Randomized Controlled Trial 2022.	**Wrong comparator**
